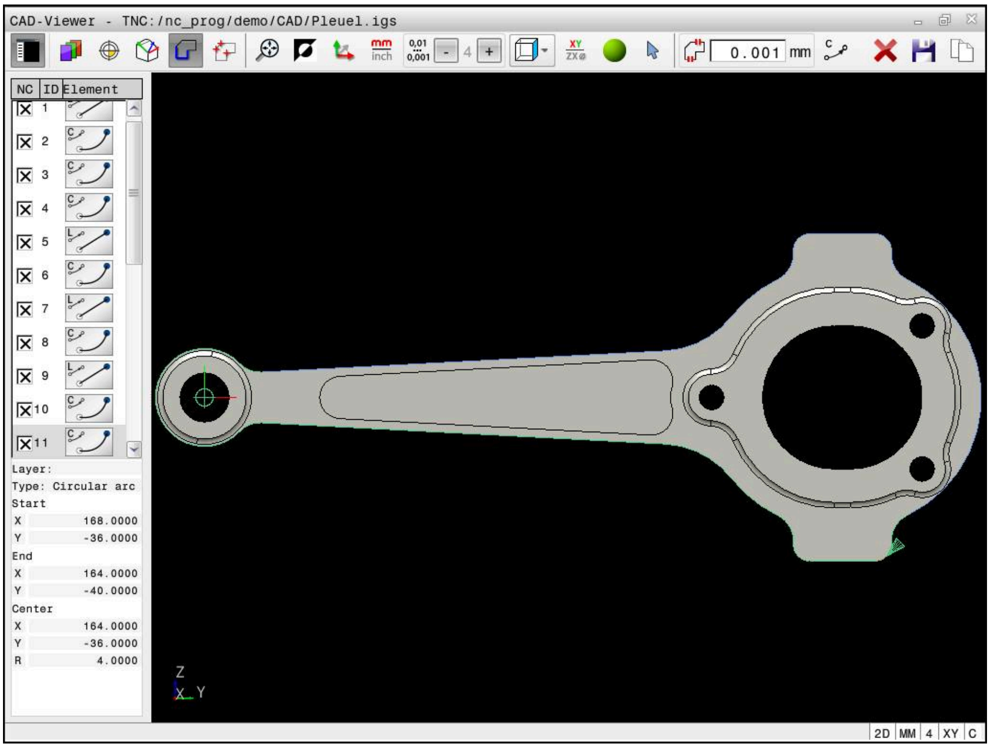
To insert a selected contour or a selected machining position directly into an NC program, use the control's clipboard. Using the clipboard, you can even transfer the contents to the software tools (e.g., **Leafpad** or **Gnumeric**).

Further information: "Opening files with additional software", Page 1972



CAD model with marked contour

Icons in the CAD Import

With the CAD Import, the control shows the following additional functions in the menu bar:

Icon	Function
	Delete entire list
	Save entire list content to a file
	Copy entire list contents to clipboard
	Set the transition tolerance The tolerance specifies how far apart neighboring contour elements may be from each other. You can use the tolerance to compensate for inaccuracies that occurred when the drawing was made. The default setting is 0.001 mm
	C or **CR** Arc mode defines whether circular arcs are output in C format or CR format (e.g., for cylinder surface interpolation) in the NC program.
	Show connections between two positions Specifies whether the control should display the tool path as a dashed line during the selection of machining positions
	Apply path optimization The control optimizes the tool traverse movement to produce shorter traverse movements between the machining positions. When the icon is pressed again, the optimization is reset
	Find circles according to diameter range. Load center coordinates to the position list The control opens a pop-up window in which you can filter holes (full circles) based on their size

Applying contours

The following elements can be selected as a contour:

- Line segment
- Circle
- Circular arc
- Polyline
- Any curves (e.g., splines, ellipses)

You can also use the CAD viewer (option 50) to select contours for turning. The icon is grayed out if option 50 is not enabled. Before selecting a turning contour, you must set the preset on the rotary axis. If you select a turning contour, it is saved with Z and X coordinates. In addition, all X coordinate values in turning contours are transferred as diameter values, i.e. the drawing dimensions for the X axis are doubled. All contour elements below the rotary axis cannot be selected and are highlighted gray.

Linearization

During linearization, a contour is divided into individual positions. The CAD Import creates a straight line **L** for each position. With the CAD Import, you can therefore also apply contours that cannot be programmed with the path functions of the control, e.g. splines.

The **CAD-Viewer** linearizes all of the contours that are not in the XY plane. The finer the resolution, the more accurately the control will display the contours.

Applying positions

You can also use the CAD Import to save positions, e.g. for holes.

Three possibilities are available in the pattern generator for defining machining positions:

- Single selection
- Multiple selection within a range
- Multiple selection using search filters

Further information: "Select positions", Page 1370

The following file types are available:

- Point table (**.PNT**)
- Klartext conversational language program (**.H**)

If you save the machining positions to a Klartext program, the control creates a separate linear block with a cycle call for every machining position (**L X... Y... Z... F MAX M99**).

Multi-selection filter settings

After you have used the quick selection function to mark hole positions, a pop-up window appears in which the smallest diameter found is to the left and the largest diameter to the right. With the buttons just below the diameter display you can adjust the diameter so that you can load the hole diameters that you want.

The following buttons are available:

Icon	Filter setting of smallest diameter
|<<	Display the smallest diameter found (default setting)
<	Display the next smaller diameter found
>	Display the next larger diameter found
>>	Display the largest diameter found. The control sets the filter for the smallest diameter to the value set for the largest diameter

Icon	Filter setting of largest diameter
<<	Display the smallest diameter found. The control sets the filter for the largest diameter to the value set for the smallest diameter
<	Display the next smaller diameter found
>	Display the next larger diameter found
>>|	Display the largest diameter found (default setting)

25.4.1 Selecting and saving a contour

- The following instructions apply to the use of a mouse. You can also perform these steps with touch gestures.

  Further information: "Common gestures for the touchscreen", Page 96
- Deselecting, deleting, and saving of elements works in the same way for taking over contours and positions.

Selecting a contour with existing contour elements

To select and save a contour with existing contour elements:

- ▶ Select **Contour**
- ▶ Place the cursor on the first contour element
- > The control shows the suggested direction of rotation as a dashed line.
- ▶ If necessary, move the cursor towards the more distant end point.
- > The control changes the suggested direction of rotation.
- ▶ Select the contour element
- > The selected contour element is displayed in blue and is marked in the Sidebar window.
- > Other contour elements are shown in green.

The control suggests the contour that deviates least from the suggested direction. To change the suggested contour path, you can select paths independently of the existing contour elements

- ▶ Select the last desired contour element
- > All contour elements up to the selected element are shown in blue and are marked in the Sidebar window.

- ▶ Select **Save entire list content to a file**
- > The **Define file name for contour program** window opens.
- ▶ Enter the desired name
- ▶ Select the path to the storage location
- ▶ Select **Save**
- > The selected contour is saved as an NC program.

- Alternatively, you can use the **Copy entire list contents to clipboard** icon to copy the selected contour to the clipboard and then paste it into an existing NC program.
- If you select an element with the CTRL key pressed, it is deselected for export.

Selecting paths independent of existing contour elements

To select a path independent of existing contour elements:

- Select **Contour**

- Select **Select**
- > The icon changes, and the control activates the **Add** mode.
- Place the cursor relative to the desired contour element
- > The control displays selectable points:
  - End point or center point of a line or curve
  - Quadrant transitions or center of a circle
  - Points of intersection between existing elements
- Select the desired point
- Select more contour elements

> If the contour element to be extended or shortened is a straight line, the control will extend or shorten the contour element along the same line. If the contour element to be extended or shortened is a circular arc, the control will extend or shorten the contour element along the same arc.

Saving the contour as a workpiece blank definition (option 50)

For a workpiece blank definition in turning mode, a closed contour is required.

NOTICE

Danger of collision!

Closed contours must completely lie inside the workpiece blank definition. Otherwise, the system will follow closed contours also along the rotary axis when machining, causing collisions.

- Select or program only those contour elements that are actually required, e.g. within the definition of a finished part.

To select a closed contour:

- Select **Contour**
- Select all required contour elements
- Select the starting point of the first element
- > The control closes the contour.

25.4.2 Select positions

> - The following instructions apply to the use of a mouse. You can also perform these steps with touch gestures.
>
>   **Further information:** "Common gestures for the touchscreen", Page 96
> - Deselecting, deleting, and saving of elements works in the same way for taking over contours and positions.
>
>   "Selecting and saving a contour"

Individual selection

To select individual positions, e.g. holes:

- ▶ Select **Positions**
- ▶ Position the cursor on the desired element
- > The control shows the circumference and center point of the element in orange.
- ▶ Select the desired element
- > The control highlights the selected element in blue and displays it in the list view window.

Multiple selection by area

To select multiple positions within an area:

- ▶ Select **Positions**
- ▶ Select **Select**
- > The icon changes, and the control activates the **Add** mode.
- ▶ Drag a box around the area while holding down the left mouse button
- > The control opens the **Find circle centers after diameter range** window and shows the smallest and largest diameter found.
- ▶ Change the filter settings as needed
- ▶ Press **OK**
- > The control highlights all positions of the selected diameter range in blue and shows them in the list view window.
- > The control shows the traversing distance between the positions.

Multiple selection by search filter

To select multiple positions using a search filter:

- ▶ Select **Positions**
- ▶ **Find circles according to diameter range.** Select **Find circles according to diameter range. Load center coordinates to the position list**
- > The control opens the **Find circle centers after diameter range** window and shows the smallest and largest diameter found.
- ▶ Change the filter settings as needed
- ▶ Press **OK**
- > The control highlights all positions of the selected diameter range in blue and shows them in the list view window.
- > The control shows the traversing distance between the positions.

Notes

- Set the correct unit of measure, because the CAD file does not contain this information.
- Ensure that the unit of measure used in the NC program matches with that used in the **CAD-Viewer**. Elements that have been copied from the **CAD-Viewer** to the clipboard do not contain any information about the unit of measure.
- The control also transfers two workpiece-blank definitions (**BLK FORM**) to the contour program. The first definition contains the dimensions of the entire CAD file. The second one, which is the active one, contains only the selected contour elements, so that an optimized size of the workpiece blank results.

Notes on applying contours

- If you double-click a layer in the list view window, the control switches to Contour Transfer mode and selects the first contour element that was drawn. The control highlights the other selectable elements of this contour in green. Especially in case of contours with many short elements, this procedure spares you the effort of running a manual search for the beginning of a contour.
- Select the first contour element such that approach without collision is possible.
- You can even select a contour if the designer has saved the lines on different layers.
- Specify the direction of rotation during contour selection so that it matches the desired machining direction.
- The contour paths available depend on the selectable contour elements that are shown in green. Without the green elements, the control will display all solutions available. To remove the proposed contour path, select the first green element by pressing the left mouse button while holding the **CTRL** key down.
  As an alternative, you can switch to the Remove mode:

25.5 Generating STL files with 3D mesh (option 152)

Application

With the **3D mesh** function, you generate STL files from 3D models. This allows you to repair defective files of fixtures and tool holders, for example, or to position STL files generated from the simulation for another machining operation.

Related topics

- Fixture Monitoring (option 40)
  Further information: "Fixture monitoring (option 40)", Page 1091
- Export simulated workpiece as STL file
  Further information: "Exporting a simulated workpiece as STL file", Page 1415
- Using an STL file as workpiece blank
  Further information: "Defining a workpiece blank with BLK FORM", Page 234

Requirement

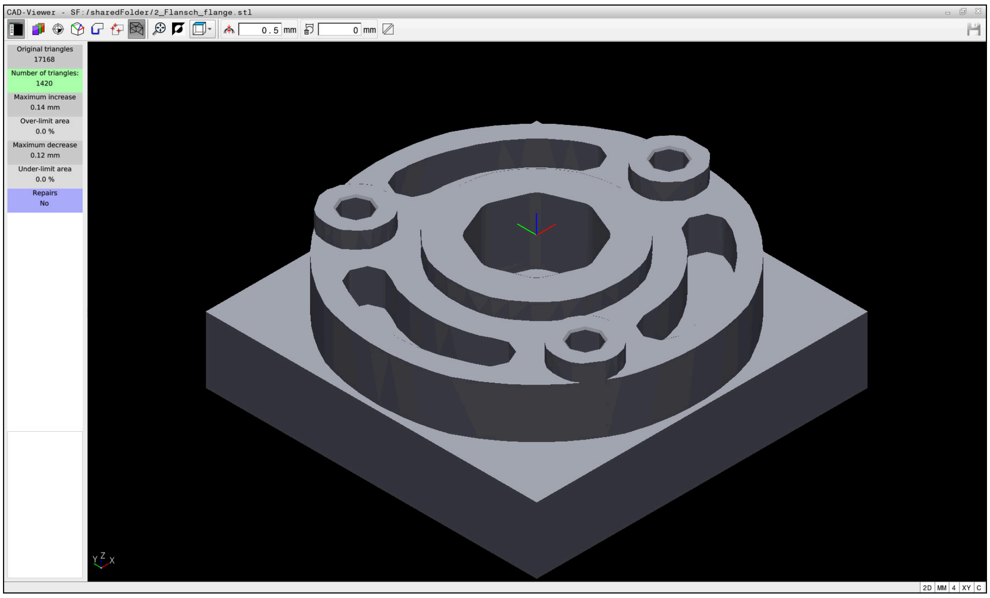
- Software option 152, CAD Model Optimizer

Description of function

When you select the **3D mesh** icon, the control changes to **3D mesh** mode. The control covers the 3D model displayed in **CAD-Viewer** with a mesh of triangles.

The control simplifies the original model and removes errors, e.g. small holes in a solid or self-intersections of a surface.

You can save the result and use it for various control functions, e.g. as a workpiece blank with the **BLK FORM FILE** function.



3D model in **3D mesh** mode

The simplified model or parts of it may be smaller or larger than the original model. The result depends on the quality of the original model and the selected settings in **3D mesh** mode.

The Sidebar window shows the following information:

Option	Meaning
Original triangles	Number of triangles in the original model
Number of triangles:	Number of triangles with active settings in the simplified model If this option is highlighted in green, the number of triangles is in the optimum range. You can further reduce the number of triangles using the available functions. **Further information:** "Functions for the simplified model", Page 1374
Maximum increase	Maximum increase of the triangle mesh
Over-limit area	Surface increase in percent compared to the original model
Maximum decrease	Maximum decrease of the triangle mesh compared to the original model
Under-limit area	Surface decrease in percent compared to the original model

Option	Meaning
Repairs	Indicates whether the original model has been repaired or not If it has been repaired, the control will indicate the type of repair, e.g. **Yes: Hole Int Shells**. This indication consists of the following items: ■ **Hole** **CAD-Viewer** closed holes in the 3D model. ■ **Int** **CAD-Viewer** removed self-intersections. ■ **Shells** **CAD-Viewer** joined multiple separate solids.

In order to use STL files for control functions, the saved files must meet the following requirements:

- Max. 20 000 triangles
- Triangular mesh forms a closed shell

The greater the number of triangles in an STL file, the greater the processing power required by the control for simulation.

Functions for the simplified model

In order to reduce the number of triangles, you can define further settings for the simplified model.

CAD-Viewer provides the following functions:

Symbol	Function
	**Allowed simplification** Use this function to simplify the output model by the specified tolerance. The higher the value, the more the surfaces may deviate from the original.
	**Remove holes <= diameter** Use this function to remove holes and pockets up to the specified diameter from the original model.
	**Only optimized mesh shown** To be able to evaluate the deviations, use this function to toggle superimposition of the view containing the optimized triangle mesh with the original mesh from the original file.
	**Save** Use this function to save the simplified 3D model with the selected settings as an STL file.

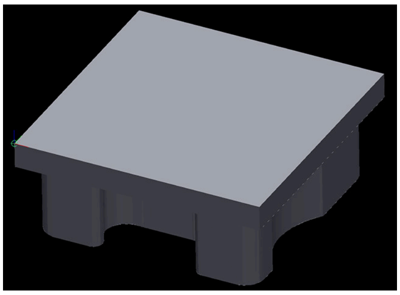
25.5.1 Positioning the 3D model for rear-face machining

To position an STL file for rear-face machining:

- Export the simulated workpiece as an STL file

  Further information: "Saving a simulated workpiece as STL file", Page 1417

- Select the **Files** operating mode
- Select the exported STL file
- > The control opens the CAD files in **CAD-Viewer**.
- Select **Preset**
- > In the Sidebar window, the control displays information on the position of the preset.
- Enter the value of the new preset under **Preset**, e.g. **Z-40**
- Confirm your input
- Orient the coordinate system by specifying values under **PLANE SPATIAL SP***, e.g. **A+180** and **C+90**
- Confirm your input



- Select **3D mesh**
- > The control opens the **3D mesh** mode and simplifies the 3D model using the default settings.
- Further simplify the 3D model using the **3D mesh** mode functions, if required.

  Further information: "Functions for the simplified model", Page 1374

- Select **Save**
- > The control opens the **Define file name for 3D mesh** menu.
- Enter the desired name
- Select **Save**
- > The control saves the STL file positioned for rear-face machining.

> The resulting file can then be used for rear-face machining with the **BLK FORM FILE** function.
>
> **Further information:** "Defining a workpiece blank with BLK FORM", Page 234

26

User Aids

26.1 Help workspace

Application

In the **Help** workspace the control displays a help graphic for the current syntax element of an NC function or the **TNCguide** integrated product help.

Related topics

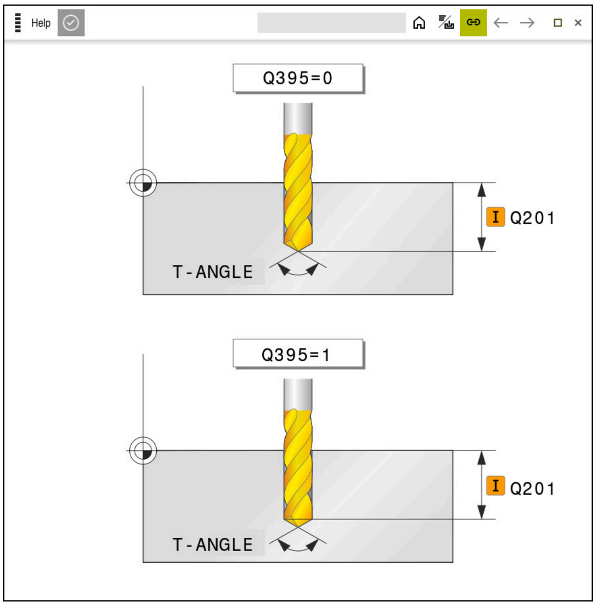
- **Help** application
  Further information: "Help application", Page 63
- User's Manual as the **TNCguide** integrated product help
  Further information: "User's Manual as integrated product help: TNCguide", Page 62

Description of function

The **Help** workspace can be selected in the **Editor** operating mode and in the **MDI** application.

Further information: "Editor operating mode", Page 192

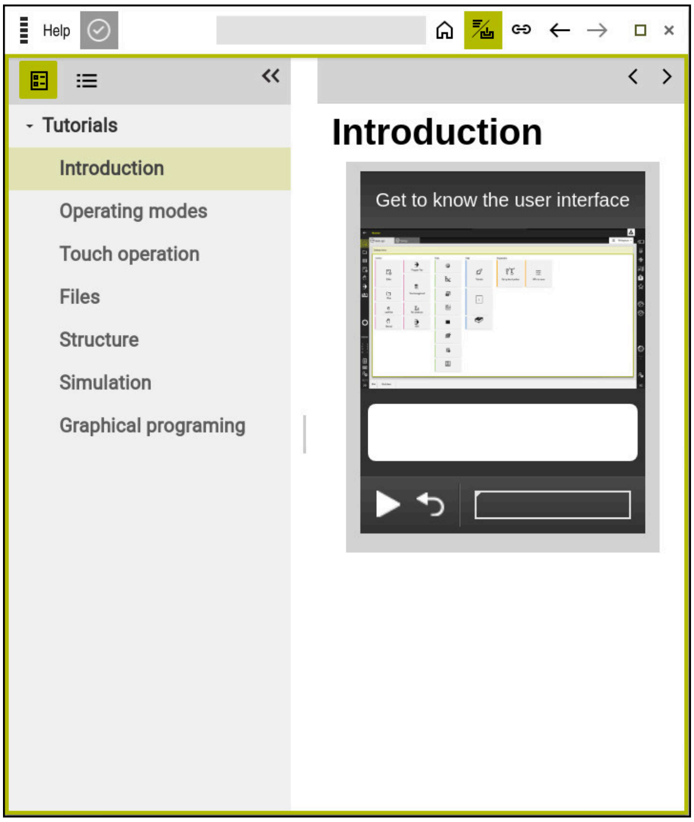
Further information: "Application MDI", Page 1759



Help workspace with a help graphic for a cycle parameter

If the **Help** workspace is active, the control can display the help screen in it during programming instead of in the **Program** workspace.

Further information: "Program workspace", Page 194



Help workspace with opened **TNCguide**

If the **Help** workspace is active, the control can display the integrated **TNCguide** product help.

Further information: "User's Manual as integrated product help: TNCguide", Page 62

Symbols in the Help workspace

Symbol	Function
	Show start page The start page displays all available documentation. Select the desired documentation, using a navigation tiles, e.g. **TNCguide**. If only one piece of documentation is available, the control opens the content directly. When a documentation is open, you can use the search function. **Further information:** "Symbols", Page 64
	Displaying the **TNCguide** **Further information:** "User's Manual as integrated product help: TNCguide", Page 62
	Displaying help images during programming

26.2 Virtual keyboard of the control bar

Application

You can use the virtual keyboard for entering NC functions, letters, and numbers, and for navigation.

The virtual keyboard offers the following modes:

- NC input
- Text input
- Formula entry

Description of function

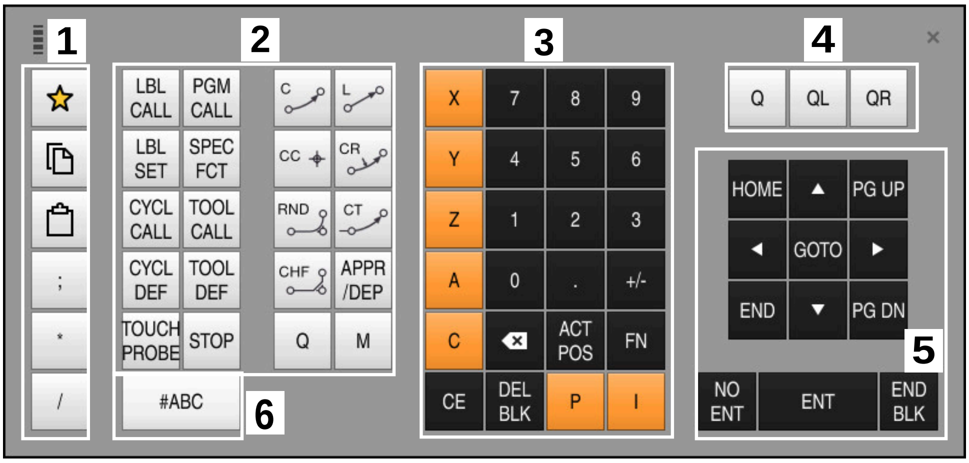
The control opens NC input mode by default after the start procedure.

You can move the keyboard on the screen. The keyboard remains active, even when the operating mode is switched, until the keyboard is closed.

The control remembers the position and mode of the virtual keyboard until it is shut down.

The **Keyboard** workspace provides the same functions as the virtual keyboard.

NC input areas



Virtual keyboard in NC input mode

NC input mode contains the following areas:

1 File functions
- Define favorites
- Copy
- Paste
- Add comment
- Add structure item
- Hide NC block

2 NC functions

3 Axis keys and numerical input

4 Q parameters

5 Navigation and dialog keys

6 Switch to text input

> If you press the **Q** button in the NC functions area repeatedly, the control cycles through the syntax in the following sequence:
> - **Q**
> - **QL**
> - **QR**

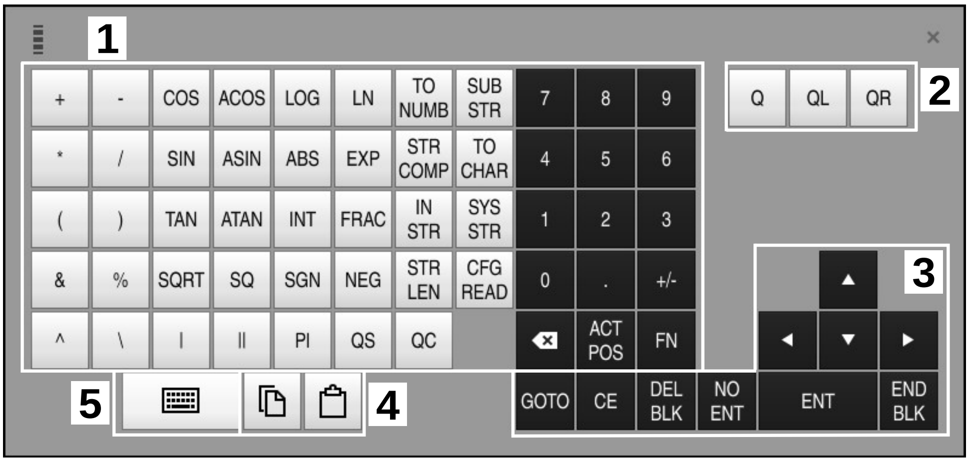
Areas of text input

Virtual keyboard in text input mode

The text input contains the following areas:

1 Input
2 Navigation and dialog keys
3 Copying and pasting
4 Switch to formula input

Areas of formula input



Virtual keyboard in formula input mode

The formula input contains the following areas:

1 Input
2 Q parameters
3 Navigation and dialog keys
4 Copying and pasting
5 Switch to NC input

26.2.1 Opening and closing the virtual keyboard

To open the virtual keyboard:

- ▶ Select the **virtual keyboard** on the control bar
- > The control opens the virtual keyboard.

To close the virtual keyboard:

- ▶ Select the **virtual keyboard** when the virtual keyboard is open
- ▶ Or press **Close** in the virtual keyboard
- > The control closes the virtual keyboard.

26.3 GOTO function

Application

With the **GOTO** key or the **GOTO block number** button you define an NC block at which the control positions the cursor. In the **Tables** mode you use the **GOTO record** button to define a table row.

Description of function

If an NC program is open for simulation or execution, the control additionally positions the execution cursor in front of the NC block. The control then starts program run or the simulation beginning from the defined NC block without considering the preceding lines of the NC program.

You can enter the block number directly or find it in the NC program with the **Search** function.

26.3.1 Selecting an NC block with GOTO

To select an NC block:

- ▶ Select **GOTO**
- > The control opens the **GOTO jump instruction** window.
- ▶ Enter the block number
- ▶ Press **OK**
- > The control positions the cursor to the defined NC block.

NOTICE

Danger of collision!

If you select an NC block in program run using the **GOTO** function and then execute the NC program, the control ignores all previously programmed NC functions, e.g. transformations. This means that there is a risk of collision during subsequent traversing movements!

- ▶ Use **GOTO** only when programming and testing NC programs
- ▶ Only use **Block scan** when executing NC programs

Further information: "Block scan for mid-program startup", Page 1786

Notes

- You can also use the keyboard shortcut **CTRL+G** instead of the **GOTO** button.
- If the control in the action bar shows an icon for selection, you can open the selection window with **GOTO**.

26.4 Adding comments

Application

You can add comments to an NC program in order to explain program steps or make general notes.

Description of function

You have the following possibilities for adding comments:

- Comment within an NC block
- Comment as a separate NC block
- Define existing NC block as comment

The control marks comments with a preceding **;** character. The control does not execute comments during simulation or program run.

A comment may contain up to 255 characters.

> The last character in a comment block must not be a tilde (**~**).

26.4.1 Adding a comment as an NC block

To add a comment as a separate NC block:

- Select the NC block after which the comment is to be added

;

- Select **;**
- > After the selected NC block, the control adds a comment as a new NC block.
- Define the comment

26.4.2 Adding a comment in an NC block

To add a comment within an NC block:

- Edit the desired NC block

;

- Select **;**
- > The control inserts a **;** character at the end of the block.
- Define the comment

26.4.3 Commenting an NC block out or in

Use the **Comment out/in** button to define an existing NC block as a comment or to change a comment back to an NC block.

To comment an existing NC block in or out:

- ▶ Select the desired NC block

- ▶ Select **Comment Off/On**
- > The control inserts a **;** character at the beginning of the block.
- > If the NC block is already defined as a comment, the control removes the **;** character.

26.5 Hiding NC blocks

Application

Use **/** or the **Hide/Show** button to hide NC blocks.

If you hide NC blocks, you can skip the hidden NC blocks in program run.

Related topics

- **Program Run** operating mode

  Further information: "Program Run operating mode", Page 1778

Description of function

If you mark an NC block with a **/** character, then the NC block is hidden. If you activate the **Skip /** switch in the **Program Run** operating mode or in the **MDI** application, the control skips these NC blocks during program run.

Further information: "Icons and buttons", Page 1780

26.5.1 Hiding or showing NC blocks

To hide or show an NC block:

- ▶ Select the desired NC block

- ▶ Select **Skip Off/On**
- > The control adds a **/** character before the NC block.
- > If the NC block is already hidden, the control removes the **/** character.

26.6 Structuring of NC programs

Application

You can use structure items to make long and complex NC programs more clear and legible, and also to navigate more quickly through an NC program.

Related topics

- **Structure** column of the **Program** workspace

  Further information: "Structure column in the Program workspace", Page 1386

Description of function

You can use structure items to arrange your NC programs. Structure items are texts that you can use as comments or headlines for the subsequent program lines.

A structure item may contain up to 255 characters.

The control displays the structure items in the **Structure** column.

Further information: "Structure column in the Program workspace", Page 1386

26.6.1 Adding a structure item

To insert a structure item:

- Select the NC block after which you want to add the structure item

*

- Select *
- After the selected NC block, the control adds a structure item as a new NC block.
- Define the structure text

26.7 Structure column in the Program workspace

Application

When you open an NC program, the control searches the NC program for structure elements and displays these structure elements in the **Structure** column. The structure elements act like links and thus enable fast navigation in the NC program.

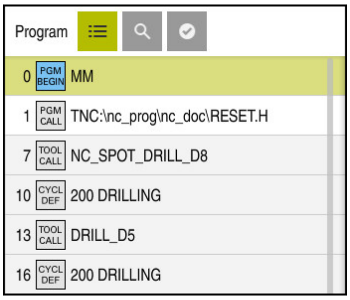
Related topics

- **Program** workspace, defining contents of the **Structure** column

  Further information: "Settings in the Program workspace", Page 197
- Inserting structure items manually

  Further information: "Structuring of NC programs", Page 1385

Description of function



Structure column with automatically created structure elements

When you open an NC program, the control automatically creates the structure.

In the **Program settings** window, you define which structure elements the control displays in the structure.

Further information: "Settings in the Program workspace", Page 197

The **Structure** column shows the following information:

- NC block number
- Icon of the NC function
- Function-dependent information

The control displays the following icons within the structure:

Icon	Syntax	Information
PGM BEGIN	**BEGIN PGM**	Unit of measurement of the NC program **MM** or **INCH**
TOOL CALL	**TOOL CALL**	Depending on the name selected in the **TOOL CALL**: ■ Tool name ■ Number of the tool If you do not specify a name or number in the **TOOL CALL**, the control does not display any additional information.
*	*** Structure block**	String entered in the NC block
LBL SET	**LBL SET**	Depending on the name selected in the dialog: ■ Name of the label ■ Number of the label
LBL SET	**LBL 0**	Label number 0
CYCL DEF	**CYCL DEF**	Number and name of the defined cycle
TCH PROBE	**TCH PROBE**	Number and name of the defined cycle
MON START	**MONITORING SECTION START**	String entered in the **AS** syntax element
MON STOP	**MONITORING SECTION STOP**	No additional information
PGM CALL	**PGM CALL**	Path of the called NC program, e.g. **TNC:\Safe.h**

Icon	Syntax	Information
SPEC FCT	**FUNCTION MODE**	Selected machining mode **MILL** or **TURN**
STOP M0	**STOP** or **M0**	No additional information
M1	**M1**	No additional information
M2 M30	**M2** or **M30**	No additional information

26.7.1 Editing an NC block using the structure

To edit an NC block using the structure:

- Open an NC program
- Open the **Structure** column
- Select structure element
- > The control positions the cursor on the corresponding NC block in the NC program. The focus of the cursor remains in the **Structure** column.
- Select the right arrow
- > The focus of the cursor changes to the NC block.
- Select the right arrow
- > The control edits the NC block.

Notes

- In the case of long NC programs, establishing the structure may take longer than loading the NC program. Even if the structure has not yet been created, you can still work independently of it in the loaded NC program.
- You can navigate within the **Structure** column using the up and down arrow keys.
- The control shows called NC programs in the structure with a white background. If you double-tap or click on such a structure element, the control opens the NC program if necessary in a new tab. When the NC program is open, the control switches to the corresponding tab.

26.8 Search column in the Program workspace

Application

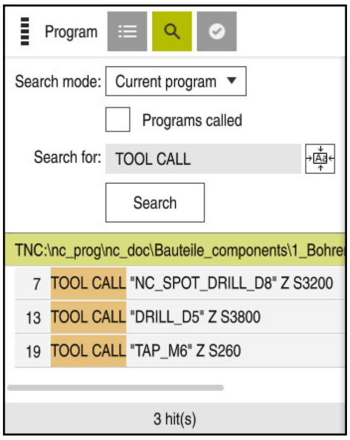
In the **Search** column, you can search the NC program for any character strings, e.g. individual syntax elements. The control lists all the results found.

Related topics

- Search for the same syntax element in the NC program with the arrow keys

  Further information: "Searching for the same syntax elements in different NC blocks", Page 201

Description of function



Search column in the **Program** workspace

The control only provides the full range of functions in the **Editor** operating mode. In the **MDI** application and the **Program Run** operating mode, you can only search in the active NC program.

The control provides the following functions, icons and buttons in the **Search** column:

Area	Function
Search in:	■ **Current program** Search the current NC program and optionally all called NC programs ■ **Opened programs** Browse all open NC programs ■ **Search and replace** Search for strings and replace them with new strings, e.g. syntax elements **Further information:** "Search and replace mode", Page 1390
Search for:	In the input area, you define the search term. If you have not yet entered any characters, the control provides the last six search terms to choose from.
	Use the **Apply selection** icon to transfer the currently selected syntax element to the input area. If the selected NC block is not edited, the control accepts the syntax opener.
Search	Use this button to start the search in the **Current program** and **Opened programs** modes.

The control shows the following information about the results:

- Number of results
- File paths of the NC programs
- NC block numbers
- Entire NC blocks

The control groups the results according to NC programs. If you select a result, the control positions the cursor on the corresponding NC block.

Search and replace mode

In **Search and replace** mode, you can search for strings and replace the results found with other strings, e.g. syntax elements.

The control performs a syntax check before replacing a syntax element. With the syntax check, the control ensures that the new content results in correct syntax. If the result produces a syntax error, the control does not replace the content and displays a message.

In **Search and replace** mode, the control provides the following checkboxes and buttons:

Checkbox or button	Meaning
Search backward	The control searches the NC program from bottom to top.
Wrap around	The control searches the entire NC program, beyond the start and end of the NC program.
Find next	The control searches the NC program for the search term. The control marks the next result in the NC program.
Replace	The control performs a syntax check and replaces the selected content in the NC program with the content of the **Replace with:** field.
Replace and find next	If a search has not yet been performed, the control only marks the first result. When a result is highlighted, the control performs a syntax check and automatically replaces the found content with the contents of the **Replace with:** field. The control then marks the next result.
Replace all	The control performs a syntax check and automatically replaces all found results with the contents of the **Replace with:** field.

26.8.1 Search for and replace syntax elements

To search for and replace syntax elements in the NC program:

- ▶ Select an operating mode, e.g. **Editor**
- ▶ Select the desired NC program
- > The control opens the selected NC program in the **Program** workspace.
- ▶ Open the **Search** column
- ▶ In the **Search in:** field, select the **Search and replace** function
- > The control displays the **Search for:** and **Replace with:** fields.
- ▶ In the **Search for:** field, enter the search content, e.g. **M4**
- ▶ In the **Replace with:** field, enter the desired content, e.g. **M3**
- ▶ Select **Find next**
- > The control marks the first result in the NC program.
- ▶ Select **Replace**
- > The control performs a syntax check and replaces the content if the check is successful.

Notes

- The search results are retained until you shut down the control or search again.
- If you double-tap or click on a search result in a called NC program, the control opens the NC program (on a new tab if not already open). If the NC program is already open, the control switches to the corresponding tab.

26.9 Program comparison

Application

Use the **Program comparison** function to determine differences between two NC programs. You can transfer the deviations to the active NC program. If there are unsaved changes in the active NC program, you can compare the NC program with the last saved version.

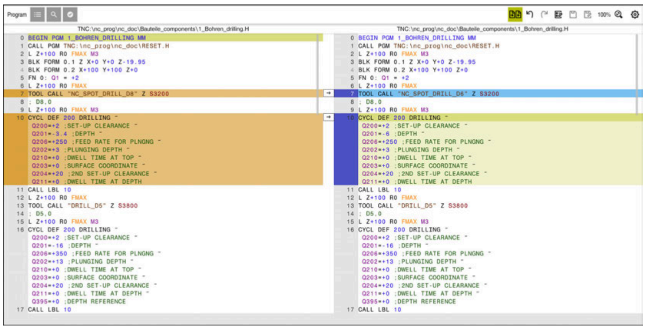
Requirements

- Max. 30,000 lines per NC program

  The control takes into account the actual lines, not the number of NC blocks. NC blocks can also contain several lines with one block number, e.g. cycles.

  Further information: "Contents of an NC program", Page 190

Description of function



Program comparison of two NC programs

You can use the program comparison only in the **Editor** operating mode in the **Program** workspace.

The control shows the active NC program on the right and the comparison program on the left.

The control marks differences with the following colors:

Color	Syntax element
Gray	Missing NC block or missing line for NC functions of different length
Orange	NC block with difference in comparison program
Blue	NC block with difference in the active NC program

During the program comparison, you can edit the active NC program, but not the comparison program.

If NC blocks differ, you can use an arrow symbol to transfer the NC blocks of the comparison program to the active NC program.

26.9.1 Applying differences to the active NC program

To transfer differences to the active NC program:

- Select the **Editor** operating mode
- Open an NC program
- Select **Program comparison**
- > The control opens a pop-up window for file selection.
- Select comparison program
- Select **Select**
- > The control shows both NC programs in the comparison view and marks all differing NC blocks.
- Select the arrow symbol for the desired NC block
- > The control transfers the NC block to the active NC program.
- Select **Program comparison**
- > The control closes the comparison view and transfers the differences to the active NC program.

Notes

- If the compared NC programs contain more than 1000 differences, the control cancels the comparison.
- If an NC program contains unsaved changes, the control displays an asterisk in front of the name of the NC program in the tab of the application bar.

26.10 Context menu

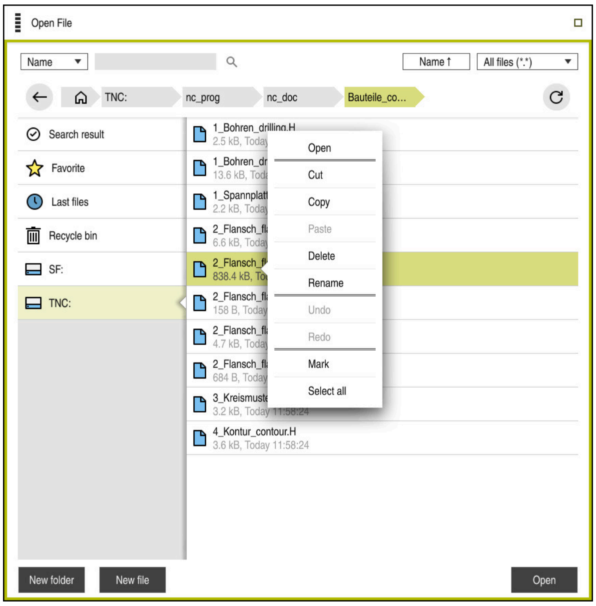
Application

With a long-press gesture or by right-clicking with the mouse, the control opens a context menu for the selected element, such as an NC block or file. Use the various functions of the context menu to run commands that affect the currently selected element(s).

Description of function

The functions available in the context menu depend on the selected element as well as the selected operating mode.

General



Context menu in the **Open File** workspace

The context menu offers the following functions:

- **Cut**
- **Copy**
- **Paste**
- **Delete**
- **Undo**
- **Redo**
- **Mark**
- **Select all**

> If you select the **Mark** or **Select all** functions, the control opens the action bar. The action bar displays all functions that are currently available for selection from the context menu.

As an alternative to the context menu, you can use keyboard shortcuts:

Further information: "Icons on the control's user interface", Page 102

Key or keyboard shortcut	Meaning
CTRL+BLANK	Mark the selected line
SHIFT+↑	Additionally mark a line above it
SHIFT+↓	Additionally mark a line below it
ESC	Cancel marking

> The keyboard shortcuts do not work in the **Job list** workspace.

Context menu in the Files operating mode

In the **Files** operating mode, the context menu also offers the following functions:

- **Open**
- **Select in Program Run**
- **Rename**

For the navigation functions, the context menu offers the respectively relevant functions, such as **Discard search results**.

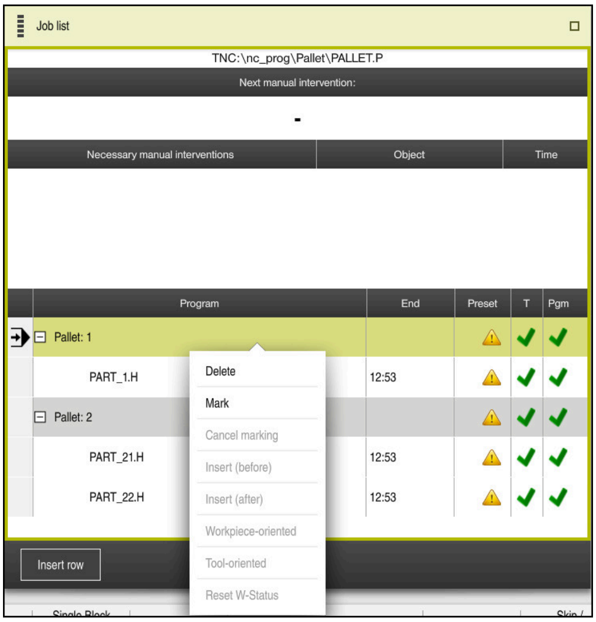
Further information: "Context menu", Page 1392

Context menu in the Tables operating mode

In the **Tables** operating mode the context menu additionally offers the **Cancel** function. Use the **Cancel** function to abort the marking action.

Further information: "Tables operating mode", Page 1802

Context menu in the Job list (option 22) workspace



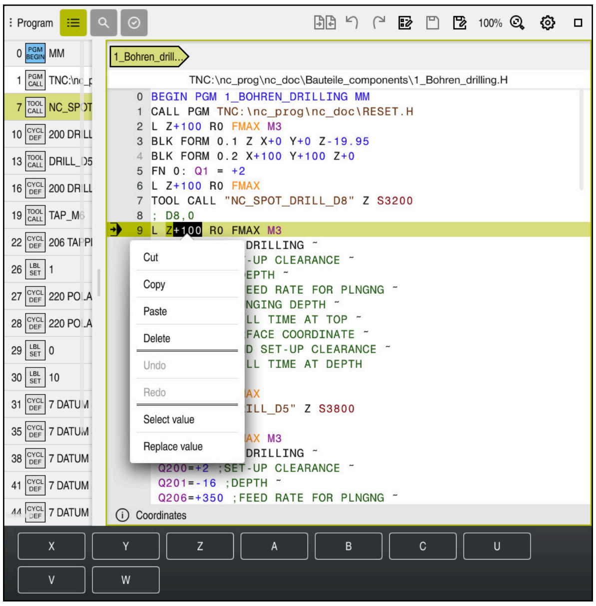
Context menu in the **Job list** workspace

In the **Job list** workspace, the context menu offers the following additional functions:

- **Cancel marking**
- **Insert (before)**
- **Insert (after)**
- **Workpiece-oriented**
- **Tool-oriented**
- **Reset W-Status**

Further information: "Job list workspace", Page 1764

Context menu in the Program workspace



Context menu for selected value in the **Program** workspace of the **Editor** operating mode

In the **Program** workspace, the context menu offers the following additional functions:

- **Edit as sketch**

  Only in the **Editor** operating mode

  Further information: "Importing contours into graphical programming", Page 1346
- **Select value**

  Active when you select a value of an NC block.
- **Replace value**

  Active when you select a value of an NC block.

Further information: "Program workspace", Page 194

> The **Select value** and **Replace value** functions are only available in the **Editor** operating mode and the **MDI** application.
>
> **Replace value** is also available during editing. In this case the otherwise necessary marking of the value to be replaced is omitted.
>
> For example, you can copy values from the calculator or position display to the clipboard and then paste them with the **Replace value** function.

Further information: "Calculator", Page 1396

Further information: "Status overview on the control bar", Page 147

If you select an NC block, the control displays marker arrows at the beginning and end of the selected area. Use these marker arrows to change the highlighted area.

Context menu in the configuration editor

In the configuration editor, the context menu also provides the following functions:

- **Direct entry of values**
- **Create copy**
- **Restore copy**
- **Change key name**
- **Open element**
- **Remove element**

Further information: "Machine parameters", Page 1958

26.11 Calculator

Application

The control offers a calculator on the control bar. You can copy the result to the clipboard and also paste values from the clipboard.

Description of function

The calculator offers the following functions:

- Basic mathematical operations
- Basic trigonometric functions
- Square root
- Exponential calculation
- Reciprocal value

Calculator

You can switch between the radian **RAD** or degrees **DEG** modes.

You can copy the result to the clipboard as well as paste the last stored value from the clipboard to the calculator.

The calculator saves the last ten calculations in the history. You can use these saved results for further calculations. You can clear the history manually.

26.11.1 Opening and closing the calculator

To open the calculator:

- Select the **calculator** on the control bar
- The control opens the calculator.

To close the calculator:

- Select the **calculator** when the calculator is open
- The control closes the calculator.

26.11.2 Selecting a result from the history

To select a result from the history for further calculations:

- Select **History**
- The control opens the calculator's history.
- Select the desired result
- Select **History**
- The control closes the calculator's history.

26.11.3 Deleting the history

To delete the calculator's history:

- Select **History**
- The control opens the calculator's history.
- Select **Delete**
- The control deletes the calculator's history.

26.12 Cutting data calculator

Application

With the cutting data calculator you can calculate the spindle speed and the feed rate for a machining process. You can load the calculated values into an opened feed rate or spindle speed dialog box in the NC program.

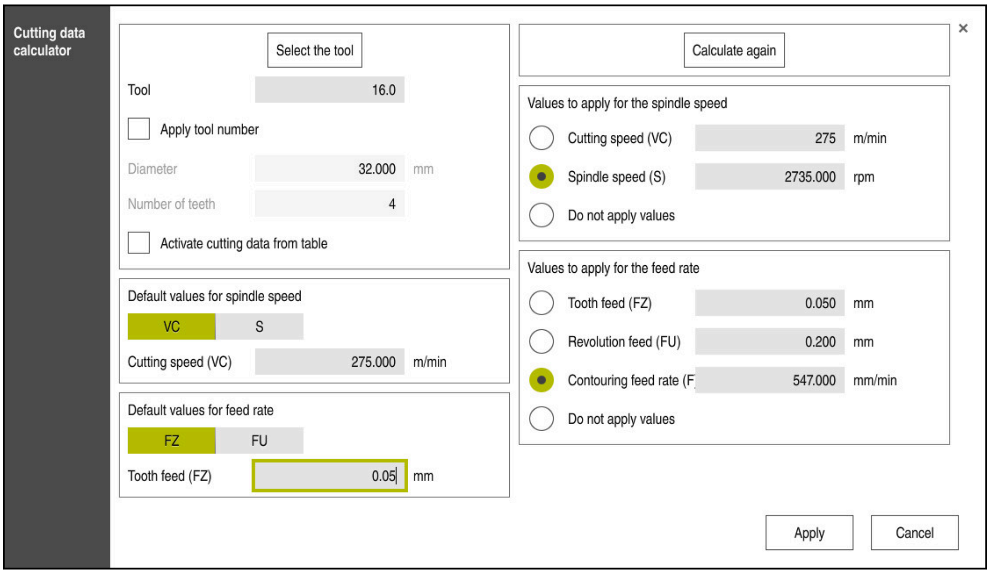
The control offers the **OCM cutting data calculator** for OCM cycles (option 167).

Further information: "OCM Cutting data calculator (option 167)", Page 604

Requirement

- Milling operation **FUNCTION MODE MILL**

Description of function



Window for the **Cutting data calculator**

On the left side of the cutting data calculator you enter the information. On the right side the control displays the calculated results.

If you select a tool defined in the tool management, the control automatically applies the tool diameter and number of teeth. If you activate the **Apply tool number** checkbox, the tool number in the current NC block is overwritten.

You can calculate the spindle speed as follows:

- Cutting speed **VC** in m/min
- Spindle speed **S** in rpm

You can calculate the feed rate as follows:

- Feed per tooth **FZ** in mm
- Feed per revolution **FU** in mm

Or you can use tables to calculate the cutting data.

Further information: "Calculation with tables", Page 1399

Applying values

After the cutting data have been calculated, you can specify which values the control should apply.

You can choose among the following for the spindle speed:

- **Cutting speed (VC)**
- **Spindle speed (S)**
- **Do not apply values**

You can choose among the following for the feed rate:

- **Tooth feed (FZ)**
- **Revolution feed (FU)**
- **Contouring feed rate (F)**
- **Do not apply values**

Calculation with tables

You must define the following in order to calculate the cutting data with tables:

- Workpiece material in the table **WMAT.tab**

  Further information: "Table for workpiece materials WMAT.tab", Page 1861
- Tool cutting material in table **TMAT.tab**

  Further information: "Table for tool materials TMAT.tab", Page 1861
- Combination of workpiece material and cutting material in the cutting data table ***.cut** or in the diameter-dependent cutting data table ***.cutd**

> Using the simplified cutting data table, you can determine speeds and feed rates using cutting data that are independent of the tool radius, e.g. **VC** and **FZ**.
>
> **Further information:** "Cutting data table *.cut", Page 1862
>
> If you require specific cutting data depending on the tool radius for your calculations, use the diameter-dependent cutting data table.
>
> **Further information:** "Diameter-dependent cutting data table *.cutd", Page 1863

- Parameters of the tool in tool management:
  - **R**: Tool radius
  - **LCUTS**: Number of cutting edges
  - **TMAT**: Cutting material from **TMAT.tab**
  - **CUTDATA**: Table row from the ***.cut** or ***.cutd** cutting data table

26.12.1 Opening the cutting data calculator

To open the cutting data calculator:

- Edit the desired NC block
- Select the syntax element for the feed rate or spindle speed
- Select **Cutting data calculator**
- > The control opens the **Cutting data calculator** window.

26.12.2 Calculating the cutting data with tables

The following prerequisites must be fulfilled in order to calculate the cutting data with tables:

- The **WMAT.tab** table exists
- The **TMAT.tab** table exists
- The ***.cut** or ***.cutd** table exists
- Tool material and cutting data table are assigned in the tool management

To calculate the cutting data with tables:

- Edit the desired NC block
- Open the **Cutting data calculator**
- Select **Activate cutting data from table**
- Use **Select material** to choose the workpiece material
- Use **Select type of machining** to choose the combination of workpiece material and tool material
- Select the desired values to be applied

Apply

- Press **Apply**
- > The control applies the calculated values in the NC block.

Notes

You cannot calculate the cutting data in turning mode (option 50) because the feed rate and spindle speed data are different in turning mode from milling mode.

In turning operations the feed rates are often defined in millimeters per revolution (mm/1) (**M136**), whereas the cutting data calculator always calculates feed rates in millimeters per minute (mm/min). Furthermore, the radius in the cutting data calculator is referenced to the tool; turning operations, however, require the workpiece diameter.

26.13 Message menu on the information bar

Application

In the message menu of the information bar, the control shows pending errors and notes. When opened, the control displays detailed information about the messages.

Description of function

The control uses the following symbols to differentiate between the types of messages:

Symbol	Message type	Meaning
	Error Question type	The control displays a dialog with several options you can select from. You cannot delete this error message: you can only choose one of the possible responses. If necessary, the control continues the dialog until the cause or correction of the error has been clearly determined.
	Reset error	The control must be restarted. This message cannot be cleared.
	Error	To continue, you must clear this message. An error message can only be cleared after the cause has been eliminated.
	Warning	You can continue without clearing the message. Most warnings can be cleared at any time; in some cases, the cause has to be eliminated first.
	Information	You can continue without clearing the message. You can clear the information at any time.
	Note	You can continue without clearing the message. The control displays the note until you press the next valid key.
		No pending messages

The message menu is collapsed by default.

The control displays messages upon various events, for example:

- Logical errors in the NC program
- Impossible contour elements
- Improper touch-probe inserts
- Hardware updates

Content

Collapsed message menu on the information bar

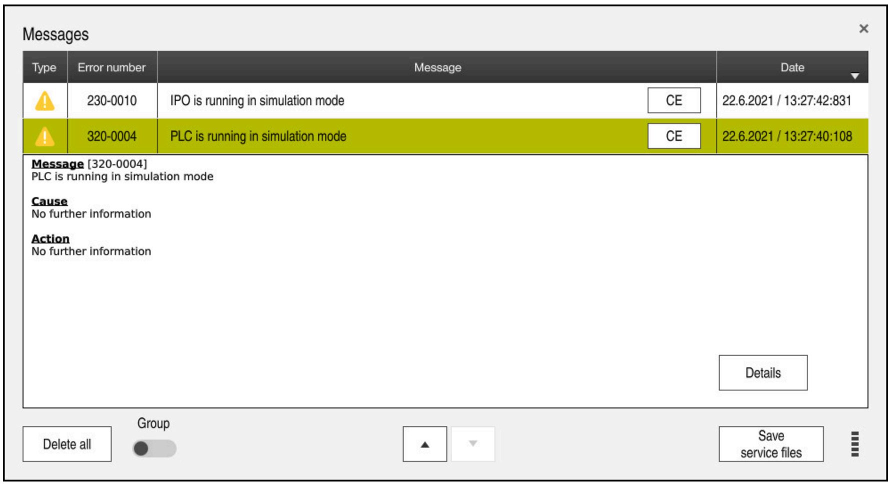
When the control displays a new message, the arrow to the left of the message blinks. Click or tap this arrow to confirm acknowledgment of the message; the control then minimizes the message.

The control displays the following information in the collapsed message menu:

- Message type
- Message
- Quantity of pending errors, warnings, and informational messages

Detailed messages

If you tap or click the symbol or within the message, the control expands the message menu.



Expanded message menu with pending messages

The control displays all pending messages in chronological order.

The message menu shows the following information:

- Message type
- Error number
- Message
- Date
- Additional information (cause, action)

Deleting messages

Messages can be deleted in the following ways:

- **CE** key
- **CE** button in the message menu
- **Delete all** button in the message menu

Details

Press the **Details** button to show or hide internal information about the message. This information is of importance in case servicing is necessary.

Group

If you activate the **Group** switch, the control displays all messages with the same error number in one row. This makes the list of messages shorter and easier to read.

Under the error number, the control displays the quantity of messages. Use **CE** to delete all messages of a group.

Service file

Use the **Save service files** button to create a service file.

A service file can be of use to the service technician during troubleshooting. The control saves data that provide information about the current machine and operation status, such as active NC programs up to 10 MB, tool data, and keystroke logs.

26.13.1 Creating a service file

To create a service file:

- Expand the message menu

Save service files

- Select **Save service files**
- > The control opens the **Save service file** window.
- Enter the file name

OK

- Press **OK**
- > The control saves the service file in the **TNC:\service** directory.

27

Simulation Workspace

27.1 Fundamentals

Application

In the **Editor** operating mode, you can use the **Simulation** workspace to graphically test whether NC programs are programmed correctly and run without collisions.

In the **Manual** and **Program Run** operating modes, the control shows the current traverse motions of the machine in the **Simulation** workspace.

Requirements

- Tool definitions according to the tool data from the machine
- Workpiece blank definition that is valid for a test run

  Further information: "Defining a workpiece blank with BLK FORM", Page 234

Description of function

In the **Editor** operating mode, the **Simulation** workspace can be open for only one NC program at a time. If you want to open the workspace on a different tab, the control prompts you for confirmation.

The functions available in the simulation depend on the following settings:

- Selected type of model, for example **2.5D**
- Selected quality of model, for example **Medium**
- Selected mode, e.g. **Machine**

Icons in the Simulation workspace

The following symbols are shown in the **Simulation** workspace:

Symbol	Function
	**Visualization options** **Further information:** "Visualization options column", Page 1407
	**Workpiece options** **Further information:** "Workpiece options column", Page 1409
	Pre-defined views **Further information:** "Pre-defined views", Page 1414
	Export simulated workpiece as STL file **Further information:** "Exporting a simulated workpiece as STL file", Page 1415
	**Simulation settings** **Further information:** "Simulation settings window", Page 1411
 	Status of dynamic collision monitoring (DCM) in the simulation **Further information:** "Visualization options column", Page 1407
	Status of the **Advanced checks** function **Further information:** "Visualization options column", Page 1407
	Selected quality of model **Further information:** "Simulation settings window", Page 1411
T 3	Number of the active tool
00:00:00	Current program run-time

Visualization options column

In the **Visualization options** column you can define the following display modes and functions:

Symbol or switch	Function	Requirements
	Select **Machine** or **Workpiece** mode If you select the **Machine** mode, the control displays the defined workpiece, the collision objects, and the tool. In the **Workpiece** mode the control shows the workpiece to be simulated. Depending on the selected mode, different functions are available.	
Workpiece position	Use this function to define the position of the workpiece preset for the simulation. You can use a button to apply the current workpiece preset from the preset table. **Further information:** "Preset management", Page 949	■ **Machine** mode ■ Type of model: **2.5D**
	You can select between the following display modes for the machine: ■ **Original**: Shaded, opaque representation ■ **Semitransparent**: Transparent representation ■ **Wire-frame model**: Representation of the machine contours	■ **Workpiece** mode ■ Type of model: **2.5D**
	You can select between the following display modes for the tool: ■ **Original**: Shaded, opaque representation ■ **Semitransparent**: transparent representation ■ **Invisible**: The object is hidden	■ **Workpiece** mode ■ Type of model: **2.5D**
	You can select between the following display modes for the workpiece: ■ **Original**: Shaded, opaque representation ■ **Semitransparent**: transparent representation ■ **Invisible**: the object is hidden	■ **Workpiece** mode ■ Type of model: **2.5D**
	You can show the tool paths during the simulation. The control displays the center-line path of the tools. You can choose between the following display modes for the tool paths: ■ **None**: Do not show tool paths ■ **Feed**: Show tool paths with programmed feed rate ■ **Feedrate + FMAX**: Show tool paths with programmed feed rate and with programmed rapid traverse	■ **Workpiece** mode ■ Operating mode: **Editor**
DCM	Use this switch to activate or deactivate collision monitoring (DCM, option 40) for the simulation. **Further information:** "Dynamic Collision Monitoring (DCM) in the Editor operating mode", Page 1087	■ **Workpiece** mode ■ Operating mode: **Editor** ■ Type of model: **2.5D**
Advanced checks	Use this switch to activate the **Advanced checks** function. **Further information:** "Advanced checks in the simulation", Page 1109	■ Operating mode: **Editor**

Symbol or switch	Function	Requirements
Skip /	If an NC block is preceded by a **/** character, then the NC block is hidden. If you activate the **Skip /** switch, the control skips all hidden NC blocks in the simulation. **Further information:** "Hiding NC blocks", Page 1385	■ Operating mode: **Editor**
Pause at M1	If you activate this switch, the control pauses the simulation at each **M1** miscellaneous function in the NC program. **Further information:** "Overview of miscellaneous functions", Page 1225	■ Operating mode: **Editor**

Workpiece options column

In the **Workpiece options** column, you can define the following simulation functions for the workpiece:

Switch or button	Function	Requirements
Measuring	Use this function to measure any points on the simulated workpiece. **Further information:** "Measuring function", Page 1417	■ **Workpiece** mode ■ Operating mode: **Editor** ■ Type of model: **2.5D**
Cutout view	Use this function to cut through the simulated workpiece along a plane. **Further information:** "Cutout view in the simulation", Page 1419	■ **Workpiece** mode ■ Operating mode: **Editor** ■ Type of model: **2.5D**
Highlight workpiece edges	Use this function to highlight the edges of the simulated workpiece.	■ **Workpiece** mode ■ Type of model: **2.5D**
Workpiece blank frame	The control uses this function to show the outside lines of the workpiece blank.	■ **Workpiece** mode ■ Operating mode: **Editor** ■ Type of model: **2.5D**
Finished part	Use this function to show a finished part that was defined with the help of the **BLK FORM FILE** function. **Further information:** "Cutout view in the simulation", Page 1419	■ **Workpiece** mode ■ Operating mode: **Editor** ■ Type of model: **2.5D**
Software limit switches	Use this function to activate the software limit switches of the machine for the active traverse range in the simulation. By simulating the limit switches you can check whether the working space of the machine is sufficient for the simulated workpiece. **Further information:** "Simulation settings window", Page 1411	■ Operating mode: **Editor**

Switch or button	Function	Requirements

Workpiece coloring	■ **Grayscale**
	The control displays the workpiece in various shades of gray.
	■ **Tool based**
	The control displays the workpiece in color. Each cutting tool is assigned a separate color.
	■ **Model comparison**
	The control displays a comparison between the workpiece blank and the finished part.
	Further information: "Model comparison", Page 1420
	■ **Monitoring**
	The control displays a heat map on the workpiece:
	  ■ Component heat map with **MONITORING HEAT MAP**
	  Further information: "Component Monitoring with MONITORING HEATMAP (option 155)", Page 1146
	  Further information: "Cycles for monitoring", Page 1148
	  ■ Process heat map with **SECTION MONITORING**
	  Further information: "Process Monitoring (option 168)", Page 1152
		■ Type of model: **2.5D**
		■ **Model comparison** function only in **Workpiece** mode
		■ **Monitoring** function only in the **Program Run** operating mode

Reset the workpiece	Use this function to reset the workpiece back to the workpiece blank	■ Operating mode: **Editor** ■ Type of model: **2.5D**
Reset the tool paths	Use this function to reset the simulated tool paths.	■ **Workpiece** mode ■ Operating mode: **Editor**
Remove the chips	Use this function to remove from the simulation those parts of the workpiece that were cut off during machining.  Workpiece before clean-up  Workpiece after clean-up	■ Operating mode: **Editor** ■ Type of model: **3D**

Simulation settings window

The **Simulation settings** window is available only in the **Editor** operating mode.

The **Simulation settings** window consists of the following areas:

<table>
<tr><th>Area</th><th>Function</th></tr>
<tr><td>General</td><td>

Model type

None: fast line graphics without volume model
2.5D: quick 3D representation without undercuts
3D: realistic 3D representation with undercuts

Quality

Low: low-quality model, low memory use
Medium: normal-quality model, average memory use
High: high-quality model, uses much memory
Highest: best-quality model, uses very much memory

Mode

Milling
Turning
Grinding

Active kinemat.
Select the kinematics model for the simulation from a selection menu. The machine manufacturer enables the kinematics models.
Generate tool-usage file

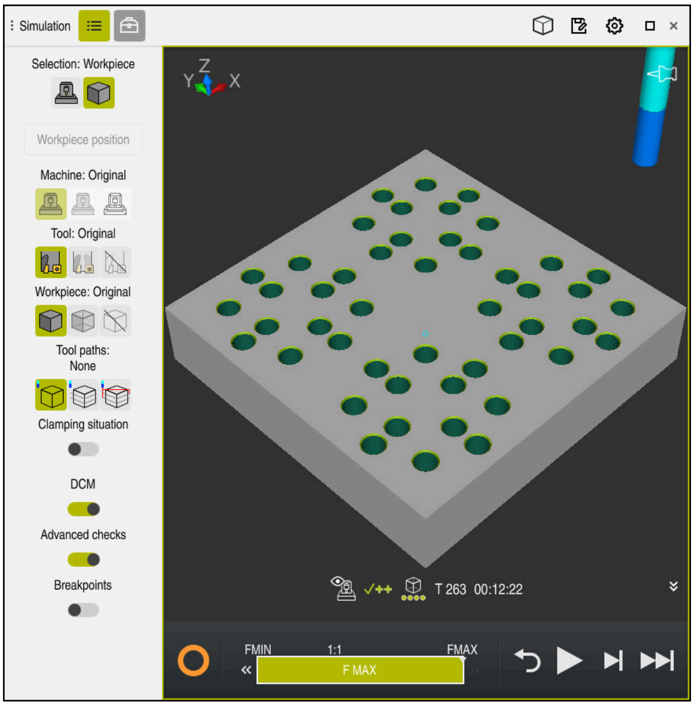
Never
Do not generate a tool-usage file
Once
Generate a tool-usage file for the next simulated NC program
Always
Generate a tool-usage file for every simulated NC program

Further information: "Channel settings", Page 1915</td></tr>
<tr><td>Traverse ranges</td><td>

Traverse ranges
In this selection menu you can choose one of the traverse ranges defined by the machine manufacturer, such as Limit1. In each traverse range the machine manufacturer defines different software limit switches for each axis of the machine. For example, the machine manufacturer defines traverse ranges for large machines with two separate working spaces.
Further information: "Workpiece options column", Page 1409
Active traverse ranges
This function shows the active traverse range and the values defined for within that range.
</td></tr>
</table>

Area	Function
Tables	You can select tables specifically for the **Editor** operating mode. The control uses the selected tables for the simulation. The selected tables are independent of any tables that are active in other operating modes. You use a selection menu to choose the tables. You can select the following tables for the **Simulation** workspace: ■ Tool table ■ Turning tool table ■ Datum table ■ Preset table ■ Grinding tool table ■ Dressing tool table **Further information:** "Tool Tables", Page 1813

Action bar



Simulation workspace in the **Editor** operating mode

In the **Editor** operating mode you can test NC programs by simulating them. The simulation helps to detect programming errors or collisions and to check the machining result visually.

The control shows the active tool and the machining time above the action bar.

The action bar contains the following symbols:

Symbol	Function
	Control-in-operation: The control uses the **Control-in-operation** symbol to show the current simulation status in the action bar and on the tab of the NC program: ■ White: no movement command ■ Green: active machining, axes are moving ■ Orange: NC program interrupted ■ Red: NC program stopped
	Simulation speed **Further information:** "Simulation speed", Page 1422
	Reset Return to the beginning of the program, reset transformations and the machining time
	Start
	Start in Single Block mode
	Run the simulation up to a certain NC block **Further information:** "Simulating an NC program up to a certain NC block", Page 1423

Simulation of tools

The control visualizes the following entries of the tool table in the simulation:

- **L**
- **LCUTS**
- **LU**
- **RN**
- **T-ANGLE**
- **R**
- **R2**
- **KINEMATIC**
- Delta values from the tool table

  Delta values from the tool table increase or decrease the size of the simulated tool. Delta values from the tool call shift the tool in the simulation.

  Further information: "Tool compensation for tool length and radius", Page 1036

  Further information: "Tool table tool.t", Page 1814

The control visualizes the following entries of the turning tool table in the simulation:

- **ZL**
- **XL**
- **YL**
- **RS**
- **T-ANGLE**
- **P-ANGLE**
- **CUTLENGTH**
- **CUTWIDTH**

If the **ZL** and **XL** columns are defined in the turning tool table, the indexable insert is displayed and the base body is shown schematically.

Further information: "Turning tool table toolturn.trn (option 50)", Page 1823

The control visualizes the following entries of the grinding tool table in the simulation:

- **R-OVR**
- **LO**
- **B**
- **R_SHAFT**

Further information: "Grinding tool table toolgrind.grd (option 156)", Page 1828

The control displays the tool in the following colors:

- Turquoise: tool length
- Red: length of cutting edge and tool is engaged
- Blue: length of cutting edge and tool is retracted

27.2 Pre-defined views

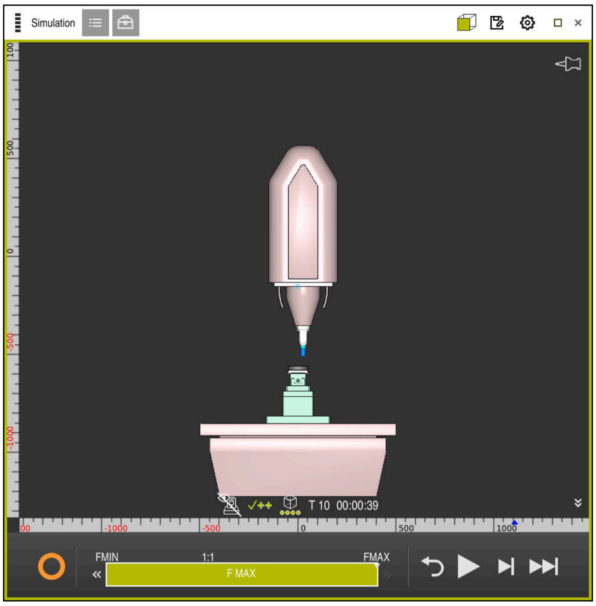
Application

In the **Simulation** workspace, you can choose between various pre-defined views in order to align the workpiece. This allows you to position the workpiece more quickly for the simulation.

Description of function

The control provides the following pre-defined views:

Symbol	Function
	Plan view
	Bottom view
	Front view
	Back view
	Side view (left side)
	Side view (right side)
	Isometric view



Front view of the simulated workpiece in **Machine** mode

27.3 Exporting a simulated workpiece as STL file

Application

In the simulation, you can use the **Save** function to save the current status of the simulated workpiece as a 3D model in STL format.

The file size of the 3D model depends on the complexity of the geometry and the selected model quality.

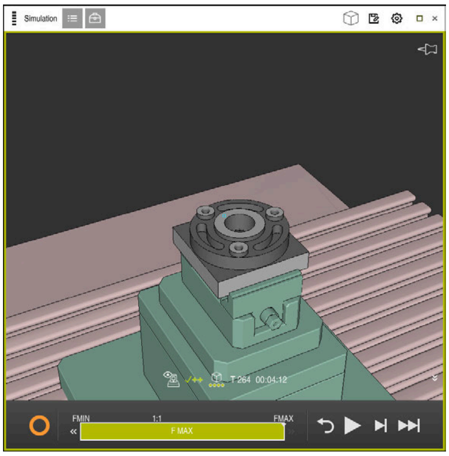
Related topics

- Using an STL file as workpiece blank

  Further information: "STL file as workpiece blank with BLK FORM FILE", Page 239
- Modifying an STL file in the **CAD-Viewer** (option 152)

  Further information: "Generating STL files with 3D mesh (option 152)", Page 1372

Description of function



Simulated workpiece

This function can be used only in the **Editor** mode.

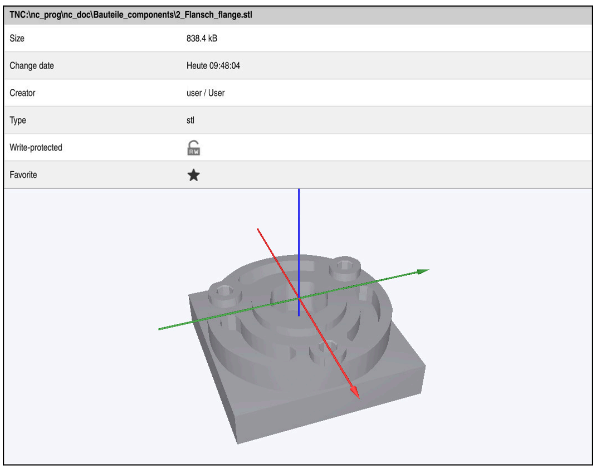
The control can only display STL files with up to 30,000 triangles. If the exported 3D model has too many triangles, due to the excessively high model quality, then you cannot use the exported 3D model on the control.

In this case, reduce the model quality in the simulation.

Further information: "Simulation settings window", Page 1411

You can also use the **3D mesh** function to reduce the number of triangles (option 152).

Further information: "Generating STL files with 3D mesh (option 152)", Page 1372



Simulated workpiece as saved STL file

27.3.1 Saving a simulated workpiece as STL file

To save a simulated workpiece as an STL file:

- ▶ Simulate workpiece
- ▶ Select **Save**
- > The control opens the **Save as** window.
- ▶ Enter the desired file name
- ▶ Select **Create**
- > The control saves the created STL file.

27.4 Measuring function

Application

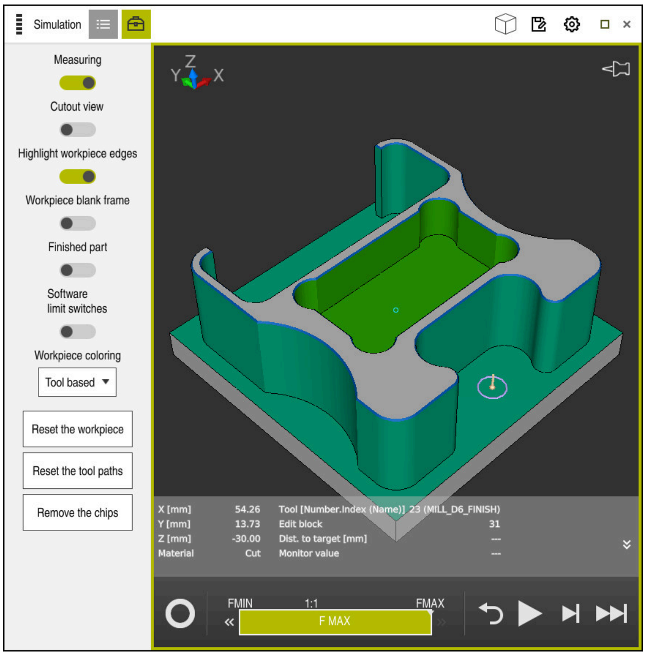
Use the measuring function to measure any points on the simulated workpiece. The control shows various pieces of information about the measured surface.

Requirement

- **Workpiece** mode

Description of function

If you measure a point on the simulated workpiece, the cursor always locks onto the currently selected surface.



Measured point on simulated workpiece

The control shows the following information about the measured surface:

- Measured positions in the **X**, **Y**, and **Z** axes
- Status of the machined surface
  - **Material Cut** = Surface that has been machined
  - **Material NoCut** = Surface that has not been machined
- Cutting tool
- NC block currently running in the NC program
- Distance between the measured surface and the finished part
- Relevant values of monitored machine components (option 155)

  Further information: "Component Monitoring with MONITORING HEATMAP (option 155)", Page 1146

27.4.1 Measuring the difference between the workpiece blank and the finished part

To measure the difference between the workpiece blank and the finished part:

- Select an operating mode, e.g. **Editor**
- Open an NC program with a workpiece blank and finished part defined in **BLK FORM FILE**
- Open the **Simulation** workspace
- Select the **Tool options** column
- Activate the **Measuring** switch
- Select the **Workpiece coloring** selection menu

- Select **Model comparison**
- > The control displays the workpiece blank and finished part defined in the **BLK FORM FILE** function.
- Start the simulation
- > The control simulates the workpiece.
- Select the desired point on the simulated workpiece
- > The control displays the difference in the dimension between the simulated workpiece and the finished part.

> The control uses the **Model comparison** function to identify dimensional differences between the simulated workpiece and the finished part first in color, starting with differences greater than 0.2 mm.

Notes

- If you need to compensate for tools, you can use the measuring function to determine the tool to be compensated for.
- If you notice an error in the simulated workpiece, you can use the measuring function to determine the NC block that causes the error.

27.5 Cutout view in the simulation

Application

In the Cutout view you can cut through the simulated workpiece along any axis. This enables you to check holes and undercuts in the simulation, for example.

Requirement

- **Workpiece** mode

Description of function

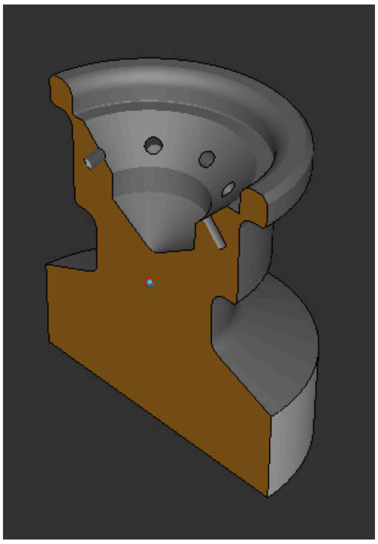
The Cutout view can be used only in the **Editor** mode.

The position of the sectional plane is shown as a percent value when it is shifted in the simulation. The sectional plane is retained until the control is restarted.

27.5.1 Shifting the sectional plane

To shift the sectional plane:

- Select the **Editor** operating mode
- Open the **Simulation** workspace
- Select the **Visualization options** column
- Select **Workpiece** mode
- > The control shows the workpiece view.
- Select **Workpiece options**
- Activate the **Cutout view** switch
- > The control activates the **Cutout view**.
- Use the selection menu to choose the desired sectional axis, such as the Z axis
- Use the slider to specify the desired percent value
- > The control simulates the workpiece with the selected sectional settings.



Simulated workpiece in the **Cutout view**

27.6 Model comparison

Application

With the **Model comparison** function you can compare the blank and finished part in STL or M3D format with each other.

Related topics

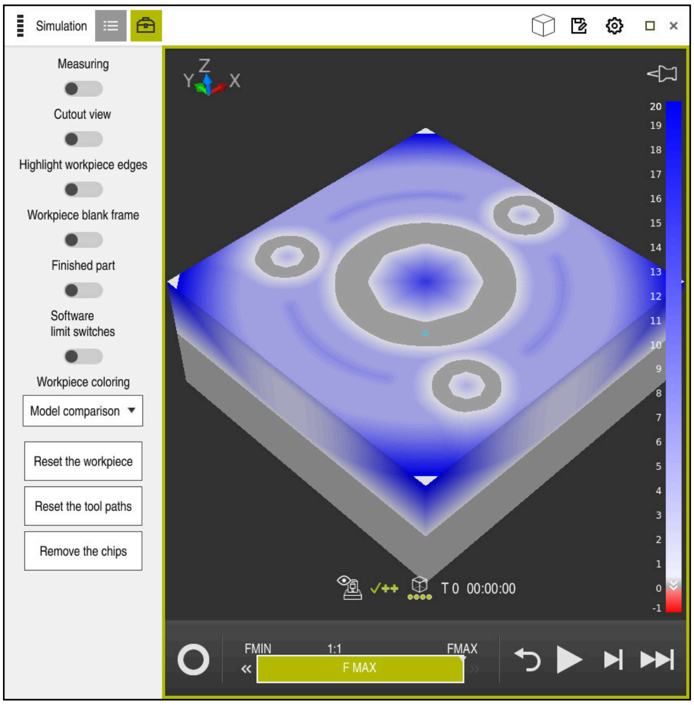
- Programming the blank and finished part with STL files

  Further information: "STL file as workpiece blank with BLK FORM FILE", Page 239

Requirements

- STL file or M3D file of workpiece blank and finished part
- **Workpiece** mode
- Workpiece blank definition with **BLK FORM FILE**

Description of function



The control uses the **Model comparison** function to show the difference in material between the models being compared. The control uses a color transition from white to blue to show the difference in material. The more material there is covering the finished part model, the deeper the blue is. When material is removed from the finished part model, the control displays this removal in red.

Notes

- The control uses the **Model comparison** function to identify dimensional differences between the simulated workpiece and the finished part, starting with differences greater than 0.2 mm.
- Use the measuring function to measure the exact dimensional difference between the workpiece blank and the finished part.

  Further information: "Measuring the difference between the workpiece blank and the finished part", Page 1419

27.7 Center of rotation in the simulation

Application

By default, the center of rotation in the simulation is at the center of the model. When you zoom in, the center of rotation is always shifted to the center of the model. If you want to rotate the simulation around a specific point, then you can define the center of rotation manually.

Description of function

Use the **Center of rotation** function to manually set the center of rotation for the simulation.

The control shows the **Center of rotation** symbol as follows, depending on the status:

Symbol	Function
	The center of rotation is at the center of the model.
	The symbol blinks. The center of rotation can be shifted.
	The center of rotation was set manually.

27.7.1 Setting the center of rotation to a corner of the simulated workpiece

To set the center of rotation to a corner of the workpiece:

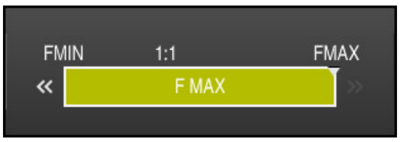
- Select an operating mode, e.g. **Editor**
- Open the **Simulation** workspace
- > The center of rotation is at the center of the model.

- Select **Center of rotation**
- > The control switches the **Center of rotation** symbol. The symbol blinks.
- Select a corner of the simulated workpiece
- > The center of rotation is defined. The control switches the **Center of rotation** symbol to "set".

27.8 Simulation speed

Application

You can use a slider to select any speed for the simulation.



Description of function

This function can be used only in the **Editor** operating mode.

The standard speed for the simulation is set to **FMAX**. If you change the simulation speed, then this change is retained until the control is restarted.

You can change simulation speed before as well as during the simulation.

The control provides the following options:

Button	Functions
FMIN	Activate minimum feed rate (**0.01*T**)
«	Reduce the feed rate
1:1	Feed-rate at 1:1 (real-time)
»	Increase the feed rate
FMAX	Activate maximum feed rate (**FMAX**)

27.9 Simulating an NC program up to a certain NC block

Application

If you want to check a critical point in the NC program then you can simulate the NC program up to a specific NC block that you specify. Once the NC block is reached in the simulation, the control stops the simulation automatically. Starting from this NC block you can then continue the simulation, for example in **Single Block** mode or at a lower simulation speed.

Related topics

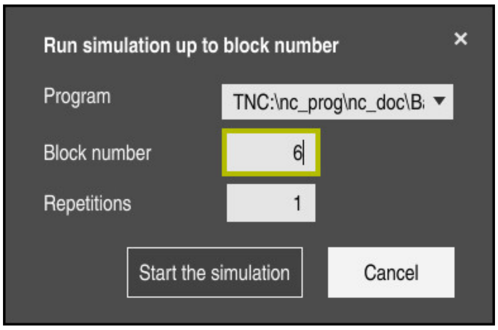
- Possibilities in the action bar

  Further information: "Action bar", Page 1413
- Simulation speed

  Further information: "Simulation speed", Page 1422

Description of function

This function can be used only in the **Editor** operating mode.



The **Run simulation up to block number** window with a defined NC block

The following settings options are offered in the **Run simulation up to block number** window:

- **Program**
  This field offers a selection menu in which you can choose to simulate up to a specific NC block in the active main program or in a called program.
- **Block number**
  In the **Block number** field, you enter the number of the NC block up to which the simulation should run. The number of the NC block refers to the NC program selected in the **Program** field.
- **Repetitions**
  Use this field if the desired NC block is located within a program-section repeat. Enter in this field up to which iteration of the program-section repeat the simulation should run.
  If you enter **1** or **0** in the **Repetitions** field, the control simulates up to the first iteration of the program section (repetition "0").
  Further information: "Program-section repeats", Page 335

27.9.1 Simulating an NC program up to a certain NC block

To simulate up to a specific NC block:

- ▶ Open the **Simulation** workspace

- ▶ Select **Run simulation up to block number**
- > The control opens the **Run simulation up to block number** window.
- ▶ Use the selection menu in the **Program** field to specify the main program or called program
- ▶ Enter the number of the desired NC block in the **Block number** field
- ▶ If the block involves a program-section repeat, enter the number of the iteration of the program-section repeat in the **Repetitions** field

- ▶ Select **Start the simulation**
- > The control simulates the workpiece up to the selected NC block.

28

Touch Probe Functions in the Manual Operating Mode

28.1 Fundamentals

Application

The touch probe functions allow you to set presets on the workpiece, measure the workpiece, and determine and compensate for workpiece misalignment.

Related topics

- Automatic touch probe cycles
  Further information: "Programmable Touch Probe Cycles", Page 1449
- Preset table
  Further information: "Preset table", Page 1851
- Datum table
  Further information: "Datum table", Page 1858
- Reference systems
  Further information: "Reference systems", Page 934
- Preassigned variables
  Further information: "Preassigned Q parameters", Page 1273

Requirements

- Calibrated workpiece touch probe
  Further information: "Calibrating the workpiece touch probe", Page 1439

Description of function

The control provides the following functions for setting up the machine in the **Manual** operating mode in the **Setup** application:

- Define the workpiece preset
- Determine and compensate for workpiece misalignment
- Calibrate the workpiece touch probe
- Calibrate the tool touch probe
- Measure the tool

Within the functions, the control provides the following probing methods:

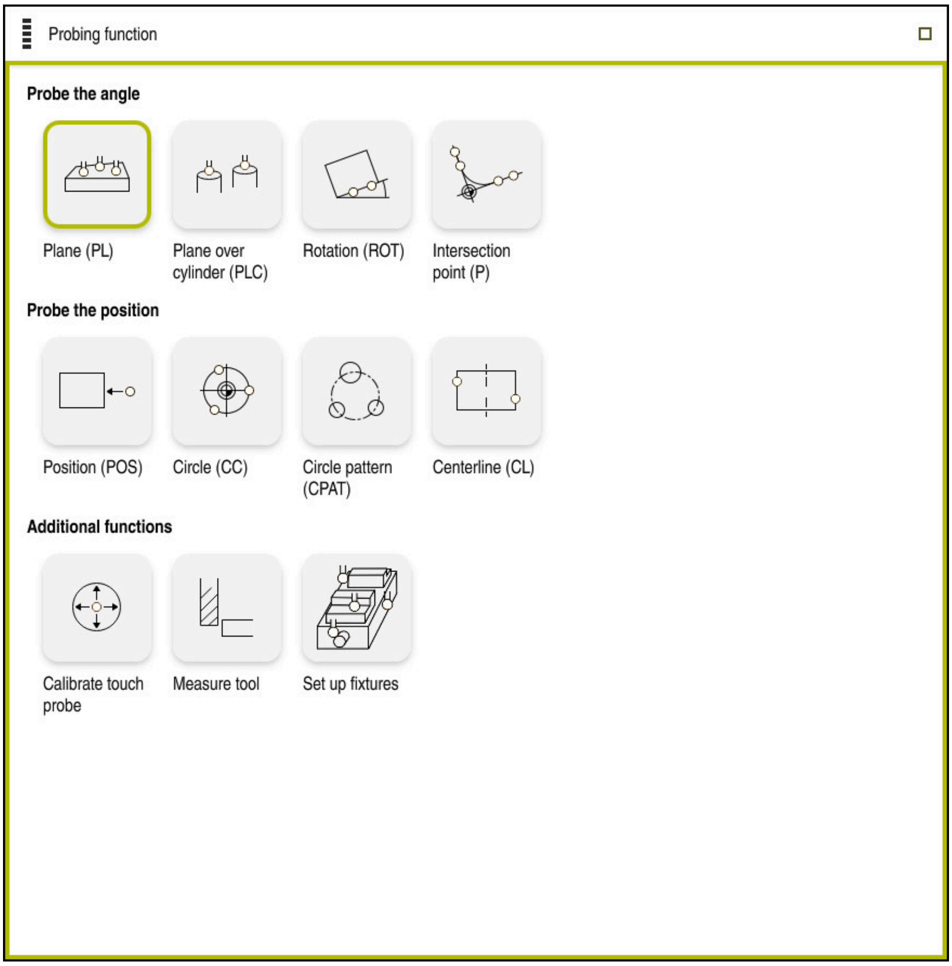
- Manual probing method

  You position and start individual probing processes manually within a touch probe function.

  Further information: "Setting a preset in a linear axis", Page 1433
- Automatic probing method

  You manually position the touch probe to the first probing point before the start of the probing routine and fill out a form with the individual parameters for the respective touch probe function. When you start the touch probe function, the control automatically positions and automatically performs probing.

  Further information: "Determining the circle center point of a stud using the automatic probing method ", Page 1435



Probing function workspace

Overview

The touch probe functions are structured in the following groups:

Probe the angle

The **Probe the angle** group contains the following touch probe functions:

Button	Function
Plane (PL) 	Use the **Plane (PL)** function to determine the solid angle of a plane. You then save the values in the preset table or align the plane.
Plane over cylinder (PLC) 	Use the **Plane over cylinder (PLC)** function to probe one or two cylinders, each at two different heights. The control calculates the solid angle of a plane from the points probed. You then save the values in the preset table or align the plane.
Rotation (ROT) 	Use the **Rotation (ROT)** function to determine the skew of a workpiece using a straight line. Then save the determined skew as a basic transformation or offset in the preset table. **Further information:** "Determining and compensating the rotation of a workpiece", Page 1436
Intersection point (P) 	Use the **Intersection point (P)** function to probe four probing objects. The probing objects can be either positions or circles. The control determines the intersection of the axes and the skew of the workpiece from the objects that have been probed. You can set the intersection point as a preset. You can transfer the determined skew to the preset table as a basic transformation or as an offset.

The control interprets a basic transformation as a basic rotation, and an offset as a table rotation.

Further information: "Preset table", Page 1851

You can compensate for the workpiece misalignment by rotating the table only if the machine is designed with a rotary table axis that is oriented perpendicularly with respect to the workpiece coordinate system **W-CS**.

Further information: "Comparison of offset and 3D basic rotation", Page 1446

Probe the position

The **Probe the position** group contains the following touch probe functions:

Button	Function
Position (POS) 	You can use the **Position (POS)** function to probe a position in the X axis, Y axis or Z axis. **Further information:** "Setting a preset in a linear axis", Page 1433
Circle (CC) 	The **Circle (CC)** function is used to determine the coordinates of a circle center point, e.g. for a hole or for a stud. **Further information:** "Determining the circle center point of a stud using the automatic probing method ", Page 1435
Circle pattern (CPAT) 	The **Circle pattern (CPAT)** function is used to determine the center point coordinates of a circle pattern.
Centerline (CL) 	The **Centerline (CL)** function is used to determine the center point of a ridge or slot.

Additional functions group

The **Additional functions** group contains the following touch probe functions:

Button	Function
Calibrate touch probe 	The **Calibrate touch probe** function is used to determine the length and radius of a workpiece touch probe. **Further information:** "Calibrating the workpiece touch probe", Page 1439
Measure tool 	The **Measure tool** function allows you to measure tools by scratching. In this function, the control supports milling tools, drilling tools and turning tools.
Set up fixtures 	The **Set up fixtures** function is used to determine the position of a clamping device in the machine space using a workpiece touch probe. **Further information:** "Spannmittel in Kollisionsüberwachung einmessen", Page

Buttons

General buttons in the touch probe functions

The following buttons are available, depending on the selected touch probe function:

Button	Function
	Finish the active touch probe function
	Open the **Change the preset** window Select the workpiece preset in the **Change the preset** window and adapt arbitrary values to the preset table. **Further information:** "Preset table", Page 1851
	Display help graphics for the selected touch probe function
	Select the probing direction
	Apply the actual position
	Approaching and probing points on a straight surface manually
	Approaching and probing points on a stud or in a hole manually
	Approaching and probing points on a stud or in a hole automatically After the last touching process and if the opening angle contains the value 360°, the control positions the workpiece touch probe back to the position it had prior to starting the probing function.

Calibration buttons

The control offers the following ways for calibrating a 3D touch probe:

Button	Function
	Calibrating the length of a 3D touch probe
	Calibrating the radius of a 3D touch probe
Apply calibration data	Transferring values from the calibration process into tool management

Further information: "Calibrating the workpiece touch probe", Page 1439

You can calibrate a 3D touch probe by using a calibration standard, e.g. a calibrating ring.

The control provides the following options:

Button	Function
	Measure the radius and the center offset using a calibration ring
	Measure the radius and the center offset using a stud or a calibration pin
	Measure the radius and the center offset using a calibration sphere Optionally calibrating the tool touch probe in 3D (option 92) **Further information:** "3D radius compensation depending on the tool contact angle (option 92)", Page 1062 **Further information:** "3D calibration (option 92)", Page 1440

Buttons in the Working plane is inconsistent! window

If the positions of the rotary axes do not match the tilting situation in the **3-D rotation** window, the control opens the **Working plane is inconsistent!** window.

The control offers the following functions in the **Working plane is inconsistent!** window:

Button	Function
3-D ROT Apply status	The **3-D ROT Apply status** function transfers the position of the rotary axes into the **3-D rotation** window. **Further information:** "3-D rotation window (option 8)", Page 1022
3-D ROT Ignore status	The **3-D ROT Ignore status** function makes the control calculate the probing results, assuming that the rotary axes are in their zero position.
Align the rotary axes	The **Align the rotary axes** function aligns the rotary axes to the active tilting situation in the **3-D rotation** window.

Buttons for measured values

After executing a touch probe function, you select the desired control reaction.

The control offers the following functions:

Button	Function
Compensate the active preset	The **Compensate the active preset** function transfers the measuring result into the active line of the preset table. **Further information:** "Preset table", Page 1851
Write the datum	The **Write the datum** function transfers the measuring result into a desired line of the datum table. **Further information:** "Datum table", Page 1858
Align rotary table	The **Align rotary table** function aligns the rotary axes mechanically according to the measuring result.

Log file of touch probe cycles

After executing the respective touch-probe cycle, the control writes the measured values to the TCHPRMAN.html file.

You can check the readings of past measurements in the **TCHPRMAN.html** file.

If you have not defined a path in the machine parameter **FN16DefaultPath** (no. 102202), the control will store the TCHPRMAN.html file directly under **TNC:**.

If you run several touch probes cycles in a row, the control stores the measured values below each other.

28.1.1 Setting a preset in a linear axis

To probe the preset in any axis:

- Select the **Manual** operating mode
- Call the workpiece touch probe as a tool
- Select the **Setup** application

- Select the **Position (POS)** touch probe function
- > The control opens the **Position (POS)** touch probe function.

- Select **Change the preset**
- > The control opens the **Change the preset** window.
- Select the desired row of the preset table
- > The control highlights the selected line in green.

- Press **Apply**
- > The control activates the selected line as the workpiece preset.
- Using the axis keys, position the workpiece touch probe at the desired probing position, e.g. above the workpiece in the workspace

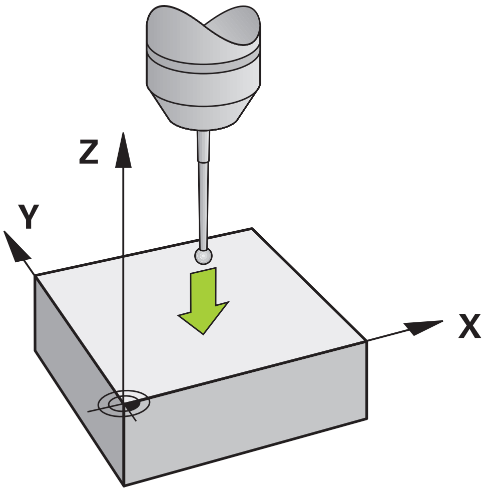
- Select the probing direction, e.g. **Z-**

- Press the **NC start** key
- > The control performs the probing process and then automatically retracts the workpiece touch probe to the starting point.
- > The control shows the measurement results.
- In the **Nominal value** area, enter the new preset of the probed axis, e.g. **1**

- Select **Compensate the active preset**
- > The control enters the defined nominal value in the preset table.

> When you have completed the probing process in the first axis, you can probe up to two additional axes using the **Position (POS)** probing function.

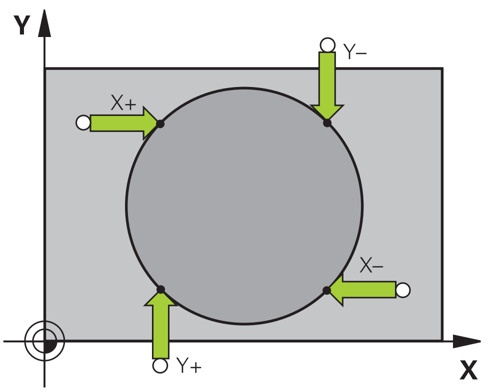
- Select **Exit probing**
- > The control closes the **Position (POS)** probing function.



28.1.2 Determining the circle center point of a stud using the automatic probing method

To probe a circle center point:

- Select the **Manual** operating mode
- Call the workpiece touch probe as a tool
  Further information: "Manual operation application", Page 180
- Select the **Setup** application
- Select **Circle (CC)**
- > The control opens the **Circle (CC)** probing function.
- If necessary, select another preset for the probing process
- Select measuring method **A**
- Select **Type of contour**, e.g. stud
- Enter **Diameter**, e.g. 60 mm
- Enter **Starting angle**, e.g. –180°
- Enter **Angular length**, e.g. 360°
- Position the 3D touch probe at the desired probing position next to the workpiece and below the workpiece surface
- Select the probing direction, e.g. **X+**
- Turn the feed rate potentiometer to zero
- Press the **NC start** key
- Slowly turn on the feed rate potentiometer
- > The control executes the touch probe function based on the data entered.
- > The control shows the measurement results.
- In the **Nominal value** area, enter the new preset of the scanned axes, e.g. **0**
- Select **Compensate the active preset**
- > The control sets the preset to the entered nominal value.
- Select **Exit probing**
- > The control closes the **Circle (CC)** probing function.



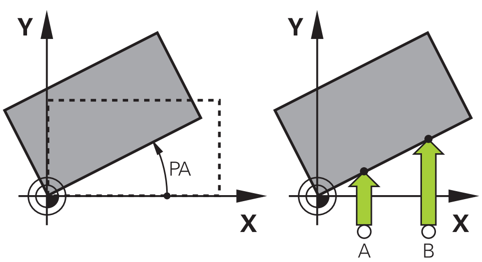
28.1.3 Determining and compensating the rotation of a workpiece

To probe the rotation of a workpiece:

- Select the **Manual** operating mode
- Call the 3D touch probe as a tool
- Select the **Setup** application
- Select **Rotation (ROT)**
- > The control opens the **Rotation (ROT)** probing function.
- If necessary, select another preset for the probing process
- Position the 3D touch probe at the desired probing position in the workspace
- Select the probing direction, e.g. **Y+**
- Press the **NC start** key
- > The control executes the first probing process and limits the subsequently selectable probing directions.
- Position the 3D touch probe at the second probing position in the workspace
- Press the **NC start** key
- > The control executes the probing process and then shows the measurement results.
- Select **Compensate the active preset**
- > The control transfers the determined basic rotation to the **SPC** column of the active line of the preset table.

> Depending on the tool axis, the measurement result can also be written to another column of the preset table, e.g. **SPA**.

- Select **Exit probing**
- > The control closes the **Rotation (ROT)** probing function.



28.1.4 Using touch probe functions with mechanical probes or dial gages

If your machine does not have an electronic 3D touch probe, you can use all manual touch probe functions with manual probing methods with mechanical buttons or with scratching.

For this, the control provides the **Accept position** button.

To determine a basic rotation with a mechanical probe:

- Select the **Manual** operating mode
- Replace tool, e.g. analog 3D probe or feeler lever gage
- Select the **Setup** application
- Select the **Rotation (ROT)** probing function
- Select the probing direction, e.g. **Y+**
- Move the mechanical probe to the first position to be captured by the control.
- Select **Accept position**
- > The control saves the current position.
- Move the mechanical probe to the next position to be captured by the control.
- Select **Accept position**
- > The control saves the current position.
- Select **Compensate the active preset**
- > The control transfers the determined basic rotation to the active line of the preset table.

> The determined angles have different effects depending on whether they are transferred as an offset or as a basic rotation to the corresponding table.
>
> **Further information:** "Comparison of offset and 3D basic rotation", Page 1446

- Select **Exit probing**
- > The control closes the **Rotation (ROT)** probing function.

Notes

- When you use a non-contacting tool touch probe, use touch probe functions by the third-party manufacturer, e.g. with a laser touch probe. Refer to your machine manual.
- The accessibility of the pallet preset table in the touch probe functions depends on the machine manufacturer's configuration. Refer to your machine manual.
- The use of touch probe functions deactivates the global program settings (GPS, option 44) temporarily.

  Further information: "Global Program Settings (GPS, option 44)", Page 1132
- You can use the manual touch probe functions only with restrictions in turning mode (option 50).
- You must calibrate the touch probe separately in turning mode. The factory default setting of the worktable may vary between milling mode and turning mode, which is why you must calibrate the touch probe without any center offset in turning mode. You can create a tool index for storing the additionally calibrated tool data in the same tool.

  Further information: "Indexed tool", Page 250
- When probing while the guard door is open and spindle orientation to probing direction is active, the number of spindle revolutions is limited. When the maximum permitted number of spindle revolutions is reached, the direction of spindle rotation changes and the control may no longer orient the spindle on the shortest path.
- If you try to set a preset in a locked axis, the control will issue either a warning or an error message, depending on what the machine manufacturer has defined.
- When writing into an empty line of the preset table, the control automatically fills the other columns with values. To define a preset completely, you must determine the values in all axes and write them into the preset table.
- If no tool touch probe is inserted, the actual position can be captured with **NC START**. The control displays a warning that no probing movement is carried out in that case.
- Recalibrate the workpiece touch probe in the cases below:
  - Initial configuration
  - Broken stylus
  - Stylus replacement
  - Change in the probe feed rate
  - Irregularities caused, for example, when the machine heats up
  - Change of active tool axis

Definition

Spindle tracking

If the **Track** parameter in the touch probe table is active, the control orients the workpiece probing system so that the same position is always used for probing. By deflecting in the same direction, you can reduce the measurement error to the repeatability of the workpiece probing system. This behavior is called spindle tracking.

28.2 Calibrating the workpiece touch probe

Application

In order to precisely specify the actual trigger point of a 3D touch probe, you must first calibrate the touch probe, otherwise the control cannot provide precise measuring results.

During 3D calibration, you determine the angle-dependent deflection behavior of a workpiece touch probe in any probing direction (option 92).

Related topics

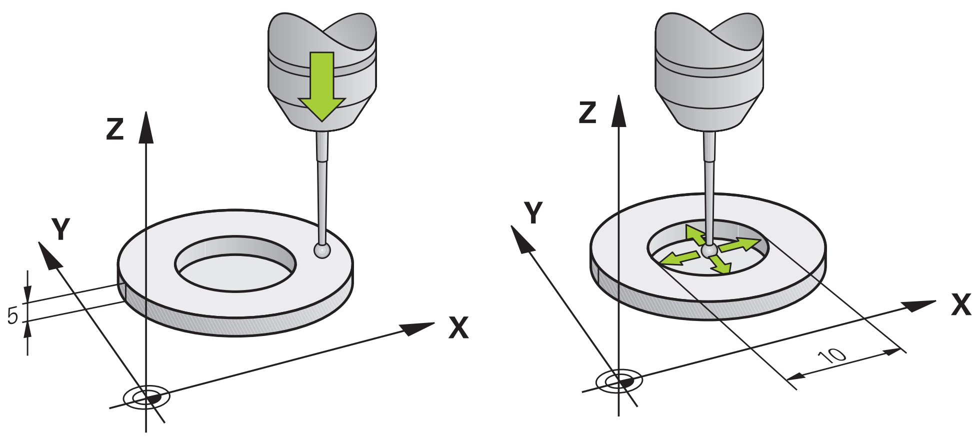
- Calibrate the workpiece touch probe automatically

  Further information: "Touch Probe Cycles: Calibration", Page 1679
- Touch probe table

  Further information: "Touch probe table tchprobe.tp", Page 1839
- 3D radius compensation depending on the contact angle (option 92)

  Further information: "3D radius compensation depending on the tool contact angle (option 92)", Page 1062

Description of function



During calibration, the control finds the effective length of the stylus and the effective radius of the ball tip. To calibrate the 3D touch probe, clamp a ring gauge or a stud of known height and known radius to the machine table.

The effective length of the workpiece touch probe refers to the tool carrier preset.

Further information: "Tool carrier reference point", Page 245

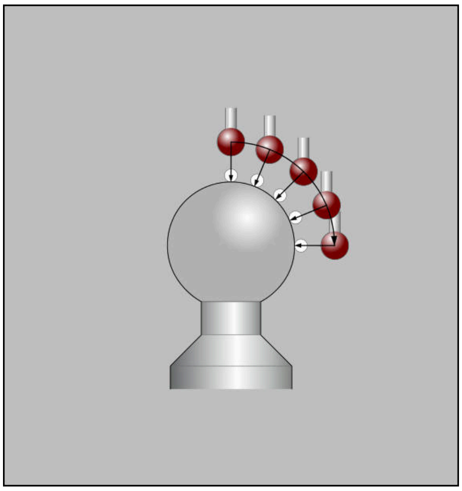
You can calibrate the workpiece touch probe with various tools. For example, the workpiece touch probe can be calibrated using an overmilled surface in length and a calibration ring in the radius. This creates a reference between the workpiece touch probe and the tools in the spindle. In this procedure, measured tools and the calibrated workpiece touch probe correspond using the tool presetting device.

3D calibration (option 92)

In addition to calibrating with a calibration sphere, the control also enables the touch probe to be calibrated dependent on the angle. For this purpose the control probes the calibration sphere in a quarter circle in the perpendicular. The 3D calibration data specifies the deflection behaviour of the touch probe in any probing direction.

The control saves the deviations in a compensation value table ***.3DTC** in the folder **TNC:\system\3D-ToolComp**.

The control creates a specific table for each calibrated touch probe. In the tool table the **DR2TABLE** column is automatically referenced to this.



3D calibration

Reversal measurement

When calibrating the ball-tip radius, the control executes an automatic probing routine. In the first run the control finds the midpoint of the calibration ring or stud (approximate measurement) and positions the touch probe in the center. Then, in the actual calibration process (fine measurement), the radius of the ball tip is ascertained. If the touch probe allows probing from opposite orientations, the center offset is determined during another cycle.

HEIDENHAIN touch probes are predefined as to whether or how a touch probe can be oriented. Other touch probes are configured by the machine manufacturer.

When calibrating the radius, up to three circular measurements can be taken depending on the possible orientation of the workpiece touch probe. The first two circular measurements determine the center offset of the workpiece touch probe. The third circular measurement determines the effective stylus tip radius. If orientation of the spindle is not possible or only a certain orientation is possible due to the workpiece touch probe, circular measurements are omitted.

28.2.1 Calibrating the length of the workpiece touch probe

To calibrate a workpiece touch probe using an overmilled surface in length:

- Measure the end milling cutter on the tool presetting device
- Store the measured end milling cutter in the tool magazine of the machine
- Enter the tool data of the end milling cutter in tool management
- Clamp the workpiece blank

- Select the **Manual** operating mode
- Replace the end milling cutter in the machine
- Switch on spindle, e.g. with **M3**
- Use the handwheel to scratch the workpiece blank

  Further information: "Setting a preset with milling cutters", Page 950
- Set preset in the tool axis, e.g. **Z**
- Position the end milling cutter next to the workpiece blank
- Set a small value in the tool axis, e.g. -0.5 mm
- Overmill the workpiece blank using the handwheel
- Set the preset again in the tool axis, e.g. **Z=0**
- Switch off spindle, e.g. with **M5**
- Replace the tool touch probe
- Select the **Setup** application
- Select **Calibrate touch probe**
- Select the **Length calibration** measurement method
- > The control displays the current calibration data.
- Enter the reference surface position, e.g. **0**
- Position the workpiece touch probe close to the surface of the overmilled area

> Check that the area to be probed is flat and free of chips before you start the touch probe function.

- Press the **NC start** key
- > The control performs the probing process and then automatically retracts the workpiece touch probe to the starting point.
- Check results

Apply calibration data

- Select **Apply calibration data**
- > The control transfers the calibrated length of the 3D touch probe to the tool table.
- Select **Exit probing**
- > The control closes the **Calibrate touch probe** function.

28.2.2 Calibrating the radius of the workpiece touch probe

To calibrate a workpiece touch probe using a setting ring in the radius:

- Clamp the setting ring on the machine table, e.g. with clamps
- Select the **Manual** operating mode
- Position the 3D touch probe in the hole of the setting ring

> Make sure that the stylus tip is completely recessed into the calibration ring. This causes the control to probe with the largest point of the stylus tip.

- Select the **Setup** application
- Select **Calibrate touch probe**
- Select **Radius** measurement method
- Select **Setting ring** calibration standard
- Enter the diameter of the ring gauge
- Enter the start angle
- Enter the number of touch points
- Press the **NC Start** key
- \> The 3D touch probe probes all required touch points in an automatic probing routine. The control calculates the effective stylus tip radius. If probing from opposite orientations is possible, the control calculates the center offset.
- Check results
- Select **Apply calibration data**
- \> The control stores the calibrated radius of the 3D touch probe in the tool table.
- Select **Exit probing**
- \> The control closes the **Calibrate touch probe** function.

28.2.3 3D calibration of workpiece touch probe (option 92)

To calibrate a workpiece touch probe using a calibration sphere in the radius:

- Clamp the setting ring on the machine table, e.g. with clamps
- Select the **Manual** operating mode
- Position the workpiece touch probe centrally above the sphere
- Select the **Setup** application
- Select **Calibrate touch probe**
- Select **Radius** measurement method
- Select the **Calibration sphere** calibration standard
- Enter the diameter of the sphere
- Enter the start angle
- Enter the number of touch points
- Press the **NC Start** key
- > The 3D touch probe probes all required touch points in an automatic probing routine. The control calculates the effective stylus tip radius. If probing from opposite orientations is possible, the control calculates the center offset.
- Check results
- Select **Apply calibration data**
- > The control stores the calibrated radius of the 3D touch probe in the tool table.
- > The control shows the **3D calibration** measurement method.
- Select the **3D calibration** measurement method
- Enter the number of touch points
- Press the **NC Start** key
- > The 3D touch probe probes all required touch points in an automatic probing routine.
- Select **Apply calibration data**
- > The control saves the deviations in a compensation value table under **TNC:\system\3D-ToolComp**.
- Select **Exit probing**
- > The control closes the **Calibrate touch probe** function.

Instructions for calibration

- In order to be able to determine ball-tip center misalignment, the control needs to be specially prepared by the machine manufacturer.
- If you press the **OK** button after the calibration process, the control accepts the calibration values for the active touch probe. The updated tool data then becomes immediately effective, and it is not necessary to repeat the tool call.
- HEIDENHAIN only guarantees the proper operation of the touch probe cycles in conjunction with HEIDENHAIN touch probes.
- If you want to calibrate using the outside of an object, you need to pre-position the touch probe above the center of the calibration sphere or calibration pin. Ensure that the probing points can be approached without collisions.
- The control saves the effective length and effective radius of the touch probe in the tool table. The control saves the touch probe center offset in the touch probe table. The control uses the **TP_NO** parameter to link the data from the touch probe table with the data from the tool table.

  Further information: "Touch probe table tchprobe.tp", Page 1839

28.3 Suppressing touch probe monitoring

Application

If you move a workpiece touch probe too close to the workpiece, you can accidentally deflect the workpiece touch probe. You cannot retract a deflected workpiece touch probe in the monitored state. You can retract a deflected workpiece touch probe by suppressing touch probe monitoring.

Description of function

If the control does not receive a stable signal from the probe, the button displays **Suppress touch probe monitoring**.

As long as touch-probe monitoring is switched off, the control displays the error message **The touch probe monitor is deactivated for 30 seconds**. This error message remains active only for 30 seconds.

28.3.1 Deactivating touch probe monitoring

To deactivate touch probe monitoring:

- ▶ Select the **Manual** operating mode
- ▶ Select **Suppress touch probe monitoring**
- > The control disables touch-probe monitoring for 30 seconds.
- ▶ If required, move the touch probe so that the control receives a stable signal from it.

Notes

NOTICE

Danger of collision!

While touch-probe monitoring is deactivated, the control will not perform collision checking. Thus, you must ensure that the touch probe can be positioned safely. There is a risk of collision if you choose the wrong direction of traverse!

- Carefully move the axes in the **Manual** operating mode

If the touch probe sends a stable signal within the 30 seconds, then touch-probe monitoring reactivates itself automatically and the error message is cleared.

28.4 Comparison of offset and 3D basic rotation

The following example shows how the two functions differ.

Offset	3D basic rotation
Initial state  Position display: ■ Actual position ■ **B** = 0 ■ **C** = 0 Preset table: ■ **SPB** = 0 ■ **B_OFFS** = -30 ■ **C_OFFS** = +0	Initial state  Position display: ■ Actual position ■ **B** = 0 ■ **C** = 0 Preset table: ■ **SPB** = -30 ■ **B_OFFS** = +0 ■ **C_OFFS** = +0
Movement in +Z without tilting 	Movement in +Z without tilting 
Offset	3D basic rotation
Movement in +Z with tilting **PLANE SPATIAL** with **SPA+0 SPB+0 SPC +0**	Movement in +Z with tilting **PLANE SPATIAL** with **SPA+0 SPB+0 SPC +0**
	> The orientation **is not correct**!	> The orientation is correct! > The next machining step will be **correct**.

HEIDENHAIN recommends using 3D basic rotation because of its greater flexibility.

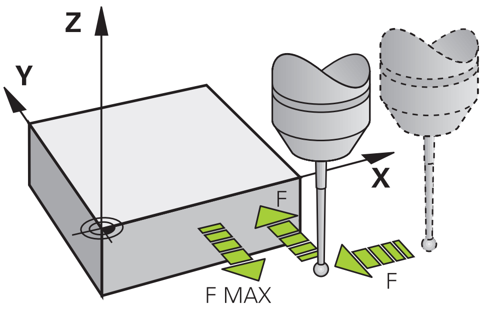
29

Programmable Touch Probe Cycles

29.1 Working with Touch Probe Cycles

29.1.1 General information about touch probe cycles

Method of function



The touch probe functions allow you to set presets on the workpiece, measure the workpiece, and determine and compensate for workpiece misalignment.

Whenever the control runs a touch probe cycle, the 3-D touch probe approaches the workpiece in one linear axis. This is also true during an active basic rotation or with a tilted working plane. The machine tool builder will determine the probing feed rate in a machine parameter.

Page 1456

When the probe stylus contacts the workpiece,

- the 3-D touch probe transmits a signal to the control: the coordinates of the probed position are stored,
- the touch probe stops moving, and
- returns to its starting position at rapid traverse.

If the stylus is not deflected within a defined distance, the control displays an error message (distance: **DIST** from touch probe table).

  If you are using a HEIDENHAIN touch probe, the software option 17, Touch Probe Functions, is automatically enabled.

Notes

⚙	The control must be specifically prepared by the machine manufacturer for the use of a touch probe. While touch probe functions are being executed, the control temporarily disables the **Global Program Settings**.

i	HEIDENHAIN only guarantees the proper operation of the touch probe cycles in conjunction with HEIDENHAIN touch probes.

Touch probe cycles in the Manual Operation and Electronic Handwheel modes

In the **Setup** application under **Manual** mode, the control provides touch probe cycles that allow you to:

- Set presets
- Probe the angle
- Probe position
- Calibrate the touch probe
- Measure the tool

Further information: "Touch Probe Functions in the Manual Operating Mode", Page 1425

Touch probe cycles for automatic operation

Besides the manual touch probe cycles, several cycles are available for a wide variety of applications in automatic operation:

- Automatic measurement of workpiece misalignment
- Automatic determination of the preset
- Automatic workpiece inspection
- Special functions
- Touch probe calibration
- Automatic kinematics measurement
- Automatic tool measurement

Defining touch probe cycles

Like the most recent machining cycles, touch probe cycles with numbers greater than **400** use Q parameters as transfer parameters. Parameters with the same function that the control requires in several cycles always have the same number: For example, **Q260** is always assigned the clearance height, **Q261** the measuring height, etc.

There are various ways to define the touch probe cycles. Touch probe cycles are programmed in the **Programming** mode of operation.

Inserting via NC function:

- Select **Insert NC function**
- > The control opens the **Insert NC function** window.
- Select the desired cycle
- > The control initiates a dialog and prompts you for all required input values.

Inserting via the TOUCH PROBE key:

- Select the **TOUCH PROBE** soft key
- > The control opens the **Insert NC function** window.
- Select the desired cycle
- > The control initiates a dialog and prompts you for all required input values.

Navigation in the cycle

Key	Function
	Navigation within the cycle: Jump to next parameter
	Navigation within the cycle: Jump to previous parameter
	Jump to the same parameter in the next cycle
	Jump to the same parameter in the previous cycle

The control provides selection possibilities for different cycle parameters via the action bar or the form.

29.1.2 Before you start working with touch probe cycles!

General information

In the touch probe table you define the set-up clearance, i.e., how far away from the defined touch point (or the one calculated by the cycle), the control will pre-position the touch probe. The smaller the value you enter, the more exactly you must define the touch point position. In many touch probe cycles, you can also define a set-up clearance that is added to the one from the touch probe table.

The following can be defined in the touch probe table:

- Type of tool
- Touch probe center offset
- Spindle angle during calibration
- Probing feed rate
- Rapid traverse in probing cycle
- Maximum measuring range
- Safety clearance
- Feed rate for pre-positioning
- Touch probe orientation
- Serial number
- Reaction in case of collision

Further information: "Touch probe table tchprobe.tp", Page 1839

Executing touch probe cycles

All touch probe cycles are DEF-active. The control runs the cycle automatically as soon as it reads the cycle definition in the program run.

Positioning logic

Touch probe cycles numbered **400** to **499** or **1400** to **1499** pre-position the touch probe according to the following positioning logic:

- If the current coordinate of the south pole of the stylus is less than the coordinate of the clearance height (as defined in the cycle), the control first retracts the touch probe in the touch probe axis to clearance height and then positions it in the working plane to the first touch point.
- If the current coordinate of the stylus south pole is greater than the coordinate of the clearance height, then the control first positions the touch probe in the working plane to the first touch point, and then in the touch-probe axis directly to the set-up clearance.

Notes

NOTICE

Danger of collision!

When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active.

- ▶ The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**.
- ▶ Reset any coordinate transformations beforehand.

NOTICE

Danger of collision!

When running touch probe cycles **444** and **14xx**, no coordinate transformations must be active (e.g., Cycles **8 MIRRORING**, **11 SCALING FACTOR**, **26 AXIS-SPECIFIC SCALING**, **TRANS MIRROR**).

- Reset any coordinate transformations before the cycle call.

- Please note that the units of measure in the measuring log and the return parameters depend on the main program.
- The touch probe cycles **40x** to **43x** will reset an active basic rotation at the beginning of the cycle.
- The control interprets a basic transformation as a basic rotation, and an offset as a table rotation.
- You can compensate for the workpiece misalignment by rotating the table only if the machine is designed with a rotary table axis that is oriented perpendicularly with respect to the workpiece coordinate system **W-CS**.

  Further information: "Comparison of offset and 3D basic rotation", Page 1446

Note about machine parameters

- Depending on the setting of the optional machine parameter **chkTiltingAxes** (no. 204600), the control will check during probing whether the position of the rotary axes matches the tilting angles (3D-ROT). If that is not the case, the control displays an error message.

29.1.3 Program defaults for cycles

Entering GLOBAL DEF definitions

- Select **Insert NC function**
- > The control opens the **Insert NC function** window.
- Select **GLOBAL DEF**
- Select the desired **GLOBAL DEF** function, e.g. **100 GENERAL**
- Enter the required definitions

Using GLOBAL DEF information

If you entered the corresponding **GLOBAL DEF** functions at program start, you can reference these globally valid values for the definition of any cycle.

Proceed as follows:

Insert NC function

- Select **Insert NC function**
- > The control opens the **Insert NC function** window.
- Select and define **GLOBAL DEF**
- Select **Insert NC function** again
- Select the desired cycle, e.g. **200 DRILLING**
- > If the cycle includes global cycle parameters, the control superimposes the selection possibility **PREDEF** in the action bar or in the form as a selection menu.

PREDEF

- Select **PREDEF**
- > The control then enters the word **PREDEF** in the cycle definition. This creates a link to the corresponding **GLOBAL DEF** parameter that you defined at the beginning of the program.

NOTICE

Danger of collision!

If you later edit the program settings with **GLOBAL DEF**, these changes will affect the entire NC program. This may change the machining sequence significantly.

- Make sure to use **GLOBAL DEF** carefully. Simulate your program before executing it
- If you enter fixed values in the cycles, they will not be changed by **GLOBAL DEF**.

Global data valid everywhere

The parameters are valid for all **2xx** machining cycles as well as for Cycles **880, 1017**, **1018**, **1021**, **1022**, **1025** and touch probe cycles **451**, **452**, **453**

Help graphic	Parameter
	Q200 Set-up clearance? Distance between tool tip and workpiece surface. This value has an incremental effect. Input: **0...99999.9999**
	Q204 2nd set-up clearance? Distance in the tool axis between touch probe and workpiece (fixtures) at which no collision can occur. This value has an incremental effect. Input: **0...99999.9999**
	Q253 Feed rate for pre-positioning? Feed rate at which the control moves the tool within a cycle. Input: **0...99999.999** or **FMAX**, **FAUTO**
	Q208 Feed rate for retraction? Feed rate at which the control retracts the tool. Input: **0...99999.999** or **FMAX**, **FAUTO**

Example

```
11 GLOBAL DEF 100 GENERAL ~
    Q200=+2                  ;SET-UP CLEARANCE ~
    Q204=+50                 ;2ND SET-UP CLEARANCE ~
    Q253=+750                ;F PRE-POSITIONING ~
    Q208=+999                ;RETRACTION FEED RATE
```

Global data for probing functions

The parameters are valid for all touch probe cycles **4xx** and **14xx** as well as for Cycles **271**, **286**, **287**, **880**, **1021**, **1022**, **1025**, **1271**, **1272**, **1273**, **1278**

Help graphic	Parameter
	Q320 Set-up clearance? Additional distance between touch point and ball tip. **Q320** is in addition to the **SET_UP** column in the touch probe table. This value has an incremental effect. Input: **0...99999.9999** or **PREDEF**
	Q260 Clearance height? Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect. Input: **-99999.9999...+99999.9999** or **PREDEF**
	Q301 Move to clearance height (0/1)? Specify how the touch probe moves between measuring points: 0: Move at measuring height between measuring points 1: Move at clearance height between measuring points Input: **0**, **1**

Example

```
11 GLOBAL DEF 120 PROBING ~
    Q320=+0                 ;SET-UP CLEARANCE ~
    Q260=+100               ;CLEARANCE HEIGHT ~
    Q301=+1                 ;MOVE TO CLEARANCE
```

29.2 Touch Probe Cycles: Automatic Measurement of Workpiece Misalignment

29.2.1 Overview

> The control must be specifically prepared by the machine manufacturer for the use of a touch probe.
>
> HEIDENHAIN only guarantees the proper operation of the touch probe cycles in conjunction with HEIDENHAIN touch probes.

Cycle	Call	Further information
1420 PROBING IN PLANE ■ Automatic measurement using three points ■ Compensation via basic rotation or rotary table rotation	**DEF**-active	Page 1472

Cycle		Call	Further information

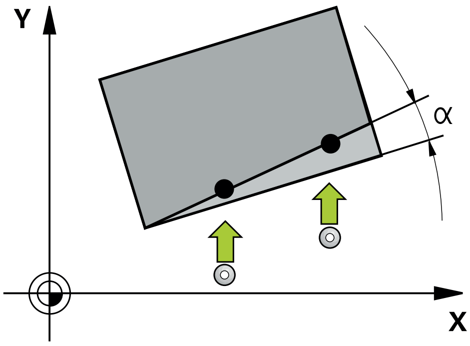
29.2.2 Fundamentals of touch probe cycles 14xx

Functionalities common to touch probe cycles 14xx for measuring rotations



The cycles are capable of determining rotation and include the following:

- Consideration of active machine kinematics
- Semi-automatic probing
- Monitoring of tolerances
- Consideration of 3-D calibration
- Simultaneous measurement of rotation and position

Programming notes:

- The probing positions are referenced to the programmed nominal coordinates in the I-CS.
- See the drawing for these nominal positions.
- Before a cycle definition you must program a tool call to define the touch-probe axis.

Explanation of terms

Designation	Short description
Nominal position	Position in the drawing (e.g., position of a hole)
Nominal dimension	Dimension in the drawing (e.g., hole diameter)
Actual position	Measured position (e.g., position of a hole)
Actual dimension	Measured dimension (e.g., hole diameter)
I-CS	I-CS: **Input Coordinate System**
W-CS	W-CS: **Workpiece Coordinate System**
Object	Object to be probed: circle, stud, plane, edge
Surface-normal vectors	

Evaluation – preset:

- If you want to probe objects in a consistent machining plane or probe objects while TCPM is active, you can program any required shifts as basic transformations in the preset table.
- Rotations can be written to the basic transformations of the preset table as basic rotations or as axial offsets from the first rotary table axis, seen from the workpiece.

> Operating notes:
> - When probing, existing 3-D calibration data are taken into account. If these calibration data do not exist, deviations might be the result.
> - If you want to use not only the measured rotation, but also a measured position, make sure to probe the surface perpendicularly, if possible. The larger the angular error and the bigger the ball-tip radius, the larger the positioning error. If the angular errors in the initial angular position are too large, corresponding position errors might be the result.

Logging:

The measured results are recorded in the **TCHPRAUTO.html** file and stored in the Q parameters programmed for this cycle.

The measured deviations are the differences between the measured actual values and the mean tolerance value. If no tolerance has been specified, they refer to the nominal dimension.

The unit of measurement of the main program can be seen in the header of the log.

Semi-automatic mode

If the probing positions relative to the current datum are unknown, you can execute the cycle in semi-automatic mode. In this mode, you can determine the starting position by manually pre-positioning before performing the probing operation.

For this purpose, precede the value for the required nominal position with **"?"**. You can do this by selecting **Name** in the action bar. Depending on the object, you need to define the nominal positions that determine the probing direction, see "Examples."

> Depending on the object, you need to define the nominal positions that determine the probing direction,
>
> Examples:
>
> - Page 1465
> - Page 1466
> - Page 1467
>

Cycle sequence

Proceed as follows:

- ▶ Run the cycle
- > The control interrupts the NC program.
- > A window opens.
- ▶ Use the axis-direction keys to position the touch probe to the desired touch point

  or
- ▶ Position the touch probe to the desired point using the electronic handwheel
- ▶ Change the probing direction in the window, if necessary
- ▶ Select the **NC start** key
- > The control closes the window and performs the first probing operation.
- > If **CLEAR. HEIGHT MODE Q1125** = **1** or **2**, the control opens a message in the **FN 16** tab, **Status** workspace, explaining that the Traverse to clearance height mode cannot be used here.
- ▶ Move the tool to a safe position
- ▶ Select the **NC start** key
- > Cycle or program execution is resumed. You may then need to repeat the entire process for further touch points.

NOTICE

Danger of collision!

The control will ignore the programmed values 1 and 2 for Traverse to clearance height when running in semi-automatic mode. Depending on the position of the touch probe, there is danger of collision.

- ▶ In semi-automatic mode, traverse to clearance height after each probing operation.

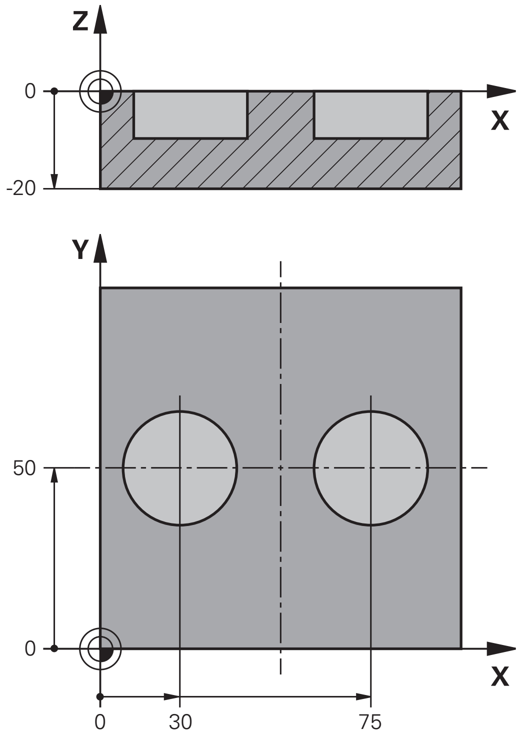
Programming and operating notes:

- See the drawing for these nominal positions.
- Semi-automatic mode is only executed in the machine operating modes, not in the simulation.
- If you did not define a nominal position for a touch point in any direction, the control generates an error message.
- If you did not define a nominal position for a single direction, the control will capture the actual position after probing the object. This means that the measured actual position will subsequently be applied as the nominal position. Consequentially, there is no deviation for this position and thus no position compensation.

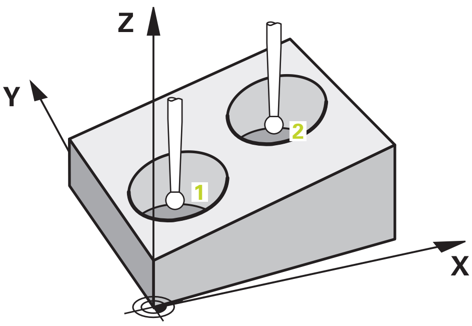
Examples

Important: Specify the **nominal positions** from the drawing!

In the following three examples, the nominal positions from this drawing will be used.



Alignment using two holes



In this example, you will align two holes. Probing is done in the X axis (main axis) and in the Y axis (secondary axis). This means that it is mandatory to define the nominal position from the drawing for these axes! A nominal position for the Z axis (tool axis) is not necessary as you will not measure in this direction.

- **QS1100** = nominal position 1 in main axis is defined, but workpiece position is unknown
- **QS1101** = nominal position 1 in secondary axis is defined, but workpiece position is unknown
- **QS1102** = nominal position 1 in tool axis is unknown
- **QS1103** = nominal position 2 in main axis is defined, but workpiece position is unknown

- **QS1104** = nominal position 2 in secondary axis is defined, but workpiece position is unknown
- **QS1105** = nominal position 2 in tool axis is unknown

11 TCH PROBE 1411 PROBING TWO CIRCLES ~	
QS1100= "?30"	;1ST POINT REF AXIS ~
QS1101= "?50"	;1ST POINT MINOR AXIS ~
QS1102= "?"	;1ST POINT TOOL AXIS ~

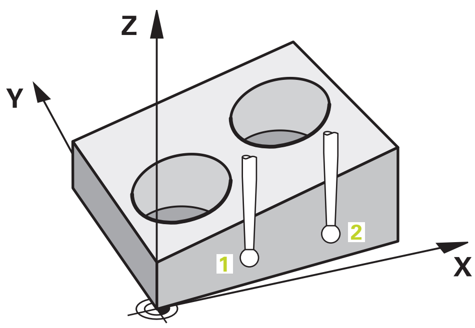
Q309=+0	;ERROR REACTION ~
Q1126=+0	;ALIGN ROTARY AXIS ~
Q1120=+0	;TRANSER POSITION ~
Q1121=+0	;CONFIRM ROTATION

Alignment through an edge



In this example, you will align an edge. Probing is done in the Y axis (secondary axis). This means that it is mandatory to define the nominal position from the drawing for these axes! Nominal positions for the X axis (main axis) and for the Z axis (tool axis) are not required because you will not measure in these directions.

- **QS1100** = nominal position 1 in main axis is unknown
- **QS1101** = nominal position 1 in secondary axis is defined, but workpiece position is unknown
- **QS1102** = nominal position 1 in tool axis is unknown
- **QS1103** = nominal position 2 in main axis is unknown

- **QS1104** = nominal position 2 in secondary axis is defined, but workpiece position is unknown
- **QS1105** = nominal position 2 in tool axis is unknown

11 TCH PROBE 1410 PROBING ON EDGE ~	
QS1100= "?"	;1ST POINT REF AXIS ~
QS1101= "?0"	;1ST POINT MINOR AXIS ~
QS1102= "?"	;1ST POINT TOOL AXIS ~

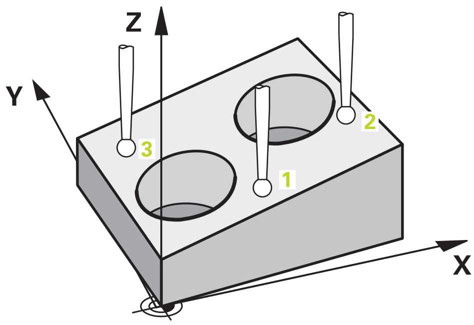
Q1126=+0	;ALIGN ROTARY AXIS ~
Q1120=+0	;TRANSER POSITION ~
Q1121=+0	;CONFIRM ROTATION

Alignment via the plane



In this example, you will align a plane. In this case, it is mandatory to define all three nominal positions from the drawing. For angle calculations, it is important that all three axes are taken into account when probing.

- **QS1100** = nominal position 1 in main axis is defined, but workpiece position is unknown
- **QS1101** = nominal position 1 in secondary axis is defined, but workpiece position is unknown
- **QS1102** = nominal position 1 in tool axis is defined, but workpiece position is unknown
- **QS1103** = nominal position 2 in main axis is defined, but workpiece position is unknown
- **QS1104** = nominal position 2 in secondary axis is defined, but workpiece position is unknown
- **QS1105** = nominal position 2 in tool axis is defined, but workpiece position is unknown
- **QS1106** = nominal position 3 in main axis is defined, but workpiece position is unknown

- **QS1107** = nominal position 3 in secondary axis is defined, but workpiece position is unknown
- **QS1108** = nominal position 3 in tool axis is defined, but workpiece position is unknown

11 TCH PROBE 1420 PROBING IN PLANE ~		; Define the cycle

Evaluation of tolerances

Cycles 14xx also allow you to check tolerance bands. This includes the checking of the position and size of an object.

The following input values with tolerances are possible:

Tolerance	Example
Dimensions	10+0.01-0.015
DIN EN ISO 286-2	10H7
ISO 2768-1	10m

Pay attention to capitalization when entering tolerances.

If you enter a value with a tolerance in your program, the control will monitor the tolerance band. The control writes the following statuses to the return parameter **Q183**: Pass, rework, or scrap. If a compensation of the preset is programmed, the control corrects the active preset after probing

The following cycle parameters allow input values with tolerances:

- **Q1100 1ST POINT REF AXIS**
- **Q1101 1ST POINT MINOR AXIS**
- **Q1102 1ST POINT TOOL AXIS**
- **Q1103 2ND POINT REF AXIS**
- **Q1104 2ND POINT MINOR AXIS**
- **Q1105 2ND POINT TOOL AXIS**
- **Q1106 3RD POINT REF AXIS**
- **Q1107 3RD POINT MINOR AXIS**
- **Q1108 3RD POINT TOOL AXIS**
- **Q1116 DIAMETER 1**
- **Q1117 DIAMETER 2**

Program this as follows:

- Start the cycle definition
- Enable the Name selection option in the action bar
- Program nominal position/dimension incl. tolerance
- > In the cycle, **QS1116="+8-2-1"** is defined, for example.

If you program an incorrect tolerance, the control will interrupt machining with an error message.

Cycle sequence

If the actual position is outside the tolerance, the control behaves as follows:

- **Q309 = 0**: The control does not interrupt program run.
- **Q309 = 1**: In the case of scrap or rework, the control interrupts program run with a message.
- **Q309 = 2**: In the case of scrap, the control interrupts program run with a message.

If Q309 = 1 or 2, proceed as follows:

> A window appears. The control displays all of the nominal and actual dimensions of the object.

- Press the **CANCEL** button to interrupt NC program run

or

- Press **NC start** to resume NC program run

> Please note that the deviations returned by the touch probe cycles are with respect to the mean tolerance in **Q98x** and **Q99x**. The values are thus the same as the correction values executed by the cycle if the input parameters **Q1120** and **Q1121** are programmed. If no automatic evaluation is active, the control will save the values with respect to the mean tolerance in the programmed Q parameters. You can further process these values.

Example

- QS1116 = diameter 1, tolerance specified
- QS1117 = diameter 2, tolerance specified

11 TCH PROBE 1411PROBING TWO CIRCLES ~	
Q1100=+30	**;1ST POINT REF AXIS ~**
Q1101=+50	**;1ST POINT MINOR AXIS ~**
Q1102=-5	**;1ST POINT TOOL AXIS ~**

Q325=+0	**;STARTING ANGLE ~**
Q1119=+360	**;ANGULAR LENGTH ~**
Q320=+2	**;SET-UP CLEARANCE ~**
Q260=+100	**;CLEARANCE HEIGHT ~**
Q1125=+2	**;CLEAR. HEIGHT MODE ~**
Q309=2	**;ERROR REACTION ~**
Q1126=+0	**;ALIGN ROTARY AXIS ~**
Q1120=+0	**;TRANSER POSITION ~**
Q1121=+0	**;CONFIRM ROTATION**

Transferring the actual position

You can determine the actual position in advance and define it as the actual position for the touch probe cycle. Then, both the nominal position and the actual position will be transferred to the object. Based on the difference, the cycle calculates the required compensation values and applies tolerance monitoring.

Program this as follows:

- Define the cycle
- Enable the Name selection option in the action bar
- Program nominal position incl. tolerance, if necessary
- Program **"@"**
- Program actual position
- > In the cycle, **QS1100="10+0.02@10.0123"** is defined, for example.

Programming and operating notes:

- If you program @, no probing will be carried out. The control only accounts for the actual and nominal positions.
- You must define the actual position for all three axes: main axis, secondary axis, and tool axis. If you define only one axis with its actual position, an error message will be generated.
- Actual positions can also be defined with Q **Q1900-Q1999**

Example

This feature allows you to do the following:

- Determine a circular pattern based on multiple different objects
- Align a gear wheel via its center and the position of a tooth

The nominal positions are defined here with tolerance monitoring and actual position.

29.2.3 Cycle 1420 PROBING IN PLANE

Application

Touch probe cycle **1420** finds the angles of a plane by measuring three points. It saves the measured values in the Q parameters.

If you program Cycle **1493 EXTRUSION PROBING** before this cycle, you can repeat probing points in a given direction over a specified distance.

Further information: "Cycle 1493 EXTRUSION PROBING ", Page 1676

Furthermore, you can perform the following operations with Cycle **1420**:

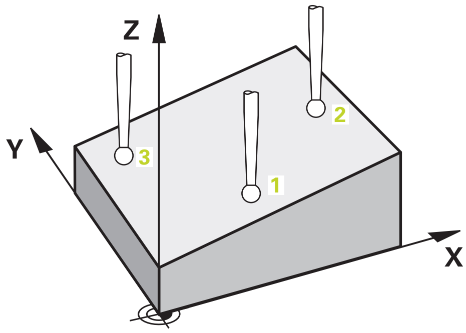
- If the probing position relative to the current datum is unknown, you can execute the cycle in semi-automatic mode.

  Page 1463
- Optionally, the cycle can monitor the tolerances. That way you can monitor the position and size of an object.

  Page 1469
- If you determine the actual position in advance, you can transfer it to the cycle as the actual position.

  Page 1471

Cycle sequence



1. Following the positioning logic, the control positions the touch probe to the programmed touch point **1** at rapid traverse **FMAX_PROBE**.

   Further information: "Positioning logic", Page 1456
2. The control then moves the touch probe to set-up clearance at rapid traverse **FMAX_PROBE**. The sum of **Q320**, **SET_UP** and the ball-tip radius is taken into account when probing in any probing direction.
3. Next, the touch probe moves to the entered measuring height and probes the first touch point at the probing feed rate **F** from the touch probe table.
4. The control offsets the touch probe by the safety clearance in the direction opposite to the direction of probing.
5. If you programmed retraction to clearance height **Q1125**, the touch probe returns to clearance height.
6. It then moves in the working plane to touch point **2** to measure the actual value of the second touch point in the plane.
7. The touch probe returns to the clearance height (depending on **Q1125**), then moves in the working plane to touch point **3** and measures the actual position of the third point of the plane.
8. Finally, the control retracts the touch probe to the clearance height (depending on **Q1125**) and saves the measured values in the following Q parameters:

Q parameter number	Meaning
Q950 to **Q952**	Measured position 1 in the main axis, secondary axis, and tool axis
Q953 to **Q955**	Measured position 2 in the main axis, secondary axis, and tool axis
Q956 to **Q958**	Measured position 3 in the main axis, secondary axis, and tool axis
Q961 to **Q963**	Measured spatial angle SPA, SPB, and SPC in the W-CS
Q980 to **Q982**	Measured deviations of touch point 1
Q983 to **Q985**	Measured deviations of touch point 2
Q986 to **Q988**	Deviation 3 of the positions
Q183	Workpiece status ■ **-1** = Not defined ■ **0** = Good ■ **1** = Rework ■ **2** = Scrap
Q970	If you have programmed Cycle **1493 EXTRUSION PROBING** before: Mean value of all deviations from the ideal line of the first touch point
Q971	If you have programmed Cycle **1493 EXTRUSION PROBING** before: Mean value of all deviations from the ideal line of the second touch point
Q972	If you have programmed Cycle **1493 EXTRUSION PROBING** before: Mean value of all deviations from the ideal line of the third touch point

Notes

NOTICE

Danger of collision!

If you do not retract the touch probe to clearance height between two objects or touch points, there is danger of collision.

- Always move to clearance height between objects or touch points

NOTICE

Danger of collision!

When running touch probe cycles **444** and **14xx**, no coordinate transformations must be active (e.g., Cycles **8 MIRRORING**, **11 SCALING FACTOR**, **26 AXIS-SPECIFIC SCALING**, **TRANS MIRROR**).

- Reset any coordinate transformations before the cycle call.

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- The control can calculate the angle values only if the three touch points are not positioned on a straight line.
- The nominal spatial angle results from the defined nominal positions. The control saves the calculated spatial angle in parameters **Q961** to **Q963**. The control transfers the difference between the measured spatial angle and the nominal spatial angle to the basic rotation in 3-D of the preset table.

- HEIDENHAIN recommends avoiding the use of axis angles in this cycle!

Aligning the rotary table axes:

- Alignment with rotary table axes is possible only if two rotary table axes have been defined in the kinematics..
- To align the rotary table axes, (**Q1126** not equal to 0), the rotation must be used (**Q1121** not equal to 0). Otherwise, an error message will be displayed.

Cycle parameters

Parameter

Q1100 1st noml. position of ref. axis?

Absolute nominal position of the first touch point in the main axis of the working plane

Input: **-99999.9999...+99999.9999** or optionally **?, -, +**, **@**

- **?**: Semiautomatic mode, Page 1463
- **-, +**: Evaluation of the tolerance, Page 1469
- **@**: Transferring the actual position, Page 1471

Q1101 1st noml. position of minor axis?

Absolute nominal position of the first touch point in the secondary axis of the working plane

Input: **-99999.9999...+9999.9999** or optional input (see **Q1100**)

Q1102 1st nominal position tool axis?

Absolute nominal position of the first touch point in the tool axis

Input: **-99999.9999...+9999.9999** or optional input (see **Q1100**)

Q1103 2nd noml. position of ref axis?

Absolute nominal position of the second touch point in the main axis of the working plane

Input: **-99999.9999...+9999.9999** or optional input (see **Q1100**)

Q1104 2nd noml. position of minor axis?

Absolute nominal position of the second touch point in the secondary axis of the working plane

Input: **-99999.9999...+9999.9999** or optional input (see **Q1100**)

Q1105 2nd nominal pos. of tool axis?

Absolute nominal position of the second touch point in the tool axis of the working plane

Input: **-99999.9999...+9999.9999** or optional input (see **Q1100**)

Q1106 3rd noml. position of ref axis?

Absolute nominal position of the third touch point in the main axis of the working plane.

Input: **-99999.9999...+9999.9999** or optional input (see **Q1100**)

Help graphic	Parameter
	Q1107 3rd noml. position minor axis? Absolute nominal position of the third touch point in the secondary axis of the working plane Input: **-99999.9999...+9999.9999** or optional input (see **Q1100**)
	Q1108 3rd nominal position tool axis? Absolute nominal position of the third touch point in the tool axis of the working plane Input: **-99999.9999...+9999.9999** or optional input (see **Q1100**)
	**Q372 Probe direction (-3 to +3)?** Axis defining the direction of probing. With the algebraic sign, you define the positive or negative direction of traverse of the probing axis. Input: **-3**, **-2**, **-1**, **+1**, **+2**, **+3**
	**Q320 Set-up clearance?** Additional distance between touch point and ball tip. **Q320** is in addition to the **SET_UP** column in the touch probe table. This value has an incremental effect. Input: **0...99999.9999** or **PREDEF**
	Q260 Clearance height? Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect. Input: **-99999.9999...+99999.9999** or **PREDEF**
	Q1125 Traverse to clearance height? Positioning behavior between the touch points: **-1**: Do not move to clearance height. **0**: Move to clearance height before and after the cycle. Pre-positioning occurs at **FMAX_PROBE**. **1**: Move to clearance height before and after each object. Pre-positioning occurs at **FMAX_PROBE**. **2**: Move to clearance height before and after each touch point. Pre-positioning occurs at **FMAX_PROBE**. Input: **-1**, **0**, **+1**, **+2**

Help graphic	Parameter
	Q309 Reaction to tolerance error? Reaction when tolerance is exceeded: **0**: Do not interrupt program run when tolerance is exceeded. The control does not open a window with the results. **1**: Interrupt program run when tolerance is exceeded. The control opens a window with the results. **2**: The control opens a window with the results if the actual position is in the scrap range. Program run is interrupted. The control does not open a window with the results if rework is necessary. Input: **0**, **1**, **2**
	Q1126 Align rotary axes? Position the rotary axes for inclined machining: **0**: Retain the current position of the rotary axis. **1**: Automatically position the rotary axis, and orient the tool tip (**MOVE**). The relative position between the workpiece and touch probe remains unchanged. The control performs a compensating movement with the linear axes. **2**: Automatically position the rotary axis without orienting the tool tip (**TURN**). Input: **0**, **1**, **2**
	Q1120 Transfer position? Define which touch point will be used to correct the active preset: **0**: No correction **1**: Correction based on the 1st touch point **2**: Correction based on the 2nd touch point **3**: Correction based on the 3rd touch point **4**: Correction based on the averaged touch point position Input: **0**, **1**, **2**, **3**, **4**
	Q1121 Confirm basic rotation? Define whether the control will use the determined misalignment as a basic rotation: **0**: No basic rotation **1**: Set basic rotation: The control will save the basic rotation Input: **0**, **1**

29.2.4 Cycle 1410 PROBING ON EDGE

Application

Touch probe cycle **1410** allows you to determine workpiece misalignment by probing two points on an edge. The cycle determines the rotation based on the difference between the measured angle and the nominal angle.

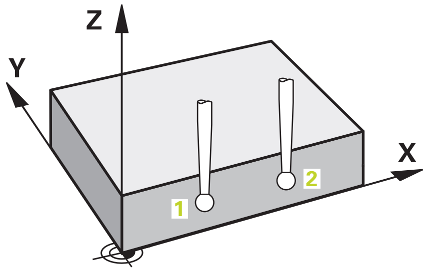
If you program Cycle **1493 EXTRUSION PROBING** before this cycle, you can repeat probing points in a given direction over a specified distance.

Further information: "Cycle 1493 EXTRUSION PROBING ", Page 1676

Furthermore, you can perform the following operations with Cycle **1410**:

- If the probing position relative to the current datum is unknown, you can execute the cycle in semi-automatic mode.
  Page 1463
- Optionally, the cycle can monitor the tolerances. That way you can monitor the position and size of an object.
  Page 1469
- If you determine the actual position in advance, you can transfer it to the cycle as the actual position.
  Page 1471

Cycle sequence



1. Following the positioning logic, the control positions the touch probe to the programmed touch point **1** at rapid traverse **FMAX_PROBE**.

   Further information: "Positioning logic", Page 1456
2. The control then moves the touch probe to set-up clearance at rapid traverse **FMAX_PROBE**. The sum of **Q320**, **SET_UP** and the ball-tip radius is taken into account when probing in any probing direction.
3. Next, the touch probe moves to the entered measuring height and probes the first touch point at the probing feed rate **F** from the touch probe table.
4. The control offsets the touch probe by the safety clearance in the direction opposite to the direction of probing.
5. If you programmed retraction to clearance height **Q1125**, the touch probe returns to clearance height.
6. The touch probe then moves to the next touch point **2** and probes again.
7. Finally, the control retracts the touch probe to the clearance height (depending on **Q1125**) and saves the measured values in the following Q parameters:

Q parameter number	Meaning
Q950 to **Q952**	Measured position 1 in the main axis, secondary axis, and tool axis
Q953 to **Q955**	Measured position 2 in the main axis, secondary axis, and tool axis
Q964	Measured basic rotation
Q965	Measured table rotation
Q980 to **Q982**	Measured deviations of touch point 1
Q983 to **Q985**	Measured deviations of touch point 2
Q994	Measured angle deviation of basic rotation
Q995	Measured angle deviation of table rotation
Q183	Workpiece status ▪ **-1** = Not defined ▪ **0** = Good ▪ **1** = Rework ▪ **2** = Scrap
Q970	If you have programmed Cycle **1493 EXTRUSION PROBING** before: Mean value of all deviations from the ideal line of the first touch point
Q971	If you have programmed Cycle **1493 EXTRUSION PROBING** before: Mean value of all deviations from the ideal line of the second touch point

Notes

NOTICE

Danger of collision!

If you do not retract the touch probe to clearance height between two objects or touch points, there is danger of collision.

- Always move to clearance height between objects or touch points

NOTICE

Danger of collision!

When running touch probe cycles **444** and **14xx**, no coordinate transformations must be active (e.g., Cycles **8 MIRRORING**, **11 SCALING FACTOR**, **26 AXIS-SPECIFIC SCALING**, **TRANS MIRROR**).

- Reset any coordinate transformations before the cycle call.

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.

Note about rotary axes:

When determining the basic rotation in a tilted working plane, keep the following in mind:

- If the current coordinates of the rotary axes and the defined tilt angles (3-D rotation window) match, the working plane is consistent. The control calculates the basic rotation in the input coordinate system **I-CS**.
- If the current coordinates of the rotary axes and the defined tilt angles (3-D rotation window) do not match, the working plane is inconsistent. The control calculates the basic rotation in the workpiece coordinate system **W-CS**, based on the tool axis.

In the optional machine parameter **chkTiltingAxes** (no. 204601), the machine manufacturer defines a check verifying the tilting situation. If no checking is configured, the cycle always assumes that the working plane is consistent. The basic rotation is then calculated in the **I-CS**.

Aligning the rotary table axes:

- The control can align the rotary table only if the measured rotation can be compensated using a rotary table axis. This axis must be the first rotary table axis (as viewed from the workpiece).
- To align the rotary table axes (**Q1126** not equal to 0), you need to adopt the rotation (**Q1121** not equal to 0). Otherwise, the control will display an error message.

```

29.2.5 Cycle 1411 PROBING TWO CIRCLES

Application

Touch probe cycle **1411** captures the center points of two holes or cylindrical studs and calculates a straight line connecting these center points. The cycle determines the rotation in the working plane based on the difference between the measured angle and the nominal angle.

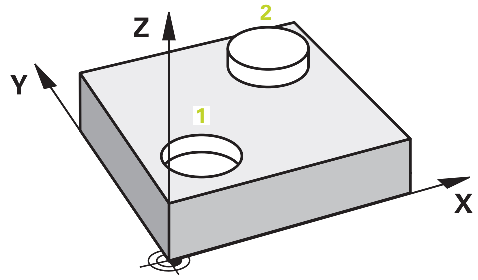
If you program Cycle **1493 EXTRUSION PROBING** before this cycle, you can repeat probing points in a given direction over a specified distance.

Further information: "Cycle 1493 EXTRUSION PROBING ", Page 1676

Furthermore, you can perform the following operations with Cycle **1411**:

- If the probing position relative to the current datum is unknown, you can execute the cycle in semi-automatic mode.
  Page 1463
- Optionally, the cycle can monitor the tolerances. That way you can monitor the position and size of an object.
  Page 1469
- If you determine the actual position in advance, you can transfer it to the cycle as the actual position.
  Page 1471

Cycle sequence



1. Following the positioning logic, the control positions the touch probe to the programmed center point **1** at the feed rate (depending on **Q1125**).

   Further information: "Positioning logic", Page 1456
2. The control then moves the touch probe to set-up clearance at rapid traverse **FMAX_PROBE**. The sum of **Q320**, **SET_UP** and the ball-tip radius is taken into account when probing in any probing direction.
3. Then the touch probe moves to the entered measuring height at the probing feed rate **F** from the touch probe table and probes (the number of touch points to be probed depends on **Q423** Number of Probes) the first hole or stud center point.
4. The control offsets the touch probe by the safety clearance in the direction opposite to the direction of probing.
5. The touch probe returns to the clearance height and then to the position entered as center of the second hole or second stud **2**.
6. Then the control moves the touch probe to the entered measuring height and probes (the number of touch points to be probed depends on **Q423** Number of Probes) the second hole or stud center point.
7. Finally, the control retracts the touch probe to the clearance height (depending on **Q1125**) and saves the measured values in the following Q parameters:

Q parameter number	Meaning
Q950 to **Q952**	Measured circle center point 1 in the main axis, secondary axis, and tool axis
Q953 to **Q955**	Measured circle center point 2 in the main axis, secondary axis, and tool axis
Q964	Measured basic rotation
Q965	Measured table rotation
Q966 to **Q967**	Measured first and second diameters
Q980 to **Q982**	Measured deviations of circle center point 1
Q983 to **Q985**	Measured deviations of circle center point 2
Q994	Measured angle deviation of basic rotation
Q995	Measured angle deviation of table rotation
Q996 to **Q997**	Measured deviation of the diameters
Q183	Workpiece status ■ **-1** = Not defined ■ **0** = Good ■ **1** = Rework ■ **2** = Scrap
Q970	If you have programmed Cycle **1493 EXTRUSION PROBING**: Mean value of all deviations from the ideal line of the first circle center point
Q971	If you have programmed Cycle **1493 EXTRUSION PROBING**: Mean value of all deviations from the ideal line of the second circle center point
Q973	If you have programmed Cycle **1493 EXTRUSION PROBING**: Mean value of all deviations of the diameters of circle 1
Q974	If you have programmed Cycle **1493 EXTRUSION PROBING**: Mean value of all deviations of the diameters of circle 2

Operating note:

- If the hole is too small to achieve the programmed set-up clearance, a window opens. In the window, the control displays the nominal dimension of the hole, the calibrated ball-tip radius, and the achievable set-up clearance.

  You have the following options:
  - If there is no danger of collision, you can press NC start to run the cycle with the values from the dialog. The effective set-up clearance will be reduced to the displayed value for this object only.
  - You can cancel the cycle by pressing Cancel.

Notes

NOTICE

Danger of collision!

If you do not retract the touch probe to clearance height between two objects or touch points, there is danger of collision.

- Always move to clearance height between objects or touch points

NOTICE

Danger of collision!

When running touch probe cycles **444** and **14xx**, no coordinate transformations must be active (e.g., Cycles **8 MIRRORING**, **11 SCALING FACTOR**, **26 AXIS-SPECIFIC SCALING**, **TRANS MIRROR**).

- Reset any coordinate transformations before the cycle call.

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.

Note about rotary axes:

When determining the basic rotation in a tilted working plane, keep the following in mind:

- If the current coordinates of the rotary axes and the defined tilt angles (3-D rotation window) match, the working plane is consistent. The control calculates the basic rotation in the input coordinate system **I-CS**.
- If the current coordinates of the rotary axes and the defined tilt angles (3-D rotation window) do not match, the working plane is inconsistent. The control calculates the basic rotation in the workpiece coordinate system **W-CS**, based on the tool axis.

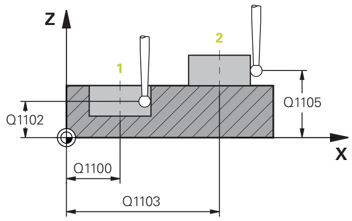
In the optional machine parameter **chkTiltingAxes** (no. 204601), the machine manufacturer defines a check verifying the tilting situation. If no checking is configured, the cycle always assumes that the working plane is consistent. The basic rotation is then calculated in the **I-CS**.

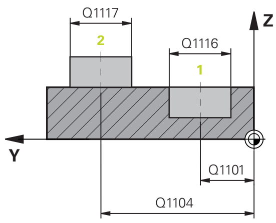
Aligning the rotary table axes:

- The control can align the rotary table only if the measured rotation can be compensated using a rotary table axis. This axis must be the first rotary table axis (as viewed from the workpiece).
- To align the rotary table axes (**Q1126** not equal to 0), you need to adopt the rotation (**Q1121** not equal to 0). Otherwise, the control will display an error message.

Cycle parameters

Help graphic | **Parameter**





Q1100 1st noml. position of ref. axis?

Absolute nominal position of the first touch point in the main axis of the working plane

Input: **-99999.9999...+99999.9999** or optionally **?, -, +**, **@**

- **?**: Semiautomatic mode, Page 1463
- **-, +**: Evaluation of the tolerance, Page 1469
- **@**: Transferring the actual position, Page 1471

Q1101 1st noml. position of minor axis?

Absolute nominal position of the first touch point in the secondary axis of the working plane

Input: **-99999.9999...+9999.9999** or optional input (see **Q1100**)

Q1102 1st nominal position tool axis?

Absolute nominal position of the first touch point in the tool axis

Input: **-99999.9999...+9999.9999** or optional input (see **Q1100**)

Q1116 Diameter of 1st position?

Diameter of the first hole or the first stud

Input: **0...9999.9999** or optional input:

"...-...+...": Evaluation of the tolerance, Page 1469

Q1103 2nd noml. position of ref axis?

Absolute nominal position of the second touch point in the main axis of the working plane

Input: **-99999.9999...+9999.9999** or optional input (see **Q1100**)

Q1104 2nd noml. position of minor axis?

Absolute nominal position of the second touch point in the secondary axis of the working plane

Input: **-99999.9999...+9999.9999** or optional input (see **Q1100**)

Q1105 2nd nominal pos. of tool axis?

Absolute nominal position of the second touch point in the tool axis of the working plane

Input: **-99999.9999...+9999.9999** or optional input (see **Q1100**)

Help graphic	Parameter
	Q1117 Diameter of 2nd position? Diameter of the second hole or the second stud Input: **0...9999.9999** or optional input: **"...-...+..."**: Evaluation of the tolerance, Page 1469
	Q1115 Geometry type (0-3)? Geometry of the objects: **0**: Position 1 = hole, and position 2 = hole **1**: Position 1 = stud, and position 2 = stud **2**: Position 1 = hole, and position 2 = stud **3**: Position 1 = stud, and position 2 = hole Input: **0**, **1**, **2**, **3**
	Q423 Number of probes? Number of touch points on the diameter Input: **3**, **4**, **5**, **6**, **7**, **8**
	**Q325 Starting angle?** Angle between the main axis of the working plane and the first touch point. The value has an absolute effect. Input: **-360.000...+360.000**
	Q1119 Arc angular length? Angular range in which the touch points are distributed. Input: **-359.999...+360.000**
	**Q320 Set-up clearance?** Additional distance between touch point and ball tip. **Q320** is added to **SET_UP** (touch probe table), and is only effective when the preset is probed in the touch probe axis. This value has an incremental effect. Input: **0...99999.9999** or **PREDEF**
	Q260 Clearance height? Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect. Input: **-99999.9999...+99999.9999** or **PREDEF**

Help graphic	Parameter
	Q1125 Traverse to clearance height? Positioning behavior between the touch points: **-1**: Do not move to clearance height. **0**: Move to clearance height before and after the cycle. Pre-positioning occurs at **FMAX_PROBE**. **1**: Move to clearance height before and after each object. Pre-positioning occurs at **FMAX_PROBE**. **2**: Move to clearance height before and after each touch point. Pre-positioning occurs at **FMAX_PROBE**. Input: **-1**, **0**, **+1**, **+2**
	Q309 Reaction to tolerance error? Reaction when tolerance is exceeded: **0**: Do not interrupt program run when tolerance is exceeded. The control does not open a window with the results. **1**: Interrupt program run when tolerance is exceeded. The control opens a window with the results. **2**: The control opens a window with the results if the actual position is in the scrap range. Program run is interrupted. The control does not open a window with the results if rework is necessary. Input: **0**, **1**, **2**
	Q1126 Align rotary axes? Position the rotary axes for inclined machining: **0**: Retain the current position of the rotary axis. **1**: Automatically position the rotary axis, and orient the tool tip (**MOVE**). The relative position between the workpiece and touch probe remains unchanged. The control performs a compensating movement with the linear axes. **2**: Automatically position the rotary axis without orienting the tool tip (**TURN**). Input: **0**, **1**, **2**
	Q1120 Transfer position? Define which touch point will be used to correct the active preset: **0**: No correction **1**: Correction based on the 1st touch point **2**: Correction based on the 2nd touch point **3**: Correction based on the averaged touch point position Input: **0**, **1**, **2**, **3**

Help graphic	Parameter
	Q1121 CONFIRM ROTATION? Define whether the control will use the determined misalignment as a basic rotation: **0**: No basic rotation **1**: Set basic rotation: The control transfers the misalignment to the preset table as basic transformations. **2**: Rotate the rotary table: The control transfers the misalignment to the preset table as offset. Input: **0**, **1**, **2**

29.2.6 Cycle 1412 INCLINED EDGE PROBING

Application

Touch probe cycle **1412** allows you to determine workpiece misalignment by probing two points on an inclined edge. The cycle determines the rotation based on the difference between the measured angle and the nominal angle.

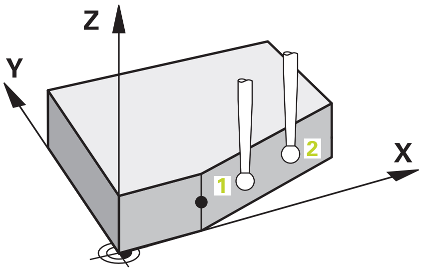
If you program Cycle **1493 EXTRUSION PROBING** before this cycle, you can repeat probing points in a given direction over a specified distance.

Further information: "Cycle 1493 EXTRUSION PROBING ", Page 1676

Cycle **1412** additionally offers the following functions:

- If the probing position relative to the current datum is unknown, you can run the cycle in semi-automatic mode.
  Page 1463
- If you determine the actual position in advance, you can then transfer it to the cycle as the actual position.
  Page 1471

Cycle sequence



1. Following the positioning logic, the control positions the touch probe to the touch point **1** at rapid traverse **FMAX_PROBE**.
   Further information: "Positioning logic", Page 1456
2. The control then moves the touch probe to set-up clearance **Q320** at rapid traverse **FMAX_PROBE**. The sum of **Q320**, **SET_UP**, and the ball-tip radius is taken into account when probing in any probing direction.
3. Next, the touch probe moves to the entered measuring height and probes the first touch point at the probing feed rate **F** from the touch probe table.
4. The control retracts the touch probe by the safety clearance in the direction opposite to the direction of probing.
5. If you programmed retraction to clearance height **Q1125**, the touch probe returns to clearance height.
6. The touch probe then moves to the touch point **2** and probes again.
7. Finally, the control retracts the touch probe to the clearance height (depending on **Q1125**) and saves the measured values in the following Q parameters:

Q parameter number	Meaning
Q950 to **Q952**	Measured position 1 in the main axis, secondary axis, and tool axis
Q953 to **Q955**	Measured position 2 in the main axis, secondary axis, and tool axis
Q964	Measured basic rotation
Q965	Measured table rotation
Q980 to **Q982**	Measured deviations of touch point 1
Q983 to **Q985**	Measured deviations of touch point 2
Q994	Measured angle deviation of basic rotation
Q995	Measured angle deviation of table rotation
Q183	Workpiece status ■ **-1** = Not defined ■ **0** = Good ■ **1** = Rework ■ **2** = Scrap
Q970	If you have programmed Cycle **1493 EXTRUSION PROBING** before: Mean value of all deviations from the ideal line of the first touch point
Q971	If you have programmed Cycle **1493 EXTRUSION PROBING** before: Mean value of all deviations from the ideal line of the second touch point

Notes

NOTICE

Danger of collision!

If you do not retract the touch probe to clearance height between two objects or touch points, there is danger of collision.

▶ Always move to clearance height between objects or touch points

NOTICE

Danger of collision!

When running touch probe cycles **444** and **14xx**, no coordinate transformations must be active (e.g., Cycles **8 MIRRORING**, **11 SCALING FACTOR**, **26 AXIS-SPECIFIC SCALING**, **TRANS MIRROR**).

▶ Reset any coordinate transformations before the cycle call.

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- If you program a tolerance in **Q1100**, **Q1101**, or **Q1102**, then this tolerance applies to the programmed nominal positions instead of to the touch points along the inclined edge. Use the parameter **TOLERANCE QS400** to program a tolerance for the surface normal along the inclined edge.

Note about rotary axes:

When determining the basic rotation in a tilted working plane, keep the following in mind:

- If the current coordinates of the rotary axes and the defined tilt angles (3-D rotation window) match, the working plane is consistent. The control calculates the basic rotation in the input coordinate system **I-CS**.
- If the current coordinates of the rotary axes and the defined tilt angles (3-D rotation window) do not match, the working plane is inconsistent. The control calculates the basic rotation in the workpiece coordinate system **W-CS**, based on the tool axis.

In the optional machine parameter **chkTiltingAxes** (no. 204601), the machine manufacturer defines a check verifying the tilting situation. If no checking is configured, the cycle always assumes that the working plane is consistent. The basic rotation is then calculated in the **I-CS**.

Aligning the rotary table axes:

- The control can align the rotary table only if the measured rotation can be compensated using a rotary table axis. This axis must be the first rotary table axis (as viewed from the workpiece).
- To align the rotary table axes (**Q1126** not equal to 0), you need to adopt the rotation (**Q1121** not equal to 0). Otherwise, the control will display an error message.

Cycle parameters

Help graphic	Parameter
 	**Q1100 1st noml. position of ref. axis?** Absolute nominal position at which the inclined edge begins in the main axis. Input: **-99999.9999...+99999.9999** or optionally **?**, **+**, **-**, **@** ■ **?**: Semiautomatic mode, Page 1463 ■ **-, +**: Evaluation of the tolerance, Page 1469 ■ **@**: Transferring the actual position, Page 1471
	Q1101 1st noml. position of minor axis? Absolute nominal position at which the inclined edge begins in the secondary axis. Input: **-99999.9999...+99999.9999** or optional input (see **Q1100**)
	Q1102 1st nominal position tool axis? Absolute nominal position of the first touch point in the tool axis Input: **-99999.9999...+9999.9999** or optional input (see **Q1100**)
	QS400 Tolerance value? Tolerance band monitored by the cycle. The tolerance defines the deviation permitted for the surface normals along the inclined edge. This deviation is determined between the nominal coordinate and the actual coordinate of the workpiece. Examples: ■ **QS400 ="0.4-0.1"**: Upper dimension = nominal coordinate +0.4; lower dimension = nominal coordinate –0.1. The following tolerance band thus results for the cycle: "nominal coordinate +0.4" to "nominal coordinate –0.1" ■ **QS400 =" "**: No tolerance band. ■ **QS400 ="0"**: No tolerance band. ■ **QS400 ="0.1+0.1"** : No tolerance band. Input: Max. **255** characters

Help graphic	Parameter
	**Q1130 Nominal angle for 1st line?** Nominal angle of the first straight line Input: **-180...+180**
	Q1131 Probing direction for 1st line? Probing direction for the first straight line: **+1**: The control rotates the probing direction by +90° with respect to the nominal angle **Q1130** **-1**: The control rotates the probing direction by –90° with respect to the nominal angle **Q1130** Input: **-1**, **+1**
	Q1132 First distance on 1st line? Distance between the beginning of the inclined edge and the first touch point. This value has an incremental effect. Input: **-999.999...+999.999**
	Q1133 Second distance on 1st line? Distance between the beginning of the inclined edge and the second touch point. This value has an incremental effect. Input: **-999.999...+999.999**
	Q1139 Plane for object (1-3)? Plane in which the control construes the nominal angle **Q1130** and the probing direction **Q1131**. **1**: The nominal angle is in the YZ plane. **2**: The nominal angle is in the ZX plane. **3**: The nominal angle is in the XY plane. Input: **1**, **2**, **3**
	**Q320 Set-up clearance?** Additional distance between touch point and ball tip. **Q320** is in addition to the **SET_UP** column in the touch probe table. This value has an incremental effect. Input: **0...99999.9999** or **PREDEF**
	Q260 Clearance height? Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect. Input: **-99999.9999...+99999.9999** or **PREDEF**
	Q1125 Traverse to clearance height? Positioning behavior between the touch points: **-1**: Do not move to clearance height. **0**: Move to clearance height before and after the cycle. Pre-positioning occurs at **FMAX_PROBE**. **1**: Move to clearance height before and after each object. Pre-positioning occurs at **FMAX_PROBE**. **2**: Move to clearance height before and after each touch point. Pre-positioning occurs at **FMAX_PROBE**. Input: **-1**, **0**, **+1**, **+2**

Help graphic	Parameter
	Q309 Reaction to tolerance error? Reaction when tolerance is exceeded: **0**: Do not interrupt program run when tolerance is exceeded. The control does not open a window with the results. **1**: Interrupt program run when tolerance is exceeded. The control opens a window with the results. **2**: The control opens a window with the results if the actual position is in the scrap range. Program run is interrupted. The control does not open a window with the results if rework is necessary. Input: **0**, **1**, **2**
	Q1126 Align rotary axes? Position the rotary axes for inclined machining: **0**: Retain the current position of the rotary axis. **1**: Automatically position the rotary axis, and orient the tool tip (**MOVE**). The relative position between the workpiece and touch probe remains unchanged. The control performs a compensating movement with the linear axes. **1**: Automatically position the rotary axis, and orient the tool tip (**MOVE**). The relative position between the workpiece and touch probe remains unchanged. The control performs a compensating movement with the linear axes. Input: **0**, **1**, **2**
	Q1120 Transfer position? Define which touch point will be used to correct the active preset: **0**: No correction **1**: Correction based on the 1st touch point **2**: Correction based on the 2nd touch point **3**: Correction based on the averaged touch point position Input: **0**, **1**, **2**, **3**
	Q1121 CONFIRM ROTATION? Define whether the control will use the determined misalignment as a basic rotation: **0**: No basic rotation **1**: Set basic rotation: The control transfers the misalignment to the preset table as basic transformations. **2**: Rotate the rotary table: The control transfers the misalignment to the preset table as offset. Input: **0**, **1**, **2**

```

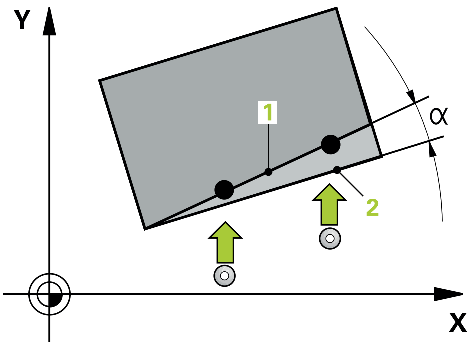
29.2.7 Touch probe cycles 4xx: fundamentals

Characteristics common to all touch probe cycles for measuring workpiece misalignment



In Cycles **400**, **401**, and **402**, you can use parameter **Q307 Preset value for rotation angle** to define whether the measurement result will be corrected by a known angle α (see figure). This enables you to measure the basic rotation against any straight line **1** of the workpiece and to establish the reference to the actual 0° direction **2**.

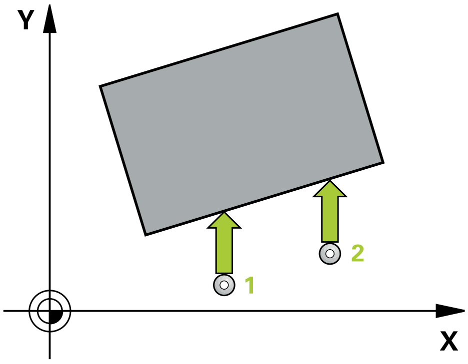
> These cycles do not work with 3-D ROT! In such a case, use Cycles **14xx**. Page 1462

29.2.8 Cycle 400 BASIC ROTATION

Application

Touch probe cycle **400** determines a workpiece misalignment by measuring two points, which must lie on a straight line. With the basic rotation function, the control compensates the measured value.

Cycle sequence



1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from **FMAX** column) to the programmed touch point **1**. The control offsets the touch probe by the set-up clearance in the direction opposite the defined traverse direction

   Further information: "Positioning logic", Page 1456
2 Next, the touch probe moves to the entered measuring height and probes the first touch point at the probing feed rate (**F** column).
3 The touch probe then moves to the next touch point **2** and probes again.
4 The control returns the touch probe to the clearance height and performs the basic rotation it determined.

Notes

NOTICE

Danger of collision!

When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active.

- The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**.
- Reset any coordinate transformations beforehand.

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- The control will reset an active basic rotation at the beginning of the cycle.

Note on programming

- Before defining this cycle, you must have programmed a tool call to define the touch probe axis.

Cycle parameters

Help graphic	Parameter
	**Q263 1st measuring point in 1st axis?** Coordinate of the first touch point in the main axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q264 1st measuring point in 2nd axis? Coordinate of the first touch point in the secondary axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q265 2nd measuring point in 1st axis? Coordinate of the second touch point in the main axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q266 2nd measuring point in 2nd axis? Coordinate of the second touch point in the secondary axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q272 Measuring axis (1=1st / 2=2nd)? Axis in the working plane in which the measurement will be performed: **1**: Main axis = measuring axis **2**: Secondary axis = measuring axis Input: **1**, **2**
	Q267 Trav. direction 1 (+1=+ / -1=-)? Direction in which the touch probe will approach the workpiece: **-1**: Negative traverse direction **+1**: Positive traverse direction Input: **-1**, **+1**
	**Q261 Measuring height in probe axis?** Coordinate of the ball tip center in the touch probe axis in which the measurement will be performed. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q320 Set-up clearance? Additional distance between touch point and ball tip. **Q320** is in addition to the **SET_UP** column in the touch probe table. This value has an incremental effect. Input: **0...99999.9999** or **PREDEF**
	Q260 Clearance height? Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect. Input: **-99999.9999...+99999.9999** or **PREDEF**

Help graphic	Parameter
	Q301 Move to clearance height (0/1)? Specify how the touch probe moves between measuring points: 0: Move at measuring height between measuring points 1: Move at clearance height between measuring points Input: **0**, **1**
	Q307 Preset value for rotation angle If the misalignment will be measured against a straight line other than the main axis, enter the angle of this reference line. For the basic rotation, the control will then calculate the difference between the value measured and the angle of the reference line. The value has an absolute effect. Input: **-360.000...+360.000**
	Q305 Preset number in table? Specify the number of the row in the preset table in which the control will save the calculated basic rotation. If you enter **Q305** = 0, the control automatically stores the calculated basic rotation in the ROT menu of the Manual Operation mode. Input: **0...99999**

Example

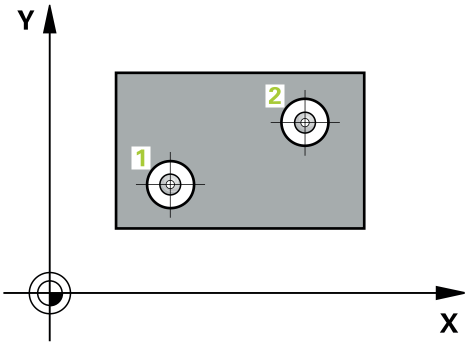
```
11 TCH PROBE 400 BASIC ROTATION ~
    Q263=+10            ;1ST POINT 1ST AXIS ~
    Q264=+3.5           ;1ST POINT 2ND AXIS ~
    Q265=+25            ;2ND POINT 1ST AXIS ~
    Q266=+2             ;2ND PNT IN 2ND AXIS ~
    Q272=+2             ;MEASURING AXIS ~
    Q267=+1             ;TRAVERSE DIRECTION ~
    Q261=-5             ;MEASURING HEIGHT ~
    Q320=+0             ;SET-UP CLEARANCE ~
    Q260=+20            ;CLEARANCE HEIGHT ~
    Q301=+0             ;MOVE TO CLEARANCE ~
    Q307=+0             ;PRESET ROTATION ANG. ~
    Q305=+0             ;NUMBER IN TABLE
```

29.2.9 Cycle 401 ROT OF 2 HOLES

Application

Touch probe cycle **401** measures the center points of two holes. The control then calculates the angle between the main axis of the working plane and the line connecting the hole center points. With the basic rotation function, the control compensates the calculated value. As an alternative, you can also compensate the determined misalignment by rotating the rotary table.

Cycle sequence



1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from **FMAX** column) to the programmed center point of the first hole **1**.

   Further information: "Positioning logic", Page 1456
2 Then the probe moves to the entered measuring height and probes four points to determine the first hole center point.
3 The touch probe returns to the clearance height and then to the position entered as center of the second hole **2**.
4 The control moves the touch probe to the entered measuring height and probes four points to determine the second hole center point.
5 Then the control returns the touch probe to the clearance height and performs the basic rotation it determined.

Notes

NOTICE

Danger of collision!

When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active.

- The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**.
- Reset any coordinate transformations beforehand.

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- The control will reset an active basic rotation at the beginning of the cycle.
- If you want to compensate the misalignment by rotating the rotary table, the control will automatically use the following rotary axes:
  - C for tool axis Z
  - B for tool axis Y
  - A for tool axis X

Note on programming

- Before defining this cycle, you must have programmed a tool call to define the touch probe axis.

Cycle parameters

Help graphic	Parameter
	**Q268 1st hole: center in 1st axis?** Center of the first hole in the main axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+9999.9999**
	Q269 1st hole: center in 2nd axis? Center of the first hole in the secondary axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q270 2nd hole: center in 1st axis? Center of the second hole in the main axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q271 2nd hole: center in 2nd axis? Center of the second hole in the secondary axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	**Q261 Measuring height in probe axis?** Coordinate of the ball tip center in the touch probe axis in which the measurement will be performed. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q260 Clearance height? Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect. Input: **-99999.9999...+99999.9999** or **PREDEF**
	Q307 Preset value for rotation angle If the misalignment will be measured against a straight line other than the main axis, enter the angle of this reference line. For the basic rotation, the control will then calculate the difference between the value measured and the angle of the reference line. The value has an absolute effect. Input: **-360.000...+360.000**

Help graphic	Parameter
	Q305 Number in table? Enter the number of a row in the preset table. The control will make the corresponding entry in the following row: **Q305** = 0: The rotary axis will be zeroed in row 0 of the preset table. The control will make an entry in the **OFFSET** column. (Example: For tool axis Z, the entry is made in **C_OFFS**). In addition, all other values (X, Y, Z, etc.) of the currently active preset will be transferred to row 0 of the preset table. In addition, the control activates the preset from row 0. **Q305** > 0: The rotary axis will be zeroed in the preset table row specified here. The control will make an entry in the corresponding **OFFSET** column of the preset table. (Example: For tool axis Z, the entry is made in **C_OFFS**). **Q305 depends on the following parameters:** ■ **Q337** = 0 and, at the same time, **Q402** = 0: A basic rotation will be set in the row specified in **Q305**. (Example: For tool axis Z, the basic rotation is entered in the **SPC** column). ■ **Q337** = 0 and, at the same time, **Q402** = 1: The parameter **Q305** is not effective. ■ **Q337** = 1: The parameter **Q305** has the effect described above. Input: **0...99999**
	Q402 Basic rotation/alignment (0/1) Define whether the control will set the determined misalignment as a basic rotation or will compensate it by rotating the rotary table: **0**: Set basic rotation: The control saves the basic rotation (example: for tool axis Z, the control uses column **SPC**) **1**: Rotate the rotary table: An entry will be made in the corresponding **Offset** column of the preset table (example: for tool axis Z, the control uses the **C_OFFS** column); in addition, the corresponding axis will be rotated Input: **0**, **1**
	Q337 Set to zero after alignment? Define whether the control will set the position display of the corresponding rotary axis to 0 after the alignment: **0**: The position display is not set to 0 after the alignment **1**: After the alignment, the position display is set to 0, provided you have defined **Q402 = 1** Input: **0**, **1**

Example

```
11 TCH PROBE 401 ROT OF 2 HOLES ~
    Q268=-37                ;1ST CENTER 1ST AXIS ~
    Q269=+12                ;1ST CENTER 2ND AXIS ~
    Q270=+75                ;2ND CENTER 1ST AXIS ~
    Q271=+20                ;2ND CENTER 2ND AXIS ~

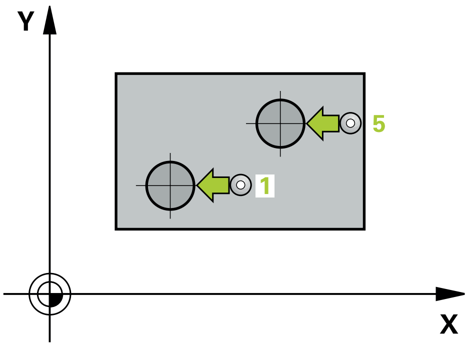
    Q337=+0                 ;SET TO ZERO
```

29.2.10 Cycle 402 ROT OF 2 STUDS

Application

Touch probe cycle **402** measures the center points of two cylindrical studs. The control then calculates the angle between the main axis of the working plane and the line connecting the stud center points. With the basic rotation function, the control compensates the calculated value. As an alternative, you can also compensate the determined misalignment by rotating the rotary table.

Cycle sequence



1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from FMAX column) to touch point **1** of the first stud.

   Further information: "Positioning logic", Page 1456

2 Then the touch probe moves to the entered **measuring height 1** and probes four points to find the center of the first stud. The touch probe moves along a circular arc between the touch points, each of which is offset by 90°.
3 The touch probe returns to the clearance height and then moves to the touch point **5** of the second stud.
4 The control moves the touch probe to the entered **measuring height 2** and probes four points to determine the center of the second stud.
5 Then the control returns the touch probe to the clearance height and performs the calculated basic rotation.

Notes

NOTICE

Danger of collision!

When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active.

- The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**.
- Reset any coordinate transformations beforehand.

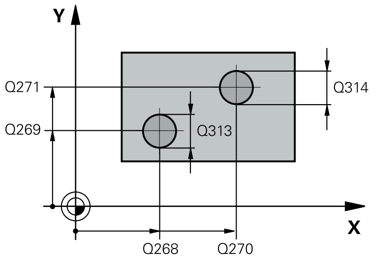
- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- The control will reset an active basic rotation at the beginning of the cycle.
- If you want to compensate the misalignment by rotating the rotary table, the control will automatically use the following rotary axes:
  - C for tool axis Z
  - B for tool axis Y
  - A for tool axis X

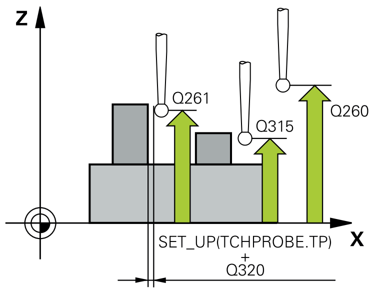
Note on programming

- Before defining this cycle, you must have programmed a tool call to define the touch probe axis.

Cycle parameters

Help graphic





Parameter

Q268 1st stud: center in 1st axis?
Center of the first stud in the main axis of the working plane. The value has an absolute effect.
Input: **-99999.9999...+99999.9999**

Q269 1st stud: center in 2nd axis?
Center of the first stud in the secondary axis of the working plane. The value has an absolute effect.
Input: **-99999.9999...+99999.9999**

Q313 Diameter of stud 1?
Approximate diameter of the first stud. Enter a value that is more likely to be too large than too small.
Input: **0...99999.9999**

Q261 Meas. height stud 1 in TS axis?
Coordinate of the ball tip center (= touch point) in the touch probe axis at which stud 1 will be measured. The value has an absolute effect.
Input: **-99999.9999...+99999.9999**

Q270 2nd stud: center in 1st axis?
Center of the second stud in the main axis of the working plane. The value has an absolute effect.
Input: **-99999.9999...+99999.9999**

Q271 2nd stud: center in 2nd axis?
Center of the second stud in the secondary axis of the working plane. The value has an absolute effect.
Input: **-99999.9999...+99999.9999**

Q314 Diameter of stud 2?
Approximate diameter of the second stud. Enter a value that is more likely to be too large than too small.
Input: **0...99999.9999**

Q315 Meas. height stud 2 in TS axis?
Coordinate of the ball tip center (= touch point) in the touch probe axis at which stud 2 will be measured. The value has an absolute effect.
Input: **-99999.9999...+99999.9999**

Q320 Set-up clearance?
Additional distance between touch point and ball tip. **Q320** is in addition to the **SET_UP** column in the touch probe table. This value has an incremental effect.
Input: **0...99999.9999** or **PREDEF**

Q260 Clearance height?
Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect.
Input: **-99999.9999...+99999.9999** or **PREDEF**

Help graphic	Parameter
	Q301 Move to clearance height (0/1)? Specify how the touch probe moves between measuring points: 0: Move at measuring height between measuring points 1: Move at clearance height between measuring points Input: **0**, **1**
	Q307 Preset value for rotation angle If the misalignment will be measured against a straight line other than the main axis, enter the angle of this reference line. For the basic rotation, the control will then calculate the difference between the value measured and the angle of the reference line. The value has an absolute effect. Input: **-360.000...+360.000**
	Q305 Number in table? Enter the number of a row in the preset table. The control will make the corresponding entry in the following row: **Q305** = 0: The rotary axis will be zeroed in row 0 of the preset table. The control will make an entry in the **OFFSET** column. (Example: For tool axis Z, the entry is made in **C_OFFS**). In addition, all other values (X, Y, Z, etc.) of the currently active preset will be transferred to row 0 of the preset table. In addition, the control activates the preset from row 0. **Q305** > 0: The rotary axis will be zeroed in the preset table row specified here. The control will make an entry in the corresponding **OFFSET** column of the preset table. (Example: For tool axis Z, the entry is made in **C_OFFS**). **Q305 depends on the following parameters:** ■ **Q337** = 0 and, at the same time, **Q402** = 0: A basic rotation will be set in the row specified in **Q305**. (Example: For tool axis Z, the basic rotation is entered in the **SPC** column). ■ **Q337** = 0 and, at the same time, **Q402** = 1: The parameter **Q305** is not effective. ■ **Q337** = 1: The parameter **Q305** has the effect described above. Input: **0...99999**

Help graphic	Parameter
	Q402 Basic rotation/alignment (0/1) Define whether the control will set the determined misalignment as a basic rotation or will compensate it by rotating the rotary table: **0**: Set basic rotation: The control saves the basic rotation (example: for tool axis Z, the control uses column **SPC**) **1**: Rotate the rotary table: An entry will be made in the corresponding **Offset** column of the preset table (example: for tool axis Z, the control uses the **C_OFFS** column); in addition, the corresponding axis will be rotated Input: **0**, **1**
	Q337 Set to zero after alignment? Define whether the control will set the position display of the corresponding rotary axis to 0 after the alignment: **0**: The position display is not set to 0 after the alignment **1**: After the alignment, the position display is set to 0, provided you have defined **Q402 = 1** Input: **0**, **1**

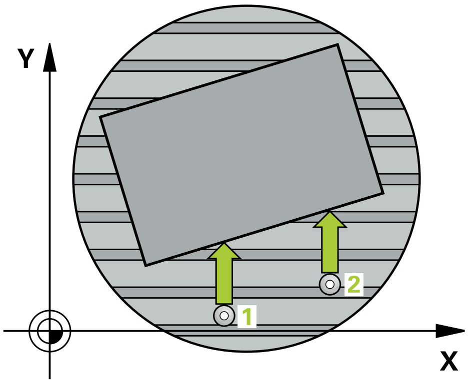
    Q337=+0               ;SET TO ZERO
```

29.2.11 Cycle 403 ROT IN ROTARY AXIS

Application

Touch probe cycle **403** determines a workpiece misalignment by measuring two points, which must lie on a straight line. The control compensates the determined misalignment by rotating the A, B, or C axis. The workpiece can be clamped in any position on the rotary table.

Cycle sequence



1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from the **FMAX** column) to the programmed touch point **1**. The control offsets the touch probe by the set-up clearance in the direction opposite the defined traverse direction

   Further information: "Positioning logic", Page 1456
2 Next, the touch probe moves to the entered measuring height and probes the first touch point at the probing feed rate (**F** column).
3 The touch probe then moves to the next touch point **2** and probes again.
4 The control returns the touch probe to the clearance height and rotates the rotary axis, which was defined in the cycle, by the measured value. Optionally, you can specify whether the control is to set the determined rotation angle to 0 in the preset table or in the datum table.

Notes

NOTICE

Danger of collision!

If the control positions the rotary axis automatically, a collision might occur.

- Check for possible collisions between the tool and any elements positioned on the table
- Select the clearance height to prevent collisions

NOTICE

Danger of collision!

If you set parameter **Q312** Axis for compensating movement? to 0, then the cycle will automatically determine the rotary axis to be aligned (recommended setting). When doing so, it determines an angle that depends on the sequence of the touch points. The measured angle goes from the first to the second touch point. If you select the A, B or C axis as compensation axis in parameter **Q312**, the cycle determines the angle, regardless of the sequence of the probing points. The calculated angle lies in the range from –90° to +90°.

- After alignment, check the position of the rotary axis.

NOTICE

Danger of collision!

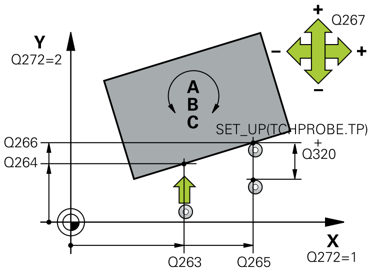
When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active.

- The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**.
- Reset any coordinate transformations beforehand.

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- The control will reset an active basic rotation at the beginning of the cycle.

Cycle parameters

Help graphic | **Parameter**



Q263 1st measuring point in 1st axis?

Coordinate of the first touch point in the main axis of the working plane. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q264 1st measuring point in 2nd axis?

Coordinate of the first touch point in the secondary axis of the working plane. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q265 2nd measuring point in 1st axis?

Coordinate of the second touch point in the main axis of the working plane. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q266 2nd measuring point in 2nd axis?

Coordinate of the second touch point in the secondary axis of the working plane. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q272 Meas. axis (1/2/3, 1=ref. axis)?

Axis in which the measurement will be made:

1: Main axis = measuring axis

2: Secondary axis = measuring axis

3: Touch probe axis = measuring axis

Input: **1**, **2**, **3**

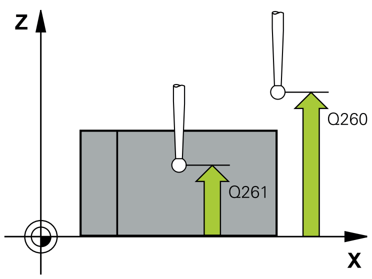
Q267 Trav. direction 1 (+1=+ / -1=-)?

Direction in which the touch probe will approach the workpiece:

-1: Negative traverse direction

+1: Positive traverse direction

Input: **-1**, **+1**



Q261 Measuring height in probe axis?

Coordinate of the ball tip center in the touch probe axis in which the measurement will be performed. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q320 Set-up clearance?

Additional distance between touch point and ball tip. **Q320** is in addition to the **SET_UP** column in the touch probe table. This value has an incremental effect.

Input: **0...99999.9999** or **PREDEF**

Q260 Clearance height?

Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect.

Input: **-99999.9999...+99999.9999** or **PREDEF**

Help graphic	Parameter
	Q301 Move to clearance height (0/1)? Specify how the touch probe moves between measuring points: 0: Move at measuring height between measuring points 1: Move at clearance height between measuring points Input: **0**, **1**
	Q312 Axis for compensating movement? Define the rotary axis in which the control will compensate the measured misalignment: **0**: Automatic mode – the control uses the active kinematics to determine the rotary axis to be aligned. In Automatic mode the first rotary axis of the table (as viewed from the workpiece) is used as compensation axis. This is the recommended setting! **4**: Compensate misalignment with rotary axis A **5**: Compensate misalignment with rotary axis B **6**: Compensate misalignment with rotary axis C Input: **0**, **4**, **5**, **6**
	Q337 Set to zero after alignment? Define whether the control will set the angle of the aligned rotary axis to 0 in the preset table or in the datum table after the alignment. **0**: Do not set the angle of the rotary axis to 0 in the table after the alignment **1**: Set the angle of the rotary axis to 0 in the table after the alignment Input: **0**, **1**

Help graphic	Parameter
	Q305 Number in table? Specify the number of the row in the preset table in which the control will enter the basic rotation. **Q305** = 0: The rotary axis is zeroed in row number 0 of the preset table. The control will make an entry in the **OFFSET** column. In addition, all other values (X, Y, Z, etc.) of the currently active preset will be transferred to row 0 of the preset table. In addition, the control activates the preset from row 0. **Q305** > 0: Specify the number of the row in the preset table in which the control will zero the rotary axis. The control will make an entry in the **OFFSET** column of the preset table. **Q305 depends on the following parameters:** ■ **Q337 = 0**: Parameter **Q305** is not effective ■ **Q337 = 1**: Parameter **Q305** has the effect described above ■ **Q312 = 0**: Parameter **Q305** has the effect described above ■ **Q305 Number in table? Q312 > 0**: The entry in **Q305** is ignored. The control will make an entry in the **OFFSET** column, in the row of the preset table that was active when the cycle was called. Input: **0...99999**

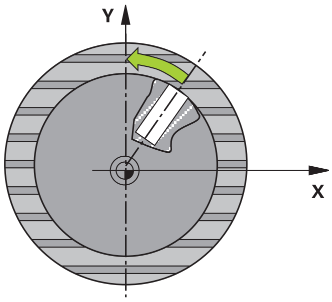
Help graphic	Parameter
	Q303 Meas. value transfer (0,1)? Define whether the calculated preset will be saved in the datum table or in the preset table: **0**: Write the calculated preset to the active datum table as a datum shift. The reference system is the active workpiece coordinate system. **1**: Write the calculated preset to the preset table. Input: **0**, **1**
	Q380 Ref. angle in ref. axis? Angle to which the control will align the probed straight line. Only effective if the rotary axis is in automatic mode or if C is selected (**Q312** = 0 or 6). Input: **0...360**

Example

```
11 TCH PROBE 403 ROT IN ROTARY AXIS ~
    Q263=+0             ;1ST POINT 1ST AXIS ~
    Q264=+0             ;1ST POINT 2ND AXIS ~
    Q265=+20            ;2ND PNT IN 1ST AXIS ~
    Q266=+30            ;2ND POINT 2ND AXIS ~
    Q272=+1             ;MEASURING AXIS ~
    Q267=-1             ;TRAVERSE DIRECTION ~
    Q261=-5             ;MEASURING HEIGHT ~
    Q320=+0             ;SET-UP CLEARANCE ~
    Q260=+20            ;CLEARANCE HEIGHT ~
    Q301=+0             ;MOVE TO CLEARANCE ~
    Q312=+0             ;COMPENSATION AXIS ~
    Q337=+0             ;SET TO ZERO ~
    Q305=+1             ;NUMBER IN TABLE ~
    Q303=+1             ;MEAS. VALUE TRANSFER ~
    Q380=+90            ;REFERENCE ANGLE
```

29.2.12 Cycle 405 ROT IN C AXIS

Application

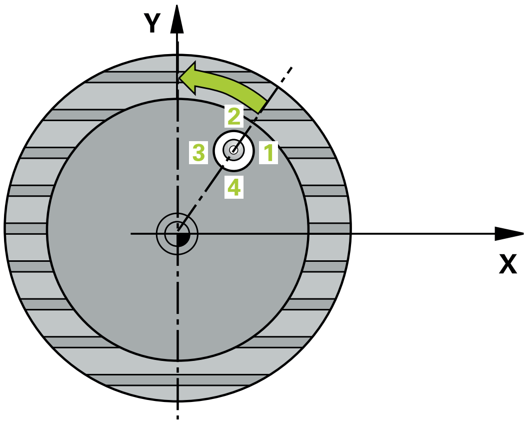


With touch probe cycle **405**, you can measure

- the angular offset between the positive Y axis of the active coordinate system and the center line of a hole
- the angular offset between the nominal position and the actual position of a hole center point

The control compensates the determined angular offset by rotating the C axis. The workpiece can be clamped in any position on the rotary table, but the Y coordinate of the hole must be positive. If you measure the angular misalignment of the hole with touch probe axis Y (horizontal position of the hole), it may be necessary to execute the cycle more than once because the measuring strategy causes an inaccuracy of approx. 1% of the misalignment.

Cycle sequence



1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from the **FMAX** column) to the touch point **1**. The control calculates the touch points from the data in the cycle and from the set-up clearance in the **SET_UP** column of the touch probe table.

   Further information: "Positioning logic", Page 1456

2 Next, the touch probe moves to the entered measuring height and probes the first touch point at the probing feed rate (**F** column). The control derives the probing direction automatically from the programmed starting angle.

3 Then, the touch probe moves along a circular arc, either at measuring height or at clearance height, to the next touch point **2** and probes again.

4 The control positions the touch probe to touch point **3** and then to touch point **4** to probe two more times and then positions the touch probe on the calculated hole center.

5 Finally, the control returns the touch probe to the clearance height and aligns the workpiece by rotating the rotary table. The control rotates the rotary table in such a way that the hole center, after compensation, lies in the direction of the positive Y axis or at the nominal position of the hole center point—both with a vertical and a horizontal touch probe axis. The measured angular offset is also available in the parameter **Q150**.

Notes

NOTICE

Danger of collision!

If the dimensions of the pocket and the set-up clearance do not permit pre-positioning in the proximity of the touch points, the control always starts probing from the center of the pocket. In this case, the touch probe does not return to the clearance height between the four measuring points.

- Make sure that there is no material in the pocket/hole
- To prevent a collision between the touch probe and the workpiece, enter a **low** estimate for the nominal diameter of the pocket (or hole).

NOTICE

Danger of collision!

When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active.

- The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**.
- Reset any coordinate transformations beforehand.

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- The control will reset an active basic rotation at the beginning of the cycle.

Notes on programming

- The smaller the stepping angle, the less accurately the control can calculate the circle center point. Minimum input value: 5°.

Cycle parameters

Help graphic	Parameter
	**Q321 Center in 1st axis?** Center of the hole in the main axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q322 Center in 2nd axis? Center of the hole in the secondary axis of the working plane. If you program **Q322** = 0, the control aligns the hole center point with the positive Y axis. If you program **Q322** not equal to 0, then the control aligns the hole center point with the nominal position (angle resulting from the position of the hole center). The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q262 Nominal diameter? Approximate diameter of the circular pocket (or hole). Enter a value that is more likely to be too small than too large. Input: **0...99999.9999**
	Q325 Starting angle? Angle between the main axis of the working plane and the first touch point. The value has an absolute effect. Input: **-360.000...+360.000**
	Q247 Intermediate stepping angle? Angle between two measuring points. The algebraic sign of the stepping angle determines the direction of rotation (negative = clockwise) in which the touch probe moves to the next measuring point. If you wish to probe a circular arc instead of a complete circle, then program the stepping angle to be less than 90°. This value has an incremental effect. Input: **-120...+120**
	**Q261 Measuring height in probe axis?** Coordinate of the ball tip center in the touch probe axis in which the measurement will be performed. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q320 Set-up clearance? Additional distance between touch point and ball tip. **Q320** is in addition to the **SET_UP** column in the touch probe table. This value has an incremental effect. Input: **0...99999.9999** or **PREDEF**
	Q260 Clearance height? Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect. Input: **-99999.9999...+99999.9999** or **PREDEF**

Help graphic	Parameter
	Q301 Move to clearance height (0/1)? Specify how the touch probe moves between measuring points: 0: Move at measuring height between measuring points 1: Move at clearance height between measuring points Input: **0**, **1**
	Q337 Set to zero after alignment? **0**: Set the display of the C axis to 0 and write to **C_Offset** of the active row of the datum table **> 0**: Write the measured angular offset to the datum table. Row number = value in **Q337**. If a C-axis shift is registered in the datum table, the control adds the measured angular offset with the correct sign, positive or negative. Input: **0...2999**

Example

```
11 TCH PROBE 405 ROT IN C AXIS ~
    Q321=+50            ;CENTER IN 1ST AXIS ~
    Q322=+50            ;CENTER IN 2ND AXIS ~
    Q262=+10            ;NOMINAL DIAMETER ~
    Q325=+0             ;STARTING ANGLE ~
    Q247=+90            ;STEPPING ANGLE ~
    Q261=-5             ;MEASURING HEIGHT ~
    Q320=+0             ;SET-UP CLEARANCE ~
    Q260=+20            ;CLEARANCE HEIGHT ~
    Q301=+0             ;MOVE TO CLEARANCE ~
    Q337=+0             ;SET TO ZERO
```

29.2.13 Cycle 404 SET BASIC ROTATION

Application

With touch probe cycle **404**, you can set any basic rotation automatically during program run or save it to the preset table. You can also use Cycle **404** if you want to reset an active basic rotation.

Notes

NOTICE

Danger of collision!

When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active.

- The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**.
- Reset any coordinate transformations beforehand.

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.

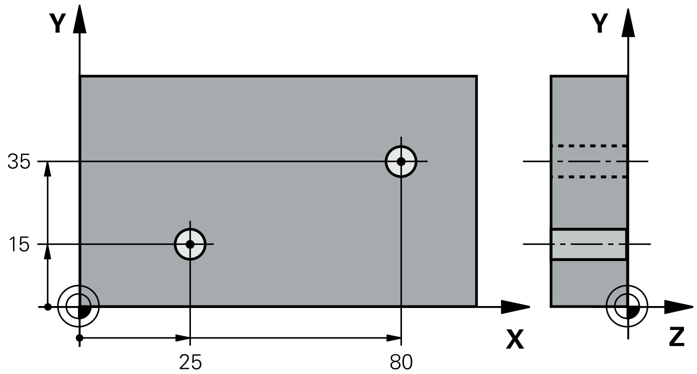
Cycle parameters

Help graphic	Parameter
	Q307 Preset value for rotation angle Angle value at which the basic rotation will be set. Input: **-360.000...+360.000**
	Q305 Preset number in table?: Specify the number of the row in the preset table in which the control will save the calculated basic rotation. If you enter **Q305** = 0 or **Q305** = –1, the control additionally saves the calculated basic rotation in the basic rotation menu (**Probing rot**) of **Manual Operation** mode. **-1**: Overwrite and activate the active preset **0**: Copy the active preset to row 0 of the preset table, write the basic rotation to row 0 of the preset table, and activate preset 0 **> 1**: Save the basic rotation to the specified preset. The preset is not activated. Input: **-1...99999**

Example

```
11 TCH PROBE 404 SET BASIC ROTATION ~
    Q307=+0                 ;PRESET ROTATION ANG. ~
    Q305=-1                 ;NUMBER IN TABLE
```

29.2.14 Example: Determining a basic rotation from two holes



- **Q268** = Center of the 1st hole: X coordinate
- **Q269** = Center of the 1st hole: Y coordinate
- **Q270** = Center of the 2nd hole: X coordinate
- **Q271** = Center of the 2nd hole: Y coordinate
- **Q261** = Coordinate in the touch probe axis in which the measurement is performed
- **Q307** = Angle of the reference line
- **Q402** = Compensation of workpiece misalignment by rotating the table
- **Q337** = Set the display to zero after the alignment

29.3 Touch Probe Cycles: Automatic Preset Measurement

29.3.1 Overview

The control offers cycles for automatic preset measurement.

> The control must be specifically prepared by the machine manufacturer for the use of a touch probe.
> HEIDENHAIN only guarantees the proper operation of the touch probe cycles in conjunction with HEIDENHAIN touch probes.

Cycle		Call	Further information
1400	**POSITION PROBING** ■ Measurement of single position ■ Definition of preset, if necessary	**DEF-**active	Page 1525
1401	**CIRCLE PROBING** ■ Measurement of points on the inside or outside of a circle ■ Definition of circle center as preset, if necessary	**DEF-**active	Page 1529
1402	**SPHERE PROBING** ■ Measurement of points on a sphere ■ Definition of sphere center as preset, if necessary	**DEF-**active	Page 1533
410	**PRESET INSIDE RECTAN** ■ Measurement of inside length and width of a rectangle ■ Definition of rectangle center as preset	**DEF-**active	Page 1540
411	**PRESET OUTS. RECTAN** ■ Measurement of outside length and width of a rectangle ■ Definition of rectangle center as preset	**DEF-**active	Page 1545
412	**PRESET INSIDE CIRCLE** ■ Measurement of any four points on the inside of a circle ■ Definition of circle center as preset	**DEF-**active	Page 1551
413	**PRESET OUTS. CIRCLE** ■ Measurement of any four points on the outside of a circle ■ Definition of circle center as preset	**DEF-**active	Page 1557
414	**PRESET OUTS. CORNER** ■ Measurement of two straight lines on the outside ■ Definition of intersection of the lines as preset	**DEF-**active	Page 1563
415	**PRESET INSIDE CORNER** ■ Measurement of two straight lines on the inside ■ Definition of intersection of the lines as preset	**DEF-**active	Page 1568
416	**PRESET CIRCLE CENTER**	**DEF-**active	Page 1574

Cycle		Call	Further information
	■ Measurement of any three holes on a circular hole pattern ■ Definition of center of circular hole pattern as preset		
417	**PRESET IN TS AXIS** ■ Measurement of any position in the tool axis ■ Definition of any position as preset	**DEF**-active	Page 1581
418	**PRESET FROM 4 HOLES** ■ Measurement of two holes on each line crosswise ■ Definition of the intersection of the lines as preset	**DEF**-active	Page 1585
419	**PRESET IN ONE AXIS** ■ Measurement of any position in a selectable axis ■ Definition of any position in a selectable axis as preset	**DEF**-active	Page 1590
408	**SLOT CENTER PRESET** ■ Measurement of width of an inside slot ■ Definition of slot center as preset	**DEF**-active	Page 1593
409	**RIDGE CENTER PRESET** ■ Measurement of width of an outside ridge ■ Definition of ridge center as preset	**DEF**-active	Page 1598

29.3.2 Fundamentals of touch probe cycles 14xx for presetting

Characteristics common to all touch probe cycles 14xx for preset setting

Preset and tool axis

The control sets the preset in the working plane based on the touch probe axis that you defined in your measuring program.

Active touch probe axis	Preset setting in
Z	X and Y
Y	Z and X
X	Y and Z

Measurement results in Q parameters

The control saves the measurement results of the respective probing cycle in the globally effective Q parameters **Q9xx**. You can use the parameters in your NC program. Note the table of result parameters listed with every cycle description.

29.3.3 Cycle 1400 POSITION PROBING

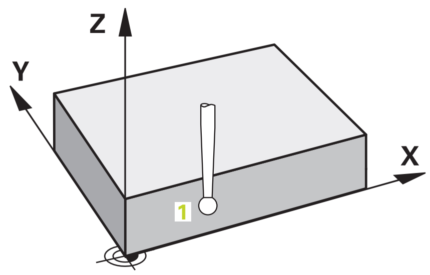
Application

Touch probe cycle **1400** measures any position in a selectable axis. You can apply the result to the active row of the preset table.

If you program Cycle **1493 EXTRUSION PROBING** before this cycle, you can repeat probing points in a given direction over a specified distance.

Further information: "Cycle 1493 EXTRUSION PROBING ", Page 1676

Cycle sequence



1. Following the positioning logic, the control positions the touch probe at rapid traverse (value from the **FMAX** column) to the programmed touch point **1**. The control takes into account the set-up clearance **Q320** during pre-positioning.
   Further information: "Positioning logic", Page 1456
2. Then the touch probe moves to the entered measuring height and measures the actual position with a single probing movement.
3. The control returns the touch probe to the clearance height.
4. The control saves the measured position in the following Q parameters. If **Q1120 = 1**, then the control writes the measured position to the active row of the preset table.
   Further information: "Fundamentals of touch probe cycles 14xx for presetting", Page 1525

Q parameter number	Meaning
Q950 to **Q952**	Measured position 1 in the main axis, secondary axis, and tool axis
Q980 to **Q982**	Measured deviations of touch point 1
Q183	Workpiece status ■ **-1** = Not defined ■ **0** = Good ■ **1** = Rework ■ **2** = Scrap
Q970	If you have programmed Cycle **1493 EXTRUSION PROBING**: Mean value of all deviations from the ideal line of the second touch point

Notes

NOTICE

Danger of collision!

When running touch probe cycles **444** and **14xx**, no coordinate transformations must be active (e.g., Cycles **8 MIRRORING**, **11 SCALING FACTOR**, **26 AXIS-SPECIFIC SCALING**, **TRANS MIRROR**).

▶ Reset any coordinate transformations before the cycle call.

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.

Cycle parameters

Help graphic	Parameter
	**Q1100 1st noml. position of ref. axis?** Absolute nominal position of the first touch point in the main axis of the working plane Input: **-99999.9999...+99999.9999** or optionally **?**, **-**, **+**, **@** **?**: Semiautomatic mode, Page 1463 **-**, **+**: Evaluation of the tolerance, Page 1469 **@**: Transferring the actual position, Page 1471
	**Q1101 1st noml. position of minor axis?** Absolute nominal position of the first touch point in the secondary axis of the working plane Input: **-99999.9999...+9999.9999** or optional input (see **Q1100**)
	Q1102 1st nominal position tool axis? Absolute nominal position of the first touch point in the tool axis Input: **-99999.9999...+9999.9999** or optional input (see **Q1100**)
	**Q372 Probe direction (-3 to +3)?** Axis defining the direction of probing. With the algebraic sign, you define the positive or negative direction of traverse of the probing axis. Input: **-3**, **-2**, **-1**, **+1**, **+2**, **+3**
	**Q320 Set-up clearance?** Additional distance between touch point and ball tip. **Q320** is in addition to the **SET_UP** column in the touch probe table. This value has an incremental effect. Input: **0...99999.9999** or **PREDEF**
	Q260 Clearance height? Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect. Input: **-99999.9999...+99999.9999** or **PREDEF**

Help graphic	Parameter
	Q1125 Traverse to clearance height? Positioning behavior between the touch points: **-1**: Do not move to clearance height. **0, 1, 2**: Move to clearance height before and after the touch point. Pre-positioning occurs at **FMAX_PROBE**. Input: **-1**, **0**, **+1**, **+2**
	Q309 Reaction to tolerance error? Reaction when tolerance is exceeded: **0**: Do not interrupt program run when tolerance is exceeded. The control does not open a window with the results. **1**: Interrupt program run when tolerance is exceeded. The control opens a window with the results. **2**: The control opens a window with the results if the actual position is in the scrap range. Program run is interrupted. The control does not open a window with the results if rework is necessary. Input: **0**, **1**, **2**
	Q1120 Transfer position? Define which touch point will be used to correct the active preset: **0**: No correction **1**: Correction based on the 1st touch point Input: **0**, **1**

Example

```
11 TCH PROBE 1400 POSITION PROBING ~
    Q1100=+25              ;1ST POINT REF AXIS ~
    Q1101=+25              ;1ST POINT MINOR AXIS ~
    Q1102=-5               ;1ST POINT TOOL AXIS ~
    Q372=+0                ;PROBING DIRECTION ~
    Q320=+0                ;SET-UP CLEARANCE ~
    Q260=+50               ;CLEARANCE HEIGHT ~
    Q1125=+1               ;CLEAR. HEIGHT MODE ~
    Q309=+0                ;ERROR REACTION ~
    Q1120=+0               ;TRANSER POSITION
```

29.3.4 Cycle 1401 CIRCLE PROBING

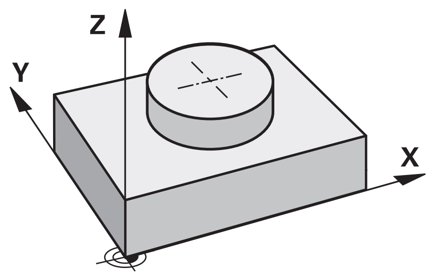
Application

Touch probe cycle **1401** determines the center point of a circular pocket or circular stud. You can transfer the result to the active row of the preset table.

If you program Cycle **1493 EXTRUSION PROBING** before this cycle, you can repeat probing points in a given direction over a specified distance.

Further information: "Cycle 1493 EXTRUSION PROBING ", Page 1676

Cycle sequence



1. Following the positioning logic, the control positions the touch probe at rapid traverse (value from **FMAX** column) to the programmed touch point. The control takes the set-up clearance **Q320** into account during pre-positioning.

   Further information: "Positioning logic", Page 1456
2. Then the touch probe moves to the entered measuring height **Q1102** and measures the actual position of the first touch point.
3. The control returns the touch probe to the clearance height **Q260** at **FMAX_PROBE** and then moves it to the next touch point.
4. The control moves the touch probe to the entered measuring height **Q1102** and measures the next touch point.
5. Depending on the definition of **Q423 NO. OF PROBE POINTS**, the control repeats the steps 3 to 4.
6. The control returns the touch probe to the clearance height **Q260**.
7. The control saves the measured position in the following Q parameters. If **Q1120 = 1**, then the control writes the measured position to the active row of the preset table.

   Further information: "Fundamentals of touch probe cycles 14xx for presetting", Page 1525

Q parameter number	Meaning
Q950 to **Q952**	Measured circle center point in the main axis, secondary axis, and tool axis
Q966	Measured diameter
Q980 to **Q982**	Measured deviations of the circle center point
Q996	Measured deviation of the diameter
Q183	Workpiece status ■ **-1** = Not defined ■ **0** = Good ■ **1** = Rework ■ **2** = Scrap
Q970	If you have programmed Cycle **1493 EXTRUSION PROBING**: Mean value of all deviations from the ideal line of the first circle center point
Q973	If you have programmed Cycle **1493 EXTRUSION PROBING**: Mean value of all deviations of the diameters of circle 1

Notes

NOTICE

Danger of collision!

When running touch probe cycles **444** and **14xx**, no coordinate transformations must be active (e.g., Cycles **8 MIRRORING**, **11 SCALING FACTOR**, **26 AXIS-SPECIFIC SCALING**, **TRANS MIRROR**).

▶ Reset any coordinate transformations before the cycle call.

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.

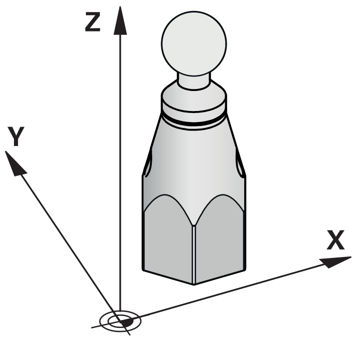
    Q1120=+0               ;TRANSER POSITION
```

29.3.5 Cycle 1402 SPHERE PROBING

Application

Touch probe cycle **1402** determines the center point of a sphere. You can apply the result to the active row of the preset table.

Cycle sequence



1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from **FMAX** column) to the programmed touch point. The control takes the set-up clearance **Q320** into account during pre-positioning.

   Further information: "Positioning logic", Page 1456
2 Then the touch probe moves to the entered measuring height **Q1102** and measures the actual position of the first touch point with a single probing movement.
3 The control returns the touch probe to the clearance height **Q260** at **FMAX_PROBE** and then moves it to the next touch point.
4 The control moves the touch probe to the entered measuring height **Q1102** and measures the next touch point.
5 Depending on the definition of **Q423** Number of Probes, the control repeats the steps 3 to 4.
6 The control moves the touch probe in the tool axis by the set-up clearance to a position above the sphere.
7 The touch probe moves to the center of the sphere and probes another touch point.
8 The touch probe returns to the clearance height **Q260**.
9 The control saves the measured position in the following Q parameters. If **Q1120 = 1**, then the control writes the measured position to the active row of the preset table.

   Further information: "Fundamentals of touch probe cycles 14xx for presetting", Page 1525

Q parameter number	Meaning
Q950 to **Q952**	Measured circle center point in the main axis, secondary axis, and tool axis
Q966	Measured diameter
Q980 to **Q982**	Measured deviations of the circle center point
Q996	Measured deviations of the diameter
Q183	Workpiece status ■ **-1** = Not defined ■ **0** = Good ■ **1** = Rework ■ **2** = Scrap

Notes

NOTICE

Danger of collision!

When running touch probe cycles **444** and **14xx**, no coordinate transformations must be active (e.g., Cycles **8 MIRRORING**, **11 SCALING FACTOR**, **26 AXIS-SPECIFIC SCALING**, **TRANS MIRROR**).

- Reset any coordinate transformations before the cycle call.

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- If you have programmed Cycle **1493 EXTRUSION PROBING** before, the control will ignore it during the execution of Cycle **1402 SPHERE PROBING**.

Cycle parameters

Help graphic	Parameter
	**Q1100 1st noml. position of ref. axis?** Absolute nominal position of the center point in the main axis of the working plane.     Q1120=+0              ;TRANSER POSITION
```

29.3.6 Fundamentals of touch probe cycles 4xx for preset setting

Characteristics common to all touch probe cycles 4xx for preset setting

Depending on the setting of the optional **CfgPresetSettings** machine parameter (no. 204600), the control will check during probing whether the position of the rotary axis matches the tilting angles **3-D ROTATION**. If that is not the case, the control displays an error message.

The control offers cycles for automatically determining presets and handling them as follows:

- Setting the calculated values directly as display values
- Writing the calculated values to the preset table
- Writing the calculated values to a datum table

Preset and touch probe axis

The control determines the preset in the working plane based on the touch probe axis that you defined in your measuring program.

Active touch probe axis	Set preset in
Z	X and Y
Y	Z and X
X	Y and Z

Saving the calculated preset

In all cycles for presetting, you can use input parameters **Q303** and **Q305** to define how the control is to save the calculated preset:

- **Q305 = 0, Q303 = 1:**
  The control copies the active preset to row 0, changes it and activates row 0, deleting simple transformations.
- **Q305 not equal to 0, Q303 = 0:**
  The result is written to the datum table, row **Q305**; **activate the datum with TRANS DATUM in the NC program**

  Further information: "Datum shift with TRANS DATUM", Page 972
- **Q305 not equal to 0, Q303 = 1:**
  The result is written to the preset table, row **Q305**; **use Cycle 247 to activate the preset in the NC program**
- **Q305 not equal to 0, Q303 = -1**

> This combination can only occur if you
> - read in NC programs (containing Cycles **410** to **418**) that were created on a TNC 4xx
> - read in NC programs (containing Cycles **410** to **418**) that were created with an older software version of an iTNC 530
> - did not specifically define the measured-value transfer with parameter **Q303** when defining the cycle
>
> In these cases, the control outputs an error message, since the complete handling of REF-referenced datum tables has changed. You must define a measured-value transfer yourself with parameter **Q303**.

Measurement results in Q parameters

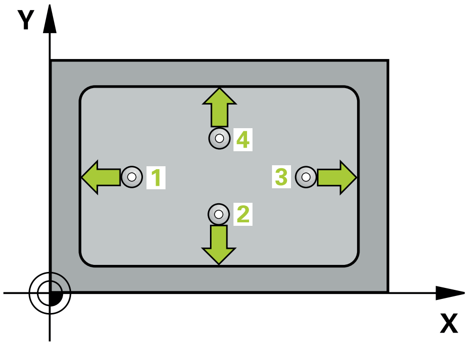
The control saves the measurement results of the respective probing cycle in the globally effective Q parameters **Q150** to **Q160**. You can use these parameters in your NC program. Note the table of result parameters listed with every cycle description.

29.3.7 Cycle 410 PRESET INSIDE RECTAN

Application

Touch probe cycle **410** finds the center of a rectangular pocket and defines this position as the preset. If desired, the control can also write the center point coordinates to a datum table or the preset table.

Cycle sequence



1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from the **FMAX** column) to the touch point **1**. The control calculates the touch points from the data in the cycle and from the set-up clearance in the **SET_UP** column of the touch probe table.

   Further information: "Positioning logic", Page 1456
2 Next, the touch probe moves to the entered measuring height and probes the first touch point at the probing feed rate (**F** column).
3 Then the touch probe moves either paraxially at measuring height or at clearance height to the next touch point **2** and probes again.
4 The control positions the touch probe to touch point **3** and then to touch point **4** to probe two more times.
5 The control returns the touch probe to the clearance height.
6 Depending on the cycle parameters **Q303** and **Q305**, the control processes the calculated preset, (see "Fundamentals of touch probe cycles 4xx for preset setting", Page 1538)
7 Then the control saves the actual values in the Q parameters listed below.
8 If desired, the control subsequently determines the preset in the touch probe axis in a separate probing operation.

Q parameter number	Meaning
Q151	Actual value of center in reference axis
Q152	Actual value of center in minor axis
Q154	Actual value of side length in the reference axis
Q155	Actual value of side length in the minor axis

Notes

NOTICE

Danger of collision!

When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active.

- The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**.
- Reset any coordinate transformations beforehand.

NOTICE

Danger of collision!

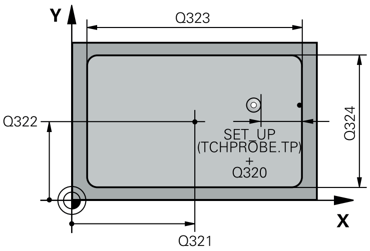
To prevent a collision between touch probe and workpiece, enter **low** estimates for the lengths of the first and second sides. If the dimensions of the pocket and the set-up clearance do not permit pre-positioning in the proximity of the touch points, the control always starts probing from the center of the pocket. In this case, the touch probe does not return to the clearance height between the four measuring points.

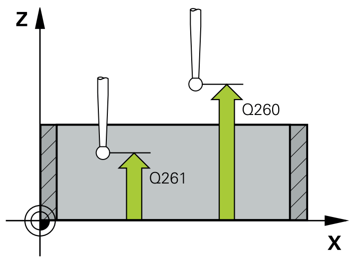
- Before the cycle definition, you must have programmed a tool call to define the touch probe axis.

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- The control will reset an active basic rotation at the beginning of the cycle.

Cycle parameters

Help graphic





Parameter

Q321 Center in 1st axis?

Center of the pocket in the main axis of the working plane. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q322 Center in 2nd axis?

Center of the pocket in the secondary axis of the working plane. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q323 First side length?

Pocket length, parallel to the main axis of the working plane. This value has an incremental effect.

Input: **0...99999.9999**

Q324 Second side length?

Pocket length, parallel to the secondary axis of the working plane. This value has an incremental effect.

Input: **0...99999.9999**

Q261 Measuring height in probe axis?

The value has an absolute effect. Input: –99999.9999... +99999.9999

Input: **-99999.9999...+99999.9999**

Q320 Set-up clearance?

Additional distance between touch point and ball tip. **Q320** is in addition to the **SET_UP** column in the touch probe table. This value has an incremental effect.

Input: **0...99999.9999** or **PREDEF**

Q260 Clearance height?

Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect.

Input: **-99999.9999...+99999.9999** or **PREDEF**

Q301 Move to clearance height (0/1)?

Specify how the touch probe moves between measuring points:

0: Move at measuring height between measuring points

1: Move at clearance height between measuring points

Input: **0**, **1**

Help graphic	Parameter
	Q305 Number in table? Indicate the number of the row in the preset table / datum table in which the control saves the center point coordinates. Depending on **Q303**, the control writes the entry to the preset table or datum table. If **Q303 = 1**, the control will write the data to the preset table. If the active preset changes, this change will immediately become effective. Otherwise, the control writes the entry to the corresponding row of the preset table without automatic activation. If **Q303 = 0**, the control will write the data to the datum table. The datum is not automatically activated. **Further information:** "Saving the calculated preset", Page 1539 Input: **0...99999**
	Q331 New preset in reference axis? Coordinate in the main axis at which the control will set the calculated pocket center. Default setting = 0. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q332 New preset in minor axis? Coordinate in the secondary axis at which the control will set the calculated pocket center. Default setting = 0. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q303 Meas. value transfer (0,1)? Define whether the calculated preset will be saved in the datum table or in the preset table: **-1**: Do not use. Is entered by the control when old NC programs are read in, (see "Characteristics common to all touch probe cycles 4xx for preset setting", Page 1538) **0**: Write the calculated preset to the active datum table. The reference system is the active workpiece coordinate system. **1**: Write the calculated preset to the preset table. Input: **-1**, **0**, **+1**
	Q381 Probe in TS axis? (0/1) Define whether the control will also set the preset in the touch probe axis: **0**: Do not set the preset in the touch probe axis **1**: Set the preset in the touch probe axis Input: **0**, **1**

Help graphic	Parameter
	Q382 Probe TS axis: Coord. 1st axis? Coordinate of the touch point in the main axis of the working plane; the preset will be set at this point in the touch probe axis. Only effective if **Q381** = 1. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q383 Probe TS axis: Coord. 2nd axis? Coordinate of the touch point in the secondary axis of the working plane; the preset will be set at this point in the touch probe axis. Only effective if **Q381** = 1. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q384 Probe TS axis: Coord. 3rd axis? Coordinate of the touch point in the touch probe axis; the preset will be set at this point in the touch probe axis. Only effective if **Q381** = 1. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q333 New preset in TS axis? Coordinate in the touch probe axis at which the control will set the preset. Default setting = 0. The value has an absolute effect. Input: **-99999.9999...+99999.9999**

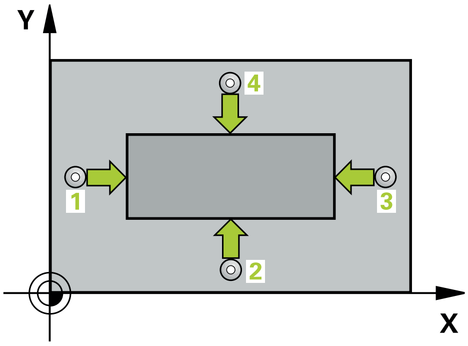
29.3.8 Cycle 411 PRESET OUTS. RECTAN

Application

Touch probe cycle **411** finds the center of a rectangular stud and defines this position as the datum. If desired, the control can also write the center point coordinates to a datum table or the preset table.

Cycle sequence



1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from the **FMAX** column) to the touch point **1**. The control calculates the touch points from the data in the cycle and from the set-up clearance in the **SET_UP** column of the touch probe table.

   Further information: "Positioning logic", Page 1456
2 Next, the touch probe moves to the entered measuring height and probes the first touch point at the probing feed rate (**F** column).
3 Then the touch probe moves either paraxially at measuring height or at clearance height to the next touch point **2** and probes again.
4 The control positions the touch probe to touch point **3** and then to touch point **4** to probe two more times.
5 The control returns the touch probe to the clearance height.
6 Depending on the cycle parameters **Q303** and **Q305**, the control processes the calculated preset, (see "Fundamentals of touch probe cycles 4xx for preset setting", Page 1538)
7 Then the control saves the actual values in the Q parameters listed below.
8 If desired, the control subsequently determines the preset in the touch probe axis in a separate probing operation.

Q parameter number	Meaning
Q151	Actual value of center in reference axis
Q152	Actual value of center in minor axis
Q154	Actual value of side length in the reference axis
Q155	Actual value of side length in the minor axis

Notes

NOTICE

Danger of collision!

When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active.

- The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**.
- Reset any coordinate transformations beforehand.

NOTICE

Danger of collision!

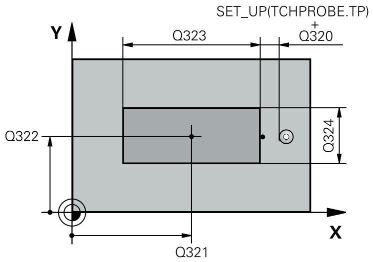
To prevent a collision between touch probe and workpiece, enter **high** estimates for the lengths of the 1st and 2nd sides.

- Before the cycle definition, you must have programmed a tool call to define the touch probe axis.

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- The control will reset an active basic rotation at the beginning of the cycle.

Cycle parameters

Help graphic	Parameter



Q321 Center in 1st axis?

Center of the stud in the main axis of the working plane. The value has an absolute effect.

Input: **-99999.9999...+9999.9999**

Q322 Center in 2nd axis?

Center of the stud in the secondary axis of the working plane. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q323 First side length?

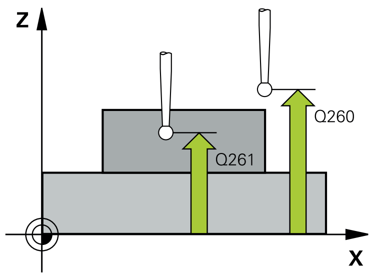
Length of stud parallel to the main axis of the working plane. This value has an incremental effect.

Input: **0...99999.9999**

Q324 Second side length?

Length of stud parallel to the secondary axis of the working plane. This value has an incremental effect.

Input: **0...99999.9999**



Q261 Measuring height in probe axis?

Coordinate of the ball tip center in the touch probe axis in which the measurement will be performed. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q320 Set-up clearance?

Additional distance between touch point and ball tip. **Q320** is in addition to the **SET_UP** column in the touch probe table. This value has an incremental effect.

Input: **0...99999.9999** or **PREDEF**

Q260 Clearance height?

Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect.

Input: **-99999.9999...+99999.9999** or **PREDEF**

Q301 Move to clearance height (0/1)?

Specify how the touch probe moves between measuring points:

0: Move at measuring height between measuring points

1: Move at clearance height between measuring points

Input: **0**, **1**

```

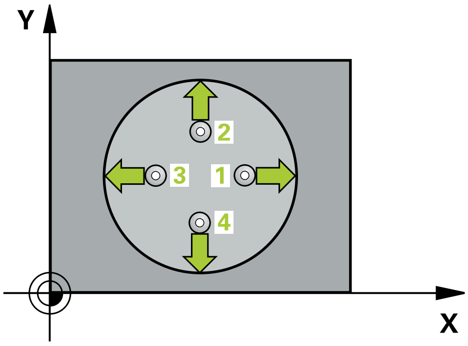
29.3.9 Cycle 412 PRESET INSIDE CIRCLE

Application

Touch probe cycle **412** finds the center of a circular pocket (hole) and defines this position as the preset. If desired, the control can also write the center point coordinates to a datum table or the preset table.

Cycle sequence



1. Following the positioning logic, the control positions the touch probe at rapid traverse (value from the **FMAX** column) to the touch point **1**. The control calculates the touch points from the data in the cycle and from the set-up clearance in the **SET_UP** column of the touch probe table.

   Further information: "Positioning logic", Page 1456
2. Next, the touch probe moves to the entered measuring height and probes the first touch point at the probing feed rate (**F** column). The control derives the probing direction automatically from the programmed starting angle.
3. Then, the touch probe moves in a circular arc either at measuring height or linearly at clearance height to the next touch point **2** and probes again.
4. The control positions the touch probe to touch point **3** and then to touch point **4** to probe two more times.
5. The control returns the touch probe to the clearance height.
6. Depending on the cycle parameters **Q303** and **Q305**, the control processes the calculated preset, (see "Fundamentals of touch probe cycles 4xx for preset setting", Page 1538)
7. Then the control saves the actual values in the Q parameters listed below.
8. If desired, the control subsequently measures the preset in the touch probe axis in a separate probing operation.

Q parameter number	Meaning
Q151	Actual value of center in reference axis
Q152	Actual value of center in minor axis
Q153	Actual value of diameter

Notes

NOTICE

Danger of collision!

When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active.

- The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**.
- Reset any coordinate transformations beforehand.

NOTICE

Danger of collision!

To prevent a collision between the touch probe and the workpiece, enter a **low** estimate for the nominal diameter of the pocket (or hole). If the dimensions of the pocket and the set-up clearance do not permit pre-positioning in the proximity of the touch points, the control always starts probing from the center of the pocket. In this case, the touch probe does not return to the clearance height between the four measuring points.

- Preposition to the pocket center
- Before the cycle definition, you must have programmed a tool call to define the touch probe axis.

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- The control will reset an active basic rotation at the beginning of the cycle.

Notes on programming

- The smaller the stepping angle **Q247**, the less accurately the control can calculate the preset. Minimum input value: 5°

Program the stepping angle to be less than 90°

Cycle parameters

Help graphic	Parameter
	**Q321 Center in 1st axis?** Center of the pocket in the main axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q322 Center in 2nd axis? Center of the pocket in the secondary axis of the working plane. If you program **Q322** = 0, the control aligns the hole center point to the positive Y axis. If you program **Q322** not equal to 0, then the control aligns the hole center point to the nominal position. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q262 Nominal diameter? Approximate diameter of the circular pocket (or hole). Enter a value that is more likely to be too small than too large. Input: **0...99999.9999**
	Q325 Starting angle? Angle between the main axis of the working plane and the first touch point. The value has an absolute effect. Input: **-360.000...+360.000**
	Q247 Intermediate stepping angle? Angle between two measuring points. The algebraic sign of the stepping angle determines the direction of rotation (negative = clockwise) in which the touch probe moves to the next measuring point. If you wish to probe a circular arc instead of a complete circle, then program the stepping angle to be less than 90°. This value has an incremental effect. Input: **-120...+120**
	**Q261 Measuring height in probe axis?** Coordinate of the ball tip center in the touch probe axis in which the measurement will be performed. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q320 Set-up clearance? Additional distance between touch point and ball tip. **Q320** is in addition to the **SET_UP** column in the touch probe table. This value has an incremental effect. Input: **0...99999.9999** or **PREDEF**
	Q260 Clearance height? Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect. Input: **-99999.9999...+99999.9999** or **PREDEF**

Help graphic	Parameter

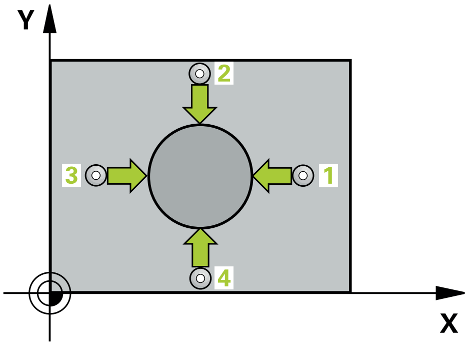
29.3.10 Cycle 413 PRESET OUTS. CIRCLE

Application

Touch probe cycle **413** finds the center of a circular stud and defines this position as the preset. If desired, the control can also write the center point coordinates to a datum table or the preset table.

Cycle sequence



1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from the **FMAX** column) to the touch point **1**. The control calculates the touch points from the data in the cycle and from the set-up clearance in the **SET_UP** column of the touch probe table.

   Further information: "Positioning logic", Page 1456
2 Next, the touch probe moves to the entered measuring height and probes the first touch point at the probing feed rate (**F** column). The control derives the probing direction automatically from the programmed starting angle.
3 Then, the touch probe moves in a circular arc either at measuring height or at clearance height to the next touch point **2** and probes again.
4 The control positions the touch probe to touch point **3** and then to touch point **4** to probe two more times.
5 The control returns the touch probe to the clearance height.
6 Depending on the cycle parameters **Q303** and **Q305**, the control processes the calculated preset, (see "Fundamentals of touch probe cycles 4xx for preset setting", Page 1538)
7 Then the control saves the actual values in the Q parameters listed below.
8 If desired, the control subsequently measures the preset in the touch probe axis in a separate probing operation.

Q parameter number	Meaning
Q151	Actual value of center in reference axis
Q152	Actual value of center in minor axis
Q153	Actual value of diameter

Notes

NOTICE

Danger of collision!

When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active.

- The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**.
- Reset any coordinate transformations beforehand.

NOTICE

Danger of collision!

To prevent a collision between touch probe and workpiece, enter a **high** estimate for the nominal diameter of the stud.

- Before a cycle definition you must have programmed a tool call to define the touch probe axis.

- The control will reset an active basic rotation at the beginning of the cycle.
- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- The smaller the stepping angle **Q247**, the less accurately the control can calculate the preset. Minimum input value: 5°

Program the stepping angle to be less than 90°

Cycle parameters

Help graphic	Parameter
	**Q321 Center in 1st axis?** Center of the stud in the main axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+9999.9999**
	Q322 Center in 2nd axis? Center of the stud in the secondary axis of the working plane. If you program **Q322** = 0, the control aligns the hole center point to the positive Y axis. If you program **Q322** not equal to 0, then the control aligns the hole center point to the nominal position. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q262 Nominal diameter? Approximate diameter of the stud. Enter a value that is more likely to be too large than too small. Input: **0...99999.9999**
	Q325 Starting angle? Angle between the main axis of the working plane and the first touch point. The value has an absolute effect. Input: **-360.000...+360.000**
	Q247 Intermediate stepping angle? Angle between two measuring points. The algebraic sign of the stepping angle determines the direction of rotation (negative = clockwise) in which the touch probe moves to the next measuring point. If you wish to probe a circular arc instead of a complete circle, then program the stepping angle to be less than 90°. This value has an incremental effect. Input: **-120...+120**
	**Q261 Measuring height in probe axis?** Coordinate of the ball tip center in the touch probe axis in which the measurement will be performed. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q320 Set-up clearance? Additional distance between touch point and ball tip. **Q320** is in addition to the **SET_UP** column in the touch probe table. This value has an incremental effect. Input: **0...99999.9999** or **PREDEF**
	Q260 Clearance height? Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect. Input: **-99999.9999...+99999.9999** or **PREDEF**

Help graphic	Parameter
	Q301 Move to clearance height (0/1)? Specify how the touch probe moves between measuring points: 0: Move at measuring height between measuring points 1: Move at clearance height between measuring points Input: **0**, **1**
	Q305 Number in table? Indicate the number of the row in the preset table / datum table in which the control saves the center point coordinates. Depending on **Q303**, the control writes the entry to the preset table or datum table. If **Q303 = 1**, the control will write the data to the preset table. If the active preset changes, this change will immediately become effective. Otherwise, the control writes the entry to the corresponding row of the preset table without automatic activation. If **Q303 = 0**, the control will write the data to the datum table. The datum is not automatically activated. **Further information:** "Saving the calculated preset", Page 1539 Input: **0...99999**
	Q331 New preset in reference axis? Coordinate in the main axis at which the control will set the calculated stud center. Default setting = 0. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q332 New preset in minor axis? Coordinate in the secondary axis at which the control will set the calculated stud center. Default setting = 0. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q303 Meas. value transfer (0,1)? Define whether the calculated preset will be saved in the datum table or in the preset table: **-1**: Do not use. Is entered by the control when old NC programs are read in, (see "Characteristics common to all touch probe cycles 4xx for preset setting", Page 1538) **0**: Write the calculated preset to the active datum table. The reference system is the active workpiece coordinate system. **1**: Write the calculated preset to the preset table. Input: **-1**, **0**, **+1**

Help graphic	Parameter
	Q381 Probe in TS axis? (0/1) Define whether the control will also set the preset in the touch probe axis: **0**: Do not set the preset in the touch probe axis **1**: Set the preset in the touch probe axis Input: **0**, **1**
	Q382 Probe TS axis: Coord. 1st axis? Coordinate of the touch point in the main axis of the working plane; the preset will be set at this point in the touch probe axis. Only effective if **Q381** = 1. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q383 Probe TS axis: Coord. 2nd axis? Coordinate of the touch point in the secondary axis of the working plane; the preset will be set at this point in the touch probe axis. Only effective if **Q381** = 1. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q384 Probe TS axis: Coord. 3rd axis? Coordinate of the touch point in the touch probe axis; the preset will be set at this point in the touch probe axis. Only effective if **Q381** = 1. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q333 New preset in TS axis? Coordinate in the touch probe axis at which the control will set the preset. Default setting = 0. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q423 No. probe points in plane (4/3)? Define whether the control will use three or four touch points to measure the circle: **3**: Use three measuring points **4**: Use four measuring points (default setting) Input: **3**, **4**
	Q365 Type of traverse? Line=0/arc=1 Specify the path function to be used by the tool for moving between the measuring points if "traverse to clearance height" (**Q301** = 1) is active. **0**: Move in a straight line between machining operations **1**: Move along a circular arc on the pitch circle diameter between machining operations Input: **0**, **1**

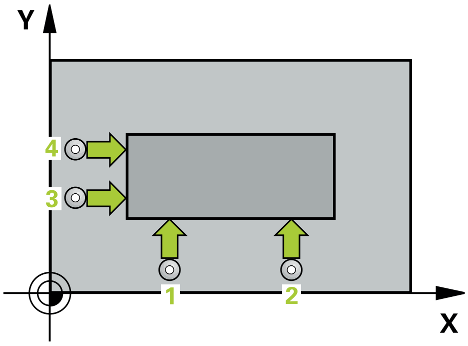
29.3.11 Cycle 414 PRESET OUTS. CORNER

Application

Touch probe cycle **414** finds the intersection of two lines and defines it as the preset. If desired, the control can also write the point of intersection coordinates to a datum table or the preset table.

Cycle sequence



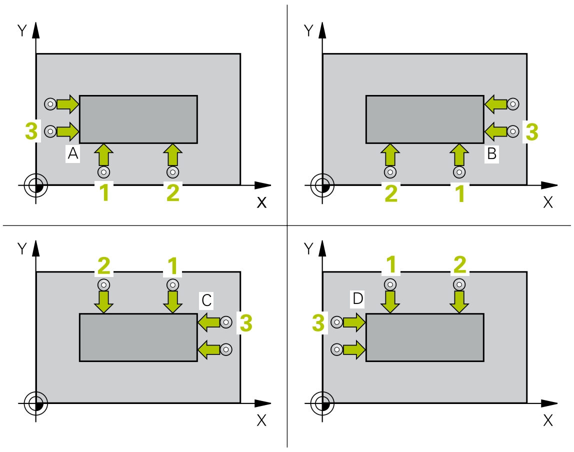
1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from **FMAX** column) at touch point **1** (see figure). The control offsets the touch probe by the set-up clearance in the direction opposite the respective traverse direction.
   Further information: "Positioning logic", Page 1456
2 Next, the touch probe moves to the entered measuring height and probes the first touch point at the probing feed rate (**F** column). The control derives the probing direction automatically from the 3rd measuring point.
3 The touch probe then moves to the next touch point **2** and probes again.
4 The control positions the touch probe to touch point **3** and then to touch point **4** to probe two more times.
5 The control returns the touch probe to the clearance height.
6 Depending on the cycle parameters **Q303** and **Q305**, the control processes the calculated preset, (see "Fundamentals of touch probe cycles 4xx for preset setting", Page 1538)
7 Then the control saves the coordinates of the calculated corner in the Q parameters listed below.
8 If desired, the control subsequently measures the preset in the touch probe axis in a separate probing operation.

The control always measures the first line in the direction of the minor axis of the working plane.

Q parameter number	Meaning
Q151	Actual value of corner in reference axis
Q152	Actual value of corner in minor axis

Definition of the corner

By defining the positions of the measuring points **1** and **3**, you also determine the corner at which the control sets the preset (see the following figure and table below).



Corner	X coordinate	Y coordinate
A	Point **1** greater than point **3**	Point **1** less than point **3**
B	Point **1** less than point **3**	Point **1** less than point **3**
C	Point **1** less than point **3**	Point **1** greater than point **3**
D	Point **1** greater than point **3**	Point **1** greater than point **3**

Notes

NOTICE

Danger of collision!

When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active.

- The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**.
- Reset any coordinate transformations beforehand.

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- The control will reset an active basic rotation at the beginning of the cycle.

Note on programming

- Before defining this cycle, you must have programmed a tool call to define the touch probe axis.

Cycle parameters

Help graphic	Parameter
	**Q263 1st measuring point in 1st axis?** Coordinate of the first touch point in the main axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q264 1st measuring point in 2nd axis? Coordinate of the first touch point in the secondary axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q326 Spacing in 1st axis? Distance between the first and second measuring points in the main axis of the working plane. This value has an incremental effect. Input: **0...99999.9999**
	Q296 3rd measuring point in 1st axis? Coordinate of the third touch point in the main axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q297 3rd measuring point in 2nd axis? Coordinate of the third touch point in the secondary axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q327 Spacing in 2nd axis? Distance between third and fourth measuring points in the secondary axis of the working plane. This value has an incremental effect. Input: **0...99999.9999**
	**Q261 Measuring height in probe axis?** Coordinate of the ball tip center in the touch probe axis in which the measurement will be performed. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q320 Set-up clearance? Additional distance between touch point and ball tip. **Q320** is in addition to the **SET_UP** column in the touch probe table. This value has an incremental effect. Input: **0...99999.9999** or **PREDEF**

Help graphic	Parameter
	Q260 Clearance height? Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect. Input: **-99999.9999...+99999.9999** or **PREDEF**
	Q301 Move to clearance height (0/1)? Specify how the touch probe moves between measuring points: 0: Move at measuring height between measuring points 1: Move at clearance height between measuring points Input: **0**, **1**
	Q304 Execute basic rotation (0/1)? Define whether the control will compensate workpiece misalignment with a basic rotation: **0**: No basic rotation **1**: Basic rotation Input: **0**, **1**
	Q305 Number in table? Indicate the number of the row of the preset table or datum table, in which the control saves the corner coordinates. Depending on **Q303**, the control writes the entry to the preset table or datum table: If **Q303 = 1**, the control will write the data to the preset table. If the active preset changes, this change will immediately become effective. Otherwise, the control writes the entry to the corresponding row of the preset table without automatic activation. If **Q303 = 0**, the control will write the data to the datum table. The datum is not automatically activated. **Further information:** "Saving the calculated preset", Page 1539 Input: **0...99999**

```

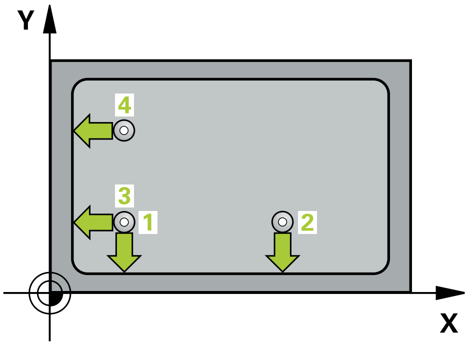
29.3.12 Cycle 415 PRESET INSIDE CORNER

Application

Touch probe cycle **415** finds the intersection of two lines and defines it as the preset. If desired, the control can also write the point of intersection coordinates to a datum table or the preset table.

Cycle sequence



1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from **FMAX** column) at touch point **1** (see figure). The control offsets the touch probe in the main axis and the secondary axis by the set-up clearance **Q320** + **SET_UP** + ball-tip radius (in the direction opposite the respective traverse direction)

   Further information: "Positioning logic", Page 1456
2 Next, the touch probe moves to the entered measuring height and probes the first touch point at the probing feed rate (**F** column). The probing direction is derived from the number by which you identify the corner.
3 The touch probe moves to the next touch point **2**; the control offsets the touch probe in the secondary axis by the set-up clearance **Q320** + **SET_UP** + ball-tip radius and then performs the second probing operation
4 The control positions the touch probe at touch point **3** (same positioning logic as for the first touch point) and performs the probing operation there
5 The touch probe then moves to touch point **4**. The control offsets the touch probe in the main axis by the set-up clearance **Q320** + **SET_UP** + ball-tip radius and then performs the fourth probing operation
6 The control returns the touch probe to the clearance height.
7 Depending on the cycle parameters **Q303** and **Q305**, the control processes the calculated preset, (see "Fundamentals of touch probe cycles 4xx for preset setting", Page 1538)
8 Then the control saves the coordinates of the calculated corner in the Q parameters listed below.
9 If desired, the control subsequently measures the preset in the touch probe axis in a separate probing operation.

> The control always measures the first line in the direction of the minor axis of the working plane.

Q parameter number	Meaning
Q151	Actual value of corner in reference axis
Q152	Actual value of corner in minor axis

Notes

NOTICE

Danger of collision!

When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active.

- The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**.
- Reset any coordinate transformations beforehand.

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- The control will reset an active basic rotation at the beginning of the cycle.

Note on programming

- Before defining this cycle, you must have programmed a tool call to define the touch probe axis.

Cycle parameters

Help graphic	Parameter
	**Q263 1st measuring point in 1st axis?** Coordinate of the corner in the main axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q264 1st measuring point in 2nd axis? Coordinate of the corner in the secondary axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**

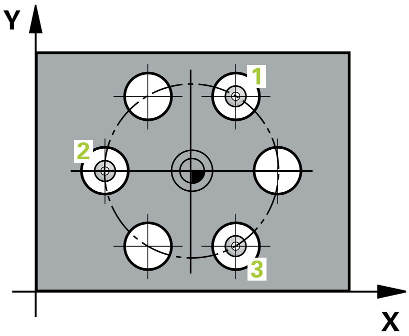
29.3.13 Cycle 416 PRESET CIRCLE CENTER

Application

Touch probe cycle **416** finds the center of a bolt hole circle by measuring three holes, and defines the determined center as the preset. If desired, the control can also write the center point coordinates to a datum table or the preset table.

Cycle sequence



1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from **FMAX** column) to the programmed center point of the first hole **1**.

   Further information: "Positioning logic", Page 1456
2 Then the probe moves to the entered measuring height and probes four points to determine the first hole center point.
3 The touch probe returns to the clearance height and then to the position entered as center of the second hole **2**.
4 The control moves the touch probe to the entered measuring height and probes four points to determine the second hole center point.
5 The touch probe returns to the clearance height and then to the position entered as center of the third hole **3**.
6 The control moves the touch probe to the entered measuring height and probes four points to determine the third hole center point.
7 The control returns the touch probe to the clearance height.
8 Depending on the cycle parameters **Q303** and **Q305**, the control processes the calculated preset, (see "Fundamentals of touch probe cycles 4xx for preset setting", Page 1538)
9 Then the control saves the actual values in the Q parameters listed below.
10 If desired, the control subsequently measures the preset in the touch probe axis in a separate probing operation.

Q parameter number	Meaning
Q151	Actual value of center in reference axis
Q152	Actual value of center in minor axis
Q153	Actual value of bolt hole circle diameter

Notes

NOTICE

Danger of collision!

When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active.

- The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**.
- Reset any coordinate transformations beforehand.

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- The control will reset an active basic rotation at the beginning of the cycle.

Note on programming

- Before defining this cycle, you must have programmed a tool call to define the touch probe axis.

Cycle parameters

Help graphic	Parameter
	**Q273 Center in 1st axis (nom. value)?** Bolt hole circle center (nominal value) in the main axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q274 Center in 2nd axis (nom. value)? Bolt hole circle center (nominal value) in the secondary axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q262 Nominal diameter? Enter the approximate bolt hole circle diameter. The smaller the hole diameter, the more exact the nominal diameter must be. Input: **0...99999.9999**
	Q291 Polar coord. angle of 1st hole? Polar coordinate angle of the first hole center in the working plane. The value has an absolute effect. Input: **-360.000...+360.000**
	Q292 Polar coord. angle of 2nd hole? Polar coordinate angle of the second hole center in the working plane. The value has an absolute effect. Input: **-360.000...+360.000**
	Q293 Polar coord. angle of 3rd hole? Polar coordinate angle of the third hole center in the working plane. The value has an absolute effect. Input: **-360.000...+360.000**
	Q261 Measuring height in probe axis? Coordinate of the ball tip center in the touch probe axis in which the measurement will be performed. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q260 Clearance height? Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect. Input: **-99999.9999...+99999.9999** or **PREDEF**

Help graphic	Parameter
	Q305 Number in table? Indicate the number of the row in the preset table / datum table in which the control saves the center point coordinates. Depending on **Q303**, the control writes the entry to the preset table or datum table. If **Q303 = 1**, the control will write the data to the preset table. If the active preset changes, this change will immediately become effective. Otherwise, the control writes the entry to the corresponding row of the preset table without automatic activation. If **Q303 = 0**, the control will write the data to the datum table. The datum is not automatically activated. **Further information:** "Saving the calculated preset", Page 1539 Input: **0...99999**
	Q331 New preset in reference axis? Coordinate in the main axis at which the control will set the calculated bolt-hole center. Default setting = 0. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q332 New preset in minor axis? Coordinate in the secondary axis at which the control will set the calculated bolt-hole circle center. Default setting = 0. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q303 Meas. value transfer (0,1)? Define whether the calculated preset will be saved in the datum table or in the preset table: **-1**: Do not use. Is entered by the control when old NC programs are read in, (see "Characteristics common to all touch probe cycles 4xx for preset setting", Page 1538) **0**: Write the calculated preset to the active datum table. The reference system is the active workpiece coordinate system. **1**: Write the calculated preset to the preset table. Input: **-1**, **0**, **+1**
	Q381 Probe in TS axis? (0/1) Define whether the control will also set the preset in the touch probe axis: **0**: Do not set the preset in the touch probe axis **1**: Set the preset in the touch probe axis Input: **0**, **1**

Help graphic	Parameter
	Q382 Probe TS axis: Coord. 1st axis? Coordinate of the touch point in the main axis of the working plane; the preset will be set at this point in the touch probe axis. Only effective if **Q381** = 1. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q383 Probe TS axis: Coord. 2nd axis? Coordinate of the touch point in the secondary axis of the working plane; the preset will be set at this point in the touch probe axis. Only effective if **Q381** = 1. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q384 Probe TS axis: Coord. 3rd axis? Coordinate of the touch point in the touch probe axis; the preset will be set at this point in the touch probe axis. Only effective if **Q381** = 1. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q333 New preset in TS axis? Coordinate in the touch probe axis at which the control will set the preset. Default setting = 0. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q320 Set-up clearance? Additional distance between touch point and ball tip. **Q320** is added to **SET_UP** (touch probe table), and is only effective when the preset is probed in the touch probe axis. This value has an incremental effect. Input: **0...99999.9999** or **PREDEF**

Example

```
11 TCH PROBE 416 PRESET CIRCLE CENTER ~
    Q273=+50                ;CENTER IN 1ST AXIS ~
    Q274=+50                ;CENTER IN 2ND AXIS ~

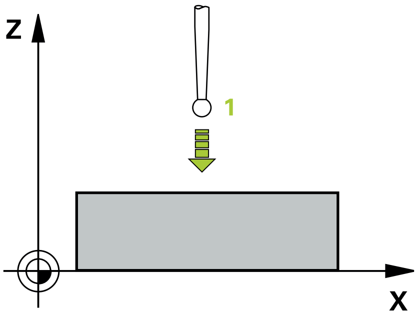
    Q292=+70                ;ANGLE OF 2ND HOLE ~
    Q293=+210               ;ANGLE OF 3RD HOLE ~
    Q261=-5                 ;MEASURING HEIGHT ~
    Q260=+20                ;CLEARANCE HEIGHT ~
    Q305=+12                ;NUMBER IN TABLE ~
    Q331=+0                 ;PRESET ~
    Q332=+0                 ;PRESET ~
    Q303=+1                 ;MEAS. VALUE TRANSFER ~
    Q381=+1                 ;PROBE IN TS AXIS ~
    Q382=+85                ;1ST CO. FOR TS AXIS ~
    Q383=+50                ;2ND CO. FOR TS AXIS ~
    Q384=+0                 ;3RD CO. FOR TS AXIS ~
    Q333=+1                 ;PRESET ~
    Q320=+0                 ;SET-UP CLEARANCE
```

29.3.14 Cycle 417 PRESET IN TS AXIS

Application

Touch probe cycle **417** measures any coordinate in the touch probe axis and defines it as the preset. If desired, the control can also write the measured coordinates to a datum table or preset table.

Cycle sequence



1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from the **FMAX** column) to the programmed touch point **1**. The control offsets the touch probe by the set-up clearance in the direction of the positive touch probe axis.

   Further information: "Positioning logic", Page 1456
2 Then the touch probe moves in its own axis to the coordinate entered as touch point **1** and measures the actual position with a simple probing movement
3 The control returns the touch probe to the clearance height.
4 Depending on the cycle parameters **Q303** and **Q305**, the control processes the calculated preset, (see "Fundamentals of touch probe cycles 4xx for preset setting", Page 1538)
5 Then the control saves the actual values in the Q parameters listed below.

Q parameter number	Meaning
Q160	Actual value of measured point

Notes

NOTICE

Danger of collision!

When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active.

- The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**.
- Reset any coordinate transformations beforehand.

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- The control sets the preset in this axis.
- The control will reset an active basic rotation at the beginning of the cycle.

Note on programming

- Before defining this cycle, you must have programmed a tool call to define the touch probe axis.

Cycle parameters

Help graphic	Parameter
	**Q263 1st measuring point in 1st axis?** Coordinate of the first touch point in the main axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q264 1st measuring point in 2nd axis? Coordinate of the first touch point in the secondary axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q294 1st measuring point in 3rd axis? Coordinate of the first touch point in the touch probe axis. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q320 Set-up clearance? Additional distance between touch point and ball tip. **Q320** is in addition to the **SET_UP** column in the touch probe table. This value has an incremental effect. Input: **0...99999.9999** or **PREDEF**
	Q260 Clearance height? Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect. Input: **-99999.9999...+99999.9999** or **PREDEF**
	Q305 Number in table? Indicate the number of the row of the preset table or datum table, in which the control saves the coordinates. Depending on **Q303**, the control writes the entry to the preset table or datum table. If **Q303 = 1**, the control will write the data to the preset table. If the active preset changes, this change will immediately become effective. Otherwise, the control writes the entry to the corresponding row of the preset table without automatic activation If **Q303 = 0**, the control will write the data to the datum table. The datum is not automatically activated. **Further information:** "Saving the calculated preset", Page 1539
	Q333 New preset in TS axis? Coordinate in the touch probe axis at which the control will set the preset. Default setting = 0. The value has an absolute effect. Input: **-99999.9999...+99999.9999**

Help graphic	Parameter
	Q303 Meas. value transfer (0,1)? Define whether the calculated preset will be saved in the datum table or in the preset table: **-1**: Do not use. ```

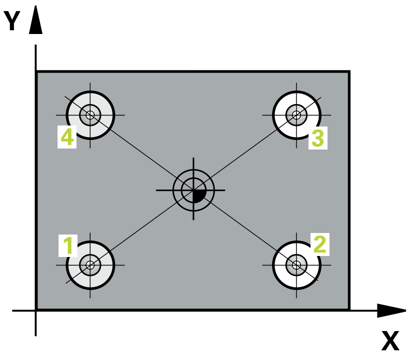
29.3.15 Cycle 418 PRESET FROM 4 HOLES

Application

Touch probe cycle **418** calculates the intersection of the lines connecting two opposite hole center points and sets the preset at the point of intersection. If desired, the control can also write the point of intersection coordinates to a datum table or the preset table.

Cycle sequence



1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from **FMAX** column) to the center point of the first hole **1**.
   Further information: "Positioning logic", Page 1456
2 Then the probe moves to the entered measuring height and probes four points to determine the first hole center point.
3 The touch probe returns to the clearance height and then to the position entered as center of the second hole **2**.
4 The control moves the touch probe to the entered measuring height and probes four points to determine the second hole center point.
5 The control repeats this step for holes **3** and **4**.
6 The control returns the touch probe to the clearance height.
7 Depending on the cycle parameters **Q303** and **Q305**, the control processes the calculated preset, (see "Fundamentals of touch probe cycles 4xx for preset setting", Page 1538)
8 The control calculates the preset as the intersection of the lines connecting the centers of holes **1**/**3** and **2**/**4** and saves the actual values in the Q parameters listed below.
9 If desired, the control subsequently measures the preset in the touch probe axis in a separate probing operation.

Q parameter number	Meaning
Q151	Actual value of intersection point in reference axis
Q152	Actual value of intersection point in minor axis

Notes

NOTICE

Danger of collision!

When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active.

- The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**.
- Reset any coordinate transformations beforehand.

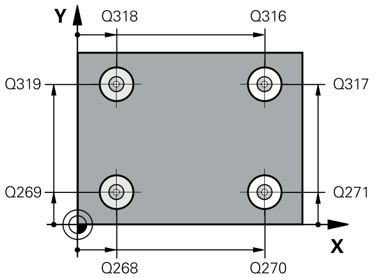
- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- The control will reset an active basic rotation at the beginning of the cycle.

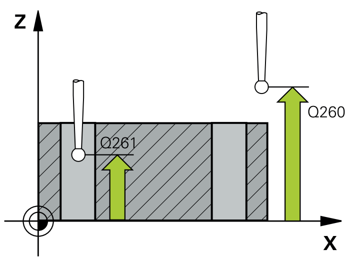
Note on programming

- Before defining this cycle, you must have programmed a tool call to define the touch probe axis.

Cycle parameters

Help graphic





Parameter

Q268 1st hole: center in 1st axis?
Center of the first hole in the main axis of the working plane. The value has an absolute effect.
Input: **-99999.9999...+9999.9999**

Q269 1st hole: center in 2nd axis?
Center of the first hole in the secondary axis of the working plane. The value has an absolute effect.
Input: **-99999.9999...+99999.9999**

Q270 2nd hole: center in 1st axis?
Center of the second hole in the main axis of the working plane. The value has an absolute effect.
Input: **-99999.9999...+99999.9999**

Q271 2nd hole: center in 2nd axis?
Center of the second hole in the secondary axis of the working plane. The value has an absolute effect.
Input: **-99999.9999...+99999.9999**

Q316 3rd hole: Center in 1st axis?
Center of the third hole in the main axis of the working plane. The value has an absolute effect.
Input: **-99999.9999...+99999.9999**

Q317 3rd hole: Center in 2nd axis?
Center of the third hole in the secondary axis of the working plane. The value has an absolute effect.
Input: **-99999.9999...+99999.9999**

Q318 4th hole: Center in 1st axis?
Center of the fourth hole in the main axis of the working plane. The value has an absolute effect.
Input: **-99999.9999...+99999.9999**

Q319 4th hole: Center in 2nd axis?
Center of the fourth hole in the secondary axis of the working plane. The value has an absolute effect.
Input: **-99999.9999...+99999.9999**

Q261 Measuring height in probe axis?
Coordinate of the ball tip center in the touch probe axis in which the measurement will be performed. The value has an absolute effect.
Input: **-99999.9999...+99999.9999**

Q260 Clearance height?
Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect.
Input: **-99999.9999...+99999.9999** or **PREDEF**

Help graphic	Parameter
	Q305 Number in table? Indicate the number of the row in the preset table or datum table in which the control saves the coordinates of the point of intersection of the connecting lines. Depending on **Q303**, the control writes the entry to the preset table or datum table. If **Q303 = 1**, the control will write the data to the preset table. If the active preset changes, this change will immediately become effective. Otherwise, the control writes the entry to the corresponding row of the preset table without automatic activation If **Q303 = 0**, the control will write the data to the datum table. The datum is not automatically activated. **Further information:** "Saving the calculated preset", Page 1539 Input: **0...99999**
	Q331 New preset in reference axis? Coordinate in the main axis at which the control will set the calculated intersection of the connecting lines. Default setting = 0. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q332 New preset in minor axis? Coordinate in the secondary axis at which the control will set the calculated intersection of the connecting lines. Default setting = 0. The value has an absolute effect. Input: **-99999.9999...+9999.9999**
	Q303 Meas. value transfer (0,1)? Define whether the calculated preset will be saved in the datum table or in the preset table: **-1**: Do not use. Is entered by the control when old NC programs are read in, (see "Characteristics common to all touch probe cycles 4xx for preset setting", Page 1538) **0**: Write the calculated preset to the active datum table. The reference system is the active workpiece coordinate system. **1**: Write the calculated preset to the preset table. Input: **-1**, **0**, **+1**
	Q381 Probe in TS axis? (0/1) Define whether the control will also set the preset in the touch probe axis: **0**: Do not set the preset in the touch probe axis **1**: Set the preset in the touch probe axis Input: **0**, **1**

Help graphic	Parameter
	Q382 Probe TS axis: Coord. 1st axis? Coordinate of the touch point in the main axis of the working plane; the preset will be set at this point in the touch probe axis. Only effective if **Q381** = 1. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q383 Probe TS axis: Coord. 2nd axis? Coordinate of the touch point in the secondary axis of the working plane; the preset will be set at this point in the touch probe axis. Only effective if **Q381** = 1. The value has an absolute effect. Input: **-99999.9999...+99999.9999**

```

29.3.16 Cycle 419 PRESET IN ONE AXIS

Application

Touch probe cycle **419** measures any coordinate in the a selectable axis and defines it as the preset. If desired, the control can also write the measured coordinates to a datum table or preset table.

Cycle sequence

1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from the **FMAX** column) to the programmed touch point **1**. The control offsets the touch probe by the set-up clearance in the direction opposite the programmed probing direction.

   Further information: "Positioning logic", Page 1456

2 Then the touch probe moves to the programmed measuring height and measures the actual position with a simple probing movement.
3 The control returns the touch probe to the clearance height.
4 Depending on the cycle parameters **Q303** and **Q305**, the control processes the calculated preset, (see "Fundamentals of touch probe cycles 4xx for preset setting", Page 1538)

Notes

NOTICE

Danger of collision!

When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active.

- The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**.
- Reset any coordinate transformations beforehand.

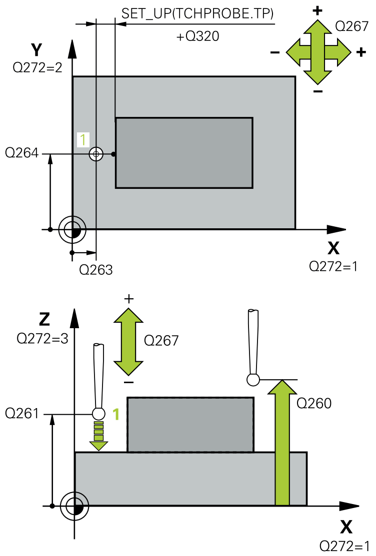
- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- If you want to save the preset in several axes in the preset table, you can use Cycle **419** several times in a row. However, you also have to reactivate the preset number after every run of Cycle **419**. If you work with preset 0 as active preset, this process is not required.
- The control will reset an active basic rotation at the beginning of the cycle.

Note on programming

- Before defining this cycle, you must have programmed a tool call to define the touch probe axis.

Cycle parameters

Help graphic



Parameter

Q263 1st measuring point in 1st axis?

Coordinate of the first touch point in the main axis of the working plane. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q264 1st measuring point in 2nd axis?

Coordinate of the first touch point in the secondary axis of the working plane. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q261 Measuring height in probe axis?

Coordinate of the ball tip center in the touch probe axis in which the measurement will be performed. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q320 Set-up clearance?

Additional distance between touch point and ball tip. **Q320** is in addition to the **SET_UP** column in the touch probe table. This value has an incremental effect.

Input: **0...99999.9999** or **PREDEF**

Q260 Clearance height?

Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect.

Input: **-99999.9999...+99999.9999** or **PREDEF**

Q272 Meas. axis (1/2/3, 1=ref. axis)?

Axis in which the measurement will be made:

1: Main axis = measuring axis

2: Secondary axis = measuring axis

3: Touch probe axis = measuring axis

Axis assignment

Active touch probe axis: Q272 = 3	Correspond-ing main axis: Q272 = 1	Corresponding secondary axis: Q272 = 2
Z	X	Y
Y	Z	X
X	Y	Z

Input: **1**, **2**, **3**

Q267 Trav. direction 1 (+1=+ / -1=-)?

Direction in which the touch probe will approach the workpiece:

-1: Negative traverse direction

+1: Positive traverse direction

Input: **-1**, **+1**

Help graphic	Parameter
	Q305 Number in table? Indicate the number of the row of the preset table or datum table, in which the control saves the coordinates. Depending on **Q303**, the control writes the entry to the preset table or datum table. If **Q303 = 1**, the control will write the data to the preset table. If the active preset changes, this change will immediately become effective. Otherwise, the control writes the entry to the corresponding row of the preset table without automatic activation If **Q303 = 0**, the control will write the data to the datum table. The datum is not automatically activated. **Further information:** "Saving the calculated preset", Page 1539
	Q333 New preset? Coordinate at which the control will set the preset. Default setting = 0. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q303 Meas. value transfer (0,1)? Define whether the calculated preset will be saved in the datum table or in the preset table: **-1**: Do not use. Is entered by the control when old NC programs are read in, (see "Characteristics common to all touch probe cycles 4xx for preset setting", Page 1538) **0**: Write the calculated preset to the active datum table. The reference system is the active workpiece coordinate system. **1**: Write the calculated preset to the preset table. Input: **-1**, **0**, **+1**

Example

```

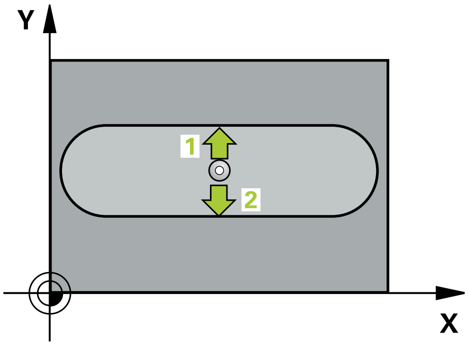
29.3.17 Cycle 408 SLOT CENTER PRESET

Application

Touch probe cycle **408** finds the center of a slot and defines this position as the preset. If desired, the control can also write the center point coordinates to a datum table or the preset table.

Cycle sequence



1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from the **FMAX** column) to the touch point **1**. The control calculates the touch points from the data in the cycle and from the set-up clearance in the **SET_UP** column of the touch probe table.

   Further information: "Positioning logic", Page 1456
2 Next, the touch probe moves to the entered measuring height and probes the first touch point at the probing feed rate (**F** column).
3 Then the touch probe moves either paraxially at measuring height or at clearance height to the next touch point **2** and probes again.
4 The control returns the touch probe to the clearance height.
5 Depending on the cycle parameters **Q303** and **Q305**, the control processes the calculated preset, (see "Fundamentals of touch probe cycles 4xx for preset setting", Page 1538)
6 Then the control saves the actual values in the Q parameters listed below.
7 If desired, the control subsequently measures the preset in the touch probe axis in a separate probing operation.

Q parameter number	Meaning
Q166	Actual value of measured slot width
Q157	Actual value of the centerline

Notes

NOTICE

Danger of collision!

When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active.

- The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**.
- Reset any coordinate transformations beforehand.

NOTICE

Danger of collision!

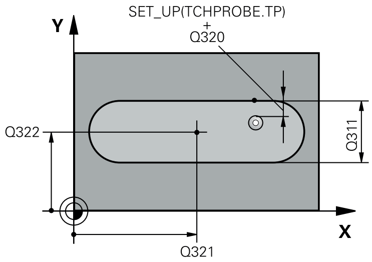
To prevent a collision between touch probe and workpiece, enter a **low** estimate for the slot width. If the slot width and the set-up clearance do not permit pre-positioning in the proximity of the touch points, the control always starts probing from the center of the slot. In this case, the touch probe does not return to the clearance height between the two measuring points.

- Before the cycle definition, you must have programmed a tool call to define the touch probe axis.

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- The control will reset an active basic rotation at the beginning of the cycle.

Cycle parameters

Help graphic	Parameter



Q321 Center in 1st axis?

Center of the slot in the main axis of the working plane. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q322 Center in 2nd axis?

Center of the slot in the secondary axis of the working plane. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q311 Width of slot?

Width of the slot, regardless of its position in the working plane. This value has an incremental effect.

Input: **0...99999.9999**

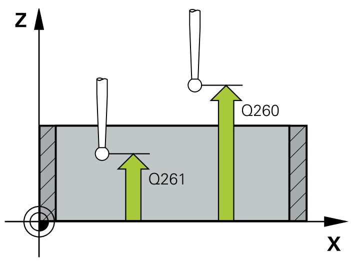
Q272 Measuring axis (1=1st / 2=2nd)?

Axis in the working plane in which the measurement will be performed:

1: Main axis = measuring axis

2: Secondary axis = measuring axis

Input: **1**, **2**



Q261 Measuring height in probe axis?

Coordinate of the ball tip center in the touch probe axis in which the measurement will be performed. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q320 Set-up clearance?

Additional distance between touch point and ball tip. **Q320** is in addition to the **SET_UP** column in the touch probe table. This value has an incremental effect.

Input: **0...99999.9999** or **PREDEF**

Q260 Clearance height?

Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect.

Input: **-99999.9999...+99999.9999** or **PREDEF**

Q301 Move to clearance height (0/1)?

Specify how the touch probe moves between measuring points:

0: Move at measuring height between measuring points

1: Move at clearance height between measuring points

Input: **0**, **1**

Help graphic	Parameter
	Q305 Number in table? Indicate the number of the row in the preset table / datum table in which the control saves the center point coordinates. Depending on **Q303**, the control writes the entry to the preset table or datum table. If **Q303 = 1**, the control will write the data to the preset table. If the active preset changes, this change will immediately become effective. Otherwise, the control writes the entry to the corresponding row of the preset table without automatic activation. If **Q303 = 0**, the control will write the data to the datum table. The datum is not automatically activated. **Further information:** "Saving the calculated preset", Page 1539 Input: **0...99999**
	Q405 New preset? Coordinate in the measuring axis at which the control will set the calculated slot center. Default setting = 0. The value has an absolute effect. Input: **-99999.9999...+9999.9999**
	Q303 Meas. value transfer (0,1)? Define whether the calculated preset will be saved in the datum table or in the preset table: **0**: Write the calculated preset to the active datum table as a datum shift. The reference system is the active workpiece coordinate system. **1**: Write the calculated preset to the preset table. Input: **0**, **1**
	Q381 Probe in TS axis? (0/1) Define whether the control will also set the preset in the touch probe axis: **0**: Do not set the preset in the touch probe axis **1**: Set the preset in the touch probe axis Input: **0**, **1**
	Q382 Probe TS axis: Coord. 1st axis? Coordinate of the touch point in the main axis of the working plane; the preset will be set at this point in the touch probe axis. Only effective if **Q381** = 1. The value has an absolute effect. Input: **-99999.9999...+99999.9999**

Help graphic	Parameter
	Q383 Probe TS axis: Coord. 2nd axis? Coordinate of the touch point in the secondary axis of the working plane; the preset will be set at this point in the touch probe axis. Only effective if **Q381** = 1. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q384 Probe TS axis: Coord. 3rd axis? Coordinate of the touch point in the touch probe axis; the preset will be set at this point in the touch probe axis. Only effective if **Q381** = 1. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q333 New preset in TS axis? Coordinate in the touch probe axis at which the control will set the preset. Default setting = 0. The value has an absolute effect. Input: **-99999.9999...+99999.9999**

```

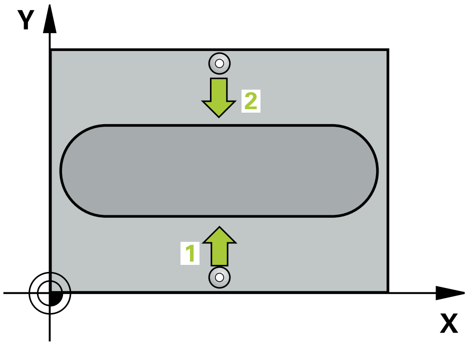
29.3.18 Cycle 409 RIDGE CENTER PRESET

Application

Touch probe cycle **409** finds the center of a ridge and defines this position as the preset. If desired, the control can also write the center point coordinates to a datum table or the preset table.

Cycle sequence



1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from the **FMAX** column) to the touch point **1**. The control calculates the touch points from the data in the cycle and from the set-up clearance in the **SET_UP** column of the touch probe table.
   Further information: "Positioning logic", Page 1456
2 Next, the touch probe moves to the entered measuring height and probes the first touch point at the probing feed rate (**F** column).
3 Then the touch probe moves at clearance height to the next touch point **2** and probes it.
4 The control returns the touch probe to the clearance height.
5 Depending on the cycle parameters **Q303** and **Q305**, the control processes the calculated preset, (see "Fundamentals of touch probe cycles 4xx for preset setting", Page 1538)
6 Then the control saves the actual values in the Q parameters listed below.
7 If desired, the control subsequently measures the preset in the touch probe axis in a separate probing operation.

Q parameter number	Meaning
Q166	Actual value of measured ridge width
Q157	Actual value of the centerline

Notes

NOTICE
Danger of collision! When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active. ▶ The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**. ▶ Reset any coordinate transformations beforehand.

NOTICE
Danger of collision! To prevent a collision between touch probe and workpiece, enter a **high** estimate for the ridge width. ▶ Before the cycle definition, you must have programmed a tool call to define the touch probe axis.

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- The control will reset an active basic rotation at the beginning of the cycle.

29.4 Touch Probe Cycles: Automatic Workpiece Inspection

29.4.1 Fundamentals

Overview

The control must be specifically prepared by the machine manufacturer for the use of a touch probe.

HEIDENHAIN only guarantees the proper operation of the touch probe cycles in conjunction with HEIDENHAIN touch probes.

NOTICE

Danger of collision!

When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active.

- The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**.
- Reset any coordinate transformations beforehand.

The control offers cycles for measuring workpieces automatically:

Cycle		Call	Further information
0	**REF. PLANE** ■ Measuring a coordinate in a selectable axis	**DEF-**active	Page 1611
1	**POLAR PRESET** ■ Measuring a point ■ Probing direction via angle	**DEF-**active	Page 1612
420	**MEASURE ANGLE** ■ Measuring an angle in the working plane	**DEF-**active	Page 1614
421	**MEASURE HOLE** ■ Measuring the position of a hole ■ Measuring the diameter of a hole ■ Nominal-to-actual value comparison, if applicable	**DEF-**active	Page 1617
422	**MEAS. CIRCLE OUTSIDE** ■ Measuring the position of a circular stud ■ Measuring the diameter of a circular stud ■ Nominal-to-actual value comparison, if applicable	**DEF-**active	Page 1623
423	**MEAS. RECTAN. INSIDE** ■ Measuring the position of a rectangular pocket ■ Measuring the length and width of a rectangular pocket ■ Nominal-to-actual value comparison, if applicable	**DEF-**active	Page 1629
424	**MEAS. RECTAN. OUTS.** ■ Measuring the position of a rectangular stud ■ Measuring the length and width of a rectangular stud ■ Nominal-to-actual value comparison, if applicable	**DEF-**active	Page 1633
425	**MEASURE INSIDE WIDTH** ■ Measuring the position of a slot ■ Measuring the width of a slot ■ Nominal-to-actual value comparison, if applicable	**DEF-**active	Page 1638
426	**MEASURE RIDGE WIDTH** ■ Measuring the position of a ridge ■ Measuring the width of a ridge ■ Nominal-to-actual value comparison, if applicable	**DEF-**active	Page 1642

Cycle		Call	Further information
427	**MEASURE COORDINATE** ■ Measuring any coordinate in a selectable axis ■ Nominal-to-actual value comparison, if applicable	**DEF**-active	Page 1645
430	**MEAS. BOLT HOLE CIRC** ■ Measuring the center point of a bolt hole circle ■ Measuring the diameter of a bolt hole circle ■ Nominal-to-actual value comparison, if applicable	**DEF**-active	Page 1650
431	**MEASURE PLANE** ■ Finding the angle of a plane by measuring three points	**DEF**-active	Page 1655

Recording the results of measurement

For all cycles in which you automatically measure workpieces (with the exception of Cycles **0** and **1**), you can have the control record the measurement results in a log. In the respective probing cycle you can define if the control is to

- Save the measuring log to a file
- Interrupt program run and display the measuring log on the screen
- Create no measuring log

If you want to save the measuring log to a file, the control by default saves the data as an ASCII file. The control will save the file in the directory that also contains the associated NC program.

The unit of measurement of the main program can be seen in the header of the log file.

> Use the HEIDENHAIN data transfer software TNCremo if you wish to output the measuring log over the data interface.

Example: Measuring log for touch probe cycle **421**:

Measuring log for Probing Cycle 421 Hole Measuring

End of measuring log

Measurement results in Q parameters

The control saves the measurement results of the respective probing cycle in the globally effective Q parameters **Q150** to **Q160**. Deviations from the nominal values are saved in parameters **Q161** to **Q166**. Note the table of result parameters listed with every cycle description.

During cycle definition, the control also shows the result parameters for the respective cycle in a help graphic . The highlighted result parameter belongs to that input parameter.

Classification of results

For some cycles you can inquire the status of measuring results through the globally effective Q parameters **Q180** to **Q182**.

Parameter value	Measuring status
Q180 = 1	Measurement results are within tolerance
Q181 = 1	Rework is required
Q182 = 1	Scrap

The control sets the rework or scrap marker as soon as one of the measuring values is out of tolerance. To determine which of the measuring results is out of tolerance, check the measuring log, or compare the respective measuring results (**Q150** to **Q160**) with their limit values.

In Cycle **427** the control assumes by default that you are measuring an outside dimension (stud). However, you can correct the status of the measurement by entering the correct maximum and minimum dimension together with the probing direction.

> The control also sets the status markers if you have not defined any tolerance values or maximum/minimum dimensions.

Tolerance monitoring

With most cycles for workpiece inspection, you can have the control perform tolerance monitoring. This requires that you define the necessary limit values during cycle definition. If you do not wish to monitor for tolerances, simply leave the default value 0 for this parameter set this parameter unchanged.

Tool monitoring

With some cycles for workpiece inspection, you can have the control perform tool monitoring. The control then monitors whether

- the tool radius should be compensated due to the deviations from the nominal value (values in **Q16x**)
- the deviations from the nominal value (values in **Q16x**) are greater than the tool breakage tolerance.

Tool compensation

Requirements:

- Active tool table
- Tool monitoring must be switched on in the cycle: Set **Q330** unequal to 0 or enter a tool name. Select the tool name input via **Name** in the action bar.

> - HEIDENHAIN recommends using this function only if the tool to be compensated for is the one that was used to machine the contour as well as if any necessary reworking will also be done with this tool.
> - If you perform several compensation measurements, the control adds the respective measured deviation to the value stored in the tool table.

Milling cutter

If you reference a milling cutter in parameter **Q330**, the appropriate values will be compensated as follows:

The control always compensates the tool radius in the **DR** column of the tool table, even if the measured deviation lies within the given tolerance.

You can inquire whether re-working is necessary via parameter **Q181** in the NC program (**Q181**=1: rework required).

Turning tool

Only applies to Cycles **421**, **422**, **427**.

If you reference a turning tool in parameter **Q330**, the appropriate values in row DZL and DXL, respectively, will be compensated. The control also monitors the breakage tolerance, which is defined in column LBREAK.

You can inquire whether re-working is necessary via parameter **Q181** in the NC program (**Q181**=1: rework required).

Compensating an indexed tool

If you want to automatically compensate the values for an indexed tool with a tool name, program the following:

- **QS0** = "TOOL NAME"
- **FN18: SYSREAD Q0 = ID990 NR10 IDX0**; specify the number of the **QS** parameter in **IDX**
- **Q0**= **Q0** +0.2; add the index of the basic tool number
- In the cycle: **Q330** = **Q0**; use the indexed tool number

Tool breakage monitoring

Requirements:

- Active tool table
- Tool monitoring must be switched on in the cycle (set **Q330** unequal to 0)
- RBREAK must be greater than 0 (in the entered tool number in the table)

  Further information: "Tool data", Page 249

The control will output an error message and stop the program run if the measured deviation is greater than the breakage tolerance of the tool. At the same time, the tool will be deactivated in the tool table (column TL = L).

Reference system for measurement results

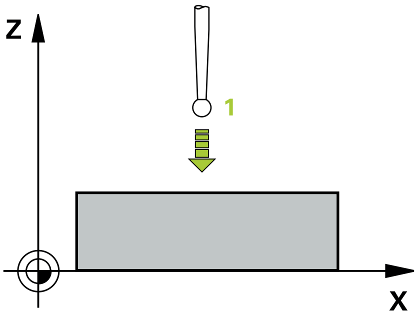
The control transfers all measurement results, which reference the active coordinate system, or as the case may be, the shifted or/and rotated/tilted coordinate system, to the result parameters and the log file.

29.4.2 Cycle 0 REF. PLANE

Application

The touch probe cycle measures any position on the workpiece in a selectable axis direction.

Cycle sequence



1. In a 3-D movement, the touch probe moves at rapid traverse (value from the **FMAX** column) to the pre-position **1** programmed in the cycle.
2. Next, the touch probe performs probing at the probing feed rate (**F** column). The probing direction must be defined in the cycle.
3. After the control has saved the position, the probe retracts to the starting point and saves the measured coordinate in a Q parameter. In addition, the control stores the coordinates of the position of the touch probe at the time of the triggering signal in parameters **Q115** to **Q119**. For the values in these parameters the control does not account for the stylus length and radius.

Notes

NOTICE

Danger of collision!

The control moves the touch probe in a 3-D movement at rapid traverse to the pre-position programmed in the cycle. Depending on the previous position of the tool, there is danger of collision!

- Pre-position to a position where there is no danger of collision when the programmed pre-positioning point is approached

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.

Cycle parameters

Help graphic	Parameter
	Parameter number for result? Enter the number of the Q parameter to which you want to assign the coordinate.. Input: **0...1999**
	Probing axis/probing direction? Select the probing axis with the axis key or the alphabetic keyboard, entering the algebraic sign for the probing direction. Input: **-, +**
	Position value? Use the axis keys or the alphabetic keyboard to enter all coordinates for pre-positioning of the touch probe. Input: **-999999999...+999999999**

Example

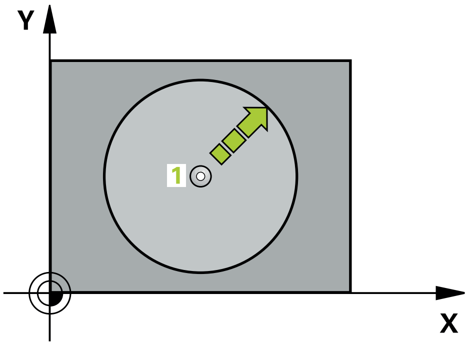
```
11 TCH PROBE 0.0 REF. PLANE Q9 Z+
12 TCH PROBE 0.1  X+99  Y+22  Z+2
```

29.4.3 Cycle 1 POLAR PRESET

Application

Touch probe cycle **1** measures any position on the workpiece in any probing direction.

Cycle sequence



1 In a 3-D movement, the touch probe moves at rapid traverse (value from the **FMAX** column) to the pre-position **1** programmed in the cycle.
2 Next, the touch probe performs probing at the probing feed rate (**F** column). During probing, the control moves the touch probe simultaneously in two axes (depending on the probing angle). Use polar angles to define the probing direction in the cycle.
3 After the control has saved the position, the touch probe returns to the starting point. The control stores the coordinates of the position of the touch probe at the time of the triggering signal in parameters **Q115** to **Q119**

Notes

NOTICE

Danger of collision!

The control moves the touch probe in a 3-D movement at rapid traverse to the pre-position programmed in the cycle. Depending on the previous position of the tool, there is danger of collision!

- Pre-position to a position where there is no danger of collision when the programmed pre-positioning point is approached

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- The probing axis defined in the cycle specifies the probing plane:
  Probing axis X: X/Y plane
  Probing axis Y: Y/Z plane
  Probing axis Z: Z/X plane

Cycle parameters

Help graphic	Parameter
	Probing axis? Enter the probing axis with the axis key or the alphabetic keyboard. Confirm with the **ENT** key. Input: **X**, **Y**, or **Z**
	Probing angle? Angle measured from the probing axis in which the touch probe will move. Input: **-180...+180**
	Position value? Use the axis keys or the alphabetic keyboard to enter all coordinates for pre-positioning of the touch probe. Input: **-999999999...+999999999**

Example

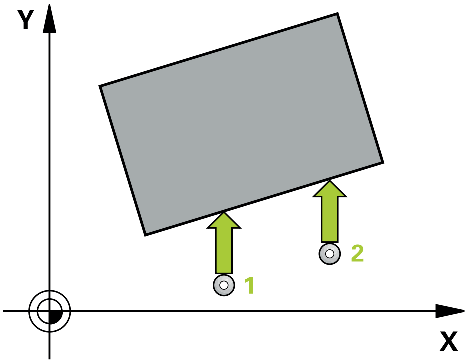
```
11 TCH PROBE 1.0 POLAR PRESET
12 TCH PROBE 1.1 X WINKEL:+30
13 TCH PROBE 1.2  X+0  Y+10  Z+3
```

29.4.4 Cycle 420 MEASURE ANGLE

Application

Touch probe cycle **420** measures the angle that any straight line on the workpiece forms with the main axis of the working plane.

Cycle sequence



1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from the **FMAX** column) to the programmed touch point **1**. The sum of **Q320**, **SET_UP** and the ball-tip radius is taken into account for probe movements in any probing direction. When the probe movement starts, the center of the ball tip will be offset by this sum in the direction opposite the probing direction.

   Further information: "Positioning logic", Page 1456
2 Next, the touch probe moves to the entered measuring height and probes the first touch point at the probing feed rate (**F** column).
3 The touch probe then moves to the next touch point **2** and probes again.
4 The control returns the touch probe to the clearance height and saves the measured angle in the following Q parameter:

Q parameter number	Meaning
Q150	The measured angle is referenced to the reference axis of the working plane.

Notes

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- If touch probe axis = measuring axis, you can measure the angle in the direction of the A axis or B axis:
  - If you want to measure the angle in the direction of the A axis, set **Q263** equal to **Q265** and **Q264** unequal to **Q266**.
  - If you want to measure the angle in the direction of the B axis, set **Q263** not equal to **Q265** and **Q264** equal to **Q266**.
- The control will reset an active basic rotation at the beginning of the cycle.

Note on programming

- Before defining this cycle, you must have programmed a tool call to define the touch probe axis.

Cycle parameters

Help graphic	Parameter
	**Q263 1st measuring point in 1st axis?** Coordinate of the first touch point in the main axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q264 1st measuring point in 2nd axis? Coordinate of the first touch point in the secondary axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q265 2nd measuring point in 1st axis? Coordinate of the second touch point in the main axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q266 2nd measuring point in 2nd axis? Coordinate of the second touch point in the secondary axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q272 Meas. axis (1/2/3, 1=ref. axis)? Axis in which the measurement will be made: **1**: Main axis = measuring axis **2**: Secondary axis = measuring axis **3**: Touch probe axis = measuring axis Input: **1**, **2**, **3**
	Q267 Trav. direction 1 (+1=+ / -1=-)? Direction in which the touch probe will approach the workpiece: **-1**: Negative traverse direction **+1**: Positive traverse direction Input: **-1**, **+1**
	**Q261 Measuring height in probe axis?** Coordinate of the ball tip center in the touch probe axis in which the measurement will be performed. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q320 Set-up clearance? Additional distance between measuring point and ball tip. The touch probe movement will start with an offset of the sum of **Q320**, **SET_UP**, and the ball-tip radius, even when probing in the tool axis direction. This value has an incremental effect. Input: **0...99999.9999** or **PREDEF**

Help graphic	Parameter
	Q260 Clearance height? Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect. Input: **-99999.9999...+99999.9999** or **PREDEF**
	Q301 Move to clearance height (0/1)? Specify how the touch probe moves between measuring points: 0: Move at measuring height between measuring points 1: Move at clearance height between measuring points Input: **0**, **1**

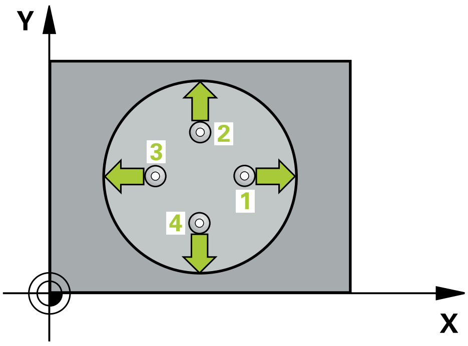
    Q281=+1               ;MEASURING LOG
```

29.4.5 Cycle 421 MEASURE HOLE

Application

Touch probe cycle **421** measures the center point and diameter of a hole (or circular pocket). If you define the corresponding tolerance values in the cycle, the control makes a nominal-to-actual value comparison and saves the deviation values in Q parameters.

Cycle sequence



1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from the **FMAX** column) to the touch point **1**. The control calculates the touch points from the data in the cycle and from the set-up clearance in the SET_UP column of the touch probe table.
   Further information: "Positioning logic", Page 1456
2 Next, the touch probe moves to the entered measuring height and probes the first touch point at the probing feed rate (**F** column). The control derives the probing direction automatically from the programmed starting angle.
3 Then, the touch probe moves in a circular arc either at measuring height or at clearance height to the next touch point **2** and probes again.
4 The control positions the touch probe to touch point **3** and then to touch point **4** to probe two more times.
5 Finally, the control returns the touch probe to the clearance height and saves the actual values and deviations in the following Q parameters:

Q parameter number	Meaning
Q151	Actual value of center in reference axis
Q152	Actual value of center in minor axis
Q153	Actual value of diameter
Q161	Deviation at center of reference axis
Q162	Deviation at center of minor axis
Q163	Deviation from diameter

Notes

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- The smaller the stepping angle, the less accurately the control can calculate the hole dimensions. Minimum input value: 5°.
- The control will reset an active basic rotation at the beginning of the cycle.

Notes on programming

- Before defining this cycle, you must have programmed a tool call to define the touch probe axis.
- If parameter **Q330** references a milling tool, the information in parameters **Q498** and **Q531** has no effect
- If parameter Q330 references a turning tool, the following applies:
  - Parameters **Q498** and **Q531** have to be defined
  - The information in parameters **Q498**, **Q531**, for example from Cycle **800**, has to match this information
  - If the control compensates the position of the turning tool, the corresponding values in rows **DZL** and **DXL**, respectively, will be compensated.
  - The control also monitors the breakage tolerance, which is defined in column **LBREAK**.

Cycle parameters

Help graphic	Parameter
	**Q273 Center in 1st axis (nom. value)?** Center of the hole in the main axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q274 Center in 2nd axis (nom. value)? Center of the hole in the secondary axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q262 Nominal diameter? Enter the diameter of the hole. Input: **0...99999.9999**
	Q325 Starting angle? Angle between the main axis of the working plane and the first touch point. The value has an absolute effect. Input: **-360.000...+360.000**
	Q247 Intermediate stepping angle? Angle between two measuring points. The algebraic sign of the stepping angle determines the direction of rotation (negative = clockwise) in which the touch probe moves to the next measuring point. If you wish to probe a circular arc instead of a complete circle, then program the stepping angle to be less than 90°. This value has an incremental effect. Input: **-120...+120**
	**Q261 Measuring height in probe axis?** Coordinate of the ball tip center in the touch probe axis in which the measurement will be performed. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q320 Set-up clearance? Additional distance between touch point and ball tip. **Q320** is in addition to the **SET_UP** column in the touch probe table. This value has an incremental effect. Input: **0...99999.9999** or **PREDEF**
	Q260 Clearance height? Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect. Input: **-99999.9999...+99999.9999** or **PREDEF**
	Q301 Move to clearance height (0/1)? Specify how the touch probe moves between measuring points: 0: Move at measuring height between measuring points 1: Move at clearance height between measuring points Input: **0**, **1**

Help graphic	Parameter
	Q275 Maximum limit of size for hole? Maximum permissible diameter for the hole (circular pocket) Input: **0...99999.9999**
	Q276 Minimum limit of size? Minimum permissible diameter for the hole (circular pocket) Input: **0...99999.9999**
	Q279 Tolerance for center 1st axis? Permissible position deviation in the main axis of the working plane. Input: **0...99999.9999**
	Q280 Tolerance for center 2nd axis? Permissible position deviation in the secondary axis of the working plane. Input: **0...99999.9999**
	Q281 Measuring log (0/1/2)? Define whether the control will create a measuring log: **0**: Do not create a measuring log **1**: Create a measuring log: The control will save the **log file named TCHPR421.TXT** by default in the directory that also contains the associated NC program. **2**: Interrupt program run and display the measuring log on the control screen. Resume the NC program run with **NC Start**. Input: **0**, **1**, **2**
	Q309 PGM stop if tolerance exceeded? Define whether in the event of a violation of tolerance limits the control will interrupt program run and output an error message: **0**: Do not interrupt program run; no error message **1**: Interrupt program run and output an error message Input: **0**, **1**
	Q330 Tool for monitoring? Define whether the control will monitor the tool Page 1609: **0**: Monitoring not active **> 0**: Number or name of the tool used for machining. Via a selection in the action bar, you have the option of applying a tool directly from the tool table. Input: **0...99999.9** or max. **255** characters

Help graphic	Parameter
	Q423 No. probe points in plane (4/3)? Define whether the control will use three or four touch points to measure the circle: **3**: Use three measuring points **4**: Use four measuring points (default setting) Input: **3**, **4**
	Q365 Type of traverse? Line=0/arc=1 Specify the path function to be used by the tool for moving between the measuring points if "traverse to clearance height" (**Q301** = 1) is active. **0**: Move in a straight line between machining operations **1**: Move along a circular arc on the pitch circle diameter between machining operations Input: **0**, **1**
	Q498 Reverse tool (0=no/1=yes)? Only relevant if you have entered a turning tool in parameter **Q330** before. For proper monitoring of the turning tool, the control requires the exact machining situation. Therefore, enter the following: **1**: Turning tool is mirrored (rotated by 180°) by, for example, Cycle **800** and parameter **Reverse the tool Q498** = 1 **0**: Turning tool corresponds to the description in the turning tool table (toolturn.trn); no modification by, for example , Cycle **800** and parameter **Reverse the tool Q498** = 0 Input: **0**, **1**
	Q531 Angle of incidence? Only relevant if you have entered a turning tool in parameter **Q330** before. Enter the angle of incidence (inclination angle) between turning tool and workpiece during machining (e.g., from Cycle **800**, **Angle of incidence? Q531**). Input: **-180...+180**

Example

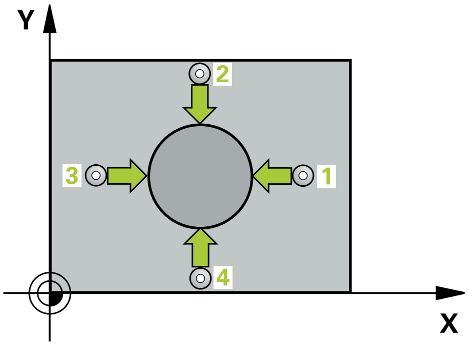
```
11 TCH PROBE 421 MEASURE HOLE ~
    Q273=+50                ;CENTER IN 1ST AXIS ~
    Q274=+50                ;CENTER IN 2ND AXIS ~
    Q262=+75                ;NOMINAL DIAMETER ~
    Q325=+0                 ;STARTING ANGLE ~
    Q247=+60                ;STEPPING ANGLE ~
    Q261=-5                 ;MEASURING HEIGHT ~
    Q320=+0                 ;SET-UP CLEARANCE ~
    Q260=+20                ;CLEARANCE HEIGHT ~
    Q301=+1                 ;MOVE TO CLEARANCE ~
    Q275=+75.12             ;MAXIMUM LIMIT ~
    Q276=+74.95             ;MINIMUM LIMIT ~
    Q279=+0.1               ;TOLERANCE 1ST CENTER ~
    Q280=+0.1               ;TOLERANCE 2ND CENTER ~
    Q281=+1                 ;MEASURING LOG ~
    Q309=+0                 ;PGM STOP TOLERANCE ~
    Q330=+0                 ;TOOL ~
    Q423=+4                 ;NO. OF PROBE POINTS ~
    Q365=+1                 ;TYPE OF TRAVERSE ~
    Q498=+0                 ;REVERSE TOOL ~
    Q531=+0                 ;ANGLE OF INCIDENCE
```

29.4.6 Cycle 422 MEAS. CIRCLE OUTSIDE

Application

Touch probe cycle **422** measures the center point and diameter of a circular stud. If you define the corresponding tolerance values in the cycle, the control makes a nominal-to-actual value comparison and saves the deviation values in Q parameters.

Cycle sequence



1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from the **FMAX** column) to the touch point **1**. The control calculates the touch points from the data in the cycle and from the set-up clearance in the **SET_UP** column of the touch probe table.

   Further information: "Positioning logic", Page 1456
2 Next, the touch probe moves to the entered measuring height and probes the first touch point at the probing feed rate (**F** column). The control derives the probing direction automatically from the programmed starting angle.
3 Then, the touch probe moves in a circular arc either at measuring height or at clearance height to the next touch point **2** and probes again.
4 The control positions the touch probe to touch point **3** and then to touch point **4** to probe two more times.
5 Finally, the control returns the touch probe to the clearance height and saves the actual values and deviations in the following Q parameters:

Q parameter number	Meaning
Q151	Actual value of center in reference axis
Q152	Actual value of center in minor axis
Q153	Actual value of diameter
Q161	Deviation at center of reference axis
Q162	Deviation at center of minor axis
Q163	Deviation from diameter

Notes

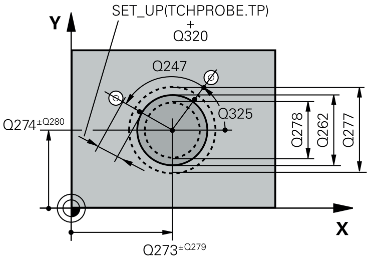
- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- The smaller the stepping angle, the less accurately the control can calculate the hole dimensions. Minimum input value: 5°.
- The control will reset an active basic rotation at the beginning of the cycle.

Notes on programming

- Before defining this cycle, you must have programmed a tool call to define the touch probe axis.
- If parameter **Q330** references a milling tool, the information in parameters **Q498** and **Q531** has no effect
- If parameter Q330 references a turning tool, the following applies:
  - Parameters **Q498** and **Q531** have to be defined
  - The information in parameters **Q498**, **Q531**, for example from Cycle **800**, has to match this information
  - If the control compensates the position of the turning tool, the corresponding values in rows **DZL** and **DXL**, respectively, will be compensated.
  - The control also monitors the breakage tolerance, which is defined in column **LBREAK**.

Cycle parameters

Help graphic | **Parameter**



Q273 Center in 1st axis (nom. value)?

Center of the stud in the main axis of the working plane. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q274 Center in 2nd axis (nom. value)?

Center of the stud in the secondary axis of the working plane. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q262 Nominal diameter?

Enter the diameter of the stud.

Input: **0...99999.9999**

Q325 Starting angle?

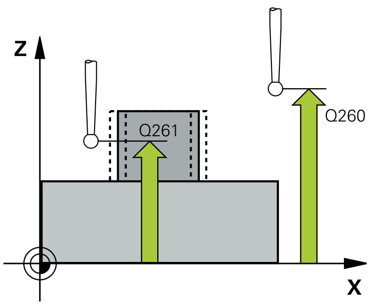
Angle between the main axis of the working plane and the first touch point. The value has an absolute effect.

Input: **-360.000...+360.000**

Q247 Intermediate stepping angle?

Angle between two measuring points. The algebraic sign of the stepping angle determines the machining direction (negative = clockwise). If you wish to probe a circular arc instead of a complete circle, then program the stepping angle to be less than 90°. This value has an incremental effect.

Input: **-120...+120**



Q261 Measuring height in probe axis?

Coordinate of the ball tip center in the touch probe axis in which the measurement will be performed. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q320 Set-up clearance?

Additional distance between touch point and ball tip. **Q320** is in addition to the **SET_UP** column in the touch probe table. This value has an incremental effect.

Input: **0...99999.9999** or **PREDEF**

Q260 Clearance height?

Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect.

Input: **-99999.9999...+99999.9999** or **PREDEF**

Q301 Move to clearance height (0/1)?

Specify how the touch probe moves between measuring points:

0: Move at measuring height between measuring points

1: Move at clearance height between measuring points

Input: **0**, **1**

Help graphic	Parameter
	Q277 Maximum limit of size for stud? Maximum permissible diameter for the stud. Input: **0...99999.9999**
	Q278 Minimum limit of size for stud? Minimum permissible diameter for the stud. Input: **0...99999.9999**
	Q279 Tolerance for center 1st axis? Permissible position deviation in the main axis of the working plane. Input: **0...99999.9999**
	Q280 Tolerance for center 2nd axis? Permissible position deviation in the secondary axis of the working plane. Input: **0...99999.9999**
	Q281 Measuring log (0/1/2)? Define whether the control will create a measuring log: **0**: Do not create a measuring log **1**: Create a measuring log: The control will save the **log file named TCHPR422.TXT** in the folder that also contains the associated NC program. **2**: Interrupt program run and display the measuring log on the control screen. Resume the NC program run with **NC Start**. Input: **0**, **1**, **2**
	Q309 PGM stop if tolerance exceeded? Define whether in the event of a violation of tolerance limits the control will interrupt program run and output an error message: **0**: Do not interrupt program run; no error message **1**: Interrupt program run and output an error message Input: **0**, **1**
	Q330 Tool for monitoring? Define whether the control will monitor the tool Page 1609. **0**: Monitoring not active **> 0**: Tool number in tool table TOOL.T Input: **0...99999.9** or max. **255** characters
	Q423 No. probe points in plane (4/3)? Define whether the control will use three or four touch points to measure the circle: **3**: Use three measuring points **4**: Use four measuring points (default setting) Input: **3**, **4**

Help graphic	Parameter
	Q365 Type of traverse? Line=0/arc=1 Specify the path function to be used by the tool for moving between the measuring points if "traverse to clearance height" (**Q301** = 1) is active. **0**: Move in a straight line between machining operations **1**: Move along a circular arc on the pitch circle diameter between machining operations Input: **0**, **1**
	Q498 Reverse tool (0=no/1=yes)? Only relevant if you have entered a turning tool in parameter **Q330** before. For proper monitoring of the turning tool, the control requires the exact machining situation. Therefore, enter the following: **1**: Turning tool is mirrored (rotated by 180°) by, for example, Cycle **800** and parameter **Reverse the tool Q498** = 1 **0**: Turning tool corresponds to the description in the turning tool table (toolturn.trn); no modification by, for example , Cycle **800** and parameter **Reverse the tool Q498** = 0 Input: **0**, **1**
	Q531 Angle of incidence? Only relevant if you have entered a turning tool in parameter **Q330** before. Enter the angle of incidence (inclination angle) between turning tool and workpiece during machining (e.g., from Cycle **800**, **Angle of incidence? Q531**). Input: **-180...+180**

```

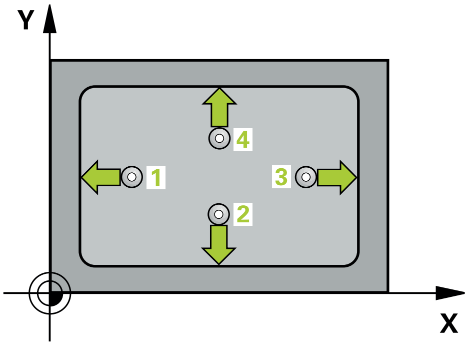
29.4.7 Cycle 423 MEAS. RECTAN. INSIDE

Application

Touch probe cycle **423** finds the center, length, and width of a rectangular pocket. If you define the corresponding tolerance values in the cycle, the control makes a nominal-to-actual value comparison and saves the deviation values in Q parameters.

Cycle sequence



1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from the **FMAX** column) to the touch point **1**. The control calculates the touch points from the data in the cycle and from the set-up clearance in the **SET_UP** column of the touch probe table.

   Further information: "Positioning logic", Page 1456

2 Next, the touch probe moves to the entered measuring height and probes the first touch point at the probing feed rate (**F** column).

3 Then the touch probe moves either paraxially at measuring height or at clearance height to the next touch point **2** and probes again.

4 The control positions the touch probe to touch point **3** and then to touch point **4** to probe two more times.

5 Finally, the control returns the touch probe to the clearance height and saves the actual values and deviations in the following Q parameters:

Q parameter number	Meaning
Q151	Actual value of center in reference axis
Q152	Actual value of center in minor axis
Q154	Actual value of side length in the reference axis
Q155	Actual value of side length in the minor axis
Q161	Deviation at center of reference axis
Q162	Deviation at center of minor axis
Q164	Deviation of side length in the reference axis
Q165	Deviation of side length in minor axis

Notes

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- If the dimensions of the pocket and the set-up clearance do not permit pre-positioning in the proximity of the touch points, the control always starts probing from the center of the pocket. In this case, the touch probe does not return to the clearance height between the four measuring points.
- Tool monitoring is dependent on the deviation of the first side length.
- The control will reset an active basic rotation at the beginning of the cycle.

Note on programming

- Before defining this cycle, you must have programmed a tool call to define the touch probe axis.

Cycle parameters

Help graphic	Parameter
	**Q273 Center in 1st axis (nom. value)?** Center of the pocket in the main axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q274 Center in 2nd axis (nom. value)? Center of the pocket in the secondary axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q282 1st side length (nominal value)? Pocket length, parallel to the main axis of the working plane Input: **0...99999.9999**
	Q283 2nd side length (nominal value)? Pocket length, parallel to the secondary axis of the working plane Input: **0...99999.9999**
	**Q261 Measuring height in probe axis?** Coordinate of the ball tip center in the touch probe axis in which the measurement will be performed. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q320 Set-up clearance? Additional distance between touch point and ball tip. **Q320** is in addition to the **SET_UP** column in the touch probe table. This value has an incremental effect. Input: **0...99999.9999** or **PREDEF**
	Q260 Clearance height? Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect. Input: **-99999.9999...+99999.9999** or **PREDEF**
	Q301 Move to clearance height (0/1)? Specify how the touch probe moves between measuring points: 0: Move at measuring height between measuring points 1: Move at clearance height between measuring points Input: **0**, **1**

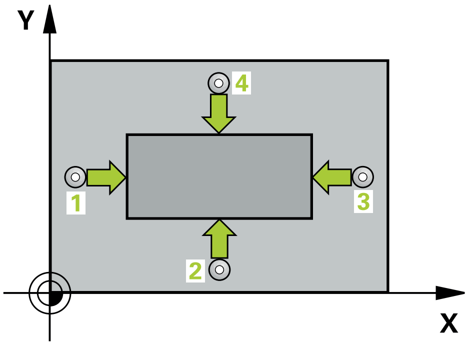
29.4.8 Cycle 424 MEAS. RECTAN. OUTS.

Application

Touch probe cycle **424** finds the center, length, and width of a rectangular stud.
If you define the corresponding tolerance values in the cycle, the control makes a nominal-to-actual value comparison and saves the deviation values in Q parameters.

Cycle sequence



1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from the **FMAX** column) to the touch point **1**. The control calculates the touch points from the data in the cycle and from the set-up clearance in the **SET_UP** column of the touch probe table.

   Further information: "Positioning logic", Page 1456
2 Next, the touch probe moves to the entered measuring height and probes the first touch point at the probing feed rate (**F** column).
3 Then the touch probe moves either paraxially at measuring height or at clearance height to the next touch point **2** and probes again.
4 The control positions the touch probe to touch point **3** and then to touch point **4** to probe two more times.
5 Finally, the control returns the touch probe to the clearance height and saves the actual values and deviations in the following Q parameters:

Q parameter number	Meaning
Q151	Actual value of center in reference axis
Q152	Actual value of center in minor axis
Q154	Actual value of side length in the reference axis
Q155	Actual value of side length in the minor axis
Q161	Deviation at center of reference axis
Q162	Deviation at center of minor axis
Q164	Deviation of side length in the reference axis
Q165	Deviation of side length in minor axis

Notes

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- Tool monitoring is dependent on the deviation of the first side length.
- The control will reset an active basic rotation at the beginning of the cycle.

Note on programming

- Before defining this cycle, you must have programmed a tool call to define the touch probe axis.

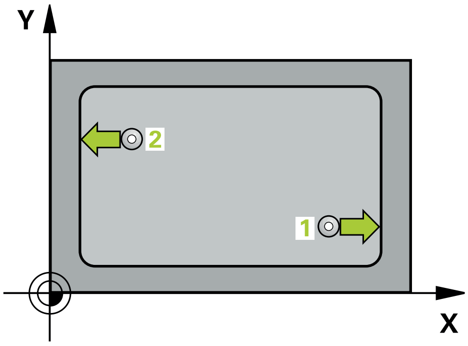
29.4.9 Cycle 425 MEASURE INSIDE WIDTH

Application

Touch probe cycle **425** measures the position and width of a slot (or pocket). If you define the corresponding tolerance values in the cycle, the control makes a nominal-to-actual value comparison and saves the deviation value in a Q parameter.

Cycle sequence



1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from the **FMAX** column) to the touch point **1**. The control calculates the touch points from the data in the cycle and from the set-up clearance in the **SET_UP** column of the touch probe table.

   Further information: "Positioning logic", Page 1456
2 Next, the touch probe moves to the entered measuring height and probes the first touch point at the probing feed rate (**F** column). The first probing is always in the positive direction of the programmed axis.
3 If you enter an offset for the second measurement, the control then moves the touch probe (if required, at clearance height) to the next touch point **2** and probes that point. If the nominal length is large, the control moves the touch probe to the second touch point at rapid traverse. If you do not enter an offset, the control measures the width in the exact opposite direction.
4 Finally, the control returns the touch probe to the clearance height and saves the actual values and deviations in the following Q parameters:

Q parameter number	Meaning
Q156	Actual value of measured length
Q157	Actual value of the centerline
Q166	Deviation of the measured length

Notes

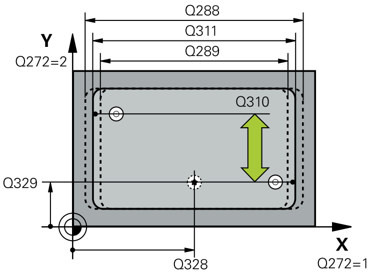
- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- The control will reset an active basic rotation at the beginning of the cycle.

Note on programming

- Before defining this cycle, you must have programmed a tool call to define the touch probe axis.

Cycle parameters

Help graphic	Parameter



Q328 Starting point in 1st axis?

Starting point for probing in the main axis of the working plane. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q329 Starting point in 2nd axis?

Starting point for probing in the secondary axis of the working plane. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q310 Offset for 2nd measuremnt (+/-)?

Distance by which the touch probe is offset before the second measurement. If you enter 0, the control does not offset the touch probe. This value has an incremental effect.

Input: **-99999.9999...+99999.9999**

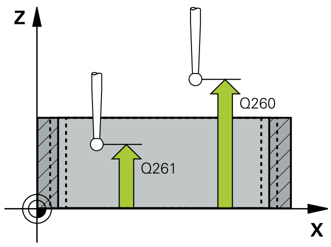
Q272 Measuring axis (1=1st / 2=2nd)?

Axis in the working plane in which the measurement will be performed:

1: Main axis = measuring axis

2: Secondary axis = measuring axis

Input: **1**, **2**



Q261 Measuring height in probe axis?

Coordinate of the ball tip center in the touch probe axis in which the measurement will be performed. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q260 Clearance height?

Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect.

Input: **-99999.9999...+99999.9999** or **PREDEF**

Q311 Nominal length?

Nominal value of the length to be measured

Input: **0...99999.9999**

Q288 Maximum limit of size?

Maximum permissible length

Input: **0...99999.9999**

Q289 Minimum limit of size?

Minimum permissible length

Input: **0...99999.9999**

Help graphic	Parameter
	Q281 Measuring log (0/1/2)? Define whether the control will create a measuring log: **0**: Do not create a measuring log **1**: Create a measuring log: The control will save the **log file named TCHPR425.TXT** in the folder that also contains the .h file **2**: Interrupt program run and display the measuring log on the control screen.     Q301=+0               ;MOVE TO CLEARANCE
```

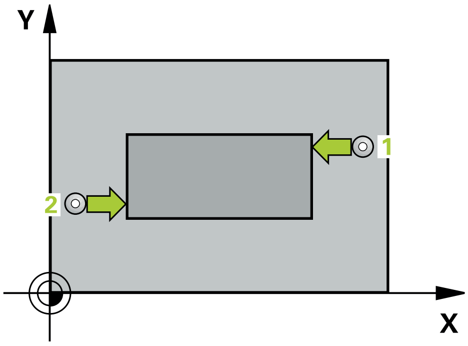
29.4.10 Cycle 426 MEASURE RIDGE WIDTH

Application

Touch probe cycle **426** measures the position and width of a ridge. If you define the corresponding tolerance values in the cycle, the control makes a nominal-to-actual value comparison and saves the deviation values in Q parameters.

Cycle sequence



1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from the **FMAX** column) to the touch point **1**. The control calculates the touch points from the data in the cycle and from the set-up clearance in the **SET_UP** column of the touch probe table.

   Further information: "Positioning logic", Page 1456

2 Next, the touch probe moves to the entered measuring height and probes the first touch point at the probing feed rate (**F** column). The first probing is always in the negative direction of the programmed axis.
3 Then the touch probe moves at clearance height to the next touch point and probes it.
4 Finally, the control returns the touch probe to the clearance height and saves the actual values and deviations in the following Q parameters:

Q parameter number	Meaning
Q156	Actual value of measured length
Q157	Actual value of the centerline
Q166	Deviation of the measured length

Notes

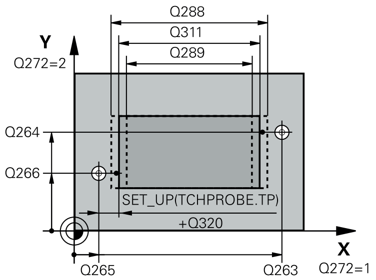
- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- The control will reset an active basic rotation at the beginning of the cycle.

Note on programming

- Before defining this cycle, you must have programmed a tool call to define the touch probe axis.

Cycle parameters

Help graphic | **Parameter**



Q263 1st measuring point in 1st axis?

Coordinate of the first touch point in the main axis of the working plane. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q264 1st measuring point in 2nd axis?

Coordinate of the first touch point in the secondary axis of the working plane. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q265 2nd measuring point in 1st axis?

Coordinate of the second touch point in the main axis of the working plane. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q266 2nd measuring point in 2nd axis?

Coordinate of the second touch point in the secondary axis of the working plane. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

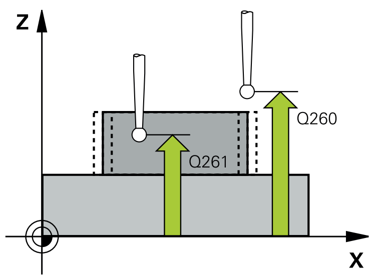
Q272 Measuring axis (1=1st / 2=2nd)?

Axis in the working plane in which the measurement will be performed:

1: Main axis = measuring axis

2: Secondary axis = measuring axis

Input: **1**, **2**



Q261 Measuring height in probe axis?

Coordinate of the ball tip center in the touch probe axis in which the measurement will be performed. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q320 Set-up clearance?

Additional distance between touch point and ball tip. **Q320** is in addition to the **SET_UP** column in the touch probe table. This value has an incremental effect.

Input: **0...99999.9999** or **PREDEF**

Q260 Clearance height?

Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect.

Input: **-99999.9999...+99999.9999** or **PREDEF**

Q311 Nominal length?

Nominal value of the length to be measured

Input: **0...99999.9999**

Q288 Maximum limit of size?

Maximum permissible length

Input: **0...99999.9999**

Help graphic	Parameter
	Q289 Minimum limit of size? Minimum permissible length Input: **0...99999.9999**
	Q281 Measuring log (0/1/2)? Define whether the control will create a measuring log: **0**: Do not create a measuring log **1**: Create a measuring log: The control will save the **log file named TCHPR426.TXT** in the folder that also contains the associated NC program. **2**: Interrupt program run and display the measuring log on the control screen. Resume the NC program run with **NC Start**. Input: **0**, **1**, **2**
	Q309 PGM stop if tolerance exceeded? Define whether in the event of a violation of tolerance limits the control will interrupt program run and output an error message: **0**: Do not interrupt program run; no error message **1**: Interrupt program run and output an error message Input: **0**, **1**
	Q330 Tool for monitoring? Define whether the control will monitor the tool Page 1609: **0**: Monitoring not active **> 0**: Number or name of the tool used for machining. Via a selection in the action bar, you have the option of applying a tool directly from the tool table. Input: **0...99999.9** or max. **255** characters

```

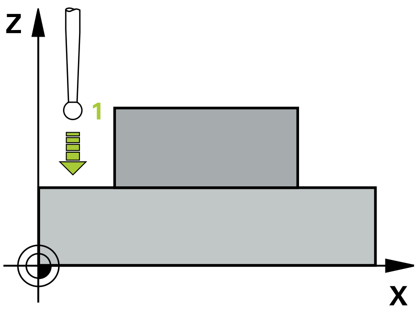
29.4.11 Cycle 427 MEASURE COORDINATE

Application

Touch probe cycle **427** measures a coordinate in a selectable axis and saves the value in a Q parameter. If you define the corresponding tolerance values in the cycle, the control makes a nominal-to-actual value comparison and saves the deviation values in Q parameters.

Cycle sequence



1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from the **FMAX** column) to the touch point **1**. The control offsets the touch probe by the set-up clearance in the direction opposite the defined traverse direction

   Further information: "Positioning logic", Page 1456
2 Then the control positions the touch probe to the specified touch point **1** in the working plane and measures the actual value in the selected axis.
3 Finally, the control returns the touch probe to the clearance height and saves the measured coordinate in the following Q parameter:

Q parameter number	Meaning
Q160	Measured coordinate

Notes

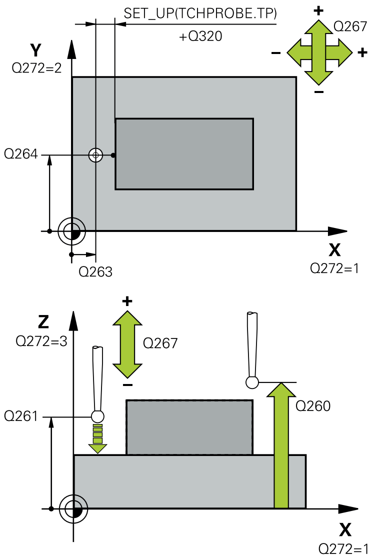
- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- If an axis of the active working plane is defined as the measuring axis (**Q272** = 1 or 2), the control will perform a tool radius compensation. The control determines the direction of compensation from the defined traversing direction (**Q267**).
- If the touch probe axis is defined as the measuring axis (**Q272** = 3), the control will perform a tool length compensation.
- The control will reset an active basic rotation at the beginning of the cycle.

Notes on programming

- Before defining this cycle, you must have programmed a tool call to define the touch probe axis.
- If parameter **Q330** references a milling tool, the information in parameters **Q498** and **Q531** has no effect
- If parameter Q330 references a turning tool, the following applies:
  - Parameters **Q498** and **Q531** have to be defined
  - The information in parameters **Q498**, **Q531**, for example from Cycle **800**, has to match this information
  - If the control compensates the position of the turning tool, the corresponding values in rows **DZL** and **DXL**, respectively, will be compensated.
  - The control also monitors the breakage tolerance, which is defined in column **LBREAK**.

Cycle parameters

Help graphic



Parameter

Q263 1st measuring point in 1st axis?

Coordinate of the first touch point in the main axis of the working plane. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q264 1st measuring point in 2nd axis?

Coordinate of the first touch point in the secondary axis of the working plane. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q261 Measuring height in probe axis?

Coordinate of the ball tip center in the touch probe axis in which the measurement will be performed. The value has an absolute effect.

Input: **-99999.9999...+99999.9999**

Q320 Set-up clearance?

Additional distance between touch point and ball tip. **Q320** is in addition to the **SET_UP** column in the touch probe table. This value has an incremental effect.

Input: **0...99999.9999** or **PREDEF**

Q272 Meas. axis (1/2/3, 1=ref. axis)?

Axis in which the measurement will be made:

1: Main axis = measuring axis

2: Secondary axis = measuring axis

3: Touch probe axis = measuring axis

Input: **1**, **2**, **3**

Q267 Trav. direction 1 (+1=+ / -1=-)?

Direction in which the touch probe will approach the workpiece:

-1: Negative traverse direction

+1: Positive traverse direction

Input: **-1**, **+1**

Q260 Clearance height?

Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect.

Input: **-99999.9999...+99999.9999** or **PREDEF**

Help graphic	Parameter
	Q281 Measuring log (0/1/2)? Define whether the control will create a measuring log: **0**: Do not create a measuring log **1**: Create a measuring log: The control will save the **log file named TCHPR427.TXT** in the folder that also contains the associated NC program. **2:** Interrupt the program run and display the measuring log on the control screen.Resume the NC program run with **NC Start**. Input: **0**, **1**, **2**
	Q288 Maximum limit of size? Maximum permissible value Input: **-99999.9999...+99999.9999**
	Q289 Minimum limit of size? Minimum permissible value Input: **-99999.9999...+99999.9999**
	Q309 PGM stop if tolerance exceeded? Define whether in the event of a violation of tolerance limits the control will interrupt program run and output an error message: **0**: Do not interrupt program run; no error message **1**: Interrupt program run and output an error message Input: **0**, **1**
	Q330 Tool for monitoring? Define whether the control will monitor the tool Page 1609: **0**: Monitoring not active **> 0**: Number or name of the tool used for machining. Via a selection in the action bar, you have the option of applying a tool directly from the tool table. Input: **0...99999.9** or max. **255** characters

Help graphic	Parameter
	Q498 Reverse tool (0=no/1=yes)? Only relevant if you have entered a turning tool in parameter **Q330** before. For proper monitoring of the turning tool, the control requires the exact machining situation. Therefore, enter the following: **1**: Turning tool is mirrored (rotated by 180°) by, for example, Cycle **800** and parameter **Reverse the tool Q498** = 1 **0**: Turning tool corresponds to the description in the turning tool table (toolturn.trn); no modification by, for example , Cycle **800** and parameter **Reverse the tool Q498** = 0 Input: **0**, **1**
	Q531 Angle of incidence? Only relevant if you have entered a turning tool in parameter **Q330** before. Enter the angle of incidence (inclination angle) between turning tool and workpiece during machining (e.g., from Cycle **800**, **Angle of incidence? Q531**). Input: **-180...+180**

Example

```
11 TCH PROBE 427 MEASURE COORDINATE ~

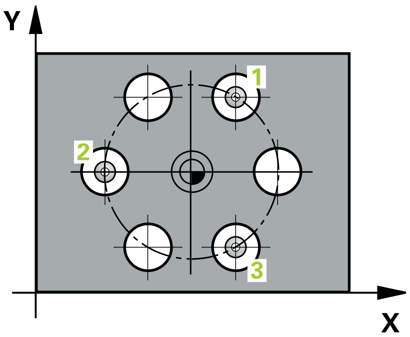
    Q267=-1             ;TRAVERSE DIRECTION ~
    Q260=+20            ;CLEARANCE HEIGHT ~
    Q281=+1             ;MEASURING LOG ~
    Q288=+5.1           ;MAXIMUM LIMIT ~
    Q289=+4.95          ;MINIMUM LIMIT ~
    Q309=+0             ;PGM STOP TOLERANCE ~
    Q330=+0             ;TOOL ~
    Q498=+0             ;REVERSE TOOL ~
    Q531=+0             ;ANGLE OF INCIDENCE
```

29.4.12 Cycle 430 MEAS. BOLT HOLE CIRC

Application

Touch probe cycle **430** finds the center and diameter of a bolt hole circle by probing three holes. If you define the corresponding tolerance values in the cycle, the control makes a nominal-to-actual value comparison and saves the deviation values in Q parameters.

Cycle sequence



1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from **FMAX** column) to the programmed center point of the first hole **1**.

   Further information: "Positioning logic", Page 1456
2 Then the probe moves to the entered measuring height and probes four points to determine the first hole center point.
3 The touch probe returns to the clearance height and then to the position entered as center of the second hole **2**.
4 The control moves the touch probe to the entered measuring height and probes four points to determine the second hole center point.
5 The touch probe returns to the clearance height and then to the position entered as center of the third hole **3**.
6 The control moves the touch probe to the entered measuring height and probes four points to determine the third hole center point.
7 Finally, the control returns the touch probe to the clearance height and saves the actual values and deviations in the following Q parameters:

Q parameter number	Meaning
Q151	Actual value of center in reference axis
Q152	Actual value of center in minor axis
Q153	Actual value of bolt hole circle diameter
Q161	Deviation at center of reference axis
Q162	Deviation at center of minor axis
Q163	Deviation of bolt circle diameter

Notes

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- Cycle **430** only monitors for tool breakage; there is no automatic tool compensation.
- The control will reset an active basic rotation at the beginning of the cycle.

Note on programming

- Before defining this cycle, you must have programmed a tool call to define the touch probe axis.

```

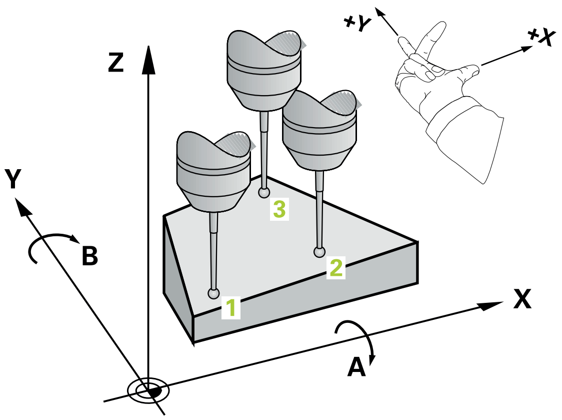
29.4.13 Cycle 431 MEASURE PLANE

Application

Touch probe cycle **431** finds the angles of a plane by measuring three points. It saves the measured values in the Q parameters.

Cycle sequence



1 Following the positioning logic, the control positions the touch probe at rapid traverse (value from the **FMAX** column) at the programmed touch point **1** and measures the first point of the plane. The control offsets the touch probe by the set-up clearance in the direction opposite to the direction of probing.

   Further information: "Positioning logic", Page 1456
2 The touch probe returns to the clearance height and then moves in the working plane to touch point **2** and measures the actual value of the second touch point in the plane.
3 The touch probe returns to the clearance height and then moves in the working plane to touch point **3** and measures the actual value of the third touch point in the plane.
4 Finally the control returns the touch probe to the clearance height and saves the measured angle values in the following Q parameters:

Q parameter number	Meaning
Q158	Projection angle of the A axis
Q159	Projection angle of the B axis
Q170	Spatial angle A
Q171	Spatial angle B
Q172	Spatial angle C
Q173 to **Q175**	Measured values in the touch probe axis (first to third measurement)

Notes

NOTICE

Danger of collision!

If you save the angle values in the preset table and then tilt the tool by programming **PLANE SPATIAL** with **SPA** = 0; **SPB** = 0; **SPC** = 0, there are multiple solutions in which the tilting axes are at 0.

- Make sure to program **SYM** (**SEQ**) + or **SYM** (**SEQ**) -

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- The control can calculate the angle values only if the three measuring points are not positioned on a straight line.
- The control will reset an active basic rotation at the beginning of the cycle.

Notes on programming

- Before defining this cycle, you must have programmed a tool call to define the touch probe axis.
- The spatial angles that are needed for the **Tilt working plane** function are saved in parameters **Q170** to **Q172**. With the first two measuring points, you also specify the direction of the main axis when tilting the working plane.
- The third measuring point determines the direction of the tool axis. Define the third measuring point in the direction of the positive Y axis to ensure that the position of the tool axis in a clockwise coordinate system is correct.

29.5 Touch Probe Cycles: Special Functions

29.5.1 Fundamentals

Overview

The control must be specifically prepared by the machine manufacturer for the use of a touch probe.

HEIDENHAIN only guarantees the proper operation of the touch probe cycles in conjunction with HEIDENHAIN touch probes.

NOTICE

Danger of collision!

When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active.

- The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**.
- Reset any coordinate transformations beforehand.

The control provides cycles for the following special purposes:

Cycle		Call	Further information
3	**MEASURING** ▪ Touch probe cycle for defining OEM cycles	**DEF-**active	Page 1663
4	**MEASURING IN 3-D** ▪ Measuring any position	**DEF-**active	Page 1665
444	**PROBING IN 3-D** ▪ Measuring any position ▪ Determining the deviation from the nominal coordinates	**DEF-**active	Page 1668
441	**FAST PROBING** ▪ Touch probe cycle for defining various touch probe parameters	**DEF-**active	Page 1674
1493	**EXTRUSION PROBING** ▪ Touch probe cycle for defining an extrusion ▪ Extrusion direction, length, and number of extrusion points can be programmed	**DEF-**active	Page 1676

29.5.2 Cycle 3 MEASURING

Application

Touch probe cycle **3** measures any position on the workpiece in a selectable probing direction. Unlike other touch probe cycles, Cycle **3** enables you to enter the measuring range **SET UP** and feed rate **F** directly. Also, the touch probe retracts by a definable value **MB** after determining the measured value.

Cycle sequence

1 The touch probe moves from the current position at the specified feed rate in the defined probing direction. Use polar angles to define the probing direction in the cycle.
2 After the control has saved the position, the touch probe stops. The control saves the X, Y, Z coordinates of the probe-tip center in three successive Q parameters. The control does not conduct any length or radius compensations. You define the number of the first result parameter in the cycle.
3 Finally, the control retracts the touch probe by the value that you defined in parameter **MB** in the direction opposite to the probing direction.

Notes

> The exact behavior of touch probe cycle **3** is defined by your machine tool builder or a software manufacturer who uses it within specific touch probe cycles.

- This cycle can only be executed in the **FUNCTION MODE MILL** and **FUNCTION MODE TURN** machining modes.
- The **DIST** (maximum traverse to touch point) and **F** (probing feed rate) touch-probe data, which are effective in other touch probe cycles, do not apply in touch probe cycle **3**.
- Remember that the control always writes to four successive Q parameters.
- If the control was not able to determine a valid touch point, the NC program is run without error message. In this case the control assigns the value –1 to the fourth result parameter so that you can deal with the error yourself.
- The control retracts the touch probe by at most the retraction distance **MB**, but not beyond the starting point of the measurement. This rules out any collision during retraction.

> With function **FN17: SYSWRITE ID 990 NR 6** you can set whether the cycle sequences through the probe input X12 or X13.

Cycle parameters

Help graphic	Parameter
	Parameter number for result? Enter the number of the Q parameter to which you want the control to assign the first measured coordinate (X). The Y and Z values will be written to the immediately following Q parameters. Input: **0...1999**
	Probing axis? Enter the axis in whose direction the touch probe will move and confirm with the **ENT** key. Input: **X**, **Y**, or **Z**
	Probing angle? Angle measured from the defined **probing axis** in which the touch probe will move. Confirm with **ENT**. Input: **-180...+180**
	Maximum measuring range? Enter the maximum distance from the starting point by which the touch probe will move. Confirm with ENT. Input: **-999999999...+999999999**
	Feed rate measurement Enter the measuring feed rate in mm/min. Input: **0...3000**
	Maximum retraction distance? Traverse path in the direction opposite the probing direction, after the stylus was deflected. The control returns the touch probe to a point no farther than the starting point, so that there can be no collision. Input: **0...999999999**
	Reference system? (0=ACT/1=REF) Define whether the probing direction and measurement result will be referenced to the current coordinate system (**ACT**, can be shifted or rotated) or the machine coordinate system (**REF**): **0**: Perform the probing operation in the current system and save the measurement result in the **ACT** system **1**: Perform the probing operation in the machine-based REF system. Save the measurement result in the REF system. Input: **0**, **1**

Help graphic	Parameter
	Error mode? (0=OFF/1=ON) Define whether the control will issue an error message if the stylus is deflected at cycle start. If mode **1** is selected, the control saves the value **-1** in the 4th result parameter and continues the cycle: **0**: Issue error message **1**: Do not issue error message Input: **0**, **1**

Example

```
11 TCH PROBE 3.0 MEASURING
12 TCH PROBE 3.1 Q1
13 TCH PROBE 3.2 X ANGLE:+15
14 TCH PROBE 3.3 ABST+10 F100 MB1 REFERENCE SYSTEM:0
15 TCH PROBE 3.4 ERRORMODE1
```

29.5.3 Cycle 4 MEASURING IN 3-D

Application

Touch probe cycle **4** measures any position on the workpiece in the probing direction defined by a vector. Unlike other touch probe cycles, Cycle **4** enables you to enter the probing distance and probing feed rate directly. You can also define the distance by which the touch probe retracts after acquiring the probed value.

Cycle **4** is an auxiliary cycle that can be used for probing with any touch probe (TS or TT). The control does not provide a cycle for calibrating the TS touch probe in any probing direction.

Cycle sequence

1 The control moves the touch probe from the current position at the entered feed rate in the defined probing direction. Define the probing direction in the cycle by using a vector (delta values in X, Y and Z).

2 After the control has saved the position, the control stops the probe movement. The control saves the X, Y, Z coordinates of the probing position in three successive Q parameters. You define the number of the first parameter in the cycle. If you are using a TS touch probe, the probe result is corrected by the calibrated center offset.

3 Finally, the control retracts the touch probe in the direction opposite to the direction of probing. You define the traverse distance in parameter **MB**—the touch probe is moved to a point no farther than the starting point.

> Ensure during pre-positioning that the control moves the probe-tip center without compensation to the defined position.

Notes

NOTICE
Danger of collision! If the control was not able to determine a valid touch point, the 4th result parameter will have the value –1. The control does **not** interrupt the program run! ▶ Make sure that all touch points can be reached.

- This cycle can only be executed in the **FUNCTION MODE MILL** and **FUNCTION MODE TURN** machining modes.
- The control retracts the touch probe by at most the retraction distance **MB**, but not beyond the starting point of the measurement. This rules out any collision during retraction.
- Remember that the control always writes to four successive Q parameters.

Cycle parameters

Help graphic	Parameter
	Parameter number for result? Enter the number of the Q parameter to which you want the control to assign the first measured coordinate (X). The Y and Z values will be written to the immediately following Q parameters. Input: **0...1999**
	Relative measuring path in X? X component of the direction vector defining the direction in which the touch probe will move. Input: **-999999999...+999999999**
	Relative measuring path in Y? Y component of the direction vector defining the direction in which the touch probe will move. Input: **-999999999...+999999999**
	Relative measuring path in Z? Z component of the direction vector defining the direction in which the touch probe will move. Input: **-999999999...+999999999**
	Maximum measuring range? Enter the maximum distance from the starting point by which the touch probe will move along the direction vector. Input: **-999999999...+999999999**
	Feed rate measurement Enter the measuring feed rate in mm/min. Input: **0...3000**
	Maximum retraction distance? Traverse path in the direction opposite the probing direction, after the stylus was deflected. Input: **0...999999999**
	Reference system? (0=ACT/1=REF) Define whether the result of probing will be saved in the input coordinate system (**ACT**), or with respect to the machine coordinate system (**REF**): **0**: Save the measurement result in the **ACT** system **1**: Save the measurement result in the **REF** system Input: **0**, **1**

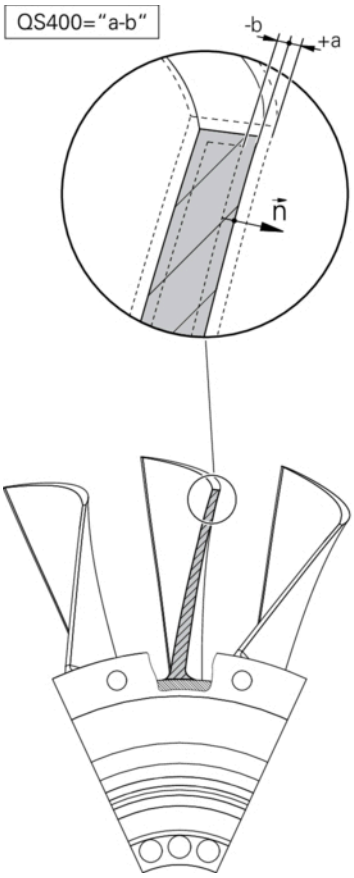
Example

```
11 TCH PROBE 4.0 MEASURING IN 3-D
12 TCH PROBE 4.1 Q1
13 TCH PROBE 4.2 IX-0.5 IY-1 IZ-1
14 TCH PROBE 4.3 ABST+45 F100 MB50 REFERENCE SYSTEM:0
```

29.5.4 Cycle 444 PROBING IN 3-D

Application

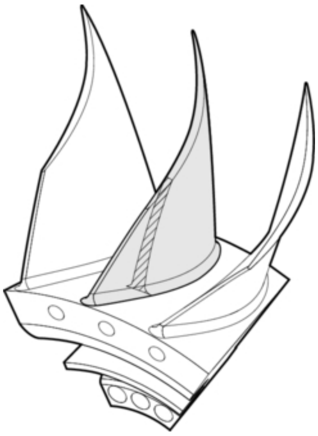
> Refer to your machine manual.
> This function must be enabled and adapted by the machine manufacturer.



Cycle **444** checks one specific point on the surface of a component. This cycle is used, for example, to measure free-form surfaces of molded parts. It can be determined whether a point on the surface of the component lies in an undersize or oversize range compared to a nominal coordinate. The operator can subsequently perform further machining steps, such as reworking.

Cycle **444** probes any point in three dimensions, and determines the deviation from a nominal coordinate. A normal vector, defined in parameters **Q581**, **Q582**, and **Q583**, is used for this purpose. The normal vector is perpendicular to an imagined surface in which the nominal coordinate is located. The normal vector points away from the surface, and does not determine the probing path. It is advisable to determine the normal vector with the help of a CAD or CAM system. A tolerance range **QS400** defines the permissible deviation between the actual and nominal coordinate along the normal vector. This way you define, for example, that the program is to be interrupted if an undersize is detected. Additionally, the control outputs a log and the deviations are stored in the Q parameters listed below.

Cycle sequence



1 Starting from the current position, the touch probe traverses to a point on the normal vector that is at the following distance from the nominal coordinate: Distance = ball-tip radius + **SET_UP** value from the tchprobe.tp table (TNC:\table \tchprobe.tp) + **Q320**. Pre-positioning takes a clearance height into account.Page 1456
2 The touch probe then approaches the nominal coordinate. The probing distance is defined by DIST, not by the normal vector! The normal vector is only used for the correct calculation of the coordinates.
3 After the control has saved the position, the touch probe is retracted and stopped. The control saves the measured coordinates of the contact point in Q parameters.
4 Finally, the control retracts the touch probe by the value that you defined in parameter **MB** in the direction opposite to the probing direction.

Result parameters

The control stores the probing results in the following parameters:

Q parameter number	Meaning
Q151	Measured position in main axis
Q152	Measured position in secondary axis
Q153	Measured position in tool axis
Q161	Measured deviation in main axis
Q162	Measured deviation in secondary axis
Q163	Measured deviation in tool axis
Q164	Measured 3-D deviation ■ Less than 0: Undersize ■ Greater than 0: Oversize
Q183	Workpiece status: ■ - 1 = undefined ■ 0 = good ■ 1 = Rework ■ 2 = Scrap

Log function

Once probing has finished, the control generates a log in HTML format. The log includes the results from the main, secondary, and tool axes as well as the 3-D deviation. The control saves the log in the same folder in which the *.h file is located (as long as no path has been configured for FN16).

The log contains the following data on the main, secondary, and tool axes:

- Actual probing direction (as a vector in the input system). The value of the vector corresponds to the configured probing path
- Defined nominal coordinate
- If a tolerance **QS400** was defined: Upper and lower dimensions are output, as well as the determined deviation along the normal vector
- Ascertained actual coordinate
- Colored display of the values (green for "good," orange for "rework," red for "scrap")

Notes

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- In order to obtain exact results from the touch probe being used, you need to perform 3-D calibration before executing Cycle **444**. Software option 92, **3D#ToolComp**, is required for 3-D calibration.
- Cycle **444** generates a measuring log in HTML format.
- An error message is output if Cycle **8 MIRRORING**, Cycle **11 SCALING FACTOR**, or Cycle **26 AXIS-SPECIFIC SCALING** is active before Cycle **444** is run.
- For probing, an active TCPM will be taken into account. While the TCPM is active, probing of positions is possible even if the position resulting from the **Tilt working plane** function is inconsistent with the current position of the rotary axes.
- If your machine is equipped with a feedback-controlled spindle, you should activate the angle tracking in the touch probe table (**TRACK column**). This generally increases the accuracy of measurements with a 3-D touch probe.
- Cycle **444** references all coordinates to the input system.
- The control writes the measured values to return parameters, Page 1668.
- The workpiece status (good/rework/scrap) is set via Q parameter **Q183**, independent of parameter **Q309** (Page 1668).

Note regarding machine parameters

- Depending on the setting of the optional machine parameter **chkTiltingAxes** (no. 204600), the control will check during probing whether the position of the rotary axes matches the tilting angles (3D-ROT). If that is not the case, the control displays an error message.

Cycle parameters

Help graphic	Parameter
	Q263 1st measuring point in 1st axis? Coordinate of the first touch point in the main axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q264 1st measuring point in 2nd axis? Coordinate of the first touch point in the secondary axis of the working plane. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q294 1st measuring point in 3rd axis? Coordinate of the first touch point in the touch probe axis. The value has an absolute effect. Input: **-99999.9999...+99999.9999**
	Q581 Surface-normal in ref. axis? Enter here the surface normal in the direction of the main axis. The surface normal of a point is normally output by a CAD/CAM system. Input: **-10...+10**
	Q582 Surface-normal in minor axis? Enter here the surface normal in the direction of the secondary axis. The surface normal of a point is normally output by a CAD/CAM system. Input: **-10...+10**
	Q583 Surface-normal in tool axis? Enter here the surface normal in the direction of the tool axis. The surface normal of a point is normally output by a CAD/CAM system. Input: **-10...+10**
	Q320 Set-up clearance? Additional distance between touch point and ball tip. **Q320** is in addition to the **SET_UP** column in the touch probe table. This value has an incremental effect. Input: **0...99999.9999** or **PREDEF**
	Q260 Clearance height? Coordinate in the tool axis at which no collision between touch probe and workpiece (fixtures) can occur. The value has an absolute effect. Input: **-99999.9999...+99999.9999** or **PREDEF**

Help graphic	Parameter
	QS400 Tolerance value? Specify a tolerance band that will be monitored by the cycle. The tolerance defines the deviation permitted along the surface normal. This deviation is determined between the nominal coordinate and the actual coordinate of the workpiece. (The surface normal is defined by **Q581** to **Q583**, and the nominal coordinate is defined by **Q263**, **Q264**, and **Q294**.) The tolerance value is distributed over the axes, depending on the normal vector (see examples). **Examples** ■ **QS400 ="0.4-0.1"** means: Upper dimension = nominal coordinate +0.4; lower dimension = nominal coordinate –0.1. The following tolerance band thus results for the cycle: "nominal coordinate +0.4" to "nominal coordinate –0.1" ■ **QS400 ="0.4"** means: Upper dimension = nominal coordinate +0.4; lower dimension = nominal coordinate. The following tolerance band thus results for the cycle: "nominal coordinate +0.4" to "nominal coordinate". ■ **QS400 ="-0.1"** means: Upper dimension = nominal coordinate; lower dimension = nominal coordinate –0.1. The following tolerance band thus results for the cycle: "nominal coordinate" to "nominal coordinate -0.1". ■ **QS400 =" "** means: No tolerance band. ■ **QS400 ="0"** means: No tolerance band. ■ **QS400 ="0.1+0.1"** means: No tolerance band. Input: Max. **255** characters
	Q309 Reaction to tolerance error? Define whether in the event of a violation of tolerance limits the control will interrupt program run and output an error message: **0**: Do not interrupt program run when tolerance is exceeded; do not output an error message **1**: Interrupt program run when tolerance is exceeded and output an error message **2:** If the value of the measured actual coordinate along the surface normal vector is less than the nominal coordinate, the control displays a message and interrupts the NC program run. However, there will be no error message if the value of the measured actual coordinate is greater than the nominal coordinate. Input: **0**, **1**, **2**

Example

11 TCH PROBE 444 PROBING IN 3-D ~	
Q263=+0	;1ST POINT 1ST AXIS ~
Q264=+0	;1ST POINT 2ND AXIS ~
Q294=+0	;1ST POINT 3RD AXIS ~
Q581=+1	;NORMAL IN REF. AXIS ~
Q582=+0	;NORMAL IN MINOR AXIS ~
Q583=+0	;NORMAL IN TOOL AXIS ~
Q320=+0	;SAFETY CLEARANCE ~
Q260=+100	;CLEARANCE HEIGHT ~
QS400="1-1"	;TOLERANCE ~
Q309=+0	;ERROR REACTION

29.5.5 Cycle 441 FAST PROBING

Application

You can use touch probe cycle **441** to globally specify various touch probe parameters (e.g. the positioning feed rate) for all subsequently used touch probe cycles.

The purpose of Cycle **441** is to set parameters for probing cycles. In this cycle, no machine movements will be performed.

Notes

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- **END PGM**, **M2**, **M30** reset the global settings of Cycle **441**.
- Cycle parameter **Q399** depends on your machine configuration. Your machine tool builder is responsible for the setting of whether the touch probe can be oriented through an NC program.
- Even if your machine has separate potentiometers for rapid traverse and feed rate, you can control the feed rate with the feed rate potentiometer only, even with **Q397**=1.

Note regarding machine parameters

- The machine parameter **maxTouchFeed** (no. 122602) allows the machine manufacturer to limit the feed rate. You define the maximum absolute feed rate in this machine parameter.

Cycle parameters

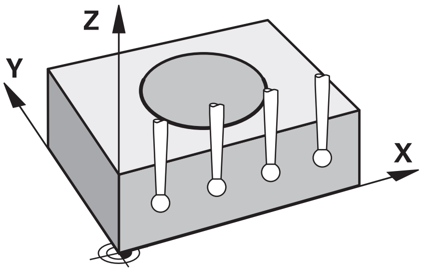
Help graphic	Parameter
	Q396 Positioning feed rate? Define the feed rate at which the touch probe will be moved to the specified positions. Input: **0...99999.999**
	Q397 Pre-pos. at machine's rapid? Define whether the control, when prepositioning the touch probe, traverses at **FMAX** feed rate (machine's rapid traverse): **0**: Pre-position at the feed rate from **Q396** **1**: Pre-position at the machine's rapid traverse **FMAX** Input: **0**, **1**
	Q399 Angle tracking (0/1)? Define whether the control will orient the touch probe before every probing operation: **0**: Do not orient the spindle **1**: Orient the spindle before every probing operation (increased accuracy)? Input: **0**, **1**
	Q400 Automatic interruption? Define whether the control will interrupt program run and output the measurement results on the screen following a touch probe cycle for automatic workpiece measurement: **0**: Do not interrupt program run even if, in the specific touch probe cycle, the output of measurement results on the screen is selected **1**: Interrupt program run and output measurement results on the screen. You can then resume the NC program run with **NC Start**. Input: **0**, **1**

Example

```
11 TCH PROBE 441 FAST PROBING ~
    Q396=+3000          ;POSITIONING FEEDRATE ~
    Q397=+0             ;SELECT FEED RATE ~
    Q399=+1             ;ANGLE TRACKING ~
    Q400=+1             ;INTERRUPTION
```

29.5.6 Cycle 1493 EXTRUSION PROBING

Application



Cycle **1493** allows you to repeat the touch points of specific touch probe cycles along a straight line. In the cycle, you define the direction and the length of the extrusion, as well as the number of extrusion points.

The repetitions allow you, for example, to perform multiple measurements at different heights and to determine deviations based on the deflection of the tool. You can also use the extrusion to increase the accuracy during probing. Multiple measuring points help you ascertain contamination on the workpiece or rough surfaces.

In order to activate the repetition of specific touch points, you need to define Cycle **1493** before the probing cycle. Depending on the definition, this cycle will remain active for only the next cycle or for the entire NC program. The control interprets the extrusion in the input coordinate system **I-CS**.

The following cycles are capable of performing extrusions:

- **PROBING IN PLANE** (Cycle **1420**, option 17), see Page 1472
- **PROBING ON EDGE** (Cycle **1410**), see Page 1478
- **PROBING TWO CIRCLES** (Cycle **1411**), see Page 1485
- **INCLINED EDGE PROBING** (Cycle **1412**), see Page 1493
- **POSITION PROBING** (Cycle **1400**), see Page 1525
- **CIRCLE PROBING** (Cycle **1401**), see Page 1529

Result parameters

The control stores the results of the probing cycle in the following Q parameters:

Q parameter number	Meaning
Q970	Maximum deviation from the ideal line of touch point 1
Q971	Maximum deviation from the ideal line of touch point 2
Q972	Maximum deviation from the ideal line of touch point 3
Q973	Maximum deviation of diameter 1
Q974	Maximum deviation of diameter 2

QS parameter

In addition to saving the results of the probing cycle in the return parameters **Q97x**, the control saves individual results to the QS parameters **QS97x**. The control saves the results of all measuring points from **one** extrusion in the corresponding QS parameters. Each result is ten characters long and the results are separated from each other by a blank space. This makes it easy for the control to convert the individual values in the NC program via string processing and use them for special automated evaluations.

Result in a QS parameter:

QS970 = "0.12345678 -1.1234567 -2.1234567 -3.12345678"

Further information: "String functions", Page 1301

Log function

Once probing has finished, the control generates a log file in HTML format. The log file contains the results of the 3-D deviation in graphical and tabular form. The control saves the log file in the same folder in which the NC program is located.

The log file contains the following data in the main axis, secondary axis and tool axis depending on the selected cycle (e.g., circle center point and diameter):

- Actual probing direction (as a vector in the input system). The value of the vector corresponds to the configured probing path
- Defined nominal coordinate
- Upper and lower dimensions, as well as the determined deviation along the normal vector
- Measured actual coordinate
- Color coding of the values:
  - Green: Good
  - Orange: Rework
  - Red: Scrap
- Extrusion points

Extrusion points:

The horizontal axis represents the direction for the extrusion. The blue points are the individual measuring points. The red lines indicate the lower limit and the upper limit of the dimensions. If a value violates a specified tolerance, the control will show the area in red color in the graphic.

Notes

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- If **Q1145 > 0** and **Q1146 = 0**, then the control will perform the number of extrusion points at the same position.
- If you use Cycle **1401 CIRCLE PROBING** or **1411 PROBING TWO CIRCLES** to perform an extrusion, the direction for the extrusion must be **Q1140 = +3**; otherwise, the control will output an error message.

Cycle parameters

Help graphic	Parameter
	**Q1140 Direction for extrusion (1-3)?** **1:** Extrusion in the direction of the main axis **2:** Extrusion in the direction of the secondary axis **3:** Extrusion in the direction of the tool axis Input: **1**, **2**, **3**
	Q1145 Number of extrusion points? Number of measuring points that the cycle repeats over the length of the extrusion **Q1146**. Input: **1...99**
	**Q1146 Length of extrusion?** Length over which the measuring points are repeated. Input: **-99...+99**
	Q1149 Extrusion: Modal duration? Effect of the cycle: **0**: The extrusion is effective for only the next cycle. **1:** The extrusion is effective until the end of the NC program. Input: **-99...+99**

Example

```
11 TCH PROBE 1493 EXTRUSION PROBING ~
    Q1140=+3                ;EXTRUSION DIRECTION ~
    Q1145=+1                ;EXTRUSION POINTS ~
    Q1146=+0                ;EXTRUSION LENGTH ~
    Q1149=+0                ;EXTRUSION MODAL
```

29.6 Touch Probe Cycles: Calibration

29.6.1 Fundamentals

Overview

The control must be specifically prepared by the machine manufacturer for the use of a touch probe.

HEIDENHAIN only guarantees the proper operation of the touch probe cycles in conjunction with HEIDENHAIN touch probes.

In order to precisely specify the actual trigger point of a 3-D touch probe, you must calibrate the touch probe; otherwise the control cannot provide precise measuring results.

Always calibrate a touch probe in the following cases:

- Initial configuration
- Broken stylus
- Stylus replacement
- Change in the probe feed rate
- Irregularities caused, for example, when the machine heats up
- Change of active tool axis

The control assumes the calibration values for the active probe system directly after the calibration process. The updated tool data are immediately effective. It is not necessary to repeat the tool call.

During calibration, the control finds the effective length of the stylus and the effective radius of the stylus tip. To calibrate the 3D touch probe, clamp a ring gauge or a stud of known height and known radius to the machine table.

The control provides calibration cycles for calibrating the length and the radius:

Cycle		Call	Further information
461	**TS CALIBRATION OF TOOL LENGTH** ■ Calibrating the length	**DEF**-active	Page 1681
462	**CALIBRATION OF A TS IN A RING** ■ Measuring the radius using a ring gauge ■ Measuring the center offset using a ring gauge	**DEF**-active	Page 1683
463	**TS CALIBRATION ON STUD** ■ Measuring the radius using a stud or a calibration pin ■ Measuring the center offset using a stud or a calibration pin	**DEF**-active	Page 1686
460	**CALIBRATION OF TS ON A SPHERE** ■ Measuring the radius using a calibration sphere ■ Measuring the center offset using a calibration sphere	**DEF**-active	Page 1689

Calibrating a touch trigger probe

In order to precisely specify the actual trigger point of a 3-D touch probe, you must calibrate the touch probe; otherwise the control cannot provide precise measuring results.

Always calibrate a touch probe in the following cases:

- Initial configuration
- Broken stylus
- Stylus replacement
- Change in the probe feed rate
- Irregularities caused, for example, when the machine heats up
- Change of active tool axis

During calibration, the control finds the effective length of the stylus and the effective radius of the ball tip. To calibrate the 3-D touch probe, clamp a ring gauge or a stud of known height and known radius to the machine table.

The control provides calibration cycles for calibrating the length and the radius.

- The control assumes the calibration values for the active probe system directly after the calibration process. The updated tool data are immediately effective. It is not necessary to repeat the tool call.
- Ensure that the touch probe number in the tool table and the touch-probe number in the touch-probe table are identical.

Further information: "Touch probe table tchprobe.tp", Page 1839

Displaying calibration values

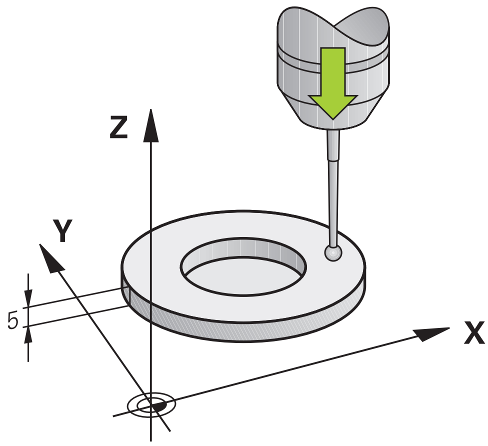
The control saves the effective length and effective radius of the touch probe in the tool table. The control saves the touch probe center offset to the touch probe table in the columns **CAL_OF1** (main axis) and **CAL_OF2** (secondary axis).

A measuring log is created automatically during calibration. The log file is named **TCHPRAUTO.html**. This file is stored in the same location as the original file. The measuring log can be displayed in the browser on the control. If an NC program uses more than one cycle to calibrate the touch probe, **TCHPRAUTO.html** will contain all the measuring logs.

29.6.2 Cycle 461 TS CALIBRATION OF TOOL LENGTH

Application

Refer to your machine manual.



Before starting the calibration cycle, you must set the preset in the spindle axis so that Z=0 on the machine table; you must also pre-position the touch probe above the calibration ring.

A measuring log is created automatically during calibration. The log file is named **TCHPRAUTO.html**. This file is stored in the same location as the original file. The measuring log can be displayed in the browser on the control. If an NC program uses more than one cycle to calibrate the touch probe, **TCHPRAUTO.html** will contain all the measuring logs.

Cycle sequence

1 The control orients the touch probe to the angle **CAL_ANG** specified in the touch probe table (only if your touch probe can be oriented).
2 The control probes from the current position in the negative spindle axis direction at the probing feed rate (column **F** from the touch probe table).
3 The control then retracts the touch probe at rapid traverse (column **FMAX** from the touch probe table) to the starting position.

Notes

HEIDENHAIN only gives warranty for the function of the probing cycles if HEIDENHAIN touch probes are used.

NOTICE

Danger of collision!

When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active.

- The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**.
- Reset any coordinate transformations beforehand.

- This cycle can only be executed in the **FUNCTION MODE MILL** and **FUNCTION MODE TURN** machining modes.
- The effective length of the touch probe is always referenced to the tool reference point. The tool reference point is often on the spindle nose, the face of the spindle. The machine manufacturer may also place the tool reference point at a different point.
- A measuring log is created automatically during calibration. The log file is named TCHPRAUTO.html.

Note on programming

- Before defining this cycle, you must have programmed a tool call to define the touch probe axis.

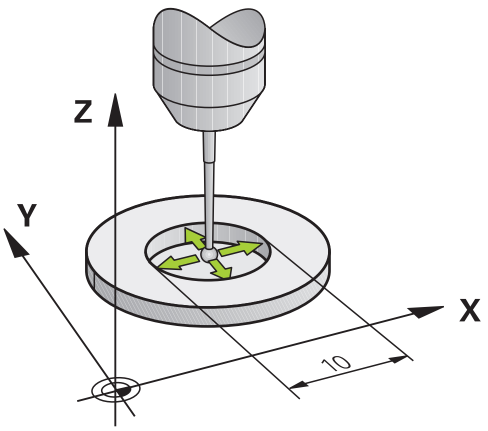
    Q434=+5                    ;PRESET
```

29.6.3 Cycle 462 CALIBRATION OF A TS IN A RING

Application

Refer to your machine manual.



Before starting the calibration cycle, you need to pre-position the touch probe in the center of the calibration ring and at the required measuring height.

When calibrating the ball-tip radius, the control executes an automatic probing routine. In the first run, the control finds the center point of the calibration ring or pin (approximate measurement) and positions the touch probe in the center. Then, in the actual calibration process (fine measurement), the radius of the ball tip is determined. If the touch probe allows probing from opposite orientations, the center offset is determined during another run.

A measuring log is created automatically during calibration. The log file is named **TCHPRAUTO.html**. This file is stored in the same location as the original file. The measuring log can be displayed in the browser on the control. If an NC program uses more than one cycle to calibrate the touch probe, **TCHPRAUTO.html** will contain all the measuring logs.

The orientation of the touch probe determines the calibration routine:

- No orientation possible, or orientation in only one direction: The control executes one approximate and one fine measurement, and then ascertains the effective ball-tip radius (column R in tool.t).
- Orientation possible in two directions (e.g. HEIDENHAIN touch probes with cable): The control executes one approximate and one fine measurement, rotates the touch probe by 180°, and then executes four more probing routines. The center offset (**CAL_OF** in touch probe table) is determined in addition to the radius by probing from opposite orientations.
- Any orientation possible (e.g. HEIDENHAIN infrared touch probes): Probing operation: see "Orientation possible in two directions").

Notes

In order to be able to determine the ball-tip center offset, the control needs to be specially prepared by the machine manufacturer.

The property of whether or how your touch probe can be oriented is predefined for HEIDENHAIN touch probes. Other touch probes are configured by the machine tool builder.

HEIDENHAIN only gives warranty for the function of the probing cycles if HEIDENHAIN touch probes are used.

NOTICE

Danger of collision!

When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active.

- The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**.
- Reset any coordinate transformations beforehand.

- This cycle can only be executed in the **FUNCTION MODE MILL** and **FUNCTION MODE TURN** machining modes.
- The center offset can be determined only with a suitable touch probe.
- A measuring log is created automatically during calibration. The log file is named TCHPRAUTO.html.

Note on programming

- Before defining this cycle, you must have programmed a tool call to define the touch probe axis.

    Q320=+0                     ;SET-UP CLEARANCE ~
    Q423=+8                     ;NO. OF PROBE POINTS ~
    Q380=+0                     ;REFERENCE ANGLE
```

29.6.4 Cycle 463 TS CALIBRATION ON STUD

Application

Refer to your machine manual.

Before starting the calibration cycle, you need to pre-position the touch probe above the center of the calibration pin. Position the touch probe in the touch probe axis by approximately the set-up clearance (value from touch probe table + value from cycle) above the calibration pin.

When calibrating the ball-tip radius, the control executes an automatic probing routine. In the first run the control finds the midpoint of the calibration ring or pin (approximate measurement) and positions the touch probe in the center. Then, in the actual calibration process (fine measurement), the radius of the ball tip is determined. If the touch probe allows probing from opposite orientations, the center offset is determined during another run.

A measuring log is created automatically during calibration. The log file is named **TCHPRAUTO.html**. This file is stored in the same location as the original file. The measuring log can be displayed in the browser on the control. If an NC program uses more than one cycle to calibrate the touch probe, **TCHPRAUTO.html** will contain all the measuring logs.

The orientation of the touch probe determines the calibration routine:

- No orientation possible, or orientation in only one direction: The control executes one approximate and one fine measurement, and then ascertains the effective ball-tip radius (column **R** in tool.t).
- Orientation possible in two directions (e.g. HEIDENHAIN touch probes with cable): The control executes one approximate and one fine measurement, rotates the touch probe by 180°, and then executes four more probing routines. The center offset (CAL_OF in touch probe table) is determined in addition to the radius by probing from opposite orientations.
- Any orientation possible (e.g. HEIDENHAIN infrared touch probes): Probing operation: see "Orientation possible in two directions").

Note:

In order to be able to determine the ball-tip center offset, the control needs to be specially prepared by the machine manufacturer.

The property of whether or how your touch probe can be oriented is predefined for HEIDENHAIN touch probes. Other touch probes are configured by the machine tool builder.

HEIDENHAIN only gives warranty for the function of the probing cycles if HEIDENHAIN touch probes are used.

NOTICE

Danger of collision!

When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active.

- The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**.
- Reset any coordinate transformations beforehand.

- This cycle can only be executed in the **FUNCTION MODE MILL** and **FUNCTION MODE TURN** machining modes.
- The center offset can be determined only with a suitable touch probe.
- A measuring log is created automatically during calibration. The log file is named TCHPRAUTO.html.

Note on programming

```

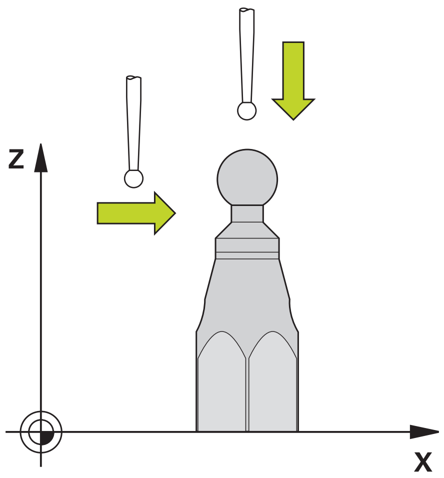
29.6.5 Cycle 460 CALIBRATION OF TS ON A SPHERE (option 17)

Application

Refer to your machine manual.

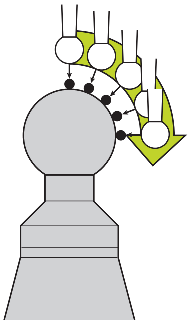


Before starting the calibration cycle, you need to pre-position the touch probe above the center of the calibration sphere. Position the touch probe in the touch probe axis by approximately the set-up clearance (value from touch probe table + value from cycle) above the calibration sphere.

With Cycle **460** you can calibrate a triggering 3-D touch probe automatically using an exact calibration sphere.

It is also possible to capture 3-D calibration data. Option 92, 3D-ToolComp, is required for this purpose. 3-D calibration data describe the deflection behavior of the touch probe in any probing direction. The 3-D calibration data are stored under TNC:\system\3D-ToolComp*. The **DR2TABLE** column of the tool table references the 3DTC table. The 3-D calibration data are then taken into account when probing. This 3-D calibration is necessary if you want to achieve a very high accuracy with Cycle **444** 3-D Probing (see "Cycle 444 PROBING IN 3-D ", Page 1668).

Cycle sequence



The setting in parameter **Q433** specifies whether you can perform radius and length calibration, or just radius calibration.

Radius calibration Q433=0

1 Clamp the calibration sphere. Ensure the prevention of collisions
2 In the touch probe axis, position the touch probe over the calibration sphere, and in the working plane, approximately over the sphere center
3 The first movement is in the plane, depending on the reference angle (**Q380**)
4 The control then positions the touch probe in touch-probe axis
5 The probing process starts, and the control begins by searching for the equator of the calibration sphere
6 Once the equator has been determined, the radius calibration begins
7 Finally, the control retracts the touch probe in the touch-probe axis to the height at which it had been pre-positioned

Radius and length calibration Q433=1

1 Clamp the calibration sphere. Ensure the prevention of collisions
2 In the touch probe axis, position the touch probe over the calibration sphere, and in the working plane, approximately over the sphere center
3 The first movement is in the plane, depending on the reference angle (**Q380**)
4 The control then positions the touch probe in touch-probe axis
5 The probing process starts, and the control begins by searching for the equator of the calibration sphere
6 Once the equator has been determined, the radius calibration begins
7 The control then retracts the touch probe in the touch-probe axis to the height at which it had been pre-positioned
8 The control determines the length of the touch probe at the north pole of the calibration sphere
9 At the end of the cycle the control retracts the touch probe in the touch-probe axis to the height at which it had been pre-positioned

The setting in parameter **Q455** specifies whether you can perform an additional 3-D calibration

3-D calibration Q455= 1...30

1 Clamp the calibration sphere. Ensure the prevention of collisions
2 After calibration of the radius and length, the control retracts the touch probe in touch-probe axis. Then the control positions the touch probe above the north pole
3 The probing process goes from the north pole to the equator in several steps. Deviations from the nominal value, and therefore the specific deflection behavior, are thus determined
4 You can specify the number of probing points between the north pole and the equator. This number depends on input parameter **Q455**. A value between 1 and 30 can be programmed. If you program **Q455**=0, no 3-D calibration will be performed
5 The deviations determined during the calibration are stored in a 3DTC table
6 At the end of the cycle the control retracts the touch probe in the touch-probe axis to the height at which it had been pre-positioned

In order to calibrate the length, the position of the center point (**Q434**) of the calibration sphere relative to the active datum must be known If this is not the case, then HEIDENHAIN recommends against using Cycle **460** to calibrate the length!

One application example for calibrating the length with Cycle **460** is the comparison of two touch probes

Notes

HEIDENHAIN only gives warranty for the function of the probing cycles if HEIDENHAIN touch probes are used.

NOTICE

Danger of collision!

When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active.

- The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**.
- Reset any coordinate transformations beforehand.

- This cycle can only be executed in the **FUNCTION MODE MILL** and **FUNCTION MODE TURN** machining modes.
- A measuring log is created automatically during calibration. The log file is named **TCHPRAUTO.html**. This file is stored in the same location as the original file. The measuring log can be displayed in the browser on the control. If an NC program uses more than one cycle to calibrate the touch probe, **TCHPRAUTO.html** will contain all the measuring logs.
- The effective length of the touch probe is always referenced to the tool reference point. The tool reference point is often on the spindle nose (and face of the spindle). The machine manufacturer may also place the tool reference point at a different point.
- Pre-position the touch probe so that it is located approximately above the center of the calibration sphere.
- Depending on the accuracy of the pre-positioning, finding the equator of the calibration sphere will require a different number of touch points.
- If you program **Q455**=0, the control will not perform a 3-D calibration.
- If you program **Q455**=1 to 30, the control will perform a 3-D calibration of the touch probe. Deviations of the deflection behavior will thus be determined under various angles. If you use Cycle **444**, you should first perform a 3-D calibration.
- If you program **Q455**=1 to 30, a table will be stored under TNC:\system\3D-ToolComp*.
- If there is already a reference to a calibration table (entry in DR2TABLE), this table will be overwritten.
- If there is no reference to a calibration table (entry in DR2TABLE), then, in dependence of the tool number, a reference and the associated table will be created.

Note on programming

- Before a cycle definition you must program a tool call to define the touch-probe axis.

Cycle parameters

Cycle parameters

Help graphic	Parameter
	**Q407 Radius of calib. sphere?** Enter the exact radius of the calibration sphere being used. Input: **0.0001...99.9999**
	Q320 Set-up clearance? Additional distance between touch point and ball tip. **Q320** is added to **SET_UP** (touch probe table), and is only effective when the preset is probed in the touch probe axis. This value has an incremental effect. Input: **0...99999.9999** or **PREDEF**
	Q301 Move to clearance height (0/1)? Specify how the touch probe moves between measuring points: 0: Move at measuring height between measuring points 1: Move at clearance height between measuring points Input: **0**, **1**
	Q423 Number of probes? Number of measuring points on the diameter. The value has an absolute effect. Input: **3...8**
	Q380 Ref. angle in ref. axis? Enter the reference angle (basic rotation) for acquiring the measuring points in the active workpiece coordinate system. Defining a reference angle can considerably enlarge the measuring range of an axis. The value has an absolute effect. Input: **0...360**
	Q433 Calibrate length (0/1)? Define whether the control will calibrate the touch probe length after radius calibration: **0**: Do not calibrate touch probe length **1**: Calibrate touch probe length Input: **0**, **1**
	Q434 Preset for length? Coordinate of the calibration sphere center. This value must be defined only if length calibration will be carried out. The value has an absolute effect. Input: **-99999.9999...+99999.9999**

Help graphic	Parameter
	Q455 No. of points for 3-D calibrtn.? Enter the number of touch points for 3-D calibration. A value of about 15 touch points is useful. If you enter 0, the control will not perform a 3-D calibration. During 3-D calibration, the deflecting behavior of the touch probe is determined under various angles, and the values are stored in a table. 3D-ToolComp is required for 3-D calibration. Input: **0...30**

```

29.7 Touch Probe Cycles: Automatic Kinematics Measurement

29.7.1 Fundamentals (option 48)

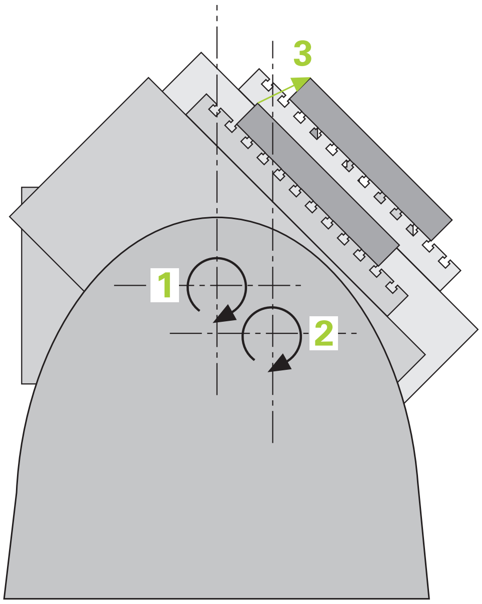
Overview

> The control must be specifically prepared by the machine manufacturer for the use of a touch probe.
> HEIDENHAIN only guarantees the proper operation of the touch probe cycles in conjunction with HEIDENHAIN touch probes.

The control offers the following cycles that enable you to automatically save, restore, check, and optimize the machine kinematics:

Cycle		Call	Further information
450	**SAVE KINEMATICS** (option 48) ■ Storing the active machine kinematic configuration ■ Restoring previously saved kinematic configuration	**DEF-**active	Page 1699
451	**MEASURE KINEMATICS** (option 48) ■ Automatic checking of the machine kinematic configuration ■ Optimizing the machine kinematic configuration	**DEF-**active	Page 1702
452	**PRESET COMPENSATION** (option 48) ■ Automatic checking of the machine kinematic configuration ■ Optimizing the kinematic transformation chain of the machine	**DEF-**active	Page 1717
453	**KINEMATICS GRID** (option 48,option 52) ■ Automatic checking depending on the rotary axis position of the machine kinematic configuration ■ Optimizing the machine kinematic configuration	**DEF-**active	Page 1727

Fundamentals



Accuracy requirements are becoming increasingly stringent, particularly in the area of 5-axis machining. Complex parts must be manufactured with both precision and reproducible accuracy, including over extended periods of time.

Some of the reasons for inaccuracy in multi-axis machining are deviations between the kinematic model saved in the control (see **1** in the figure) and the kinematic conditions actually existing on the machine (see **2** in the figure). When the rotary axes are positioned, these deviations cause inaccuracy of the workpiece (see **3** in the figure). It is therefore necessary for the model to approach reality as closely as possible.

The **KinematicsOpt** function of the control is an important component that helps you to really meet these complex requirements: a 3-D touch probe cycle measures the rotary axes on your machine fully automatically, regardless of whether they are realized as tables or spindle heads. For this purpose, a calibration sphere is attached at any position on the machine table, and measured with a resolution that you define. During cycle definition, you simply define for each rotary axis the area that you want to measure.

From the measured values, the control calculates the static tilting accuracy. The software minimizes the positioning error arising from the tilting movements and, at the end of the measurement process, automatically saves the machine geometry in the respective machine constants of the kinematics table.

Requirements

Refer to your machine manual.

Advanced Function Set 1 (option 8) must have been enabled.

Option 48 must have been enabled.

Machine and control must be specially prepared by the machine manufacturer for use of this cycle.

Prerequisites for using KinematicsOpt:

The machine tool builder must have defined the machine parameters for **CfgKinematicsOpt** (no. 204800) in the configuration data.

- **maxModification** (no. 204801) specifies the tolerance limit starting from which the control is to display a message if the changes made to the kinematic data exceed this limit value
- **maxDevCalBall** (no. 204802) defines how much the measured radius of the calibration sphere may deviate from the entered cycle parameter
- **mStrobeRotAxPos** (no. 204803) defines an M function that is specifically configured by the machine tool builder and is used to position the rotary axes

- The 3-D touch probe used for the measurement must be calibrated
- The cycles can only be carried out with the tool axis Z
- A calibration sphere with an exactly known radius and sufficient rigidity must be attached to any position on the machine table
- The kinematics description of the machine must be complete and correct, and the transformation dimensions must have been entered with an accuracy of approx. 1 mm
- The complete machine geometry must have been measured (by the machine tool builder during commissioning)

HEIDENHAIN recommends using the calibration spheres **KKH 250** (ID number 655475-01) or **KKH 80 (ID number 655475-03)**, which are particularly rigid and are designed especially for machine calibration. Please contact HEIDENHAIN if you have any questions in this regard.

Notes

HEIDENHAIN only guarantees the proper operation of the probing cycles if HEIDENHAIN touch probes are used.

NOTICE

Danger of collision!

When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active.

- The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**.
- Reset any coordinate transformations beforehand.

NOTICE

Danger of collision!

A change in the kinematics always changes the preset as well. Basic rotations will automatically be reset to 0. There is a danger of collision!

- After an optimization, reset the preset

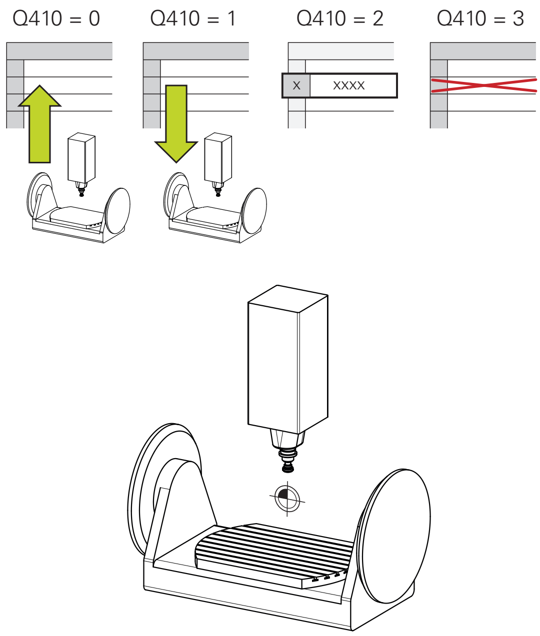
Notes about machine parameters

- In the machine parameter **mStrobeRotAxPos** (no. 204803), the machine manufacturer defines the position of the rotary axes. If an M function has been defined in the machine parameter, you have to position the rotary axes to 0° (ACTUAL system) before starting one of the KinematicsOpt cycles (except for **450**).
- If machine parameters were changed through the KinematicsOpt cycles, the control must be restarted. Otherwise the changes could be lost in certain circumstances.

29.7.2 Cycle 450 SAVE KINEMATICS (option 48)

Application

Refer to your machine manual.
This function must be enabled and adapted by the machine manufacturer.



With touch probe cycle **450** you can save the active machine kinematic configuration or restore a previously saved one. The saved data can be displayed and deleted. 16 memory spaces in total are available.

Notes

Only save and restore data with Cycle **450** while no tool carrier kinematics configuration that includes transformations is active.

- This cycle can only be executed in the **FUNCTION MODE MILL** and **FUNCTION MODE TURN** machining modes.
- Always save the active kinematic model before running a kinematics optimization.
  Advantage:
  - You can restore the old data if you are not satisfied with the results or if errors occur during optimization (e.g. power failure).
- With the **Restore** mode, note the following:
  - The control can restore saved data only to a matching kinematic configuration
  - A change in the kinematics always changes the preset as well. So redefine the preset, if required.
- The cycle does not restore identical values. It only restores values that differ from the present values. Compensations can only be restored if they had been saved before.

Notes on data management

The control stores the saved data in the file **TNC:\table\DATA450.KD**. This file can be backed up to an external PC with **TNCremo**, for example. If you delete the file, the stored data are removed, too. If the data in the file are changed manually, the data records may become corrupted so that they are unusable.

Operating notes:

- If the file **TNC:\table\DATA450.KD** does not exist, it is generated automatically when Cycle **450** is run.
- Make sure that you delete any empty files with the name **TNC:\table\DATA450.KD** before starting Cycle **450**. If there is an empty memory table (**TNC:\table\DATA450.KD**) without any rows in it, an error message will be issued when running Cycle **450**. In this case, delete the empty memory table and call the cycle again.
- Do not change stored data manually.
- Make a backup of the **TNC:\table\DATA450.KD** file so that you can restore the file, if necessary (e.g. if the data medium is damaged).

Cycle parameters

Help graphic	Parameter
	Q410 Mode (0/1/2/3)? Define whether a kinematic model will be saved or restored: **0**: Save active kinematics **1**: Restore saved kinematics **2**: Display the current memory status **3**: Delete a data record Input: **0**, **1**, **2**, **3**
	Q409/QS409 Name of data record? Number or name of data record identifier. **Q409** has no function if mode 2 has been selected. Wildcards can be used for searches in modes 1 and 3 (Restore and Delete). If the control finds several possible data records because of the wildcards, the control restores the mean values of the data (mode 1) or deletes all selected data records after confirmation (mode 3). You can use the following wildcards in searches: **?**: A single, undefined character **$**: A single alphabetic character (letter) **#**: A single, undefined number *****: An undefined string of any length Input: **0...99999** or max. **255** characters. A total of 16 memory locations is available.

```

Deleting data records

```
11 TCH PROBE 450 SAVE KINEMATICS ~
    Q410=+3                  ;MODE ~
    Q409=+950                ;MEMORY DESIGNATION
```

Log function

After running Cycle **450**, the control creates a log (**tchpr450.txt**) containing the following information:

- Creation date and time of the log
- Name of the NC program from which the cycle was run
- Designator of the current kinematics
- Active tool

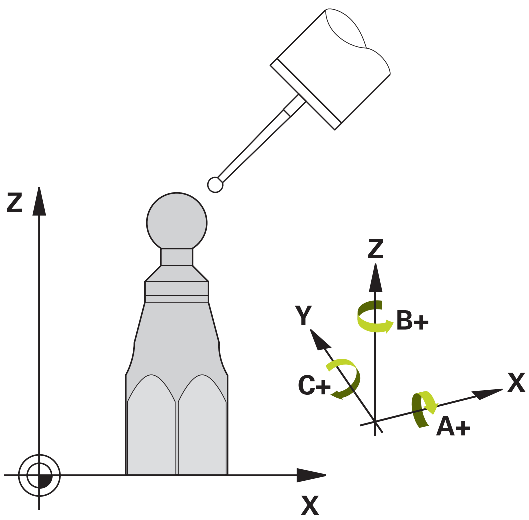
The other data in the log vary depending on the selected mode:

- Mode 0: Logging of all axis entries and transformation entries of the kinematics chain that the control has saved.
- Mode 1: Logging of all transformation entries before and after restoring the kinematics configuration.
- Mode 2: List of the saved data records
- Mode 3: List of the deleted data records

29.7.3 Cycle 451 MEASURE KINEMATICS (option 48)

Application

⚙	Refer to your machine manual. This function must be enabled and adapted by the machine manufacturer.



Touch probe cycle **451** enables you to check and, if required, optimize the kinematics of your machine. Use the 3-D TS touch probe to measure a HEIDENHAIN calibration sphere that you have attached to the machine table.

The control will determine the static tilting accuracy. The software minimizes the spatial error arising from the tilting movements and, at the end of the measurement process, automatically saves the machine geometry in the respective machine constants of the kinematics description.

Cycle sequence

1 Clamp the calibration sphere and check for potential collisions.
2 In **Manual operation** mode, set the preset to the center of the sphere or, if you defined **Q431** = 1 or **Q431** = 3: Manually position the touch probe above the calibration sphere in the touch probe axis and at the center of the sphere in the working plane.
3 Select the Program Run operating mode and start the calibration program.
4 The control automatically measures all rotary axes successively in the resolution you defined.

Programming and operating notes:

- If the kinematics data determined in Optimize mode exceed the permissible limit (**maxModification** no. 204801), the control displays a warning. Then you have to confirm acceptance of the determined values by pressing **NC start**.
- During presetting, the programmed radius of the calibration sphere will only be monitored for the second measurement. The reason is that if pre-positioning with respect to the calibration sphere is inaccurate and you then start presetting, the calibration sphere will be probed twice.

The control saves the measured values in the following Q parameters:

Q parameter number	Meaning
Q141	Standard deviation measured in the A axis (–1 if axis was not measured)
Q142	Standard deviation measured in the B axis (–1 if axis was not measured)
Q143	Standard deviation measured in the C axis (–1 if axis was not measured)
Q144	Optimized standard deviation in the A axis (–1 if axis was not optimized)
Q145	Optimized standard deviation in the B axis (–1 if axis was not optimized)
Q146	Optimized standard deviation in the C axis (–1 if axis was not optimized)
Q147	Offset error in X direction, for manual transfer to the corresponding machine parameter
Q148	Offset error in Y direction, for manual transfer to the corresponding machine parameter
Q149	Offset error in Z direction, for manual transfer to the corresponding machine parameter

Positioning direction

The positioning direction of the rotary axis to be measured is determined from the start angle and the end angle that you define in the cycle. A reference measurement is automatically performed at 0°.

Specify the start and end angles in such a way that the same position is not measured twice. A duplicated point measurement (e.g. measuring positions +90° and -270°) is not advisable, but it will not generate an error message.

- Example: Start angle = +90°, end angle = –90°
  - Start angle = +90°
  - End angle = –90°
  - No. of measuring points = 4
  - Stepping angle resulting from the calculation = (-90° - +90°) / (4 – 1) = -60°
  - Measuring point 1 = +90°
  - Measuring point 2 = +30°
  - Measuring point 3 = -30°
  - Measuring point 4 = -90°
- Example: start angle = +90°, end angle = +270°
  - Start angle = +90°
  - End angle = +270°
  - No. of measuring points = 4
  - Stepping angle resulting from the calculation = (270° – 90°) / (4 – 1) = +60°
  - Measuring point 1 = +90°
  - Measuring point 2 = +150°
  - Measuring point 3 = +210°
  - Measuring point 4 = +270°

Machines with Hirth-coupled axes

NOTICE

Danger of collision!

In order to be positioned, the axis must move out of the Hirth grid. If necessary, the control rounds the calculated measuring positions so that they fit into the Hirth grid (depending on the start angle, end angle and number of measuring points).

- So remember to leave a large enough safety clearance to prevent any risk of collision between the touch probe and calibration sphere
- Also ensure that there is enough space to reach the safety clearance (software limit switch)

NOTICE

Danger of collision!

Depending on the machine configuration, the control cannot position the rotary axes automatically. If this is the case, you need a special M function from the machine manufacturer, enabling the control to move the rotary axes. The machine manufacturer must have entered the number of the M function in machine parameter **mStrobeRotAxPos** (no. 204803) for this purpose.

- Note the documentation of the machine tool builder

- Define a retraction height greater than 0 if option 2 is not available.
- The measured positions are calculated from the start angle, end angle, and number of measurements for the respective axis and from the Hirth grid.

Example calculation of measuring positions for an A axis:

Start angle **Q411** = –30

End angle **Q412** = +90

Number of measuring points **Q414** = 4

Hirth grid = 3°

Calculated stepping angle = (**Q412** – **Q411**) / (**Q414** – 1)

Calculated stepping angle = (90° - (-30°)) / (4 – 1) = 120 / 3 = 40°

Measuring position 1 = **Q411** + 0 * stepping angle = –30° --> –30°

Measuring position 2 = **Q411** + 1 * stepping angle = +10° --> 9°

Measuring position 3 = **Q411** + 2 * stepping angle = +50° --> 51°

Measuring position 4 = **Q411** + 3 * stepping angle = +90° --> 90°

Choice of number of measuring points

To save time, you can make a rough optimization with a small number of measuring points (1 or 2), e.g. when commissioning the machine.

You then make a fine optimization with a medium number of measuring points (recommended value = approx. 4). Higher numbers of measuring points do not usually improve the results. Ideally, you should distribute the measuring points evenly over the tilting range of the axis.

This is why you should measure an axis with a tilting range of 0° to 360° at three measuring points, namely at 90°, 180° and 270°. Thus, define a starting angle of 90° and an end angle of 270°.

If you want to check the accuracy accordingly, you can also enter a higher number of measuring points in the **Check** mode.

> If a measuring point has been defined at 0°, it will be ignored because the reference measurement is always done at 0°.

Choice of the calibration sphere position on the machine table

In principle, you can fix the calibration sphere to any accessible position on the machine table and also on fixtures or workpieces. The following factors should positively influence the result of measurement:

- On machines with rotary tables/tilting tables: Clamp the calibrating ball as far as possible away from the center of rotation.
- On machines with very large traverse paths: Clamp the calibration sphere as closely as possible to the position intended for subsequent machining.

> Position the calibration sphere on the machine table so that there can be no collisions during the measuring process.

Notes on various calibration methods

- **Rough optimization during commissioning after entering approximate dimensions.**
  - Number of measuring points between 1 and 2
  - Angular step of the rotary axes: Approx. 90°
- **Fine optimization over the entire range of traverse**
  - Number of measuring points between 3 and 6
  - The start and end angles should cover the largest possible traverse range of the rotary axes.
  - Position the calibration sphere in such a way on the machine table that with rotary table axes, there is a large measuring circle or that on swivel head axes, measurement can be made at a representative position (e.g. in the center of the traverse range).
- **Optimization of a specific rotary axis position**
  - Number of measuring points between 2 and 3
  - The measurements are made with the aid of the inclination angle of an axis (**Q413**/**Q417**/**Q421**) around the rotary axis angle at which the workpiece is to be machined later.
  - Position the calibration sphere on the machine table for calibration at the position subsequently intended for machining.
- **Inspecting the machine accuracy**
  - Number of measuring points between 4 and 8
  - The start and end angles should cover the largest possible traverse range of the rotary axes.
- **Determination of the rotary axis backlash**
  - Number of measuring points between 8 and 12
  - The start and end angles should cover the largest possible traverse range of the rotary axes.

Notes on the accuracy

	If required, deactivate the lock on the rotary axes for the duration of the calibration. Otherwise it may falsify the results of measurement. The machine manual provides further information.

The geometrical and positioning errors of the machine influence the measured values and therefore also the optimization of a rotary axis. For this reason there will always be a certain amount of error.

If there were no geometrical and positioning errors, any values measured by the cycle at any point on the machine at a certain time would be exactly reproducible. The greater the geometrical and positioning errors are, the greater is the dispersion of measured results when you perform measurements at different positions.

The dispersion of results recorded by the control in the measuring log is a measure of the machine's static tilting accuracy. However, the measuring circle radius and the number and position of measuring points have to be included in the evaluation of accuracy. One measuring point alone is not enough to calculate dispersion. For only one point, the result of the calculation is the spatial error of that measuring point.

If several rotary axes are moved simultaneously, their error values are combined. In the worst case they are added together.

	If your machine is equipped with a feedback-controlled spindle, you should activate the angle tracking in the touch probe table (**TRACK column**). This generally increases the accuracy of measurements with a 3-D touch probe.

Notes on various calibration methods

- **Rough optimization during commissioning after entering approximate dimensions.**
  - Number of measuring points between 1 and 2
  - Angular step of the rotary axes: Approx. 90°
- **Fine optimization over the entire range of traverse**
  - Number of measuring points between 3 and 6
  - The start and end angles should cover the largest possible traverse range of the rotary axes.
  - Position the calibration sphere in such a way on the machine table that with rotary table axes, there is a large measuring circle or that on swivel head axes, measurement can be made at a representative position (e.g. in the center of the traverse range).
- **Optimization of a specific rotary axis position**
  - Number of measuring points between 2 and 3
  - The measurements are made with the aid of the inclination angle of an axis (**Q413**/**Q417**/**Q421**) around the rotary axis angle at which the workpiece is to be machined later.
  - Position the calibration sphere on the machine table for calibration at the position subsequently intended for machining.
- **Inspecting the machine accuracy**
  - Number of measuring points between 4 and 8
  - The start and end angles should cover the largest possible traverse range of the rotary axes.
- **Determination of the rotary axis backlash**
  - Number of measuring points between 8 and 12
  - The start and end angles should cover the largest possible traverse range of the rotary axes.

Backlash

Backlash is a small amount of play between the rotary or angle encoder and the table that occurs when the traverse direction is reversed. If the rotary axes have backlash outside of the control loop, for example because the angle measurement is performed with the motor encoder, this can result in significant error during tilting.

With input parameter **Q432**, you can activate backlash measurement. Enter an angle that the control uses as the traversing angle. The cycle will then carry out two measurements per rotary axis. If you take over the angle value 0, the control will not measure any backlash.

Backlash measurement is not possible if an M function for positioning the rotary axes is set in the optional **mStrobeRotAxPos** machine parameter (no. 204803) or if the axis is a Hirth axis.

Programming and operating notes:

- The control does not perform an automatic backlash compensation.
- If the measuring circle radius is < 1 mm, the control does not calculate the backlash. The larger the measuring circle radius, the more accurately the control can ascertain the rotary axis backlash (Page 1717).

Notes

Angle compensation is only possible with option 52 KinematicsComp.

NOTICE

Danger of collision!

If you run this cycle, a basic rotation or 3-D basic rotation must not be active. The control will delete the values from the columns **SPA**, **SPB** and **SPC** of the preset table as needed. After the cycle, you need to set a basic rotation or 3-D basic rotation again; otherwise, there is a danger of collision.

- Deactivate the basic rotation before running the cycle.
- Set the preset and the basic rotation again after optimization.

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- Before the beginning of the cycle, **M128** or **FUNCTION TCPM** must be switched off.
- As with Cycles **451** and **452**, Cycle **453** ends with active 3D-ROT in automatic mode, matching the position of the rotary axes.
- Before defining the cycle, you must set the preset to the center of the calibration sphere and activate it, or set input parameter **Q431** to 1 or 3, respectively.
- For the positioning feed rate when moving to the probing height in the touch probe axis, the control uses the value from cycle parameter **Q253** or the **FMAX** value from the touch probe table, whichever is smaller. The control always moves the rotary axes at positioning feed rate **Q253**, while probe monitoring is inactive.
- The control ignores cycle definition data that applies to inactive axes.
- A correction in the machine datum (**Q406**=3) is only possible if superimposed rotary axes on the spindle head side or table side are measured.
- If you have activated presetting before the calibration (**Q431** = 1/3), then move the touch probe to the set-up clearance (**Q320** + SET_UP) to a position approximately above the center of the calibration sphere before the start of the cycle.
- Programming in inches: The control always records the log data and results of measurement in millimeters.

Notes about machine parameters

- If the optional machine parameter **mStrobeRotAxPos** (no. 204803) is not equal to –1 (M function positions the rotary axis), then start a measurement only if all rotary axes are at 0°.
- In every probing process the control first measures the radius of the calibration sphere. If the measured sphere radius differs from the entered sphere radius by more than the value you have defined in the optional machine parameter **maxDevCalBall** (no. 204802), the control displays an error message and ends the measurement.
- For angle optimization, the machine manufacturer must adapt the configuration correspondingly.

Cycle parameters

Help graphic	Parameter
	Q406 Mode (0/1/2/3)? Define whether the control will check or optimize the active kinematics: **0**: Check the active machine kinematics. The control measures the kinematics in the rotary axes you have defined, but it does not make any changes to the active kinematics. The control displays the measurement results in a measuring log. **1**: Optimize the active machine kinematics: The control measures the kinematics in the rotary axes you have defined. It then optimizes **the rotary axes positions** of the active kinematics. **2**: Optimize the active machine kinematics: The control measures the kinematics in the rotary axes you have defined. It then optimizes **angle and position errors**. Software option 52, KinematicsComp, is required for compensation of angle errors. **3**: Optimize the active machine kinematics: The control measures the kinematics in the rotary axes you have defined. It then automatically compensates the machine datum. It then optimizes **angle and position errors**. Software option 52, KinematicsComp, is required. Input: **0**, **1**, **2**, **3**
	Q407 Radius of calib. sphere? Enter the exact radius of the calibration sphere being used. Input: **0.0001...99.9999**
	Q320 Set-up clearance? Additional distance between touch point and ball tip. **Q320** is in addition to the **SET_UP** column in the touch probe table. This value has an incremental effect. Input: **0...99999.9999** or **PREDEF**
	Q408 Retraction height? **0**: Do not move to any retraction height; the control moves to the next measuring position in the axis to be measured. Not allowed for Hirth axes! The control moves to the first measuring position in the sequence A, then B, then C. **> 0**: Retraction height in the untilted workpiece coordinate system to which the control positions the spindle axis before positioning a rotary axis. In addition, the control moves the touch probe in the working plane to the datum. Touch probe monitoring is not active in this mode. Define the positioning feed rate in parameter **Q253**. The value has an absolute effect. Input: **0...99999.9999**

Help graphic	Parameter
	Q253 Feed rate for pre-positioning? Define the traversing speed of the tool during pre-positioning in mm/min. Input: **0...99999.9999** or **FMAX**, **FAUTO**, **PREDEF**
	Q380 Ref. angle in ref. axis? Enter the reference angle (basic rotation) for acquiring the measuring points in the active workpiece coordinate system. Defining a reference angle can considerably enlarge the measuring range of an axis. The value has an absolute effect. Input: **0...360**
	Q411 Starting angle in A axis? Starting angle in the A axis at which the first measurement will be made. The value has an absolute effect. Input: **-359.9999...+359.9999**
	Q412 End angle in A axis? End angle in the A axis at which the last measurement will be made. The value has an absolute effect. Input: **-359.9999...+359.9999**
	Q413 Angle of incidence in A axis? Angle of incidence in the A axis at which the other rotary axes will be measured. Input: **-359.9999...+359.9999**
	Q414 No. of meas. points in A (0...12)? Number of measuring points the control will use to measure the A axis. If the input value = 0, the control does not measure the respective axis. Input: **0...12**
	Q415 Starting angle in B axis? Starting angle in the B axis at which the first measurement will be made. The value has an absolute effect. Input: **-359.9999...+359.9999**
	Q416 End angle in B axis? End angle in the B axis at which the last measurement will be made. The value has an absolute effect. Input: **-359.9999...+359.9999**
	Q417 Angle of incidence in B axis? Angle of incidence in the B axis at which the other rotary axes will be measured. Input: **-359.999...+360.000**

Help graphic	Parameter
	Q418 No. of meas. points in B (0...12)? Number of measuring points the control will use to measure the B axis. If the input value = 0, the control does not measure the respective axis. Input: **0...12**
	Q419 Starting angle in C axis? Starting angle in the C axis at which the first measurement will be made. The value has an absolute effect. Input: **-359.9999...+359.9999**
	Q420 End angle in C axis? End angle in the C axis at which the last measurement will be made. The value has an absolute effect. Input: **-359.9999...+359.9999**
	Q421 Angle of incidence in C axis? Angle of incidence in the C axis at which the other rotary axes will be measured. Input: **-359.9999...+359.9999**
	Q422 No. of meas. points in C (0...12)? Number of measuring points the control will use to measure the C axis. If the input value = 0, the control does not measure the respective axis. Input: **0...12**
	Q423 Number of probes? Define the number of measuring points the control will use to measure the calibration sphere in the plane. Fewer measuring points increase speed and more measuring points increase measurement precision. Input: **3...8**
	Q431 Preset (0/1/2/3)? Define whether the control will automatically set the active preset at the center of the sphere: **0**: Do not set the preset automatically at the center of the sphere: Set the preset manually before the start of the cycle **1**: Set the preset automatically at the center of the sphere before measurement (the active preset will be overwritten): Pre-position the touch probe manually above the calibration sphere before the start of the cycle **2**: Set the preset automatically at the center of the sphere after measurement (the active preset will be overwritten): Set the preset manually before the start of the cycle **3**: Set the preset at the center of the sphere before and after measurement (the active preset will be overwritten): Pre-position the touch probe manually above the calibration sphere before the start of the cycle Input: **0**, **1**, **2**, **3**

Help graphic	Parameter
	Q432 Angular range of backlash comp.? Define the traversing angle the control will use to measure the rotary axis backlash. The traversing angle must be significantly larger than the actual backlash of the rotary axes. If input value = 0, the control does not measure the backlash. Input: **-3...+3**

Various modes (Q406)

Test mode Q406 = 0

- The control measures the rotary axes in the positions defined and calculates the static accuracy of the tilting transformation.
- The control records the results of a possible position optimization but does not make any adjustments.

"Optimize position of rotary axes" mode Q406 = 1

- The control measures the rotary axes in the positions defined and calculates the static accuracy of the tilting transformation.
- During this, the control tries to change the position of the rotary axis in the kinematics model in order to achieve higher accuracy.
- The machine data are adjusted automatically.

Position and Angle Optimization mode Q406 = 2

- The control measures the rotary axes in the positions defined and calculates the static accuracy of the tilting transformation.
- First the control tries to optimize the angular orientation of the rotary axis by means of compensation (option 52, KinematicsComp)
- After angle optimization, the control will perform a position optimization. No additional measurements are necessary for this; the control calculates the optimization of the position automatically.

> Depending on the machine kinematics for correctly determining the angles, HEIDENHAIN recommends performing the measurement once with an inclination angle of 0°.

"Optimize machine datum, position, and angle" mode (Q406 = 3)

- The control measures the rotary axes in the positions defined and calculates the static accuracy of the tilting transformation.
- The control automatically tries to optimize the datum (option 52, KinematicsComp). In order to use a machine datum to compensate for the angular position of a rotary axis, the rotary axis to be compensated must be nearer to the machine base than the measured rotary axis.
- The control then tries to optimize the angular orientation of the rotary axis by means of compensation (option 52, KinematicsComp)
- After angle optimization, the control will perform a position optimization. No additional measurements are necessary for this; the control calculates the optimization of the position automatically.

> For correct determination of the angles, HEIDENHAIN recommends performing the measurement once with an inclination angle of 0°.

Log function

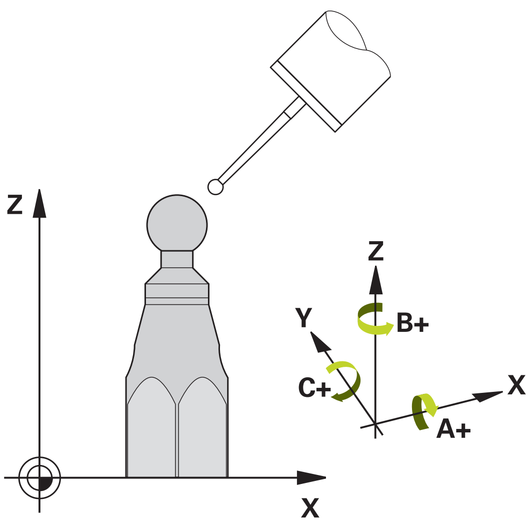
After running Cycle 451, the control will create a log **(TCHPR451.html**) and saves it in the folder that also contains the associated NC program. This log contains the following data:

- Creation date and time of the log
- Path of the NC program from which the cycle was run
- Mode used (0=Check/1=Optimize position/2=Optimize pose)
- Active kinematic number
- Entered calibration sphere radius
- For each measured rotary axis:
  - Starting angle
  - End angle
  - Angle of incidence
  - Number of measuring points
  - Dispersion (standard deviation)
  - Maximum error
  - Angular error
  - Averaged backlash
  - Averaged positioning error
  - Measuring circle radius
  - Compensation values in all axes (preset shift)
  - Position before optimization of the rotary axes checked (relative to the beginning of the kinematic transformation chain, usually the spindle nose)
  - Position after optimization of the rotary axes checked (relative to the beginning of the kinematic transformation chain, usually the spindle nose)

29.7.4 Cycle 452 PRESET COMPENSATION (option 48)

Application

Refer to your machine manual.
This function must be enabled and adapted by the machine manufacturer.



Touch probe cycle **452** optimizes the kinematic transformation chain of your machine (see "Cycle 451 MEASURE KINEMATICS (option 48)", Page 1702). Then the control corrects the workpiece coordinate system in the kinematics model in such a way that the current preset is at the center of the calibration sphere after optimization.

Cycle sequence

> Position the calibration sphere on the machine table so that there can be no collisions during the measuring process.

This cycle enables you, for example, to adjust different interchangeable heads so that the workpiece preset applies for all heads.

1. Clamp the calibration sphere
2. Measure the complete reference head with Cycle **451**, and then use Cycle **451** to set the preset in the center of the sphere.
3. Insert the second head
4. Use Cycle **452** to measure the interchangeable head up to the point where the head is changed.
5. Use Cycle **452** to adjust other interchangeable heads to the reference head

If it is possible to leave the calibration sphere clamped to the machine table during machining, you can compensate for machine drift, for example. This procedure is also possible on a machine without rotary axes.

1. Clamp the calibration sphere and check for potential collisions.
2. Set the preset in the calibration sphere.
3. Set the preset on the workpiece, and start machining the workpiece.
4. Use Cycle **452** for preset compensation at regular intervals. The control measures the drift of the axes involved and compensates it in the kinematics description.

Q parameter number	Meaning
Q141	Standard deviation measured in the A axis (–1 if axis was not measured)
Q142	Standard deviation measured in the B axis (–1 if axis was not measured)
Q143	Standard deviation measured in the C axis (–1 if axis was not measured)
Q144	Optimized standard deviation in the A axis (–1 if axis was not measured)
Q145	Optimized standard deviation in the B axis (–1 if axis was not measured)
Q146	Optimized standard deviation in the C axis (–1 if axis was not measured)
Q147	Offset error in X direction, for manual transfer to the corresponding machine parameter
Q148	Offset error in Y direction, for manual transfer to the corresponding machine parameter
Q149	Offset error in Z direction, for manual transfer to the corresponding machine parameter

Notes

In order to be able to perform a preset compensation, the kinematics must be specially prepared. The machine manual provides further information.

NOTICE

Danger of collision!

If you run this cycle, a basic rotation or 3-D basic rotation must not be active. The control will delete the values from the columns **SPA**, **SPB** and **SPC** of the preset table as needed. After the cycle, you need to set a basic rotation or 3-D basic rotation again; otherwise, there is a danger of collision.

- Deactivate the basic rotation before running the cycle.
- Set the preset and the basic rotation again after optimization.

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- Before the beginning of the cycle, **M128** or **FUNCTION TCPM** must be switched off.
- As with Cycles **451** and **452**, Cycle **453** ends with active 3D-ROT in automatic mode, matching the position of the rotary axes.
- Ensure that all functions for tilting the working plane are reset.
- Before defining the cycle, you must set the preset at the center of the calibration sphere and activate it.
- For rotary axes without separate position encoders, select the measuring points in such a way that you have to traverse an angle of 1° to the limit switch. The control needs this traverse for internal backlash compensation.
- For the positioning feed rate when moving to the probing height in the touch probe axis, the control uses the value from cycle parameter **Q253** or the **FMAX** value from the touch probe table, whichever is smaller. The control always moves the rotary axes at positioning feed rate **Q253**, while touch probe monitoring is inactive.
- Programming in inches: The control always records the log data and results of measurement in millimeters.

- If you interrupt the cycle during the measurement, the kinematic data might no longer be in the original condition. Save the active kinematic configuration before an optimization with Cycle **450**, so that in case of a failure the most recently active kinematic configuration can be restored.

Notes about machine parameters

- In the machine parameter **maxModification** (no. 204801), the machine manufacturer defines the permissible limit value for modifications of a transformation. If the kinematics data determined exceed the permissible limit value, the control displays a warning. Then you have to confirm acceptance of the determined values by pressing **NC Start**.
- In the machine parameter **maxDevCalBall** (no. 204802), the machine manufacturer defines the maximum deviation of the calibration sphere radius. In every probing process the control first measures the radius of the calibration sphere. If the measured sphere radius differs from the entered sphere radius by more than the value you have defined in the machine parameter **maxDevCalBall** (no. 204802), the control displays an error message and ends the measurement.

Cycle parameters

Help graphic	Parameter
	Q407 Radius of calib. sphere? Enter the exact radius of the calibration sphere being used. Input: **0.0001...99.9999**
	Q320 Set-up clearance? Additional distance between touch point and ball tip. **Q320** is in addition to the **SET_UP** column in the touch probe table. This value has an incremental effect. Input: **0...99999.9999** or **PREDEF**
	Q408 Retraction height? **0**: Do not move to any retraction height; the control moves to the next measuring position in the axis to be measured. Not allowed for Hirth axes! The control moves to the first measuring position in the sequence A, then B, then C. **> 0**: Retraction height in the untilted workpiece coordinate system to which the control positions the spindle axis before positioning a rotary axis. In addition, the control moves the touch probe in the working plane to the datum. Touch probe monitoring is not active in this mode. Define the positioning feed rate in parameter **Q253**. The value has an absolute effect. Input: **0...99999.9999**
	Q253 Feed rate for pre-positioning? Define the traversing speed of the tool during pre-positioning in mm/min. Input: **0...99999.9999** or **FMAX**, **FAUTO**, **PREDEF**
	Q380 Ref. angle in ref. axis? Enter the reference angle (basic rotation) for acquiring the measuring points in the active workpiece coordinate system. Defining a reference angle can considerably enlarge the measuring range of an axis. The value has an absolute effect. Input: **0...360**
	Q411 Starting angle in A axis? Starting angle in the A axis at which the first measurement will be made. The value has an absolute effect. Input: **-359.9999...+359.9999**
	Q412 End angle in A axis? End angle in the A axis at which the last measurement will be made. The value has an absolute effect. Input: **-359.9999...+359.9999**
	Q413 Angle of incidence in A axis? Angle of incidence in the A axis at which the other rotary axes will be measured. Input: **-359.9999...+359.9999**

Help graphic	Parameter
	Q414 No. of meas. points in A (0...12)? Number of measuring points the control will use to measure the A axis. If the input value = 0, the control does not measure the respective axis. Input: **0...12**
	Q415 Starting angle in B axis? Starting angle in the B axis at which the first measurement will be made. The value has an absolute effect. Input: **-359.9999...+359.9999**
	Q416 End angle in B axis? End angle in the B axis at which the last measurement will be made. The value has an absolute effect. Input: **-359.9999...+359.9999**
	Q417 Angle of incidence in B axis? Angle of incidence in the B axis at which the other rotary axes will be measured. Input: **-359.999...+360.000**
	Q418 No. of meas. points in B (0...12)? Number of measuring points the control will use to measure the B axis. If the input value = 0, the control does not measure the respective axis. Input: **0...12**
	Q419 Starting angle in C axis? Starting angle in the C axis at which the first measurement will be made. The value has an absolute effect. Input: **-359.9999...+359.9999**
	Q420 End angle in C axis? End angle in the C axis at which the last measurement will be made. The value has an absolute effect. Input: **-359.9999...+359.9999**
	Q421 Angle of incidence in C axis? Angle of incidence in the C axis at which the other rotary axes will be measured. Input: **-359.9999...+359.9999**
	Q422 No. of meas. points in C (0...12)? Number of measuring points the control will use to measure the C axis. If the input value = 0, the control does not measure the respective axis. Input: **0...12**
	Q423 Number of probes? Define the number of measuring points the control will use to measure the calibration sphere in the plane. Fewer measuring points increase speed and more measuring points increase measurement precision. Input: **3...8**

Help graphic	Parameter
	Q432 Angular range of backlash comp.? Define the traversing angle the control will use to measure the rotary axis backlash. The traversing angle must be significantly larger than the actual backlash of the rotary axes. If input value = 0, the control does not measure the backlash. Input: **-3...+3**

Adjustment of interchangeable heads

The head change function can vary depending on the individual machine tool. Refer to your machine manual.

- Load the second interchangeable head.
- Insert the touch probe
- Measure the interchangeable head with Cycle **452**
- Measure only the axes that have actually been changed (in this example: only the A axis; the C axis is hidden with **Q422**)
- The preset and the position of the calibration sphere must not be changed during the entire process.
- All other interchangeable heads can be adjusted in the same way

```

The goal of this procedure is to achieve that the workpiece preset remains unchanged after changing rotary axes (head change).

In the following example, the adjustment of a fork head with A and C axes is described. The A axis is changed, whereas the C axis continues being a part of the basic configuration.

- Insert the interchangeable head that will be used as a reference head.
- Clamp the calibration sphere
- Insert the touch probe
- Use Cycle **451** to measure the complete kinematics, including the reference head
- Define the preset (using **Q431** = 2 or 3 in Cycle **451**) after measuring the reference head

Measuring a reference head

```

Drift compensation

> **i** This procedure can also be performed on machines without rotary axes.

During machining, various machine components are subject to drift due to varying ambient conditions. If the drift remains sufficiently constant over the range of traverse, and if the calibration sphere can be left on the machine table during machining, the drift can be measured and compensated with Cycle **452**.

- Clamp the calibration sphere
- Insert the touch probe
- Measure the complete kinematics with Cycle **451** before starting the machining process
- Define the preset (using **Q432** = 2 or 3 in Cycle **451**) after measuring the kinematics
- Then set the presets on your workpiece and start the machining process.

Reference measurement for drift compensation

Log function

After running Cycle **452**, the control creates a log (**TCHPR452.html**) containing the following information:

- Creation date and time of the log
- Path of the NC program from which the cycle was run
- Active kinematic number
- Entered calibration sphere radius
- For each measured rotary axis:
  - Starting angle
  - End angle
  - Angle of incidence
  - Number of measuring points
  - Dispersion (standard deviation)
  - Maximum error
  - Angular error
  - Averaged backlash
  - Averaged positioning error
  - Measuring circle radius
  - Compensation values in all axes (preset shift)
  - Measurement uncertainty of rotary axes
  - Position before preset compensation of the rotary axes checked (relative to the beginning of the kinematic transformation chain, usually the spindle nose)
  - Position after preset compensation of the rotary axes checked (relative to the beginning of the kinematic transformation chain, usually the spindle nose)

Notes on log data

Page 1717

29.7.5 Cycle 453 KINEMATICS GRID (option 48), (option 52)

Application

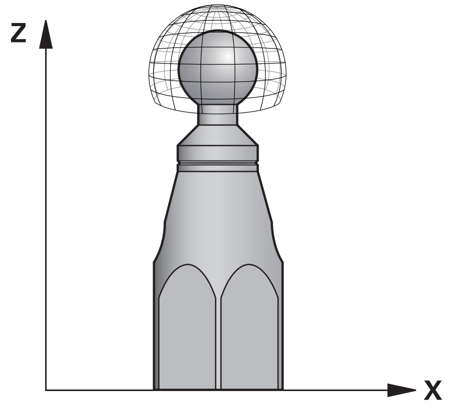
Refer to your machine manual.

KinematicsOpt (software option 48) is required.

KinematicsComp (software option 52) is required.

This function must be enabled and adapted by the machine manufacturer.

To use this cycle, your machine tool builder needs to create and configure a compensation table (*.kco) first and enter some more settings.



Even if your machine was already optimized regarding positioning errors (e.g. via Cycle **451**), residual errors at the Tool Center Point (**TCP**) during tilting of the rotary axes may remain. Such errors occur particularly with swivel-head machines. These can result, for example, from component errors (e.g. a bearing error) with head rotation axes.

Cycle **453 KINEMATICS GRID** enables these errors to be detected and compensated in accordance with the tilting axis positions. Options 48 (**KinematicsOpt**) and 52 (**KinematicsComp**) are required. With this cycle and using a 3-D TS touch probe, you measure a HEIDENHAIN calibration sphere that you have attached to the machine table. The cycle then moves the touch probe automatically to positions in a grid-line arrangement around the calibration sphere. The machine tool builder defines these tilting axis positions. You can arrange the positions in up to three dimensions. (Each dimension is a rotary axis.) After the probing process on the sphere, compensation of the errors can be performed using a multi-dimensional table. The machine tool builder defines this compensation table (*.kco) and specifies its storage location.

When using Cycle **453**, run it at different positions in the workspace. This allows you to check immediately if a compensation with Cycle **453** has the desired positive effect on the machine's accuracy. Only when the desired improvements are achieved with the same compensation values at several positions is such a type of compensation suitable for the respective machine. If this is not the case, then the errors are to be sought outside the rotary axes.

Perform the measurement with Cycle **453** in an optimized condition regarding the rotary axis positioning errors. For this purpose, use e.g. Cycle **451** beforehand.

> HEIDENHAIN recommends using the calibration spheres **KKH 250** (ID number 655475-01) or **KKH 100 (ID number 655475-02)**, which are particularly rigid and are designed especially for machine calibration. Please contact HEIDENHAIN if you have any questions in this regard.

The control then optimizes the accuracy of your machine. For this purpose, it automatically saves the compensation values resulting from a measurement in a compensation table (*.kco). (This applies to mode **Q406**=1.)

Cycle sequence

1 Clamp the calibration sphere and check for potential collisions.
2 In Manual mode of operation, set the preset to the center of the sphere or, if you defined **Q431=1** or **Q431=3**: Manually position the touch probe above the calibration sphere in the touch probe axis and at the center of the sphere in the working plane.
3 Select one of the Program Run operating modes and start the NC program
4 The cycle is executed in accordance with the setting in **Q406** (–1=Delete mode / 0=Test mode / 1=Compensate mode)

> During presetting, the programmed radius of the calibration sphere will only be monitored for the second measurement. The reason is that if pre-positioning with respect to the calibration sphere is inaccurate and you then start presetting, the calibration sphere will be probed twice.

Various modes (Q406)

Delete mode Q406 = -1

- The axes are not moved
- The control writes all values to the compensation table (*.kco), setting them to "0". The result is that no further compensations will be effective for the currently selected kinematics.

Test mode Q406 = 0

- The control probes the calibration sphere.
- The results are saved to a log in html format that is stored in the directory as the current NC program

Compensate mode Q406 = 1

- The control probes the calibration sphere.
- The control writes the deviations to the compensation table (*.kco). The table is updated and the compensation settings are immediately effective.
- The results are saved to a log in html format that is stored in the directory as the current NC program

Choice of the calibration sphere position on the machine table

In principle, you can fix the calibration sphere to any accessible position on the machine table and also on fixtures or workpieces. It is recommended to clamp the calibration sphere as closely as possible to the position intended for subsequent machining.

> Position the calibration sphere on the machine table so that there can be no collisions during the measuring process.

Notes

> KinematicsOpt (software option 48) is required. KinematicsComp (software option 52) is required.
>
> This function must be enabled and adapted by the machine manufacturer.
>
> Your machine tool builder defines the storage location of the compensation table (*.kco).

NOTICE

Danger of collision!

If you run this cycle, a basic rotation or 3-D basic rotation must not be active. The control will delete the values from the columns **SPA**, **SPB** and **SPC** of the preset table as needed. After the cycle, you need to set a basic rotation or 3-D basic rotation again; otherwise, there is a danger of collision.

- Deactivate the basic rotation before running the cycle.
- Set the preset and the basic rotation again after optimization.

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- Before the beginning of the cycle, **M128** or **FUNCTION TCPM** must be switched off.
- As with Cycles **451** and **452**, Cycle **453** ends with active 3D-ROT in automatic mode, matching the position of the rotary axes.
- Before defining the cycle, you must set the preset to the center of the calibration sphere and activate it, or you set input parameter **Q431** to 1 or 3, respectively.
- For the positioning feed rate when moving to the probing height in the touch probe axis, the control uses the value from cycle parameter **Q253** or the **FMAX** value from the touch probe table, whichever is smaller. The control always moves the rotary axes at positioning feed rate **Q253**, while probe monitoring is inactive.
- Programming in inches: The control always records the log data and results of measurement in millimeters.
- If you have activated preset setting before the calibration (**Q431** = 1/3), then move the touch probe by the set-up clearance (**Q320** + **SET_UP**) to a position approximately above the center of the calibration sphere before the start of the cycle.

- If your machine is equipped with a feedback-controlled spindle, you should activate the angle tracking in the touch probe table (**TRACK column**). This generally increases the accuracy of measurements with a 3-D touch probe.

Notes about machine parameters

- In the machine parameter **mStrobeRotAxPos** (no. 204803), the machine manufacturer defines the maximum permissible modification of a transformation. If the value is not equal to –1 (M function positions the rotary axis), then start a measurement only if all rotary axes are at 0°.
- In the machine parameter **maxDevCalBall** (no. 204802), the machine manufacturer defines the maximum deviation of the calibration sphere radius. In every probing process the control first measures the radius of the calibration sphere. If the measured sphere radius differs from the entered sphere radius by more than the value you have defined in the machine parameter **maxDevCalBall** (no. 204802), the control displays an error message and ends the measurement.

Cycle parameters

Help graphic	Parameter
	Q406 Mode (-1/0/+1) Define whether the control will write a value of 0 to the values of the compensation table (*.kco), will check the currently existing deviations, or will perform a compensation. A log file (*.html) is created. **−1**: Delete values in the compensation table (*.kco). The compensation values for TCP positioning errors are set to 0 in the compensation table (*.kco). The control will not perform any probing. No results will be output to the log (*.html). **0**: Check TCP positioning errors. The control measures the TCP positioning errors based on the rotary axis positions but does not write values to the compensation table (*.kco). The control displays the standard and maximum deviation in a log (*.html). **1**: Compensate TCP positioning errors. The control measures the TCP positioning errors based on the rotary axis positions and writes the deviations to the compensation table (*.kco). The compensations are then immediately effective. The control displays the standard and maximum deviation in a log (*.html). Input: **-1**, **0**, **+1**
	Q407 Radius of calib. sphere? Enter the exact radius of the calibration sphere being used. Input: **0.0001...99.9999**
	Q320 Set-up clearance? Additional distance between touch point and ball tip. **Q320** is in addition to the **SET_UP** column in the touch probe table. This value has an incremental effect. Input: **0...99999.9999** or **PREDEF**
	Q408 Retraction height? **0**: Do not move to any retraction height; the control moves to the next measuring position in the axis to be measured. Not allowed for Hirth axes! The control moves to the first measuring position in the sequence A, then B, then C. **> 0**: Retraction height in the untilted workpiece coordinate system to which the control positions the spindle axis before positioning a rotary axis. In addition, the control moves the touch probe in the working plane to the datum. Touch probe monitoring is not active in this mode. Define the positioning feed rate in parameter **Q253**. The value has an absolute effect. Input: **0...99999.9999**
	Q253 Feed rate for pre-positioning? Define the traversing speed of the tool during pre-positioning in mm/min. Input: **0...99999.9999** or **FMAX**, **FAUTO**, **PREDEF**

Help graphic	Parameter
	Q380 Ref. angle in ref. axis? Enter the reference angle (basic rotation) for acquiring the measuring points in the active workpiece coordinate system. Defining a reference angle can considerably enlarge the measuring range of an axis. The value has an absolute effect. Input: **0...360**
	Q423 Number of probes? Define the number of measuring points the control will use to measure the calibration sphere in the plane. Fewer measuring points increase speed and more measuring points increase measurement precision. Input: **3...8**
	Q431 Preset (0/1/2/3)? Define whether the control will automatically set the active preset at the center of the sphere: **0**: Do not set the preset automatically at the center of the sphere: Set the preset manually before the start of the cycle **1**: Set the preset automatically at the center of the sphere before measurement (the active preset will be overwritten): Pre-position the touch probe manually above the calibration sphere before the start of the cycle **2**: Set the preset automatically at the center of the sphere after measurement (the active preset will be overwritten): Set the preset manually before the start of the cycle **3**: Set the preset at the center of the sphere before and after measurement (the active preset will be overwritten): Pre-position the touch probe manually above the calibration sphere before the start of the cycle Input: **0**, **1**, **2**, **3**

Probing with Cycle 453

```
11 TCH PROBE 453 KINEMATICS GRID ~
    Q406=+0              ;MODE ~
    Q407=+12.5           ;SPHERE RADIUS ~
    Q320=+0              ;SET-UP CLEARANCE ~
    Q408=+0              ;RETR. HEIGHT ~

```

Log function

After running Cycle **453**, the control will create a log **(TCHPR453.html**) and save it in the folder where the current NC program resides. It contains the following data:

- Date and time of protocol creation
- Path of the NC program from which the cycle was run
- Number and name of the currently active tool
- Mode
- Measured data: Standard deviation and maximum deviation
- Information at which position in degrees (°) the maximum deviation occurred
- Number of measuring positions

29.8 Touch Probe Cycles: Automatic Tool Measurement

29.8.1 Fundamentals

Overview

Refer to your machine manual.
Some cycles and functions may not be provided on your machine.
Option 17 is required.
The control must be specifically prepared by the machine manufacturer for the use of a touch probe.
HEIDENHAIN only guarantees the proper operation of the touch probe cycles in conjunction with HEIDENHAIN touch probes.

NOTICE

Danger of collision!

When running touch probe cycles **400** to **499**, no cycles for coordinate transformation must be active.

- The following cycles must not be activated before a touch probe cycle: Cycle **7 DATUM SHIFT**, Cycle **8 MIRRORING**, Cycle **10 ROTATION**, Cycle **11 SCALING FACTOR**, and Cycle **26 AXIS-SPECIFIC SCALING**.
- Reset any coordinate transformations beforehand.

In conjunction with the control's tool measurement cycles, the tool touch probe enables you to measure tools automatically: the compensation values for tool length and radius are stored in the tool table and are accounted for at the end of the touch probe cycle. The following types of tool measurement are provided:

- Measurement of a stationary tool
- Measurement of a rotating tool
- Measurement of individual teeth

Cycle		Call	Further information
480 **30**	**CALIBRATE TT** ■ Calibrating the tool touch probe	**DEF-** active	Page 1738
481 **31**	**CAL. TOOL LENGTH** ■ Measuring the tool length	**DEF-** active	Page 1740
482 **32**	**CAL. TOOL RADIUS** ■ Measuring the tool radius	**DEF-** active	Page 1743
483 **33**	**MEASURE TOOL** ■ Measuring the tool length and radius	**DEF-** active	Page 1746
484	**CALIBRATE IR TT** ■ Calibrating the tool touch probe (e.g., infrared tool touch probe)	**DEF-** active	Page 1749
485	**MEASURE LATHE TOOL** (option 50) ■ Measurement of turning tools	**DEF-** active	Page 1753

Differences between Cycles 30 to 33 and Cycles 480 to 483

The features and the operating sequences are absolutely identical. There are only the following differences between Cycles **30** to **33** and Cycles **480** to **483**:

- Instead of a selectable parameter for the status of the measurement, Cycles **481** to **483** use the fixed parameter **Q199**.

Setting machine parameters

The touch probe cycles **480**, **481**, **482**, **483**, **484** can be hidden with the optional **hideMeasureTT** machine parameter (no. 128901).

Programming and operating notes:

- Before you start working with the touch probe cycles, check all machine parameters defined in **ProbeSettings** > **CfgTT** (no. 122700) and **CfgTTRoundStylus** (no. 114200) or **CfgTTRectStylus** (no. 114300).
- When measuring a stationary tool, the control will use the feed rate for probing defined in the **probingFeed** machine parameter (no. 122709).

When measuring a rotating tool, the control automatically calculates the spindle speed and feed rate for probing.

The spindle speed is calculated as follows:

n = **maxPeriphSpeedMeas** / (r • 0.0063) where

n:	Spindle speed [rpm]
maxPeriphSpeedMeas:	Maximum permissible cutting speed in m/min
r:	Active tool radius [mm]

The probing feed rate is calculated as follows:
v = measuring tolerance • n with

v:	Probing feed rate [mm/min]
Measuring tolerance	Measuring tolerance [mm], depending on **maxPeriphSpeedMeas**
n:	Shaft speed [rpm]

probingFeedCalc (no. 122710) determines the calculation of the probing feed rate:

probingFeedCalc (no. 122710) = **ConstantTolerance**:

The measuring tolerance remains constant—regardless of the tool radius. With very large tools, however, the feed rate for probing is reduced to zero. The lower you set the maximum permissible rotational speed **maxPeriphSpeedMeas** (no. 122712) and the permissible tolerance **measureTolerance1** (no. 122715), the sooner you will encounter this effect.

probingFeedCalc (no. 122710) = **VariableTolerance**:

The measuring tolerance is adjusted relative to the size of the tool radius. This ensures a sufficient feed rate for probing even with large tool radii. The control adjusts the measuring tolerance according to the following table:

Tool radius	Measuring tolerance
Up to 30 mm	**measureTolerance1**
30 to 60 mm	2 • **measureTolerance1**
60 to 90 mm	3 • **measureTolerance1**
90 to 120 mm	4 • **measureTolerance1**

probingFeedCalc (No. 122710) = **ConstantFeed**:

The measuring feed rate remains constant; the measuring error, however, rises linearly with the increase in tool radius:

Measuring tolerance = (r • **measureTolerance1**)/ 5 mm) where

r:	Active tool radius [mm]
measureTolerance1:	Maximum permissible error of measurement

Entries in the tool table for milling and turning tools

Abbr.	Inputs	Dialog
CUT	Number of teeth (20 teeth maximum)	**Number of teeth?**
LTOL	Permissible deviation from tool length L for wear detection. If the entered value is exceeded, the control locks the tool (status **L**). Input range: 0 to 0.9999 mm	**Wear tolerance: length?**
RTOL	Permissible deviation from tool radius R for wear detection. If the entered value is exceeded, the control locks the tool (status **L**). Input range: 0 to 0.9999 mm	**Wear tolerance: radius?**
DIRECT.	Cutting direction of the tool for measuring a rotating tool	**Cutting direction (M3 = -)?**
R-OFFS	Tool length measurement: Tool offset between stylus center and tool center. Default setting: No value entered (offset = tool radius)	**Tool offset: radius?**
L-OFFS	Radius measurement: Tool offset between upper edge of stylus and lower edge of tool in addition to **offsetToolAxis**. Default: 0	**Tool offset: length?**
LBREAK	Permissible deviation from tool length L for breakage detection. If the entered value is exceeded, the control locks the tool (status **L**). Input range: 0 to 0.9999 mm	**Breakage tolerance: length?**
RBREAK	Permissible deviation from tool radius R for breakage detection. If the entered value is exceeded, the control locks the tool (status **L**). Input range: 0 to 0.9999 mm	**Breakage tolerance: radius?**

Input examples for common tool types

Tool type	CUT	R-OFFS	L-OFFS
Drill	No function	0: No offset required because tool tip is to be measured	
End mill	4: four cutting edges	R: Offset required because the tool diameter is greater than the contact plate diameter of the TT	0: No additional offset required during radius measurement. Offset from **offsetToolAxis** (no. 122707) used.
Spherical cutter with a diameter of 10 mm	4: four cutting edges	0: No offset required because the south pole of the ball is to be measured.	5: At a diameter of 10 mm, the tool radius will be defined as offset. If this is not the case, the diameter of the spherical cutter will be measured too far down. So the tool diameter will not be correct.

29.8.2 Cycle 30 or 480 CALIBRATE TT

Application

Refer to your machine manual!

You calibrate the TT with touch probe cycle **30** or **480** (Page 1735). The calibration process runs automatically. The control also measures the center misalignment of the calibration tool automatically by rotating the spindle by 180° after the first half of the calibration cycle.

You calibrate the TT with touch probe cycle **30** or **480** .

Touch probe

For the touch probe you use a spherical or cuboid probe contact

Cuboid probe contact

For a cuboid probe contact, the machine manufacturer can store in the optional machine parameters **detectStylusRot** (no. 114315) and **tippingTolerance** (no. 114319) whether the angle of misalignment and tilt angle are determined. Determining the angle of misalignment enables compensation for it when measuring tools. The control displays a warning if the tilt angle is exceeded. The values determined can be seen in the status display of the **TT**.

Further information: "TT tab", Page 161

When clamping the tool touch probe, make sure that the edges of the cuboid probe contact are aligned as parallel to the machine axes as possible. The angle of misalignment should be less than 1° and the tilt angle should be less than 0.3°.

Calibration tool

The calibration tool must be a precisely cylindrical part, for example a cylindrical pin. The resulting calibration values are stored in the control memory and are accounted for during subsequent tool measurement.

Cycle sequence

1 Clamp the calibration tool. The calibration tool must be a precisely cylindrical part, for example a cylindrical pin
2 Manually position the calibration tool in the working plane over the center of the TT
3 Position the calibration tool in the tool axis at approximately 15 mm plus set-up clearance over the TT
4 The first movement of the tool is along the tool axis. The tool is first moved to clearance height, i.e. set-up clearance + 15 mm.
5 The calibration process along the tool axis starts
6 This is followed by calibration in the working plane
7 The control positions the calibration tool in the working plane at a position of TT radius + set-up clearance + 11 mm
8 Then the control moves the tool downwards along the tool axis and the calibration process starts
9 During probing, the control moves in a square pattern
10 The control saves the calibration values and considers them during subsequent tool measurement
11 The control then retracts the stylus along the tool axis to set-up clearance and moves it to the center of the TT

Notes

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- Before calibrating the touch probe, you must enter the exact length and radius of the calibration tool into the TOOL.T tool table.

Notes about machine parameters

- Use the machine parameter **CfgTTRoundStylus** (no. 114200) or **CfgT-TRectStylus** (no. 114300) to define the functionality of the calibration cycle. Refer to your machine manual.
  - Use the machine parameter **centerPos** to define the position of the TT within the machine's working space.
- The TT needs to be recalibrated if you change the position of the TT on the table and/or a **centerPos** machine parameter.
- In the machine parameter **probingCapability** (no. 122723), the machine manufacturer defines the functionality of the cycle. This parameter allows you to permit tool length measurement with a stationary spindle and at the same time to inhibit tool radius and individual teeth measurements.

Cycle parameters

Help graphic	Parameter
	Q260 Clearance height? Enter the position in the spindle axis at which there is no danger of collision with the workpiece or fixtures. The clearance height is referenced to the active workpiece preset. If you enter such a small clearance height value that the tool tip would lie below the top of the probe contact, the control automatically positions the calibration tool above the top of the probe contact (safety zone from **safetyDistToolAx** (no. 114203)). Input: **-99999.9999...+99999.9999**

Example of new format

```
11 TOOL CALL 12 Z
12 TCH PROBE 480 CALIBRATE TT ~
    Q260=+100                    ;CLEARANCE HEIGHT
```

Example of old format

```
11 TOOL CALL 12 Z
12 TCH PROBE 30.0 CALIBRATE TT
13 TCH PROBE 30.1 HEIGHT:+90
```

29.8.3 Cycle 31 or 481 CAL. TOOL LENGTH

Application

Refer to your machine manual!

If you want to measure the tool length, program the touch probe cycle **31** or **482** (Page 1735). Input parameters allow you to select which of the three following methods will be used to measure the tool length:

- If the tool diameter is larger than the diameter of the measuring surface of the TT, you measure the tool while it is rotating.
- If the tool diameter is smaller than the diameter of the measuring surface of the TT, or if you are measuring the length of a drill or spherical cutter, you measure the tool while it is stationary.
- If the tool diameter is larger than the diameter of the measuring surface of the TT, you measure the individual teeth of the tool while it is stationary.

Cycle for measuring a tool during rotation

The control determines the longest tooth of a rotating tool by positioning the tool to be measured at an offset to the center of the touch probe and then moving it toward the measuring surface of the TT until it contacts the surface. The offset is programmed in the tool table under Tool offset: Radius (**R-OFFS**).

Cycle for measuring a stationary tool (e.g. for drills)

The control positions the tool to be measured above the center of the measuring surface. It then moves the non-rotating tool toward the measuring surface of the TT until contact is made. For this measurement, enter 0 in the tool table under Tool offset: radius (**R-OFFS**).

Cycle for measuring individual teeth

The control pre-positions the tool to be measured to a position at the side of the touch probe head. The distance from the tip of the tool to the upper edge of the touch probe head is defined in **offsetToolAxis** (no. 122707). You can enter an additional offset in Tool offset: Length (**L-OFFS**) in the tool table. The control probes the tool radially while it is rotating to determine the starting angle for measuring the individual teeth. It then measures the length of each tooth by changing the corresponding angle of spindle orientation. To activate this function, set the parameter **PROBING THE TEETH** = 1 in Cycle **31**.

Notes

NOTICE

Danger of collision!

If you set **stopOnCheck** (no. 122717) to **FALSE**, the control does not evaluate the result parameter **Q199** and the NC program is not stopped if the breakage tolerance is exceeded. There is a danger of collision!

- Set **stopOnCheck** (no. 122717) to **TRUE**
- You must then take steps to ensure that the NC program stops if the breakage tolerance is exceeded

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- Before measuring a tool for the first time, enter the following data on the tool into the TOOL.T tool table: the approximate radius, the approximate length, the number of teeth, and the cutting direction.
- You can run an individual tooth measurement for tools with **up to 20 teeth**.
- Cycles **31** and **481** do not support touch probes, turning or dressing tools.

Measuring grinding tools

- The cycle takes into account the basic and compensation data from the **TOOLGRIND.GRD** table, as well as the wear and compensation data (**LBREAK** and **LTOL**) from the **TOOL.T** table.

Q340: **0** and **1**

- This cycle will modify compensation or basic data, depending on whether or not an initial dressing operation (**INIT_D**) is defined. This cycle will enter the values automatically at the correct locations in the **TOOLGRIND.GRD** table.

Note the following sequence for setting up grinding tools, see "Tool data for grinding tools (option 156)", Page 263.

Cycle parameters

Help graphic	Parameter
	Q340 Tool measurement mode (0-2)? Define whether and how the measured data will be entered in the tool table. **0**: The measured tool length is written to column L of tool table TOOL.T, and the tool compensation is set to DL = 0. If there is already a value in TOOL.T, it will be overwritten. **1**: The measured tool length is compared to the tool length L from TOOL.T. The control calculates the deviation from the stored value and enters it into TOOL.T as the delta value DL. The deviation is also available in the Q parameter **Q115**. If the delta value is greater than the permissible tool length tolerance for wear or break detection, the control will lock the tool (status L in TOOL.T). **2**: The measured tool length is compared to the tool length L from TOOL.T. The control calculates the deviation from the stored value and writes it to Q parameter **Q115**. Nothing is entered under L or DL in the tool table. Input: **0**, **1**, **2** Note the behavior with grinding tools, Page 1741
	Q260 Clearance height? Enter the position in the spindle axis at which there is no danger of collision with the workpiece or fixtures. The clearance height is referenced to the active workpiece preset. If you enter such a small clearance height that the tool tip would lie below the top of the probe contact, the control automatically positions the tool above the top of the probe contact (safety zone from **safetyDistStylus**). Input: **-99999.9999...+99999.9999**
	Q341 Probe the teeth? 0=no/1=yes Define whether the control will measure the individual teeth (maximum of 20 teeth) Input: **0**, **1**

Example of new format

```
11 TOOL CALL 12 Z
12 TCH PROBE 481 CAL. TOOL LENGTH ~

15 TCH PROBE 31.3 PROBING THE TEETH:1
```

29.8.4 Cycle 32 or 482 CAL. TOOL RADIUS

Application

Refer to your machine manual!

If you want to measure the tool radius, program the touch probe cycle **32** or **482** (Page 1735). Input parameters allow you to select which of the two following methods will be used to measure the tool radius:

- Measuring the tool while it is rotating
- Measuring the tool while it is rotating and subsequently measuring the individual teeth

The control pre-positions the tool to be measured to a position at the side of the touch probe head. The distance from the face of the milling tool to the upper edge of the touch probe head is defined in **offsetToolAxis** (no. 122707). The control probes the tool radially while it is rotating. If you have programmed a subsequent measurement of individual teeth, the control will measure the radius of each tooth with the aid of oriented spindle stops.

Notes

NOTICE

Danger of collision!

If you set **stopOnCheck** (no. 122717) to **FALSE**, the control does not evaluate the result parameter **Q199** and the NC program is not stopped if the breakage tolerance is exceeded. There is a danger of collision!

- Set **stopOnCheck** (no. 122717) to **TRUE**
- You must then take steps to ensure that the NC program stops if the breakage tolerance is exceeded

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- Before measuring a tool for the first time, enter the following data on the tool into the TOOL.T tool table: the approximate radius, the approximate length, the number of teeth, and the cutting direction.
- Cycles **32** and **482** do not support touch probes, turning or dressing tools.

Measuring grinding tools

- The cycle takes into account the basic and compensation data from the **TOOLGRIND.GRD** table, as well as the wear and compensation data (**RBREAK** and **RTOL**) from the **TOOL.T** table.

Q340: **0** and **1**

- This cycle will modify compensation or basic data, depending on whether or not an initial dressing operation (**INIT_D**) is defined. This cycle will enter the values automatically at the correct locations in the **TOOLGRIND.GRD** table.

Note the following sequence for setting up grinding tools, see "Tool data for grinding tools (option 156)", Page 263.

Notes about machine parameters

- In the machine parameter **probingCapability** (no. 122723), the machine manufacturer defines the functionality of the cycle. This parameter allows you to permit tool length measurement with a stationary spindle and at the same time to inhibit tool radius and individual teeth measurements.
- Cylindrical tools with diamond surfaces can be measured while the spindle is stationary. To do so, in the tool table define the number of teeth **CUT** as 0 and adjust the machine parameter **CfgTT**. Refer to your machine manual.

Cycle parameters

Help graphic	Parameter
	Q340 Tool measurement mode (0-2)? Define whether and how the measured data will be entered in the tool table. **0**: The measured tool radius is written to column R of the TOOL.T tool table, and the tool compensation is set to DR = 0. If there is already a value in TOOL.T, it will be overwritten. **1**: The measured tool radius is compared to the tool radius R from TOOL.T. The control calculates the deviation from the stored value and enters it into TOOL.T as the delta value DR. The deviation is also available in the Q parameter **Q116**. If the delta value is greater than the permissible tool radius tolerance for wear or break detection, the control will lock the tool (status L in TOOL.T). **2**: The measured tool radius is compared to the tool radius from TOOL.T. The control calculates the deviation from the stored value and writes it to Q parameter **Q116**. Nothing is entered under R or DR in the tool table. Input: **0**, **1**, **2**
	Q260 Clearance height? Enter the position in the spindle axis at which there is no danger of collision with the workpiece or fixtures. The clearance height is referenced to the active workpiece preset. If you enter such a small clearance height that the tool tip would lie below the top of the probe contact, the control automatically positions the tool above the top of the probe contact (safety zone from **safetyDistStylus**). Input: **-99999.9999...+99999.9999**
	Q341 Probe the teeth? 0=no/1=yes Define whether the control will measure the individual teeth (maximum of 20 teeth) Input: **0**, **1**

Example of new format

```

29.8.5 Cycle 33 or 483 MEASURE TOOL

Application

Refer to your machine manual!

To measure both the length and radius of a tool, program the touch probe cycle **33** or **483** (Page 1735). This cycle is particularly suitable for the first measurement of tools, as it saves time when compared with individual measurement of length and radius. Input parameters allow you to select which of the two following methods will be used to measure the tool:

- Measuring the tool while it is rotating
- Measuring the tool while it is rotating and subsequently measuring the individual teeth

Measuring the tool while it is rotating:

The control measures the tool in a fixed programmed sequence. First, if possible, it measures the tool length, and then the tool radius.

Measuring the individual teeth:

The control measures the tool in a fixed programmed sequence. First it measures the tool radius, then the tool length. The sequence of measurement is the same as for touch probe cycles **31** and **32** as well as **481** and **482**.

Notes

NOTICE

Danger of collision!

If you set **stopOnCheck** (no. 122717) to **FALSE**, the control does not evaluate the result parameter **Q199** and the NC program is not stopped if the breakage tolerance is exceeded. There is a danger of collision!

- Set **stopOnCheck** (no. 122717) to **TRUE**
- You must then take steps to ensure that the NC program stops if the breakage tolerance is exceeded

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- Before measuring a tool for the first time, enter the following data on the tool into the TOOL.T tool table: the approximate radius, the approximate length, the number of teeth, and the cutting direction.
- Cycles **33** and **483** do not support touch probes, turning or dressing tools.

Measuring grinding tools

- The cycle takes into account the basic and compensation data from the **TOOLGRIND.GRD** table, as well as the wear and compensation data (**LBREAK** , **RBREAK**, **LTOL**, and **RTOL**) from the **TOOL.T** table.

Q340: **0** and **1**

- This cycle will modify compensation or basic data, depending on whether or not an initial dressing operation (**INIT_D**) is defined. This cycle will enter the values automatically at the correct locations in the **TOOLGRIND.GRD** table.

Note the following sequence for setting up grinding tools, see "Tool data for grinding tools (option 156)", Page 263.

Notes about machine parameters

- In the machine parameter **probingCapability** (no. 122723), the machine manufacturer defines the functionality of the cycle. This parameter allows you to permit tool length measurement with a stationary spindle and at the same time to inhibit tool radius and individual teeth measurements.
- Cylindrical tools with diamond surfaces can be measured while the spindle is stationary. To do so, in the tool table define the number of teeth **CUT** as 0 and adjust the machine parameter **CfgTT**. Refer to your machine manual.

Cycle parameters

Help graphic	Parameter
	Q340 Tool measurement mode (0-2)? Define whether and how the measured data will be entered in the tool table. **0**: The measured tool length and the measured tool radius are written to columns L and R of the TOOL.T tool table, and the tool compensation is set to DL = 0 and DR = 0. If there is already a value in TOOL.T, it will be overwritten. **1**: The measured tool length and the measured tool radius are compared to the tool length L and tool radius R in TOOL.T. The control calculates the deviation from the stored value and enters them into TOOL.T as the delta values DL and DR. The deviation is also available in the Q parameters **Q115** and **Q116**. If the delta value is greater than the permissible tool length or tool radius tolerance for wear or break detection, the control will lock the tool (status L in TOOL.T). **2**: The measured tool length and the measured tool radius are compared to the tool length L and tool radius R in TOOL.T. The control calculates the deviation from the stored values and writes it to the Q parameter **Q115** or **Q116**. Nothing is entered under L, R, or DL, DR in the tool table. Input: **0**, **1**, **2**
	Q260 Clearance height? Enter the position in the spindle axis at which there is no danger of collision with the workpiece or fixtures. The clearance height is referenced to the active workpiece preset. If you enter such a small clearance height that the tool tip would lie below the top of the probe contact, the control automatically positions the tool above the top of the probe contact (safety zone from **safetyDistStylus**). Input: **-99999.9999...+99999.9999**
	Q341 Probe the teeth? 0=no/1=yes Define whether the control will measure the individual teeth (maximum of 20 teeth) Input: **0**, **1**

Example of new format

```
11 TOOL CALL 12 Z
12 TCH PROBE 483 MEASURE TOOL ~
    Q340=+1                 ;CHECK ~
    Q260=+100               ;CLEARANCE HEIGHT ~
    Q341=+1                 ;PROBING THE TEETH
```

Cycle **33** includes an additional parameter:

Help graphic	Parameter
	Parameter number for result? Parameter number in which the control stores the status of the measurement: **0.0**: Tool is within the tolerance **1.0**: Tool is worn (**LTOL** or/and **RTOL** exceeded) **2.0**: Tool is broken (**LBREAK** or/and **RBREAK** exceeded). If you do not wish to use the result of measurement within the NC program, answer the dialog prompt with **NO ENT**. Input: **0...1999**

Measuring a rotating tool for the first time; old format

```
11 TOOL CALL 12 Z
12 TCH PROBE 33.0 MEASURE TOOL
13 TCH PROBE 33.1 CHECK:0
14 TCH PROBE 33.2 HEIGHT:+120
15 TCH PROBE 33.3 PROBING THE TEETH:0
```

Inspecting a tool and measuring the individual teeth and saving the status in Q5; old format

```
11 TOOL CALL 12 Z
12 TCH PROBE 33.0 MEASURE TOOL
13 TCH PROBE 33.1 CHECK:1 Q5
14 TCH PROBE 33.2 HEIGHT:+120
15 TCH PROBE 33.3 PROBING THE TEETH:1
```

29.8.6 Cycle 484 CALIBRATE IR TT

Application

Cycle **484** allows you to calibrate your tool touch probe (e.g., the wireless infrared TT 460 tool touch probe). You can perform the calibration process with or without manual intervention.

- **With manual intervention**: If you define **Q536** = 0, then the control will stop before the calibration process. You then need to position the calibration tool manually above the center of the tool touch probe.
- **Without manual intervention**: If you define **Q536** = 1, then the control will automatically execute the cycle. You may have to program a prepositioning movement before. This depends on the value of the parameter **Q523 POSITION TT**.

Cycle sequence

> Refer to your machine manual.
> The machine manufacturer defines the functionality of the cycle.

To calibrate the tool touch probe, program the touch probe cycle **484**. In input parameter **Q536**, you can specify whether you want to run the cycle with or without manual intervention.

Touch probe

For the touch probe you use a spherical or cuboid probe contact

Cuboid probe contact:

For a cuboid probe contact, the machine manufacturer can store in the optional machine parameters **detectStylusRot** (no. 114315) and **tippingTolerance** (no. 114319) whether the angle of misalignment and tilt angle are determined. Determining the angle of misalignment enables compensation for it when measuring tools. The control displays a warning if the tilt angle is exceeded. The values determined can be seen in the status display of the **TT**.

Further information: "TT tab", Page 161

> When clamping the tool touch probe, make sure that the edges of the cuboid probe contact are aligned as parallel to the machine axes as possible. The angle of misalignment should be less than 1° and the tilt angle should be less than 0.3°.

Calibration tool:

The calibration tool must be a precisely cylindrical part, for example a cylindrical pin. Enter the exact length and radius of the calibration tool into the TOOL.T tool table. After the calibration, the control stores the calibration values and takes them into account during subsequent tool measurements. The calibration tool should have a diameter of more than 15 mm and protrude approx. 50 mm from the chuck.

Q536 = 0: With manual intervention before calibration

Proceed as follows:

- Insert the calibration tool
- Start the calibration cycle
- \> The control interrupts the calibration cycle and displays a dialog.
- Manually position the calibration tool above the center of the tool touch probe.

> Ensure that the calibration tool is located above the measuring surface of the probe contact.

- Press **NC start** to resume cycle sequence
- \> If you have programmed **Q523** = **2**, then the control writes the calibrated position to the machine parameter **centerPos** (no. 114200)

Q536 = 1: Without manual intervention before calibration

Proceed as follows:

- Insert the calibrating tool
- Position the calibration tool above the center of the tool touch probe before the start of the cycle.

> - Ensure that the calibration tool is located above the measuring surface of the probe contact.
> - For a calibration process without manual intervention, you do not need to position the calibration tool above the center of the tool touch probe. The cycle adopts the position from the machine parameters and automatically moves the tool to this position.

- Start the calibration cycle
- > The calibration cycle is executed without stopping.
- > If you have programmed **Q523** = **2**, then the control writes the calibrated position to the machine parameter **centerPos** (no. 114200).

Notes

NOTICE

Danger of collision!

To avoid collisions the tool must be pre-positioned before calling the cycle with **Q536**=1! The control also measures the center misalignment of the calibrating tool by rotating the spindle by 180° after the first half of the calibration cycle.

- Specify whether to stop before cycle start or run the cycle automatically without stopping.

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- The calibration tool should have a diameter of more than 15 mm and protrude approx. 50 mm from the chuck. If you use a cylinder pin of these dimensions, the resulting deformation will only be 0.1 µm per 1 N of probing force. Major inaccuracies may occur if you use a calibration tool whose diameter is too small and/or that protrudes too far from the chuck.
- Before calibrating the touch probe, you must enter the exact length and radius of the calibration tool into the TOOL.T tool table.
- The TT needs to be recalibrated if you change its position on the table.

Note regarding machine parameters

- In the machine parameter **probingCapability** (no. 122723), the machine manufacturer defines the functionality of the cycle. This parameter allows you to permit tool length measurement with a stationary spindle and at the same time to inhibit tool radius and individual teeth measurements.

Cycle parameters

Help graphic	Parameter
	Q536 Stop before running (0=Stop)? Define whether the control will stop before the calibration process or whether the cycle will automatically be executed without a stop: **0**: Stop before the calibration process. The control prompts you to position the calibration tool manually above the tool touch probe. After moving the tool to the approximate position above the tool touch probe, press **NC Start** to continue the calibration process or press the the **CANCEL** button to cancel the calibration process. **1**: Without stopping before the calibration process. The control starts the calibration process depending on **Q523**. Before running Cycle **484**, you may have to position the tool above the tool touch probe. Input: **0**, **1**
	Q523 Position of tool probe (0-2)? Position of the tool touch probe: **0**: Current position of the calibration tool. The tool touch probe is below the current position of the calibration tool. If **Q536 = 0**, position the calibration tool manually above the center of the tool touch probe during the cycle. If **Q536 = 1**, you need to position the calibration tool above the center of the tool touch probe before the start of the cycle. **1**: Configured position of the tool touch probe. The control adopts the position from the machine parameter **centerPos** (no. 114201). You do not need to preposition the tool. The calibration tool approaches the position automatically. **2**: Current position of the calibration tool. See **Q523 = 0**. The control additionally writes the determined position (where applicable) to the machine parameter **centerPos** (no. 114201) after calibration. Input: **0**, **1**, **2**

Example

```
11 TOOL CALL 12 Z
12 TCH PROBE 484 CALIBRATE IR TT ~
    Q536=+0                ;STOP BEFORE RUNNING ~
    Q523=+0                ;TT POSITION
```

29.8.7 Cycle 485 MEASURE LATHE TOOL (option 50)

Application

Refer to your machine manual!

Machine and control must be specially prepared by the machine manufacturer for use of this cycle.

Cycle **485 MEASURE LATHE TOOL** is available for the measurement of lathe tools using the tool touch probe from HEIDENHAIN. The control measures the tool in a fixed programmed sequence.

Cycle sequence

1 The control positions the lathe tool to the clearance height
2 The lathe tool is oriented based on the entries in **TO** and **ORI**
3 The control moves the tool to the measuring position in the main axis; traverse movement is interpolated in the main and secondary axes
4 Then the lathe tool moves to the measuring position in the tool axis
5 The tool is measured. Depending on the definition of **Q340**, either tool dimensions are changed or the tool is locked
6 The measuring result is transferred to the result parameter **Q199**
7 After the measurement has been performed, the control positions the tool in the tool axis to the clearance height

Result parameter Q199:

Result	Meaning
0	Tool dimensions within the tolerance **LTOL** / **RTOL** Tool is not locked
1	Tool dimensions outside the tolerance **LTOL** / **RTOL** Tool is locked
2	Tool dimensions outside the tolerance **LBREAK** / **RBREAK** Tool is locked

The cycle uses the following entries from toolturn.trn:

Abbr.	Entries	Dialog
ZL	Tool length 1 (**Z** direction)	**Tool length 1?**
XL	Tool length 2 (**X** direction)	**Tool length 2?**
DZL	Delta value of tool length 1 (**Z** direction), is added to **ZL**	**Oversize in tool length 1?**
DXL	Delta value of tool length 2 (**X** direction), is added to **XL**	**Oversize in tool length 2?**
RS	Cutting edge radius: if contours were programmed with radius compensation **RL** or **RR**, the control takes the cutting edge radius into account in turning cycles, and performs cutting radius compensation	**Cutting edge radius?**
TO	Tool orientation: from the tool orientation, the control determines the position of the tool tip and, depending on the selected tool type, additional information such as the tool angle direction, position of the tool reference point, etc. This information is necessary, for example, for calculating the cutting radius compensation, milling cutter radius compensation, plunge angle, etc.	**Tool orientation?**
ORI	Spindle orientation angle: angle of the indexable insert to the main axis	**Angle of spindle orientation?**
TYPE	Type of turning tool: Roughing tool **ROUGH**, finishing tool **FINISH**, thread tool **THREAD**, recessing tool **RECESS**, button tool **BUTTON**, groove turning tool **RECTURN**	**Type of turning tool**

Page 1755

Tool orientation (TO) that is supported for the following types of turning tools (TYPE)

TYPE	Supported TO with possible limitations	Non-supported TO	
ROUGH, FINISH	■ 1 ■ 7 ■ 2, only **XL** ■ 3, only **XL** ■ 5, only **XL** ■ 6, only **XL** ■ 8, only **ZL**	■ 4 ■ 9	BUTTON	■ 1 ■ 7 ■ 2, only **XL** ■ 3, only **XL** ■ 5, only **XL** ■ 6, only **XL** ■ 8, only **ZL**	■ 4 ■ 9	RECESS, RECTURN	■ 1 ■ 7 ■ 8 ■ 2 ■ 3, only **XL** ■ 5, only **XL**	■ 4 ■ 6 ■ 9	
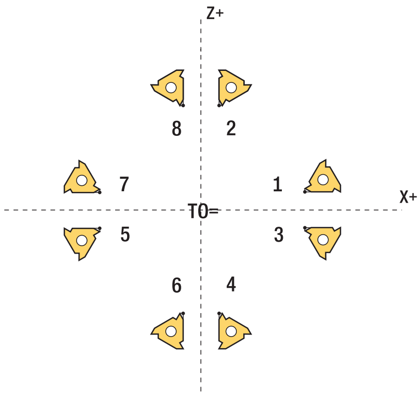
TYPE	Supported TO with possible limitations	Non-supported TO
THREAD	■ 1 ■ 7 ■ 8 ■ 2 ■ 3, only **XL** ■ 5, only **XL**	■ 4 ■ 6 ■ 9



Notes

NOTICE

Danger of collision!

If you set **stopOnCheck** (no. 122717) to **FALSE**, the control does not evaluate the result parameter **Q199** and the NC program is not stopped if the breakage tolerance is exceeded. There is a danger of collision!

- Set **stopOnCheck** (no. 122717) to **TRUE**
- You must then take steps to ensure that the NC program stops if the breakage tolerance is exceeded

NOTICE

Danger of collision!

If the tool data **ZL** / **DZL** and **XL** / **DXL** deviate by more than ±2 mm from the real tool data, then there is a danger of collision.

- Enter the approximate tool data closer than ±2 mm
- Run the cycle carefully

- This cycle can only be executed in the **FUNCTION MODE MILL** machining mode.
- Before you begin the cycle, you must run a **TOOL CALL** with the tool axis **Z**.
- If you define **YL** and **DYL** with a value outside of ±5 mm, the tool won't reach tool touch probe.
- The cycle does not support **SPB-INSERT** (angular offset). You must enter the value 0 in **SPB-INSERT**, otherwise the control will generate an error message.

Note regarding machine parameters

- The cycle depends on the optional machine parameter **CfgTTRectStylus** (no. 114300). Refer to your machine manual.

Cycle parameters

Help graphic	Parameter
	Q340 Tool measurement mode (0-2)? Use of the measured values: **0**: The measured values are entered in **ZL** and **XL**. If values are already entered in the tool table, they will be overwritten. **DZL** and **DXL** will be reset to **0**. TL will not be changed **1**: The measured values **ZL** and **XL** are compared with the values from the tool table. These values will not be changed. The control then calculates the deviations of **ZL** and **XL**, and enters these in **DZL** and **DXL**. If the delta values are larger than the permissible wear or breakage tolerance, the control locks the tool (**TL** = Tool Locked). In addition, the deviation is also entered in the Q parameters **Q115** and **Q116** **2**: The measured values **ZL** and **XL** as well as **DZL** and **DXL** are compared with the values from the tool table, but are not changed. If the values are larger than the permissible wear or breakage tolerance, the control locks the tool (**TL** = Tool Locked). Input: **0**, **1**, **2**
	Q260 Clearance height? Enter the position in the spindle axis at which there is no danger of collision with the workpiece or fixtures. The clearance height is referenced to the active workpiece preset. If you enter such a small clearance height that the tool tip would lie below the top of the probe contact, the control automatically positions the tool above the top of the probe contact (safety zone from **safetyDistStylus**). Input: **-99999.9999...+99999.9999**

Example

```
11 TOOL CALL 12 Z
12 TCH PROBE 485 MEASURE LATHE TOOL ~
    Q340=+1                  ;CHECK ~
    Q260=+100                ;CLEARANCE HEIGHT
```

30

Application MDI

Application

The **MDI** application allows you to execute individual NC blocks outside of the context of an NC program (e.g., **PLANE RESET**). When you press the **NC Start** key, the control will run the NC blocks separately.

You can also create an NC program step by step. The control memorizes modally effective program information.

Related topics

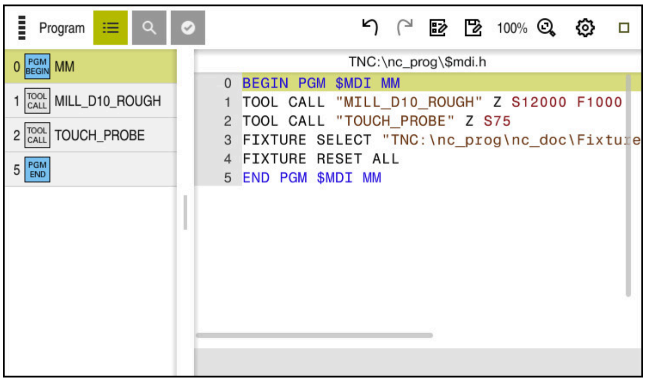
- Creating NC programs

  Further information: "Programming fundamentals", Page 190
- Running NC programs

  Further information: "Program Run", Page 1777

Description of function

If you program using the millimeter unit of measurement, the control will use the NC program **$mdi.h** by default. If you program using the inch unit of measurement, the control will use the NC program **$mdi_inch.h**.



Program workspace in the **MDI** application

The **MDI** application provides the following workspaces:

- **GS** (option 44)

  Further information: "Global Program Settings (GPS, option 44)", Page 1132
- **Help**
- **Positions**

  Further information: "Positions workspace", Page 141
- **Program**

  Further information: "Program workspace", Page 194
- **Simulation**

  Further information: "Simulation Workspace", Page 1405
- **Status**

  Further information: "Status workspace", Page 149
- **Keyboard**

  Further information: "Virtual keyboard of the control bar", Page 1380

Buttons

In the **MDI** application, the function bar provides the following buttons:

Button	Meaning
Klartext programming	If this switch is active, then you are using dialog-guided programming. If this switch is not active, then you are programming in the text editor. **Further information:** "Editing NC programs", Page 202
Insert NC function	The control opens the **Insert NC function** window. **Further information:** "Inserting NC functions", Page 203
Q info	The control opens the **Q parameter list** window, where you can see and edit the current values and descriptions of the variables. **Further information:** "Q parameter list window", Page 1271
GOTO block number	Mark an NC block to be run without considering any previous NC blocks **Further information:** "GOTO function", Page 1383
/ Skip Off/On	Mark NC blocks with a **/** character. NC blocks marked with a **/** character will be ignored during program run as soon as the **Skip /** switch is active. **Further information:** "Hiding NC blocks", Page 1385
Skip /	If this switch is active, the control ignores NC blocks marked with a **/** character. **Further information:** "Hiding NC blocks", Page 1385
; Comment Off/On	Insert or remove a **;** character in front of an NC block. If an NC block begins with a **;** character, then the block is a comment. **Further information:** "Adding comments", Page 1384
FMAX	You activate a feed-rate limitation and define the value. **Further information:** "Feed rate limit F MAX", Page 1781
Editing	The control opens the context menu. **Further information:** "Context menu", Page 1392
Internal stop	If an NC program is interrupted due to an error or a stop, the control activates this button. Use this button to abort program run. **Further information:** "Interrupting, stopping or canceling program run", Page 1782
Reset program	If you select **Internal stop**, the control activates this button. The control places the cursor back to the beginning of the program and resets any modally effective program information as well as the program run-time.

Modally effective program information

In the **MDI** application, you always run the NC blocks in **Single Block** mode. After the control has run an NC block, the program run is considered to be interrupted.

Further information: "Interrupting, stopping or canceling program run", Page 1782

The block numbers of all NC blocks that you have successively run are shown in green.

The control saves the following data in this state:

- The last tool that was called
- Current coordinate transformations (e.g., datum shift, rotation, mirroring)
- The coordinates of the circle center that was last defined

Notes

NOTICE

Danger of collision!

Certain manual interactions may lead to the control losing the modally effective program information (i.e., the contextual reference). Loss of this contextual reference may result in unexpected and undesirable movements. There is a risk of collision during the subsequent machining operation!

- ▶ Do not perform the following interactions:
  - Cursor movement to another NC block
  - The jump command **GOTO** to another NC block
  - Editing an NC block
  - Modifying the values of variables by using the window **Q parameter list**
  - Switching the operating modes
- ▶ Restore the contextual reference by repeating the required NC blocks

- In the **MDI** application, you can create and execute NC programs step by step. Then you can use **Save as** to save the current contents with a different file name.
- The following functions are not available in the **MDI** application:
  - Calling an NC program with **PGM CALL**, **SEL PGM**, or **CALL SELECTED PGM**
  - Test Run in the **Simulation** workspace
  - **Manual traverse** and **Approach position** while program run is interrupted
  - **Block scan** function

31

Pallet Machining and Job Lists

31.1 Fundamentals

	Refer to your machine manual. Pallet table management is a machine-dependent function. The standard functional range is described below.

Pallet tables (**.p**) are mainly used in machining centers with pallet changers. The pallet tables call the different pallets (PAL), optionally the fixtures (FIX), and the associated NC programs (PGM). The pallet tables activate all defined presets and datum tables.

Without a pallet changer, you can use pallet tables to successively run NC programs with different presets with just one press of **NC Start**. This type of usage is also called job list.

Tool-oriented machining is possible with pallet tables and with job lists. The control will reduce the number of tool changes, thereby reducing the machining time.

Further information: "Tool-oriented machining", Page 1772

31.1.1 Pallet counter

You can define a pallet counter on the control. This allows you to define a variable number of parts produced, for example during pallet machining with automatic workpiece change.

For this purpose, you define a value in the **TARGET** column of the pallet table. The control repeats the NC programs of this pallet until the nominal value has been reached.

By default, every NC program that has been executed increases the actual value by 1. If, for example, an NC program produces more than one workpiece, you define the value in the **COUNT** column of the pallet table.

Further information: "Pallet table", Page 1864

The control displays the defined nominal value and the current actual value in the **Job list** workspace.

Further information: "Information about the pallet table", Page 1765

31.2 Job list workspace

31.2.1 Fundamentals

Application

In the **Job list** workspace, you edit and execute pallet tables.

Related topics

- Contents of a pallet table

  Further information: "Pallet table", Page 1864
- **Form** workspace for pallets

  Further information: "Form workspace for pallets", Page 1771
- Tool-oriented machining

  Further information: "Tool-oriented machining", Page 1772

Description of function

In the **Job list** workspace, the control displays the individual rows of the pallet table and the status.

Further information: "Information about the pallet table", Page 1765

If you activate the **Edit** switch, the **Insert row** button will be displayed in the action bar and allows you to insert a new table row.

Further information: "Insert row window", Page 1767

When you open a pallet table in **Editor** or **Program Run** operating mode, the control will automatically display the **Job list** workspace. You cannot close this workspace.

Information about the pallet table

When you open a pallet table, the following information will be displayed in the **Job list** workspace:

Column	Meaning
No column name	Status of the pallet, fixture, or NC program In the **Program Run** operating mode: execution cursor **Further information:** "Status of the pallet, fixture, or NC program", Page 1765
Program	Information about the pallet counter: ■ For rows of the **PAL** type: Current actual value (**COUNT**) and defined nominal value (**TARGET**) of the pallet counter. ■ For rows of the **PGM** type: Value indicating by how much the actual value will be incremented after the execution of the NC program. **Further information:** "Pallet counter", Page 1764 Machining method: ■ Workpiece-oriented machining ■ Tool-oriented machining **Further information:** "Machining method", Page 1766
Sts	Machining status **Further information:** "Machining status", Page 1766

Status of the pallet, fixture, or NC program

The control uses the following icons to display the status:

Icon	Meaning
	The **Pallet**, **Clamping**, or **Program** is locked
	The **Pallet** or **Clamping** is not enabled for machining
	This line is currently being executed in **Program run, single block** or **Program run, full sequence** mode and cannot be edited
	In this line, the program was interrupted manually

Machining method

The control uses the following icons to display the machining method:

Icon	Meaning
No icon	Workpiece-oriented machining
 	Tool-oriented machining ▪ Start ▪ End

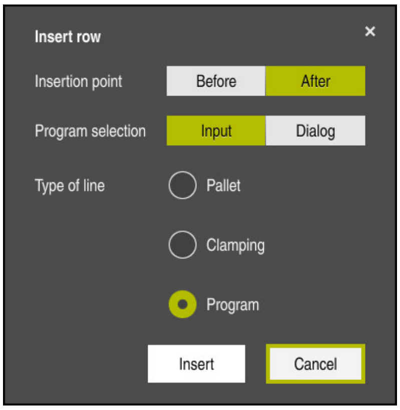
Machining status

The control updates the machining status during program run.

The control uses the following icons to display the machining status:

Icon	Meaning
	Workpiece blank, machining required
	Partially machined, requires further machining
	Completely machined, no further machining required
	Skip machining

Insert row window



Insert row window with **Program** selected

The **Insert row** window provides the following settings:

Setting	Meaning
Insertion point	■ **Before**: Insert a new row before the current cursor position ■ **After**: Insert a new row after the current cursor position
Program selection	■ **Input**: Enter the path of the NC program ■ **Dialog**: Select the NC program via a selection window
Type of line	Corresponds to the **TYPE** column of the pallet table Insert a **Pallet**, **Clamping** or **Program**

You can edit the contents and settings of a row in the **Form** workspace.
Further information: "Form workspace for pallets", Page 1771

Program Run operating mode

You can open the **Program** workspace in addition to the **Job list** workspace. After you have selected a table row with an NC program, the control displays the program contents in the **Program** workspace.

The control uses the execution cursor to indicate which table row is marked for running or is currently being run.

Use the **GOTO Cursor** button to move the execution cursor to the currently selected row of the pallet table.

Further information: "Mid-program startup at any NC block", Page 1768

Mid-program startup at any NC block

To perform a block scan for mid-program startup at an NC block:

- Open the pallet table in **Program Run** operating mode
- Open the **Program** workspace
- Select the table row with the desired NC program

GOTO Cursor

- Select **GOTO Cursor**
- > The control marks the table row with the execution cursor.
- > The control displays the contents of the NC program in the **Program** workspace.
- Select the desired NC block

Block scan

- Select **Block scan**
- > The control opens the **Block scan** window displaying the values of the NC block.

- Press the **NC Start** key
- > The control starts the block scan.

Notes

- After you have opened a pallet table in **Program Run** operating mode, you can no longer edit this pallet table in **Editor** operating mode.
- In the machine parameter **stopAt** (no. 202101), the machine manufacturer defines when the control will stop program run during the execution of a pallet table.
- In the machine parameter **editTableWhileRun** (no. 202102), the machine manufacturer defines whether you will be allowed to edit the pallet table during program run.
- In the optional machine parameter **resumePallet** (no. 200603), the machine manufacturer defines whether the control will continue program execution after an error message.

31.2.2 Batch Process Manager (option 154)

Application

Batch Process Manager enables you to plan production orders on a machine tool.

The Batch Process Manager software option allows the control to display the following additional information in the **Job list** workspace:

- Times at which manual interventions at the machine are necessary
- Run time of the NC programs
- Availability of the tools
- Whether the NC program is free of errors

Related topics

- **Job list** workspace

  Further information: "Job list workspace", Page 1764
- Editing a pallet table in the **Form** workspace

  Further information: "Form workspace for pallets", Page 1771
- Contents of the pallet table

  Further information: "Pallet table", Page 1864

Requirements

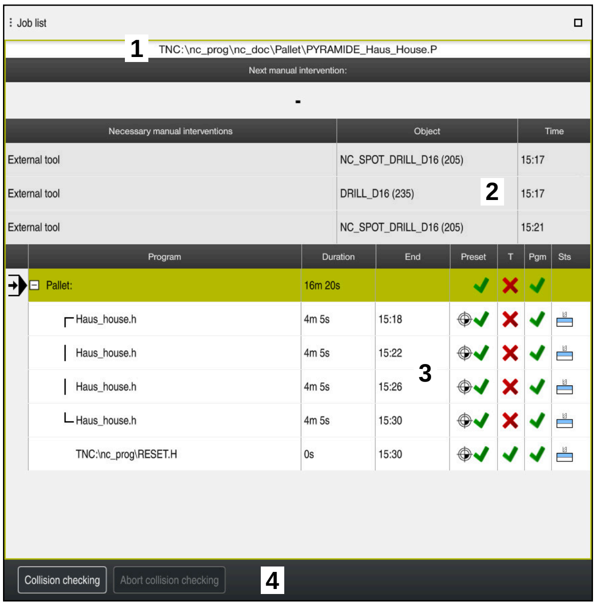
- Software option 22: Pallet Management
- Software option 154: Batch Process Manager

  Batch Process Manager is an expansion to the pallet management feature. Batch Process Manager provides you with all functions available in the **Job list** workspace.
- Tool usage test is active

  The tool usage test function has to be enabled and switched on to ensure you get all information!

  Further information: "Channel settings", Page 1915

Description of function



Job list workspace with **Batch Process Manager** (option 154)

When Batch Process Manager is enabled, the **Job list** workspace provides the following areas:

1. File information bar

   In the file information bar, the control shows the path of the pallet table.
2. Information about necessary manual interventions
   - Time until the next manual intervention
   - Type of intervention
   - Affected object
   - Time of manual intervention
3. Information about and status of the pallet table

   Further information: "Information about the pallet table", Page 1770
4. Action bar

   If the **Edit** switch is active, you can add a new row.

   If the **Edit** switch is inactive, you can use the Dynamic Collision Monitoring (DCM) feature (option 40) to check all NC programs of the pallet table in **Program Run** operating mode.

Information about the pallet table

When you open a pallet table, the following information is displayed in the **Job list** workspace:

Column	Meaning
No column name	Status of the pallet, fixture, or NC program In the **Program Run** operating mode: execution cursor **Further information:** "Status of the pallet, fixture, or NC program", Page 1765
Program	Name of the pallet, fixture, or NC program Information about the pallet counter: ■ For rows of the **PAL** type: Current actual value (**COUNT**) and defined nominal value (**TARGET**) of the pallet counter. ■ For rows of the **PGM** type: Value indicating by how much the actual value will be incremented after the execution of the NC program. **Further information:** "Pallet counter", Page 1764 Machining method: ■ Workpiece-oriented machining ■ Tool-oriented machining **Further information:** "Machining method", Page 1766
Duration	Duration of the NC program Only in the **Editor** operating mode
End	Expected point in time when the execution of the NC program will have been completed In the **Editor** operating mode, this column displays a duration, not a point in time
Preset	Status of the workpiece preset: ■ Workpiece preset is defined ■ Check input **Further information:** "Status of the workpiece preset, the tools, and the NC program", Page 1771
T	Status of the tools used: ■ Test completed ■ Test not yet completed ■ Test failed This column is populated only in the **Program Run** operating mode **Further information:** "Status of the workpiece preset, the tools, and the NC program", Page 1771
Pgm	Status of the NC program: ■ Test completed ■ Test not yet completed ■ Test failed **Further information:** "Status of the workpiece preset, the tools, and the NC program", Page 1771
Sts	Machining status **Further information:** "Machining status", Page 1766

Status of the workpiece preset, the tools, and the NC program

The control displays the status using the following icons:

Icon	Meaning
	Test completed
	Test completed Program simulation with active **Dynamic Collision Monitoring (DCM)**, option 40)
	Test failed (e.g., because of expired tool life, danger of collision)
	Test not yet completed
	Incorrect program structure (e.g., pallet does not contain any subprograms)
	Workpiece preset is defined
	Check input You can assign a workpiece preset either to the pallet or to all NC subprograms.

Note

If you edit the job list, the Collision checking completed  status is reset to Check completed .

31.3 Form workspace for pallets

Application

In the **Form** workspace, the control shows the contents of the pallet table for the selected row.

Related topics

- **Job list** workspace
  Further information: "Job list workspace", Page 1764
- Contents of the pallet table
  Further information: "Pallet table", Page 1864
- Tool-oriented machining
  Further information: "Tool-oriented machining", Page 1772

Description of function

Form workspace with the contents of a pallet table

A pallet table can have the following types of rows:

- **Pallet**
- **Clamping**
- **Program**

In the **Form** workspace, the control shows the contents of the pallet table. The control shows the contents relevant to the respective type of the selected row.

You can edit the settings in the **Form** workspace or in **Tables** operating mode. The control synchronizes the contents.

By default, the names of the table columns are used to designate the settings options in the form.

The switches provided in the form correspond to the following table columns:

- The **Locked** switch corresponds to the column **LOCK**
- The **Machinable** switch corresponds to the column **LOCATION**

If the control displays an icon next to the input field, a selection window for selecting the contents is available

The **Form** workspace can be selected for pallet tables in **Editor** or **Program Run** operating mode.

31.4 Tool-oriented machining

Application

Tool-oriented machining allows you to machine several workpieces together even on a machine without pallet changer, which reduces tool-change times. You can thus use the pallet management feature even on machines without a pallet changer.

Related topics

- Contents of the pallet table
  Further information: "Pallet table", Page 1864
- Block scan for mid-program startup in a pallet table
  Further information: "Block scan in pallet tables", Page 1792

Requirements

- Software option 22: Pallet Management
- Tool-change macro for tool-oriented machining
- **METHOD** column with the values **TO** or **TCO**
- NC programs with identical tools
  The tools being used must, at least in part, be the same tools.
- **W-STATUS** column with the values **BLANK** or **INCOMPLETE**
- NC programs must not contain the following functions:
  - **FUNCTION TCPM** or **M128** (option 9)
    Further information: "Compensating the tool angle of inclination with FUNCTION TCPM (option 9)", Page 1027
  - **M144** (option 9)
    Further information: "Factoring the tool offset into the calculations with M144 (option 9)", Page 1255
  - **M101**
    Further information: "Automatically inserting a replacement tool with M101", Page 1260
  - **M118**
    Further information: "Activating handwheel superimpositioning with M118", Page 1239
  - Changing the pallet preset
    Further information: "Pallet preset table", Page 1775

Description of function

The following columns of the pallet table are effective for tool-oriented machining:

- **W-STATUS**
- **METHOD**
- **CTID**
- **SP-X** to **SP-W**
  You can enter safety positions for the axes. The control only approaches these positions if the machine tool builder processes them in the NC macros.

Further information: "Pallet table", Page 1864

In the **Job list** workspace, you can activate or deactivate tool-oriented machining for each NC program via the context menu. This will also cause the control to update the **METHOD** column.

Further information: "Context menu", Page 1392

Sequence of tool-oriented machining

1. The entries TO and CTO tell the control that tool-oriented machining is effective for these rows of the pallet table
2. The control executes the NC program with the entry TO up to the TOOL CALL
3. The W-STATUS changes from BLANK to INCOMPLETE and the control enters a value into the CTID field
4. The control executes all other NC programs with the entry CTO up to the TOOL CALL
5. The control uses the next tool for the following machining steps if one of the following situations applies:
   - The next table row contains the entry PAL
   - The next table rowcontains the entry TO or WPO
   - There are rows in the table that do not yet contain the entry ENDED or EMPTY
6. The control updates the entry in the CTID field with each machining operation
7. If all table rows of the group contain the entry ENDED, the control processes the next rows of the pallet table

Block scan for mid-program startup

You can also return to a pallet table after an interruption. The control can show the rows and the NC block at which the interruption occurred.

The control saves the mid-program startup information in the **CTID** column of the pallet table.

The block scan in the pallet table is workpiece-oriented.

After a block scan, the control can resume tool-oriented machining if the tool-oriented machining method TO and CTO is defined in the following rows.

Further information: "Pallet table", Page 1864

The following functions require special attention, particularly for mid-program startup:

- Changing the machine statuses with a miscellaneous function (e.g. M13)
- Writing to the configuration (e.g. WRITE KINEMATICS)
- Traverse range switchover
- Cycle **32**
- Cycle **800**
- Tilting the working plane

Notes

NOTICE

Danger of collision!

Not all pallet tables and NC programs are suitable for tool-oriented machining. With tool-oriented machining, the control no longer executes the NC programs continuously, but divides them at the tool calls. The division of the NC programs allows functions that were not reset to be effective across programs (machine states). This leads to a danger of collision during machining!

- Consider the stated limitations
- Adapt pallet tables and NC programs to the tool-oriented machining
  - Reprogram the program information after each tool in every NC program (e.g. **M3** or **M4**).
  - Reset special functions and miscellaneous functions before each tool in every NC program (e. g., **Tilt the working plane** or **M138**)
- Carefully test the pallet table and associated NC programs in the **Program run, single block** operating mode

- If you want to start machining again, change the W-STATUS to BLANK or remove the previous input.

Notes on mid-program startup

- The entry in the CTID field remains there for two weeks. After this time, mid-programs startup is no longer possible.
- Do not change or delete the entry in the CTID field.
- The data from the CTID field become invalid after a software update.
- The control saves the preset numbers for mid-program startup. If you change this preset, machining is shifted, too.
- Mid-program startup is no longer possible after editing an NC program within tool-oriented machining.

31.5 Pallet preset table

Application

Pallet presets are an easy way to compensate e.g. mechanical differences between individual pallets.

The machine manufacturer defines the pallet preset table.

Related topics

- Contents of the pallet table
  Further information: "Pallet table", Page 1864
- Workpiece preset management
  Further information: "Preset management", Page 949

Description of function

If a pallet preset is active, the workpiece preset is referenced to it.

In the **PALPRES** column of the pallet table, you can enter the corresponding pallet preset for a pallet.

You can also completely align the coordinate system to the pallet by e.g. positioning the pallet preset in the center of a clamping tower.

If a pallet preset is active, the control does not display an icon. You can check the active pallet preset and the defined values in the **Setup** application.

Further information: "Touch Probe Functions in the Manual Operating Mode", Page 1425

Note

NOTICE

Danger of collision!

Despite a basic rotation based on the active pallet preset, the control does not display an icon in the status display. There is a risk of collision during all subsequent axis movements!

- Check the traverse movements of the machine
- Use pallet presets only in conjunction with pallets

If the pallet preset changes, you need to reset the workpiece preset.

Further information: "Setting a preset manually", Page 952

32

Program Run

32.1 Program Run operating mode

32.1.1 Fundamentals

Application

In the **Program Run** operating mode you produce workpieces by having the control execute NC programs either one block at a time or in full sequence.

You also execute pallet tables in this operating mode.

Related topics

- Executing individual NC blocks in the **MDI** application
  Further information: "Application MDI", Page 1759
- Creating NC programs
  Further information: "Programming fundamentals", Page 190
- Pallet tables
  Further information: "Pallet Machining and Job Lists", Page 1763

NOTICE

Caution: Danger due to manipulated data!

If you execute NC programs directly from a network drive or a USB device, you have no control over whether the NC program has been changed or manipulated. In addition, the network speed can slow down the execution of the NC program. Undesirable machine movements or collisions may result.

- Copy the NC program and all called files to the **TNC:** drive

Description of function

The following information also applies to pallet tables and job lists.

When you select a new NC program or when an NC program has been completely executed, the cursor is at the beginning of the program.

If you want to start machining at a different NC block, you first need to select the desired NC block by using the **Block scan** function.

Further information: "Block scan for mid-program startup", Page 1786

By default, the control runs NC programs in Full Sequence mode after the **NC Start** key has been pressed. In this mode, the control runs an NC program continuously up to its end, or up to a manual or programmed interruption.

In the **Single Block** mode, you execute each NC block separately by pressing the **NC Start** key.

The control shows the status of the machining process with the **Control-in-operation** icon in the status overview.

Further information: "Status overview on the control bar", Page 147

The **Program Run** operating mode provides the following workspaces:

- **GS** (option 44)

  Further information: "Global Program Settings (GPS, option 44)", Page 1132
- **Positions**

  Further information: "Positions workspace", Page 141
- **Program**

  Further information: "Program workspace", Page 194
- **Simulation**

  Further information: "Simulation Workspace", Page 1405
- **Status**

  Further information: "Status workspace", Page 149
- **Process Monitoring**

  Further information: "Process Monitoring workspace (option 168)", Page 1153

When you open a pallet table, the control will display the **Job list** workspace. You cannot edit this workspace.

Further information: "Job list workspace", Page 1764

Icons and buttons

The **Program Run** operating mode contains the following icons and buttons:

Icon or button	Meaning
	**Open file** With **Open file** you can open a file, for example an NC program. If you open a file, the control closes the file that was already open.
	Execution cursor The execution cursor shows which NC block is currently being run or is marked for running.
Single Block	If this switch is active, then you run each NC block separately with the **NC Start** key. If Single Block mode is selected, then the operating mode's icon in the control bar changes.
Q info	The control opens the **Q parameter list** window, where you can see and edit the current values and descriptions of the variables. **Further information:** "Q parameter list window", Page 1271
Compensation tables	The control opens a selection menu with the following tables: ■ **D** ■ **T-CS** ■ **WPL-CS** **Further information:** "Compensation during program run", Page 1795
FMAX	You activate a feed-rate limitation and define the value. **Further information:** "Feed rate limit F MAX", Page 1781
GOTO Cursor	The control marks the currently selected table row for execution. Active only if a pallet table is open (option 22) **Further information:** "Job list workspace", Page 1764
Skip /	If this switch is active, the control ignores NC blocks marked with a **/** character. **Further information:** "Hiding NC blocks", Page 1385
Pause at M1	If this switch is active, the control pauses program run at the next NC block with **M1**. **Further information:** "Overview of miscellaneous functions", Page 1225
GOTO block number	Mark an NC block to be run without considering any previous NC blocks **Further information:** "GOTO function", Page 1383
Manual traverse	During a program run interruption you can move the axes manually. If **Manual traverse** is active, then the operating mode's icon in the control bar changes. **Further information:** "Manual traverse during an interruption", Page 1785
Edit	If this switch is active, then you can edit the pallet table. Active only if a pallet table is open **Further information:** "Job list workspace", Page 1764
3D ROT	During a program run interruption you can move the axes manually in the tilted working plane (option 8). **Further information:** "Manual traverse during an interruption", Page 1785

Icon or button	Meaning
Approach position	Return to contour after manual traverse of the machine axes during an interruption **Further information:** "Returning to the contour", Page 1793
Block scan	The **Block scan** function allows you to start program run at any desired NC block. The control takes the preceding parts of the NC program up to this NC block into account mathematically; for example, whether the spindle was switched on with **M3**. **Further information:** "Block scan for mid-program startup", Page 1786
Open in the editor	The control opens the NC program in the **Editor** operating mode. Active only if an NC program is open **Further information:** "Programming fundamentals", Page 190
Internal stop	If an NC program is interrupted due to an error or a stop, the control activates this button. Use this button to abort program run.
Reset program	If you select **Internal stop**, the control activates this button. The control places the cursor back to the beginning of the program and resets any modally effective program information as well as the program run-time.

Feed rate limit F MAX

The **F MAX** button allows you to reduce the feed rate for all operating modes. The reduction applies to all rapid traverse and feed rate movements. The value you have entered remains active across power cycles.

The **FMAX** button is available in the **MDI** application and in **Editor** operating mode.

When you select the **FMAX** button in the function bar, the control will open the **Feedrate + FMAX** window.

If a feed rate limit is active, the control highlights the **FMAX** button in color and displays the defined value.

You deactivate the feed rate limit by entering a value of 0 in the **Feedrate + FMAX** window.

Interrupting, stopping or canceling program run

There are several ways to stop a program run:

- Interrupt the program run (e.g., with the miscellaneous function **M0**)
- Stop the program run (e.g., with the **NC stop** key)
- Cancel the program run (e.g., with the **NC Stop** key in combination with the **INTERNAL STOP** button)
- Terminate the program run (e.g., with the miscellaneous functions **M2** or **M30**)

During major errors, the control automatically aborts the program run (e.g., during a cycle call with stationary spindle).

Further information: "Message menu on the information bar", Page 1400

If you run your NC program in **Single Block** mode or in the **MDI** application, the control will switch to the interrupted state after the execution of each NC block.

The control shows the current program run status with the **Control-in-operation** icon.

Further information: "Status overview on the control bar", Page 147

You can execute, e.g., the following functions in an interrupted or canceled state:

- Select operating mode
- Manual traverse of axes
- Check Q parameters and change these if necessary using the **Q INFO** function
- Change setting for the optional programmed interruption with **M1**
- Change setting for the programmed skipping of NC blocks with **/**

NOTICE

Danger of collision!

Certain manual interactions may lead to the control losing the modally effective program information (i.e., the contextual reference). Loss of this contextual reference may result in unexpected and undesirable movements. There is a risk of collision during the subsequent machining operation!

- Do not perform the following interactions:
  - Cursor movement to another NC block
  - The jump command **GOTO** to another NC block
  - Editing an NC block
  - Modifying the values of variables by using the window **Q parameter list**
  - Switching the operating modes
- Restore the contextual reference by repeating the required NC blocks

Programmed interruptions

You can set interruptions directly in the NC program. The control interrupts the program run in the NC block containing one of the following inputs:

- Programmed stop **STOP** (with and without miscellaneous function)
- Programmed stop **M0**
- Conditional stop **M1**

Refer to your machine manual.

The miscellaneous function **M6** may also lead to a suspension of the program run. The machine manufacturer sets the functional scope of the miscellaneous functions.

Resuming program run

After stopping the program with the **NC Stop** key or a programmed interruption, you can resume program run by pressing the **NC Start** key.

After canceling the program run with an **Internal stop**, you must start the program run at the beginning of the NC program or use the **Block scan** function.

After an interruption of the program run within a subprogram or program section repeat, you need to use the **Block scan** function for mid-program startup.

Further information: "Block scan for mid-program startup", Page 1786

Modally effective program information

The control saves the following data during a program interruption:

- The last tool that was called
- Current coordinate transformations (e.g., datum shift, rotation, mirroring)
- The coordinates of the circle center that was last defined

The control uses the stored data for returning the tool to the contour (**Approach position** button).

Further information: "Returning to the contour", Page 1793

> The saved data remains active until it is reset (e.g., by selecting a program).

Notes

NOTICE
Danger of collision! Program cancellation, manual intervention, or forgotten resetting of NC functions or transformations can lead to the control performing unexpected or undesirable movements. This can lead to workpiece damage or collision. ▶ Rescind all programmed NC functions and transformations within the NC program ▶ Run a simulation before executing an NC program ▶ Check both the general as well as the additional status display for NC functions and transformations, such as an active basic rotation, before executing an NC program ▶ Carefully verify the NC program in the **Single Block** mode

NOTICE
Danger of collision! With NC software 81762x-16, the TNC7 does not support ISO programming. There is a risk of collision during execution due to the missing support. ▶ Use Klartext NC programs exclusively.

- In the **Program Run** operating mode, the control marks active files with the status **M**, such as a selected NC program or tables. If you open such a file in another operating mode, the controls shows the status on the tab of the application bar.
- When moving an axis, the control checks whether the defined rotational speed has been reached. The control does not check the rotational speed in positioning blocks with **FMAX** as feed rate.
- You can adjust the feed rate and the spindle speed during program run with the potentiometers.
- If you modify the workpiece reference point during a program run interruption, you must re-select the NC block to resume.

  Further information: "Block scan for mid-program startup", Page 1786
- HEIDENHAIN recommends switching the spindle on with **M3** or **M4** after every tool call. That way you avoid problems during program run, such as when restarting after an interruption.
- The settings in the **GS** workspace have an effect on program run, such as handwheel superimpositioning (option 44).

  Further information: "Global Program Settings (GPS, option 44)", Page 1132

Definitions

Abbreviation	Definition
GS (global program settings)	Global program settings
ACC (active chatter control)	Active Chatter Control

32.1.2 Manual traverse during an interruption

Application

During a program run interruption you can move the machine axes manually.

Use the **Tilt the working plane (3D ROT)** window to assign the reference system for traversing the axes (option 8).

Related topics

- Manual traverse of machine axes
  Further information: "Moving the machine axes", Page 182
- Manual tilting of the working plane (option 8)
  Further information: "Tilting the working plane (option 8)", Page 978

Description of function

When you select **Manual traverse**, you can move the axes with the axis keys of the control.

Further information: "Using axis keys to move the axes ", Page 182

In the **Tilt the working plane (3D ROT)** window, you can select the following functions:

Icon	Function	Meaning
	M-CS machine	Traversing in the machine coordinate system **M-CS** **Further information:** "Machine coordinate system M-CS", Page 935
	**W-CS workpiece**	Traversing in the workpiece coordinate system **W-CS** **Further information:** "Workpiece coordinate system W-CS", Page 940
	**WPL-CS working plane**	Traversing in the working plane coordinate system **WPL-CS** **Further information:** "Working plane coordinate system WPL-CS", Page 942
	**T-CS tool**	Traversing in the tool coordinate system **T-CS** **Further information:** "Working plane coordinate system WPL-CS", Page 942

When you select one of the functions, the control will display the associated icon in the **Positions** workspace. The control additionally shows the active coordinate system on the **3D ROT** button.

If **Manual traverse** is active, then the operating mode's icon in the control bar changes.

Notes

NOTICE
Danger of collision! During a program interruption, you can move the axes manually (e.g., in order to retract from a hole when the working plane is tilted). There is a risk of collision if the **3-D ROT** setting is incorrect! ▶ It is better to use the **T-CS** function ▶ Use a low feed rate

- On some machines, you may have to press the **NC Start** key while **Manual traverse** is active in order to enable the axis keys.

  Refer to your machine manual.

32.1.3 Block scan for mid-program startup

Application

The **BLOCK SCAN** function allows you to start an NC program at any desired NC block. The control factors workpiece machining up to this NC block into the calculations. For example, the control will switch on the spindle before the start.

Related topics

- Creating NC programs

  Further information: "Programming fundamentals", Page 190
- Pallet tables and job lists

  Further information: "Pallet Machining and Job Lists", Page 1763

Requirement

- The function must be enabled by your machine manufacturer.

  The **Block scan** function must be enabled and configured by your machine manufacturer.

Description of function

If the NC program was interrupted under the following conditions, the control saves the interruption point:

- **Internal stop** button
- Emergency stop
- Power failure

If, while restarting, the control finds a saved point of interruption, then it outputs a message. You can then execute a block scan directly to the point of interruption. The control displays the message when you switch to **Program Run** operating mode for the first time.

You have the following options for a block scan:

- Block scan in the main program, with repetitions if necessary

  Further information: "Performing a single-level block scan", Page 1789
- Multi-level block scan in subprograms and touch probe cycles

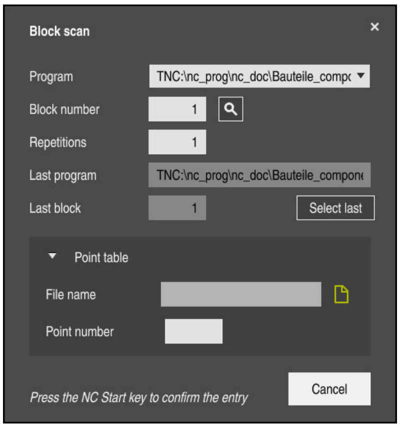
  Further information: "Performing a multi-level block scan", Page 1790
- Block scan in a point table

  Further information: "Block scan in point tables", Page 1791
- Block scan in pallet programs

  Further information: "Block scan in pallet tables", Page 1792

At the start of the block scan, the control resets the data, as with a selection of a new NC program. During a block scan you can activate or deactivate **Single Block** mode.

Block scan window



Block scan window with the interruption point saved and the **Point table** area opened

The **Block scan** window provides the following data:

Row	Meaning
Pallet number	Row number in the pallet table
Program	Path of the active NC program
Block number	Number of the NC block at which program run should start Use the **search** icon to select the NC block in the NC program.
Repetitions	Number of the repetition for mid-program startup if the desired NC block is located within a program-section repeat.
Last pallet number	Pallet number that is active at the time of interruption Select the interruption point by using the **Select last** button.
Last program	Path of the NC program that is active at the time of interruption Select the interruption point by using the **Select last** button.
Last block	Number of the NC block that was active at the time of interruption Select the interruption point by using the **Select last** button.
Point file	Path of the point table In the **Point table** area
Point number	Row in the point table In the **Point table** area

Performing a single-level block scan

To start in an NC program by using a single-level block scan:

- Select the **Program Run** operating mode
- Select **Block scan**
- > The control opens the **Block scan** window. The fields **Program**, **Block number** and **Repetitions** contain the current values.
- Enter the **Program** as needed
- Enter the **Block number**
- Enter the **Repetitions** as needed
- If required, use **Select last** to start at a saved interruption point
- Press the **NC Start** key
- > The control starts the block scan and calculates up to the entered NC block.
- > If you have changed the machine status, the control will display the **Restore machine status** window.
- Press the **NC Start** key
- > The control restores the machine status (e.g., **TOOL CALL** or M functions).
- > If you have changed the axis positions, the control will display the **Axis sequence for return to contour:** window.
- Press the **NC Start** key
- > Using the displayed positioning logic, the control moves to the required positions.

> You can also position the axes individually in a self-selected sequence.
>
> **Further information:** "Positioning the axes in a self-selected sequence", Page 1794

- Press the **NC Start** key
- > The control resumes execution of the NC program.

Performing a multi-level block scan

If you, for example, start in a subprogram that is called several times by the main program, then use the multi-level block scan. For this, you first go to the desired subprogram call and then continue the block scan. The same procedure is used for called NC programs.

To start in an NC program by using a multi-level block scan:

- Select the **Program Run** operating mode

Block scan

- Select **Block scan**
- > The control opens the **Block scan** window. The fields **Program**, **Block number** and **Repetitions** contain the current values.
- Perform a block scan to the first start-up point:

  Further information: "Performing a single-level block scan", Page 1789

Single Block

- Activate the **Single Block** switch as needed
- Press the **NC Start** key to execute individual NC blocks as needed

Continue block scan

- Select **Continue block scan**
- Define the NC block for mid-program startup
- Press the **NC Start** key
- > The control starts the block scan and calculates up to the entered NC block.
- > If you have changed the machine status, the control will display the **Restore machine status** window.
- Press the **NC Start** key
- > The control restores the machine status (e.g., **TOOL CALL** or M functions).
- > If you have changed the axis positions, the control will display the **Axis sequence for return to contour:** window.
- Press the **NC Start** key
- > Using the displayed positioning logic, the control moves to the required positions.

> You can also position the axes individually in a self-selected sequence.
>
> **Further information:** "Positioning the axes in a self-selected sequence", Page 1794

Continue block scan

- Select **Continue block scan** again as needed
- Repeat the steps
- Press the **NC Start** key
- > The control resumes execution of the NC program.

Block scan in point tables

To start in a point table:

- Select the **Program Run** operating mode

Block scan

- Select **Block scan**
- > The control opens the **Block scan** window. The fields **Program**, **Block number** and **Repetitions** contain the current values.
- Select **Point table**
- > The control opens the **Point table** area.
- **Point file**: Enter the path of the point table
- **Point number**: Select the row number of the point table for mid-program startup
- Press the **NC Start** key
- > The control starts the block scan and calculates up to the entered NC block.
- > If you have changed the machine status, the control will display the **Restore machine status** window.
- Press the **NC Start** key
- > The control restores the machine status (e.g., **TOOL CALL** or M functions).
- > If you have changed the axis positions, the control will display the **Axis sequence for return to contour:** window.
- Press the **NC Start** key
- > Using the displayed positioning logic, the control moves to the required positions.

> You can also position the axes individually in a self-selected sequence.
>
> **Further information:** "Positioning the axes in a self-selected sequence", Page 1794

> If you would like to use the block scan function to start in a point pattern, then use the same procedure. Define the desired point for mid-program startup in the **Point number** field. The first point in the point pattern has the number 0.
>
> **Further information:** "Cycles for pattern definition", Page 377

Block scan in pallet tables

To start in a pallet table:

- Select the **Program Run** operating mode

Block scan

- Select **Block scan**
- > The control opens the **Block scan** window.
- **Pallet number**: Enter the row number of the pallet table
- Enter the **Program** as needed
- Enter the **Block number**
- Enter the **Repetitions** as needed

Select last

- If required, use **Select last** to start at a saved interruption point
- Press the **NC Start** key
- > The control starts the block scan and calculates up to the entered NC block.
- > If you have changed the machine status, the control will display the **Restore machine status** window.
- Press the **NC Start** key
- > The control restores the machine status (e.g., **TOOL CALL** or M functions).
- > If you have changed the axis positions, the control will display the **Axis sequence for return to contour:** window.
- Press the **NC Start** key
- > Using the displayed positioning logic, the control moves to the required positions.

> You can also position the axes individually in a self-selected sequence.
>
> **Further information:** "Positioning the axes in a self-selected sequence", Page 1794

> If the program run of a pallet table has been canceled, the control will suggest the most recently selected NC block of the most recently executed NC program as a point of interruption.

Notes

NOTICE

Danger of collision!

If you select an NC block in program run using the **GOTO** function and then execute the NC program, the control ignores all previously programmed NC functions, e.g. transformations. This means that there is a risk of collision during subsequent traversing movements!

- Use **GOTO** only when programming and testing NC programs
- Only use **Block scan** when executing NC programs

NOTICE

Danger of collision!

The **Block scan** function skips over the programmed touch probe cycles. As a result, the result parameters contain no values or, possibly, incorrect values. If the subsequent machining operation uses these result parameters, then there is a risk of collision!

- Use the **Block scan** function at multiple levels

- The control only displays the dialogs required by the process in the pop-up window.
- A **Block scan** always takes place in a workpiece-oriented manner, even if you selected a tool-oriented machining method. After the block scan, the control continues working again in accordance with the selected machining method.

  Further information: "Tool-oriented machining", Page 1772
- Even after an internal stop, the control shows the number of repetitions on the **LBL** tab of the **Status** workspace.

  Further information: "LBL tab", Page 153
- The **Block scan** function must not be used in conjunction with the following functions:
  - Touch probe cycles **0**, **1**, **3**, and **4** during the block scan search phase
- HEIDENHAIN recommends switching the spindle on with **M3** or **M4** after every tool call. That way you avoid problems during program run, such as when restarting after an interruption.

32.1.4 Returning to the contour

Application

With the **RESTORE POSITION** function, the control moves the tool to the workpiece contour in the following situations:

- Return to the contour after the machine axes were moved during a program interruption that was not performed with the **INTERNAL STOP** function.
- Return to the contour after a block scan (e.g., after an interruption with **INTERNAL STOP**)
- Depending on the machine, if the position of an axis has changed after the control loop has been opened during a program interruption

Related topics

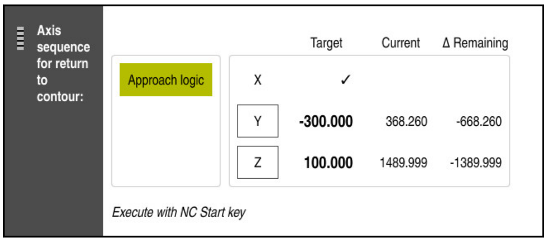
- Manual traverse during program run interruptions
  Further information: "Manual traverse during an interruption", Page 1785
- **Block scan** function
  Further information: "Block scan for mid-program startup", Page 1786

Description of function

If you have selected the **Manual traverse** button, this button will change to **Approach position**.

When you select **Approach position**, the control will open the **Axis sequence for return to contour:** window.

Axis sequence for return to contour: window



Axis sequence for return to contour: window

In the **Axis sequence for return to contour:** window, the control displays all of the axes that are not yet located at the correct position for program execution.

The control suggests a positioning logic for the sequence of the traversing movements. If the tool is located in the tool axis below the position to be approached, then the control offers the tool axis as the first traverse direction. You can also traverse the axes in a self-selected sequence.

Further information: "Positioning the axes in a self-selected sequence", Page 1794

If manual axes are included in the axes to be returned to the contour, then the control will not suggest a positioning logic. As soon as you have correctly positioned the manual axis, the control will suggest a positioning logic for the remaining axes.

Further information: "Positioning manual axes", Page 1795

Positioning the axes in a self-selected sequence

To position the axes in a self-selected sequence:

- Select **Approach position**
- > The control displays the **Axis sequence for return to contour:** window and the axes to be positioned.
- Select the desired axis (e.g., **X**)

- Press the **NC Start** key
- > The control moves the axis to the required position.
- > When the axis has reached the correct position, the control shows a checkmark under **Target**.
- Position the remaining axes
- > When all axes have reached their positions, the control closes the window.

Positioning manual axes

To position manual axes:

Approach position

- ▶ Select **Approach position**
- > The control displays the **Axis sequence for return to contour:** window and the axes to be positioned.
- ▶ Select the manual axis (e.g., **W**)
- ▶ Position the manual axis to the value shown in the window
- > When a manual axis with encoder has reached the position, the control automatically clears the value.
- ▶ Select **Axis in position**
- > The control saves the position.

Definition

Manual axis
Manual axes are non-driven axes that need to be positioned by the machine operator.

32.2 Compensation during program run

Application

During program run, you can open the selected compensation tables and the active datum table, and edit the values.

Related topics

- Using compensation tables
  Further information: "Tool compensation with compensation tables", Page 1044
- Editing compensation tables in the NC program
  Further information: "Accessing table values ", Page 1809
- Contents and creation of compensation tables
  Further information: "Compensation table *.tco", Page 1868
  Further information: "Compensation table *.wco", Page 1870
- Contents and preparing a datum table
  Further information: "Datum table", Page 957
- Activating a datum table in the NC program
  Further information: "Datum table", Page 1858

Description of function

The control opens the selected tables in **Tables** operating mode.

The changed values do not take effect until the compensation or the datum has been activated again.

32.2.1 Opening tables from within Program Run operating mode

To open the compensation tables from within **Program Run** operating mode:

Compensation tables

- Select **Compensation tables**
- > The control displays a selection menu.
- Select the desired table
  - **D**: Datum table
  - **T-CS**: Compensation table ***.tco**
  - **WPL-CS**: Compensation table ***.wco**
- > The control opens the selected table in **Tables** operating mode.

Notes

NOTICE

Danger of collision!

The control does not consider the changes made to a datum table or compensation table until the values have been saved. You need to activate the datum or compensation value in the NC program again; otherwise, the control will continue using the previous values.

- Make sure to confirm any changes made to the table immediately, e.g., by pressing the **ENT** key
- Activate the datum or compensation value in the NC program again
- Carefully test the NC program after changing the table values

- When you open a table in **Program Run** operating mode, the control will display the status **M** on the tab of the table. This status indicates that this table is active for program run.
- The clipboard allows you to transfer axis positions from the position display to the datum table.

  Further information: "Status overview on the control bar", Page 147

32.3 Retract application

Application

The **Retract** application allows you to disengage the tool from the workpiece after an interruption in power (e.g., retraction of a tap engaged in the workpiece).

You can also retract a tool when the working plane is tilted or retract an inclined tool.

Requirement

- This application must be enabled by your machine manufacturer.

  The machine parameter **retractionMode** (no. 124101) allows the machine manufacturer to define whether the control will display the **Retract** switch during start-up.

Description of function

The **Retract** application provides the following workspaces:

- **Retract**
  Further information: "Retract workspace", Page 1798
- **Positions**
  Further information: "Positions workspace", Page 141
- **Status**
  Further information: "Status workspace", Page 149

The **Retract** application provides the following buttons in the function bar:

Button	Meaning
Retract	Retract the tool with the axis keys or the electronic handwheel
End retraction	Close the **Retract** application The control opens the **End retraction?** window and prompts you to answer a confirmation request.
Start values	Reset the entries in the **A**, **B**, **C**, and **Thread pitch** fields to their original values

You select the **Retract** application by using the **Retract** switch if the following conditions apply during start-up:

- Power interrupted
- No control voltage for the relay
- **Move to ref. point** application

If you have activated a feed rate limit before the power failure occurred, this feed rate limit will still be active. When you select the **Retract** button, the control will display a pop-up window: This window allows you to deactivate the feed rate limit.

Further information: "Feed rate limit F MAX", Page 1781

Retract workspace

The **Retract** workspace provides the following contents:

Row	Meaning
Traversing mode	Traverse mode for retraction: ■ **Machine axes**: Traverse in the machine coordinate system **M-CS** ■ **Tilted system**: Traverse in the working plane coordinate system **WPL-CS** (option 8) ■ **Tool axis**: Traverse in the tool coordinate system **T-CS** (option 8) ■ **Thread**: Traverse in the tool coordinate system **T-CS** with compensating movements of the spindle **Further information:** "Reference systems", Page 934
Kinematics	Name of the active machine kinematics
A, **B**, **C**	Current position of the rotary axes Effective for **Tilted system** traverse mode
Thread pitch	Thread pitch from the **PITCH** column of tool management Effective for **Thread** traverse mode
Direct. of rotation	Direction of rotation of the thread-turning tool: ■ **Right-hand thread** ■ **Left-hand thread** Effective for **Thread** traverse mode
Coordinate system for handwheel superimposition	Coordinate system in which handwheel superimpositioning takes effect Effective for **Tool axis** traverse mode

The control selects the mode of traverse and the associated parameters automatically. If the traverse mode or the parameters have not been correctly preselected, you are able to reset them manually.

Note

NOTICE

Caution: Danger to the tool and workpiece!

A power failure during the machining operation can cause uncontrolled “coasting” or braking of the axes. In addition, if the tool was in effect prior to the power failure, then the axes cannot be referenced after the control has been restarted. For non-referenced axes, the control takes over the last saved axis values as the current position, which can deviate from the actual position. Thus, subsequent traverse movements do not correspond to the movements prior to the power failure. If the tool is still in effect during the traverse movements, then the tool and the workpiece can sustain damage through tension!

- ▶ Use a low feed rate
- ▶ Please keep in mind that the traverse range monitoring is not available for non-referenced axes

Example

The power failed while a thread-cutting cycle was being performed in the tilted working plane. You have to retract the tap:

- Switch on the power supply for control and machine
- > The control starts the operating system. This process may take several minutes.
- > The control displays the **Power interrupted** dialog in the **Start/Login** workspace

- Activate the **Retract** switch

- Press **OK**
- > The control compiles the PLC program.

- Switch the machine control voltage on
- > The control checks the functioning of the emergency stop circuit
- > The control opens the **Retract** application and displays the **Assume position values?** window.
- Compare the displayed position values with the actual position values

- Select **OK**
- > The control closes the **Assume position values?** window
- Select the **Thread** traverse mode as needed
- Enter the thread pitch as needed
- Enter the direction of rotation as needed

- Select **Retract**
- Retract the tool with the axis keys or the handwheel

- Select **End retraction**
- > The control opens the **End retraction?** window and prompts you to answer a confirmation request.

- If the tool was correctly retracted, select **Yes**
- > The control closes the **End retraction?** window and the **Retract** application.

33

Tables

33.1 Tables operating mode

Application

In the **Tables** operating mode you can open various tables and edit them as necessary.

Description of function

If you select **Add**, the control will display the **Quick selection** and **Open File** workspaces.

In the **Quick selection** workspace, you can open some tables directly.

Further information: "Quick selection workspace", Page 1076

In the **Open File** workspace, you can open an existing table or create a new table.

Further information: "Open File workspace", Page 1075

Multiple tables can be open at the same time. The control displays each table in a separate workspace.

If a table is selected for program run or simulation, the control shows the status **M** or **S** on the tab of the application.

You can open the **Table** and **Form** workspaces in every application.

Further information: "Table workspace", Page 1803

Further information: "Form workspace for tables", Page 1807

You can select various functions by using the context menu (e.g., **Copy**).

Further information: "Context menu", Page 1392

Buttons

The **Tables** operating mode provides the following buttons in the function bar:

Button	Meaning
Activate the preset	Activate the selected row of the preset table as a preset. **Further information:** "Preset table", Page 1851
Undo	Undo the last change
Redo	Redo the last undone change
GOTO record	The control opens the **GOTO jump instruction** window. The control jumps to the row number you have defined.
Edit	If the switch is active, you can edit the table.
Insert tool	The control opens the **Insert tool** window that allows you to add a new tool to tool management. **Further information:** "Tool management ", Page 270 When you select the **Append** check box, the control will insert the tool below the last row of the table.
Insert line	The control inserts a row at the end of the table.
Reset row	The control resets all data contained in the row.
Delete tool	The control deletes the tool selected in tool management **Further information:** "Tool management ", Page 270
Delete row	The control deletes the currently selected row.
T INSPECT	The control inspects a tool.
T OUT	The control unloads a tool.
T IN	The controls loads a tool.

33.1.1 Editing the contents of tables

To edit the contents of a table:

- Select the desired table cell

- Activate **Edit**
- > The control enables the values for editing.

> If the **Edit** switch is active, you can edit the contents in both the **Table** workspace and the **Form** workspace.

33.2 Table workspace

Application

In the **Table** workspace, the control shows the contents of a table. The control displays a column with filters and a search function on the left side of some tables.

Description of function

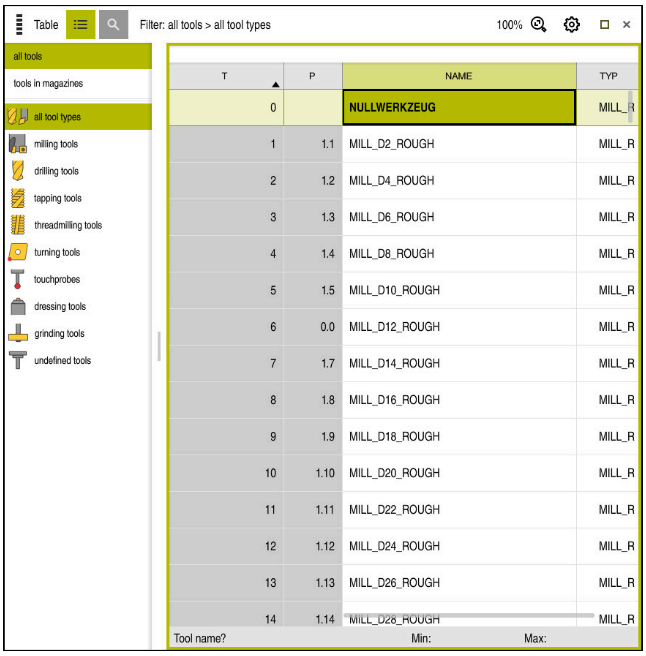


Table workspace

In **Tables** operating mode, the **Table** workspace is open in every application by default.

The control displays the name and path of the file above the header of the table.

When you select the title of a column, the control will sort the table contents by this column.

If the table allows it, you can also edit the table contents in this workspace.

Icons and shortcuts

The **Table** workspace provides the following icons or shortcuts:

Icon or shortcut	Function
	Open the filters **Further information:** "Filters in the Table workspace", Page 1805
	Open the search function **Further information:** "Search column in the Table workspace", Page 1806
100%	Font size of the table When you select the percent value, the control will display icons for increasing and decreasing the font size.
	Set the font size of the table to 100%
	Open the settings in the **Tables** window **Further information:** "Settings in the Table workspace", Page 1806
CTRL+A	Mark all rows
CTRL+BLANK	Mark the active row or end the marking function
SHIFT+↑	Additionally mark the row above
SHIFT+↓	Additionally mark the row below

Filters in the Table workspace

You can filter the tool tables and the **Pocket table**.

Filtering in Tool management

The following filter options are available for tool management:

- **All tools**
- **Magazine tools**

Depending on the filter you have selected (all tools or magazine tools), you can additionally filter by tool type in this area:

- **All types**
- **Milling cutters**
- **Drills**
- **Taps**
- **Thread cutters**
- **Lathe tools**
- **Touch probes**
- **Dressing tools**
- **Grinding tools**
- **Undefined tools**

Filters in the Pocket table

The following filter options are available for the pocket table:

- **All magazines**
- **Main magazine**
- **Spindle**

Depending on the filter you have selected (all magazines, main magazine, or spindle), you can additionally filter by pockets in this area:

- **All pockets**
- **Empty pockets**
- **Assigned pockets**

Search column in the Table workspace

You can search the **Tool management** and **Pocket table** tables.

You can define multiple search conditions in the search function.

Each condition includes the following information:

- Table column, such as **T** or **NAME**
  Use the **Search in** selection menu to select the column.
- Operator, such as **Contains** or **Equal to (=)**
  Use the **Operator** selection menu to select the operator.
- Search term in the **Search for** input field

Settings in the Table workspace

In the **Tables** window, you can influence the contents shown in the **Table** workspace.

The **Tables** window consists of the following areas:

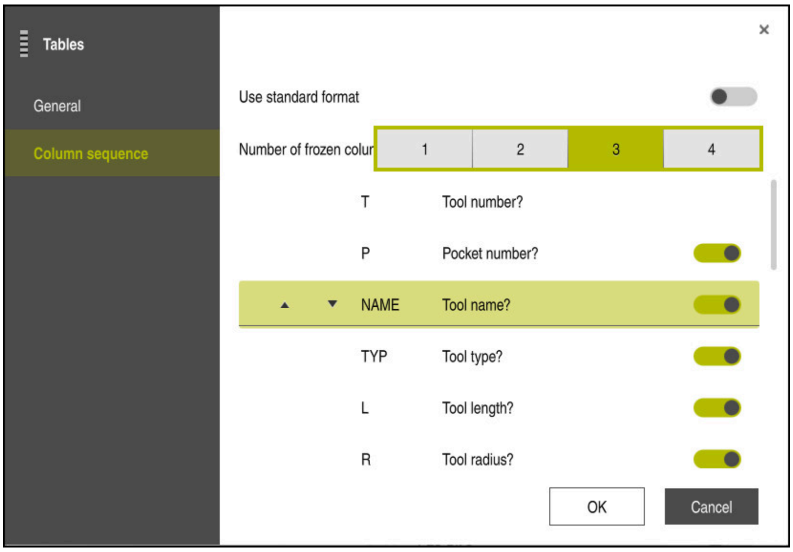
- **General**
- **Column sequence**

General area

The setting selected in the **General** area is modally effective.

If the **Synchronize table and form** switch is active, the cursor will move synchronously. If, for example, you select a different table column in the **Table** workspace, the control will move the cursor synchronously in the **Form** workspace.

Column sequence area



Tables window

In the **Column sequence** area, you define the view for each table.

The **Use standard format** switch allows you to show all columns in the default sequence.

The **Number of frozen columns** switch allows you to define how many columns the control will freeze to the left border of the screen. These columns will remain visible when you navigate further to the right within the table.

The control lists all table columns vertically below each other. Use the switch to select for each column whether it will be shown or hidden.

The control displays a line below the selected number of frozen columns. The control will freeze the columns above this line.

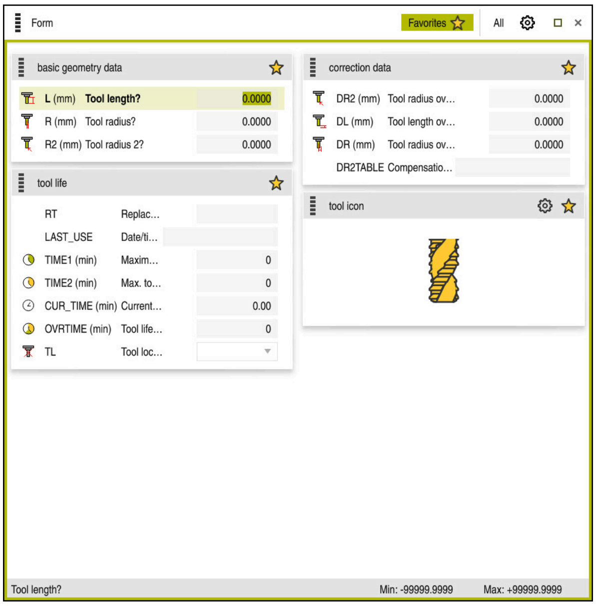
When you select a column, the control will display up and down arrows. Use these arrows to change the sequence of the columns.

33.3 Form workspace for tables

Application

In the **Form** workspace, the control shows all contents of a selected table row. Depending on the table, you can edit the values in the form.

Description of function



Form workspace in the **Favorites** view

The control displays the following information for each column:

- Icon of the column as needed
- Name of the column
- Unit of measure as needed
- Column description
- Current value

If an input is invalid, the control will display an icon ahead of the input field. When you tap this icon, the control will show the cause of the error (e.g., **Too many characters**).

The control displays the contents of specific tables in groups within the **Form** workspace. In the **All** view, the control shows all groups. Use the **Favorites** function to select individual groups, in order to configure a customized view. Use the handle to arrange the groups.

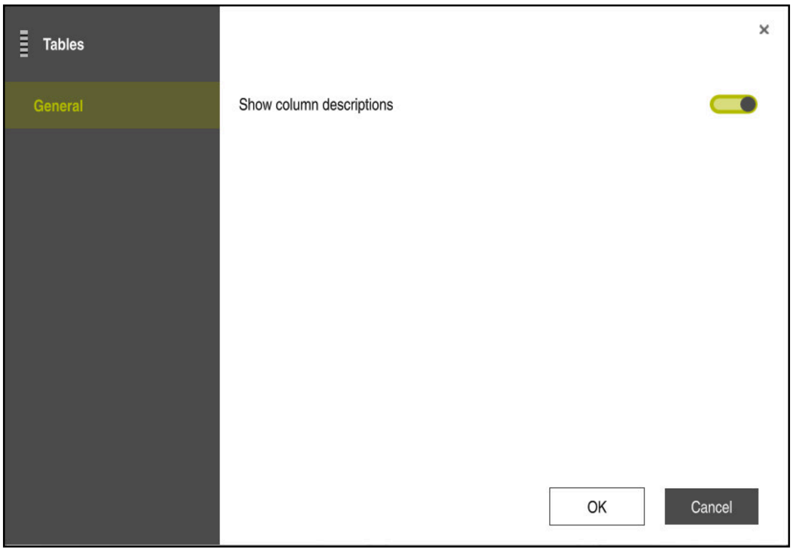
Icons

The **Table** workspace provides the following icons:

Icon or shortcut	Function
	Open the settings in the **Tables** window **Further information:** "Settings in the Form workspace", Page 1809
	Favorite

Settings in the Form workspace

In the **Tables** window, you can select whether the control will show the column descriptions. The selected setting is modally effective.



33.4 Accessing table values

33.4.1 Fundamentals

The **TABDATA** functions allow you to access table values.

These functions enable automated editing of compensation values from within the NC program, for example.

You can access the following tables:

- Tool table ***.t** (read-only access)
- Compensation table ***.tco** (read and write access)
- Compensation table ***.wco** (read and write access)

In each case, the active table is accessed. Read-only access is always possible, whereas write access is possible only during program run. Write access during simulation or during a block scan has no effect.

The control provides the following functions for accessing the table values:

Syntax	Function	Further information
TABDATA READ	Read the value from a table cell	Page 1810
TABDATA WRITE	Write a value to a table cell	Page 1811
TABDATA ADD	Add a value to a table value	Page 1811

If the unit of measure used in the NC program differs from that used in the table, the control will convert the values from **millimeters** to **inches**, and vice versa.

Related topics

- Fundamentals regarding variables
  Further information: "Basics", Page 1268
- Tool table
  Further information: "Tool table tool.t", Page 1814
- Compensation tables
  Further information: "Compensation tables", Page 1868
- Reading values from freely definable tables
  Further information: "Reading a freely definable table with FN 28: TABREAD", Page 1297
- Writing values to freely definably tables
  Further information: "Writing to a freely definable table with FN 27: TABWRITE", Page 1296

33.4.2 Reading table values with TABDATA READ

Application

The function **TABDATA READ** allows you to read a value from a table and save it to a Q parameter.

For example, the **TABDATA READ** function enables you to pre-check the data of the tool to be used to prevent error messages from occurring during program run.

Description of function

Depending on the type of column you want to transfer, you can use **Q**, **QL**, **QR**, or **QS** to save the value. The control will automatically convert the table values to the unit of measure used in the NC program.

Input

11 TABDATA READ Q1 = CORR-TCS COLUMN "DR" KEY "5"	; Save the value in row 5, column **DR**, from the compensation table to **Q1**

The NC function includes the following syntax elements:

Syntax element	Meaning
TABDATA	Syntax initiator for accessing table values
READ	Reading a table value
Q/QL/QR or **QS**	Type of variable and number in which the control saves the value
TOOL, **CORR-TCS**, or **CORR-WPL**	Read the value from the tool table or a compensation table ***.tco** or ***.wco**
COLUMN	Column name Fixed or variable name
KEY	Row number Fixed or variable name

33.4.3 Writing table values with TABDATA WRITE

Application

The function **TABDATA WRITE** allows you to write a value from a Q parameter into a table

You can use the **TABDATA WRITE** function after a touch probe cycle to enter a necessary tool compensation into the compensation table, for example.

Description of function

Depending on the type of column you want to write to, you can use **Q**, **QL**, **QR**, or **QS** as a transfer parameter.

Input

11 TABDATA WRITE CORR-TCS COLUMN "DR" KEY "3" = Q1	; Write the value from **Q1** to row 5, column **DR**, of the compensation table

The NC function includes the following syntax elements:

Syntax element	Meaning
TABDATA	Syntax initiator for accessing table values
WRITE	Writing a table value
CORR-TCS or **CORR-WPL**	Writing a value to a compensation table ***.tco** or ***.wco**
COLUMN	Column name Fixed or variable name
KEY	Row number Fixed or variable name
Q/QL/QR or **QS**	Type of variable and number that contains the value to be written

33.4.4 Adding table values with TABDATA ADD

Application

The function **TABDATA ADD** allows you to add a value from a Q parameter to a value contained in the table.

You can use the **TABDATA ADD** function to update a tool compensation value after a measurement has been repeated, for example.

Description of function

Depending on the type of column you want to write to, you can use **Q**, **QL**, or **QR** as a transfer parameter.

In order to write into a compensation table, you need to activate the table.

Further information: "Selecting a compensation table with SEL CORR-TABLE", Page 1046

Input

11 TABDATA ADD CORR-TCS COLUMN "DR" KEY "3" = Q1	; Add the value from **Q1** to row 5, column **DR**, of the compensation table

The NC function includes the following syntax elements:

Syntax element	Meaning
TABDATA	Syntax initiator for accessing table values
ADD	Adding a value to a table value
CORR-TCS or **CORR-WPL**	Writing a value to a compensation table ***.tco** or ***.wco**
COLUMN	Column name Fixed or variable name
KEY	Row number Fixed or variable name
Q/QL/QR	Type of variable and number that contains the value to be added

33

Tool Tables

33.5.1 Overview

This chapter describes the tool tables of the control.

- Tool table **tool.t**
  Further information: "Tool table tool.t", Page 1814
- Turning tool table **toolturn.trn** (option 50)
  Further information: "Turning tool table toolturn.trn (option 50)", Page 1823
- Grinding tool table **toolgrind.grd** (option 156)
  Further information: "Grinding tool table toolgrind.grd (option 156)", Page 1828
- Dressing tool table **tooldress.drs** (option 156)
  Further information: "Dressing tool table tooldress.drs (option 156)", Page 1836
- Touch probe table **tchprobe.tp**
  Further information: "Touch probe table tchprobe.tp", Page 1839

You can edit the tools, except for the touch probes, in tool management only.

Further information: "Tool management ", Page 270

33.5.2 Tool table tool.t

Application

The tool table **tool.t** contains the data specific to drilling and milling tools. The tool table also contains all tool data that are independent of the technology, such as the tool life **CUR_TIME**.

Related topics

- Editing tool data in tool management
  Further information: "Tool management ", Page 270
- Tool data required for milling or drilling tools
  Further information: "Tool data for milling and drilling tools", Page 259

Description of function

The file name of the tool table is **tool.t** and this table must be stored in the folder **TNC:\table**.

The **tool.t** tool table provides the following parameters:

Parameter	Meaning
T	**Tool number?** Row number in the tool table The tool number allows identifying each tool unambiguously, e.g. for calling a tool. **Further information:** "Tool call by TOOL CALL", Page 277 You can define an index after the period. **Further information:** "Indexed tool", Page 250 This parameter applies to all tools, regardless of technology. Input: **0.0...32767.9**

Parameter	Meaning
NAME	**Tool name?** The tool name allows identifying a tool, e.g. for calling a tool. **Further information:** "Tool call by TOOL CALL", Page 277 You can define an index after the period. **Further information:** "Indexed tool", Page 250 This parameter applies to all tools, regardless of technology. Input: **Text width 32**
L 	**Tool length?** Length of tool, with respect to the tool carrier preset **Further information:** "Tool carrier reference point", Page 245 Input: **-99999.9999...+99999.9999**
R 	**Tool radius?** Tool radius, with respect to the tool carrier reference point **Further information:** "Tool carrier reference point", Page 245 Input: **-99999.9999...+99999.9999**
R2 	**Tool radius 2?** Corner radius for the exact definition of the tool for three-dimensional radius compensation, graphic representation and collision monitoring of e.g. ball-nose cutter or toroid cutters. **Further information:** "3D tool compensation (option 9)", Page 1049 Input: **-99999.9999...+99999.9999**
DL 	**Tool length oversize?** Delta value of tool length as a compensation value in connection with touch probe cycles. The control enters corrections automatically after measuring the workpiece. **Further information:** "Programmable Touch Probe Cycles", Page 1449 Is added to the parameter **L** Input: **-999.9999...+999.9999**
DR 	**Tool radius oversize?** Delta value of tool radius as a compensation value in connection with touch probe cycles. The control enters corrections automatically after measuring the workpiece. **Further information:** "Programmable Touch Probe Cycles", Page 1449 Is added to parameter **R** Input: **-999.9999...+999.9999**
DR2 	**Tool radius oversize 2?** Delta value of tool radius 2 as a compensation value in connection with touch probe cycles. The control enters compensation values automatically after measuring the workpiece. **Further information:** "Programmable Touch Probe Cycles", Page 1449 Is added to parameter **R2** Input: **-999.9999...+999.9999**

Parameter	Meaning
TL	**Tool locked?** Tool is enabled or locked for machining: ■ No value entered: Enabled ■ **L**: Locked The control locks the tool after exceeding maximum tool age **TIME1**, maximum tool age 2 **TIME2** or after exceeding one of the parameters for automatic tool measurement. This parameter applies to all tools, regardless of technology. Selection by means of a selection window Input: No value, **L**
RT	**Replacement tool?** Number of the replacement tool If the control calls a tool in a TOOL CALL and the tool is not available or locked, the control inserts the replacement tool. If **M101** is active and the current tool age **CUR_TIME** exceeds the **TIME2** value, the control locks the tool and inserts the replacement tool at a suitable location. **Further information:** "Automatically inserting a replacement tool with M101", Page 1260 If the replacement tool is not available or locked, the control inserts the replacement tool of the replacement tool. You can define an index after the period. **Further information:** "Indexed tool", Page 250 If you define the value 0, the control will not use a replacement tool. This parameter applies to all tools, regardless of technology. Selection by means of a selection window Input: **0.0...32767.9**
TIME1	**Maximum tool age?** Maximum tool age in minutes If the current tool age **CUR_TIME** exceeds the **TIME1** value, the control locks the tool and displays an error message when the tool is called the next time. The behavior depends on the machine. Refer to your machine manual. This parameter applies to all tools, regardless of technology. Input: **0...99999**

Parameter	Meaning
TIME2	**Max. tool age for TOOL CALL?** Maximum tool age 2 in minutes The control inserts a replacement tool in the cases below: ■ When the current tool age **CUR_TIME** exceeds the **TIME2** value, the control locks the tool. The control no longer inserts the tool when the tool is called. If a replacement tool **RT** is defined and available in the magazine, the control inserts the replacement tool. If no replacement tool is available, the control will display an error message. ■ If **M101** is active and the current tool age **CUR_TIME** exceeds the **TIME2** value, the control locks the tool and inserts the replacement tool **RT** at a suitable location. **Further information:** "Automatically inserting a replacement tool with M101", Page 1260 This parameter applies to all tools, regardless of technology. Input: **0...99999**
CUR_TIME	**Current tool age?** The current tool age equals the time during which the tool is cutting a workpiece. The control counts this time automatically and enters the current tool age in minutes. This parameter applies to all tools, regardless of technology. Input: **0...99999.99**
TYPE	**Tool type?** Depending on the selected tool type, the control displays the suitable tool parameters in the **Form** workspace of tool management. **Further information:** "Tool types", Page 255 **Further information:** "Tool management ", Page 270 This parameter applies to all tools, regardless of technology. Selection by means of a selection window Input: **MILL**, **MILL_R**, **MILL_F**, **BALL**, **TORUS**, **DRILL**, **TAP**, **CENT**, **TURN**, **TCHP**, **REAM**, **CSINK**, **TSINK BOR**, **BCKBOR**, **GF**, **GSF**, **EP**, **WSP**, **BGF**, **ZBGF**, **GRIND**, and **DRESS**
DOC	**Tool description** This parameter applies to all tools, regardless of technology. Input: **Text width 32**
PLC	**PLC status?** Tool information for the PLC Refer to your machine manual. This parameter applies to all tools, regardless of technology. Entry: **%00000000...%11111111**
LCUTS	**Tooth length in the tool axis?** Length of cutting edge for exact definition of the tool for graphical simulation, automatic calculation within cycles and collision monitoring. Input: **-99999.9999...+99999.9999**

Parameter	Meaning
LU	**Usable length of the tool?** Usable length of the tool for exact definition of the tool for graphical simulation, automatic calculation within cycles and collision monitoring of e.g. necks of end mills. Input: **0.0000...999.9999**
RN	**Neck radius of the tool?** Neck radius for the exact definition of the tool for graphic simulation and collision monitoring of e.g. neck of end mills or side milling cutters. Only if the useful length **LU** is longer than the **LCUTS** length of the cutting edge can the tool contain a neck radius **RN**. Input: **0.0000...999.9999**
ANGLE	**Maximum plunge angle?** Maximum plunge angle of the tool for reciprocating plunge-cutting in the cycles. Input: **-360.00...+360.00**
CUT	**Number of teeth?** Number of teeth of the tool for automatic tool measurement or cutting data calculation. **Further information:** "Touch Probe Cycles: Automatic Tool Measurement", Page 1734 **Further information:** "Cutting data calculator", Page 1397 This parameter applies to the following tools, regardless of technology: ■ Milling and drilling tools ■ Turning tools (option 50) Input: **0...99**
TMAT	**Tool material?** Tool material from the tool material table **TMAT.tab** for cutting data calculation. **Further information:** "Table for tool materials TMAT.tab", Page 1861 Selection by means of a selection window Input: **Text width 32**
CUTDATA	**Cutting data table?** **Further information:** "Cutting data calculator", Page 1397 Select cutting data table with the ***.cut** or ***.cutd** file extensions for cutting data calculation. **Further information:** "Cutting data table *.cut", Page 1862 Selection by means of a selection window Entry: **Text width 20**

Parameter	Meaning
LTOL 	**Wear tolerance: length?** Permitted tool length deviation in wear detection for automatic tool measurement. **Further information:** "Touch Probe Cycles: Automatic Tool Measurement", Page 1734 If the entered value is exceeded, the control locks the tool in column **TL**. This parameter applies to the following tools, regardless of technology: ■ Milling and drilling tools ■ Turning tools (option 50) Input: **0...9.9999**
RTOL 	**Wear tolerance: radius?** Permitted tool radius deviation in wear detection for automatic tool measurement. **Further information:** "Touch Probe Cycles: Automatic Tool Measurement", Page 1734 If the entered value is exceeded, the control locks the tool in column **TL**. This parameter applies to the following tools, regardless of technology: ■ Milling and drilling tools ■ Turning tools (option 50) Input: **0...9.9999**
R2TOL	**Wear tolerance: Radius 2?** Permitted tool radius 2 deviation in wear detection for automatic tool measurement. **Further information:** "Touch Probe Cycles: Automatic Tool Measurement", Page 1734 If the entered value is exceeded, the control locks the tool in column **TL**. This parameter applies to the following tools, regardless of technology: ■ Milling and drilling tools ■ Turning tools (option 50) Input: **0...9.9999**
DIRECT 	**Cutting direction?** Cutting direction of the tool for automatic tool measurement with a rotating tool: ■ -: **M3** ■ +: **M4** **Further information:** "Touch Probe Cycles: Automatic Tool Measurement", Page 1734 This parameter applies to the following tools, regardless of technology: ■ Milling and drilling tools ■ Turning tools (option 50) Input: **-**, **+**

Parameter	Meaning
R-OFFS 	**Tool offset: radius?** Position of tool upon length measurement, offset between the center of the tool touch probe and the tool center for automatic tool measurement. **Further information:** "Touch Probe Cycles: Automatic Tool Measurement", Page 1734 This parameter applies to the following tools, regardless of technology: ■ Milling and drilling tools ■ Turning tools (option 50) Input: **-99999.9999...+99999.9999**
L-OFFS 	**Tool offset: length?** Position of tool upon radius measurement, distance between the top edge of the tool touch probe and the tool tip for automatic tool measurement. **Further information:** "Touch Probe Cycles: Automatic Tool Measurement", Page 1734 Is added to the machine parameter **offsetToolAxis** (no. 122707) This parameter applies to the following tools, regardless of technology: ■ Milling and drilling tools ■ Turning tools (option 50) Input: **-99999.9999...+99999.9999**
LBREAK 	**Breakage tolerance: length?** Permitted tool length deviation in breakage detection for automatic tool measurement. **Further information:** "Touch Probe Cycles: Automatic Tool Measurement", Page 1734 If the entered value is exceeded, the control locks the tool in column **TL**. This parameter applies to the following tools, regardless of technology: ■ Milling and drilling tools ■ Turning tools (option 50) Input: **0...3.2767**
RBREAK 	**Breakage tolerance: radius?** Permitted tool radius deviation in breakage detection for automatic tool measurement. **Further information:** "Touch Probe Cycles: Automatic Tool Measurement", Page 1734 If the entered value is exceeded, the control locks the tool in column **TL**. This parameter applies to the following tools, regardless of technology: ■ Milling and drilling tools ■ Turning tools (option 50) Input: **0.0000...0.9999**
NMAX 	**Maximum speed [rpm]** Limitation of spindle speed for the programmed value including control by the potentiometer. Input: **0...999999**

Parameter	Meaning
LIFTOFF	**Lift-off allowed?** Automatic tool lift-off with active **M148** or allow **FUNCTION LIFTOFF**: ■ **Y**: Activate **LIFTOFF** ■ **N**: Deactivate **LIFTOFF** **Further information:** "Automatically lifting off upon an NC stop or a power failure with M148", Page 1257 **Further information:** "Automatic tool liftoff with FUNCTION LIFTOFF", Page 1110 Selection by means of a selection window Input: **Y**, **N**
TP_NO	**Number of the touch probe** Number of touch probe in the touch probe table **tchprobe.tp** **Further information:** "Touch probe table tchprobe.tp", Page 1839 Input: **0...99**
T-ANGLE 	**Point angle** Point angle of the tool for exact definition of the tool for graphical simulation, automatic calculation within cycles and collision monitoring of e.g. drills. **Further information:** "Cycles for milling", Page 452 Input: **-180...+180**
LAST_USE	**Date/time of last tool call** Time of last tool presence in the spindle This parameter applies to all tools, regardless of technology. Input: **00:00:00 01.01.1971**...**23:59:59 31.12.2030**
PTYP	**Tool type for pocket table?** Tool type for evaluation in the pocket table **Further information:** "Pocket table tool_p.tch", Page 1843 Refer to your machine manual. This parameter applies to all tools, regardless of technology. Input: **0...99**
AFC	**Feedback-control strategy** Control setting for adaptive feed control (AFC) (option 45) from the **AFC.tab** table. **Further information:** "Adaptive Feed Control (AFC, option 45)", Page 1114 Selection by means of a selection window Entry: **Text width 10**
ACC	**ACC active?** Activate or deactivate active chatter control (ACC) (option 145): ■ **Y**: Activate ■ **N**: Deactivate **Further information:** "Active Chatter Control (ACC, option 145)", Page 1121 Selection by means of a selection window Input: **Y**, **N**

Parameter	Meaning
PITCH 	**Tool thread pitch?** Thread pitch of the tool for automatic calculations within cycles. A positive sign means a right-hand thread. **Further information:** "Cycles for milling", Page 452 Input: **-9.9999...+9.9999**
AFC-LOAD	**Reference power for AFC [%]** Tool-dependent reference power for AFC (option 45). The input in percent refers to the rated spindle power. The control immediately uses the value given for feedback control, meaning a teach-in cut is dropped. Calculate the value beforehand with a teach-in step. **Further information:** "AFC teach-in cut", Page 1119 Input: **1.0...100.0**
AFC-OVLD1	**AFC overload warning level [%]** Cut-related tool wear monitoring for AFC (option 45). The input in percent refers to the reference power. The value 0 deactivates the monitoring function. An empty field has no effect. **Further information:** "Monitoring tool wear and tool load", Page 1120 Input: **0.0...100.0**
AFC-OVL2	**AFC ovrload switch-off level [%]** Cut-related tool load monitoring for AFC (option 45). The input in percent refers to the reference power. The value 0 deactivates the monitoring function. An empty field has no effect. **Further information:** "Monitoring tool wear and tool load", Page 1120 Input: **0.0...100.0**
KINEMATIC	**Tool-carrier kinematics** Assigning a tool carrier for exact definition of the tool for graphical simulation and collision monitoring. **Further information:** "Tool carrier management", Page 274 Selection by means of a selection window This parameter applies to all tools, regardless of technology. Entry: **Text width 20**
DR2TABLE	**Compensation val. table for DR2** Assigning a compensation value table ***.3dtc** for 3D tool radius compensation depending on the contact angle (option 92). This allows the control to compensate for, e.g., inaccuracies in the shape of a ball-nose cutter or the deflection behavior of a touch probe. **Further information:** "3D radius compensation depending on the tool contact angle (option 92)", Page 1062 Selection by means of a selection window Entry: **Text width 16**

Parameter	Meaning
OVRTIME	**Tool life expired** Time in minutes during which the tool may be used beyond the tool life defined in column **TIME1**. The machine manufacturer defines the function of this parameter. The machine manufacturer defines how the control uses the parameter when searching for tool names. Refer to your machine manual. This parameter applies to all tools, regardless of technology. Input: **0...99**
RCUTS	**Width of the indexable insert** Front-face width of cutting edge for exact definition of the tool for graphical simulation, automatic calculation within cycles and collision monitoring, e.g. for indexable inserts. Input: **0...99999.9999**

Notes

- Use the machine parameter **unitOfMeasure** (no. 101101) to define inches as the unit of measure. This does not automatically change the unit of measure in the tool table!

  Further information: "Creating a tool table in inches", Page 1842
- If you want to archive tool tables or use them for simulation, save them with different file names and the corresponding file extension.
- The control shows delta values from the tool management graphically in the simulation. For delta values from the NC program or from compensation tables, the control only changes the position of the tool in the simulation.
- Assign unique tool names!

  If you define identical tool names for multiple tools, the control looks for the tool in the following sequence:
  - Tool that is in the spindle
  - Tool that is in the magazine

    > Refer to your machine manual.
    > If there are multiple magazines, the machine manufacturer can specify the search sequence of the tools in the magazines.
  - Tool that is defined in the tool table but is currently not in the magazine

  If the control, for example, finds multiple available tools in the tool magazine, it inserts the tool with least remaining tool life.
- In the machine parameter **offsetToolAxis** (no. 122707), the machine manufacturer defines the distance between the upper edge of the tool touch probe and the tool tip.

  The parameter **L-OFFS** is added to this defined distance.
- In the machine parameter **zeroCutToolMeasure** (no. 122724) the machine manufacturer defines whether the control takes the parameter **R-OFFS** into account for automatic tool measurement.

33.5.3 Turning tool table toolturn.trn (option 50)

Application

The turning tool table **toolturn.trn** contains the data specific to turning tools.

Related topics

- Editing tool data in tool management
  Further information: "Tool management ", Page 270
- Tool data required for turning tools
  Further information: "Tool data for turning tools (option 50)", Page 261
- Milling-turning operations on the control
  Further information: "Turning (option 50)", Page 212
- General tool data, regardless of the technology
  Further information: "Tool table tool.t", Page 1814

Requirements

- Software option 50: Combined milling-turning
- Turning tool is defined in **TYPE** column of tool management
  Further information: "Tool types", Page 255

Description of function

The file name of the turning tool table is **toolturn.trn** and this table must be stored in the folder **TNC:\table**.

The **toolturn.trn** turning tool table provides the following parameters:

Parameter	Meaning
T	Row number in the turning tool table The tool number allows identifying each tool unambiguously, e.g. for calling a tool. **Further information:** "Tool call by TOOL CALL", Page 277 You can define an index after the period. **Further information:** "Indexed tool", Page 250 The row number must match the tool number in the **tool.t** tool table. Input: **0.0...32767.9**
NAME	**Tool name?** The tool name allows identifying a tool, e.g. for calling a tool. **Further information:** "Tool call by TOOL CALL", Page 277 You can define an index after the period. **Further information:** "Indexed tool", Page 250 Input: **Text width 32**
ZL 	**Tool length 1?** Length of the tool in the Z direction, with respect to the tool carrier preset **Further information:** "Tool carrier reference point", Page 245 Input: **-99999.9999...+99999.9999**
XL 	**Tool length 2?** Length of the tool in the X direction, with respect to the tool carrier preset **Further information:** "Tool carrier reference point", Page 245 Input: **-99999.9999...+99999.9999**
YL 	**Tool length 3?** Length of the tool in the Y direction, with respect to the tool carrier preset **Further information:** "Tool carrier reference point", Page 245 Input: **-99999.9999...+99999.9999**

Parameter	Meaning
DZL 	**Oversize in tool length 1?** Delta value of tool length 1 as a compensation value in connection with touch probe cycles. The control enters compensation values automatically after measuring the workpiece. **Further information:** "Programmable Touch Probe Cycles", Page 1449 Is added to the parameter **ZL** Input: **-99999.9999...+99999.9999**
DXL 	**Oversize in tool length 2?** Delta value of tool length 2 as a compensation value in connection with touch probe cycles. The control enters compensation values automatically after measuring the workpiece. **Further information:** "Programmable Touch Probe Cycles", Page 1449 Is added to the parameter **XL** Input: **-99999.9999...+99999.9999**
DYL 	**Tool length oversize 3?** Delta value of tool length 3 as a compensation value in connection with touch probe cycles. The control enters compensation values automatically after measuring the workpiece. **Further information:** "Programmable Touch Probe Cycles", Page 1449 Is added to the parameter **YL** Input: **-99999.9999...+99999.9999**
RS 	**Cutting edge radius?** The control takes into account the cutter radius for tool tip radius compensation. **Further information:** "Tooth radius compensation for turning tools (option 50)", Page 1041 In turning cycles, the control takes into account the cutter geometry to prevent damage to the defined contour. If the contour cannot be machined completely, the control will display a warning. **Further information:** "Cycles for milling and turning", Page 677 For the cutter geometry, the control also considers the parameters **TO**, **T-ANGLE**, and **P-ANGLE**. Input: **0...99999.9999**
DRS 	**Cutter radius oversize?** Delta value of cutter radius as a compensation value in connection with touch probe cycles. The control enters compensation values automatically after measuring the workpiece. **Further information:** "Programmable Touch Probe Cycles", Page 1449 Is added to the parameter **RS** Input: **-999.9999...+999.9999**

Parameter	Meaning
TO 	**Tool orientation?** From the tool orientation, the control determines the position of the tool tip and, depending on the selected tool type, additional information such as the tool angle direction. This information is necessary, for example, for calculating the cutter radius compensation, milling cutter radius compensation, plunge angle, etc.. In turning cycles, the control takes into account the cutter geometry to prevent damage to the defined contour. If the contour cannot be machined completely, the control will display a warning. **Further information:** "Cycles for milling and turning", Page 677 For the cutter geometry, the control also considers the parameters **RS**, **T-ANGLE**, and **P-ANGLE**. Input: **1...19**
SPB-INSERT 	**Angular offset?** Angular offset for recessing tools Input: **-90.0...+90.0**
ORI 	**Angle of spindle orientation?** Angle of tool spindle for aligning the turning tool Input: **-360.000...+360.000**
T-ANGLE 	**Tool angle** In turning cycles, the control takes into account the cutter geometry to prevent damage to the defined contour. If the contour cannot be machined completely, the control will display a warning. **Further information:** "Cycles for milling and turning", Page 677 For the cutter geometry, the control also considers the parameters **RS**, **TO**, and **P-ANGLE**. Input: **0...179.999**
P-ANGLE 	**Point angle** In turning cycles, the control takes into account the cutter geometry to prevent damage to the defined contour. If the contour cannot be machined completely, the control will display a warning. **Further information:** "Cycles for milling and turning", Page 677 For the cutter geometry, the control also considers the parameters **RS**, **TO**, and **T-ANGLE**. Input: **0...179.999**
CUTLENGTH  	**Cutting length of recessing tool** Length of the cutting edge of a turning or recessing tool The control monitors the length of the cutting edge in the turning cycles. If the cutting depth programmed in the turning cycle is greater than the length of the cutting edge defined in the tool table, then the control will display a warning and will automatically reduce the cutting depth. **Further information:** "Fundamentals of turning cycles", Page 693 Input: **0...99999.9999**

Parameter	Meaning
CUTWIDTH  	**Width of recessing tool** The control uses the width of a recessing tool for calculations within cycles. **Further information:** "Cycles for milling and turning", Page 677 Input: **0...99999.9999**
DCW 	**Oversize f. recessing tool width** Delta value of recessing tool width as a compensation value in connection with touch probe cycles. The control enters compensation values automatically after measuring the workpiece. **Further information:** "Programmable Touch Probe Cycles", Page 1449 Is added to parameter **CUTWIDTH** Input: **-99999.9999...+99999.9999**
TYPE 	**Type of turning tool** Depending on the selected turning tool type, the control displays the suitable tool parameters in the **Form** workspace of tool management. **Further information:** "Types within the turning tools", Page 256 **Further information:** "Tool management ", Page 270 Selection by means of a selection window Input: **ROUGH**, **FINISH**, **THREAD**, **RECESS**, **BUTTON**, and **RECTURN**
WPL-DX-DIAM	**Compensation value for the workpiece diameter** Compensation value for the workpiece diameter with respect to the working plane coordinate system (**WPL CS**). **Further information:** "Working plane coordinate system WPL-CS", Page 942 Input: **-99999.9999...+99999.9999**
WPL-DZL	**Compensation value for the workpiece length** Compensation value for the workpiece length with respect to the working plane coordinate system (**WPL CS**). **Further information:** "Working plane coordinate system WPL-CS", Page 942 Input: **-99999.9999...+99999.9999**

Notes

- The control shows delta values from the tool management graphically in the simulation. For delta values from the NC program or from compensation tables, the control only changes the position of the tool in the simulation.
- Geometry values from the tool table **tool.t**, such as length **L** or radius **R**, are not effective with turning tools.
- Assign unique tool names!

  If you define identical tool names for multiple tools, the control looks for the tool in the following sequence:

  - Tool that is in the spindle
  - Tool that is in the magazine

    > Refer to your machine manual.
    > If there are multiple magazines, the machine manufacturer can specify the search sequence of the tools in the magazines.

  - Tool that is defined in the tool table but is currently not in the magazine

  If the control, for example, finds multiple available tools in the tool magazine, it inserts the tool with least remaining tool life.
- If you want to archive tool tables or use them for simulation, save them with different file names and the corresponding file extension.
- Use the machine parameter **unitOfMeasure** (no. 101101) to define inches as the unit of measure. This does not automatically change the unit of measure in the tool table!

  Further information: "Creating a tool table in inches", Page 1842
- The columns **WPL-DX-DIAM** and **WPL-DZL** are deactivated in the default configuration.

  In the machine parameter **columnKeys** (no. 105501), the machine manufacturer activates the columns **WPL-DX-DIAM** and **WPL-DZL**. The names of the columns may be different, however.

33.5.4 Grinding tool table toolgrind.grd (option 156)

Application

The grinding tool table **toolgrind.grd** contains the data specific to grinding tools.

Related topics

- Editing tool data in tool management

  Further information: "Tool management ", Page 270
- Tool data required for grinding tools

  Further information: "Tool data for grinding tools (option 156)", Page 263
- Grinding operations on milling machines

  Further information: "Grinding operations (option 156)", Page 224
- Tool table for dressing tools

  Further information: "Dressing tool table tooldress.drs (option 156)", Page 1836
- General tool data, regardless of the technology

  Further information: "Tool table tool.t", Page 1814

Requirements

- Software option 156: Jig grinding
- Grinding tool is defined in **TYPE** column of tool management

  Further information: "Tool types", Page 255

Description of function

The file name of the grinding tool table is **toolgrind.grd** and this table must be stored in the folder **TNC:\table**.

The **toolgrind.grd** grinding tool table provides the following parameters:

Parameter	Meaning
T	**Tool number** Row number in the grinding tool table The tool number allows identifying each tool unambiguously, e.g. for calling a tool. **Further information:** "Tool call by TOOL CALL", Page 277 You can define an index after the period. **Further information:** "Indexed tool", Page 250 The row number must match the tool number in the **tool.t** tool table Input: **0...32767**
NAME	**Name of grinding wheel** The tool name allows identifying a tool, e.g. for calling a tool. **Further information:** "Tool call by TOOL CALL", Page 277 You can define an index after the period. **Further information:** "Indexed tool", Page 250 Input: **Text width 32**
TYPE 	**Type of grinding wheel** Depending on the selected grinding tool type, the control displays the suitable tool parameters in the **Form** workspace of tool management. **Further information:** "Types within the grinding tools", Page 257 **Further information:** "Tool management ", Page 270 Selection by means of a selection window Input: **GRIND_M**, **GRIND_MS**, **GRIND_MT**, **GRIND_S**, **GRIND_A**, and **GRIND_P**
R-OVR 	**Radius of grinding wheel** Outermost radius of grinding tool After initial dressing, you can no longer edit this parameter. **Further information:** "Cycle 1032 GRINDING WHL LENGTH COMPENSATION (option 156)", Page 889 Input: **0.000000...999.999999**
L-OVR 	**Overhang of grinding wheel** Length up to the outermost radius of the grinding tool, with respect to the tool carrier preset After initial dressing, you can no longer edit this parameter. **Further information:** "Cycle 1032 GRINDING WHL LENGTH COMPENSATION (option 156)", Page 889 Input: **0.000000...999.999999**

Parameter	Meaning
LO 	**Overall length** Absolute length of the grinding tool, with respect to the tool carrier preset After initial dressing, you can no longer edit this parameter. **Further information:** "Cycle 1032 GRINDING WHL LENGTH COMPENSATION (option 156)", Page 889 Input: **0.000000...999.999999**
LI 	**Length to the inner edge** Length up to the inner edge, with respect to the tool carrier preset After initial dressing, you can no longer edit this parameter. **Further information:** "Cycle 1032 GRINDING WHL LENGTH COMPENSATION (option 156)", Page 889 Input: **0.000000...999.999999**
B 	**Width** Width of the grinding tool After initial dressing, you can no longer edit this parameter. **Further information:** "Cycle 1032 GRINDING WHL LENGTH COMPENSATION (option 156)", Page 889 Input: **0.000000...999.999999**
G 	**Depth** Depth of grinding wheel After initial dressing, you can no longer edit this parameter. **Further information:** "Cycle 1032 GRINDING WHL LENGTH COMPENSATION (option 156)", Page 889 Input: **0.000000...999.999999**
ALPHA	**Angle for the slant** After initial dressing, you can no longer edit this parameter. **Further information:** "Cycle 1032 GRINDING WHL LENGTH COMPENSATION (option 156)", Page 889 Input: **0.00000...90.00000**
GAMMA	**Angle for the corner** After initial dressing, you can no longer edit this parameter. **Further information:** "Cycle 1032 GRINDING WHL LENGTH COMPENSATION (option 156)", Page 889 Input: **45.00000...180.00000**
RV 	**Radius at the edge for L-OVR** After initial dressing, you can no longer edit this parameter. **Further information:** "Cycle 1032 GRINDING WHL LENGTH COMPENSATION (option 156)", Page 889 Input: **0.00000...999.99999**
RV1 	**Radius at the edge for LO** After initial dressing, you can no longer edit this parameter. **Further information:** "Cycle 1032 GRINDING WHL LENGTH COMPENSATION (option 156)", Page 889 Input: **0.00000...999.99999**

Parameter	Meaning
RV2	**Radius at the edge for LI** After initial dressing, you can no longer edit this parameter. **Further information:** "Cycle 1032 GRINDING WHL LENGTH COMPENSATION (option 156)", Page 889 Input: **0.00000...999.99999**
dR-OVR	**Compensation of the radius** Delta value of the radius for tool compensation The control uses this value only for machining, and not for dressing! After dressing and measuring the grinding tool, the control will automatically enter the compensation value. Is added to the parameter **R-OVR** Input: **-999.999999...+999.999999**
dL-OVR	**Compensation of the overhang** Delta value of the overhang for tool compensation The control uses this value only for machining, and not for dressing! After dressing and measuring the grinding tool, the control will automatically enter the compensation value. Is added to the parameter **L-OVR** Input: **-999.999999...+999.999999**
dLO	**Compensation of the total length** Delta value of the total length for tool compensation The control uses this value only for machining, and not for dressing! After dressing and measuring the grinding tool, the control will automatically enter the compensation value. Is added to the parameter **LO** Input: **-999.999999...+999.999999**
dLI	**Compensation of the length to the inner edge** Delta value of the length up to the inner edge for tool compensation The control uses this value only for machining, and not for dressing! After dressing and measuring the grinding tool, the control will automatically enter the compensation value. Is added to the parameter **LI** Input: **-999.999999...+999.999999**
R_SHAFT	**Radius of the tool shank** Input: **0.00000...999.99999**
R_MIN	**Min. permissible radius** If, after dressing, the actual radius is below the minimum permissible radius defined here, the control will display an error message. Input: **0.00000...999.99999**
B_MIN	**Min. permissible width** If, after dressing, the actual width is below the minimum permissible width defined here, the control will display an error message. Input: **0.00000...999.99999**

Parameter	Meaning
V_MAX 	**Maximum permissible cutting speed** Cutting speed limit This value cannot be exceeded by programming a higher value or by using the potentiometer. Input: **0.000...999.999**
V	**Current cutting speed** Currently no function Input: **0.000...999.999**
W	**Tilt angle** Currently no function Input: **-90.00000...90.0000**
W_TYPE	**Tilted toward inner or outer edge** Currently no function Input: **-1**, **0**, **+1**
KIND	**Type of machining (internal/external grinding)** Currently no function Input: **0**, **1**
HW	**Wheel has a relief cut** Grinding wheel with or without relief cut: ▪ **0**: **No relief cut** ▪ **1**: **With relief cut** Selection by means of a selection window Input: **0**, **1**
HWA 	**Angle for relief cut on the outer edge** Input: **0.00000...45.00000**
HWI 	**Angle for relief cut on the inner edge** Input: **0.00000...45.00000**
INIT_D_OK	**Initial dressing performed** Initial dressing is the first dressing operation performed on the grinding wheel. If the following requirements are fulfilled, the control will set the parameter **INIT_D_OK** to **1**: ▪ Grinding tool is defined ▪ Initial dressing performed If the parameter **INIT_D_OK** is set to **1**, the control will disable the parameters for defining the grinding tool. If you set the parameter **INIT_D_OK** to **0**, the control will re-enable the editing of the parameters. In this case, the control will have to perform initial dressing of the tool again. **Further information:** "Cycle 1032 GRINDING WHL LENGTH COMPENSATION (option 156)", Page 889 Input: **0**, **1**

Parameter	Meaning
INIT_D_PNR	**Dresser location for initial dressing** Dressing location used for initial dressing Input: **0...9999**
INIT_D_DNR	**Dresser number for initial dressing** Number of the dresser used for initial dressing Input: **0...32767**
MESS_OK	**Measure the grinding wheel** Currently no function Input: **0**, **1**
STATE	**Setup status** Currently no function Input: **%0000000000000000...%1111111111111111**
A_NR_D	**Dresser number (diameter dressing)** Number of dresser used for dressing the diameter Input: **0...32767**
A_NR_A	**Dresser number (outer edge dressing)** Number of dresser used for dressing the outer edge Input: **0...32767**
A_NR_I	**Dresser number (inner edge dressing)** Number of dresser used for dressing the inner edge Input: **0...32767**
DRESS_N_D	**Dressing counter for diameter (specification)** Specified number of dressing cycle calls that will be skipped until the next dressing of the diameter. Input: **0...999**
DRESS_N_A	**Dressing counter for outer edge (specification)** Specified number of dressing cycle calls that will be skipped until the next dressing of the outer edge. Input: **0...999**
DRESS_N_I	**Dressing counter for inner edge (specification)** Specified number of dressing cycle calls that will be skipped until the next dressing of the inner edge. Input: **0...999**
DRESS_N_D_ACT	**Current dressing counter of the diameter** Current number of dressing cycles that have been skipped since the last dressing of the diameter. Input: **0...999**
DRESS_N_A_ACT	**Current dressing counter of the outer edge** Current number of dressing cycles that have been skipped since the last dressing of the outer edge. Input: **0...999**

Parameter	Meaning
DRESS_N_I_ACT 	**Current dressing counter of the inner edge** Current number of dressing cycles that have been skipped since the last dressing of the inner edge. Input: **0...999**
AD 	**Retraction amount at the diameter** The control uses this parameter when using a cycle for dressing. **Further information:** "General information on the dressing cycles", Page 843 Input: **0.00000...999.99999**
AA 	**Retraction amount at the outer edge** The control uses this parameter when using a cycle for dressing. **Further information:** "General information on the dressing cycles", Page 843 Input: **0.00000...999.99999**
AI 	**Retraction amount at the inner edge** The control uses this parameter when using a cycle for dressing. **Further information:** "General information on the dressing cycles", Page 843 Input: **0.00000...999.99999**
FORM	**Wheel shape** Currently no function Input: **0.00...99.99**
A_PL	**Chamfer length at outside** Currently no function Input: **0.00000...999.99999**
A_PW	**Chamfer angle at outside** Currently no function Input: **0.00000...89.99999**
A_R1	**Corner radius at outside** Currently no function Input: **0.00000...999.99999**
A_L	**Length of outside** Currently no function Input: **0.00000...999.99999**
A_HL	**Length of relief cut, wheel depth at outside** Currently no function Input: **0.00000...999.99999**
A_HW	**Angle of relief cut at outside** Currently no function Input: **0.00000...45.00000**
A_S	**Side depth at outside** Currently no function Input: **0.00000...999.99999**
A_R2	**Angle of departure at outside** Currently no function Input: **0.00000...999.99999**

Parameter	Meaning
A_G	**Reserve at outside** Currently no function Input: **0.00000...999.99999**
I_PL	**Chamfer length at inside** Currently no function Input: **0.00000...999.99999**
I_PW	**Chamfer angle at inside** Currently no function Input: **0.00000...89.99999**
I_R1	**Corner radius at inside** Currently no function Input: **0.00000...999.99999**
I_L	**Length of inside** Currently no function Input: **0.00000...999.99999**
I_HL	**Length of relief cut, wheel depth at inside** Currently no function Input: **0.00000...999.99999**
I_HW	**Angle of relief cut at inside** Currently no function Input: **0.00000...45.00000**
I_S	**Side depth at inside** Currently no function Input: **0.00000...999.99999**
I_R2	**Angle of departure at inside** Currently no function Input: **0.00000...999.99999**
I_G	**Reserve at inside** Currently no function Input: **0.00000...999.99999**

Notes

- Geometry values from the tool table **tool.t**, such as length or radius, are not effective with grinding tools.
- When dressing a grinding tool, the tool must not be assigned a tool carrier kinematic model.
- Measure the grinding tool after dressing so that the control enters the correct delta values.
- Assign unique tool names!

  If you define identical tool names for multiple tools, the control looks for the tool in the following sequence:
  - Tool that is in the spindle
  - Tool that is in the magazine

    > Refer to your machine manual.
    > If there are multiple magazines, the machine manufacturer can specify the search sequence of the tools in the magazines.

  - Tool that is defined in the tool table but is currently not in the magazine

  If the control, for example, finds multiple available tools in the tool magazine, it inserts the tool with least remaining tool life.
- The control shows delta values from the tool management graphically in the simulation. For delta values from the NC program or from compensation tables, the control only changes the position of the tool in the simulation.
- If you want to archive tool tables or use them for simulation, save them with different file names and the corresponding file extension.
- Use the machine parameter **unitOfMeasure** (no. 101101) to define inches as the unit of measure. This does not automatically change the unit of measure in the tool table!

  Further information: "Creating a tool table in inches", Page 1842

33.5.5 Dressing tool table tooldress.drs (option 156)

Application

The dressing tool table **tooldress.drs** contains the data specific to dressing tools.

Related topics

- Editing tool data in tool management

  Further information: "Grinding tool table toolgrind.grd (option 156)", Page 1828
- General tool data, regardless of the technology

  Further information: "Tool table tool.t", Page 1814

Requirements

- Software option 156: Jig grinding
- Dressing tool is defined in **TYPE** column of tool management
  Further information: "Tool types", Page 255

Description of function

The file name of the dressing tool table is **tooldress.drs** and this table must be stored in the folder **TNC:\table**.

The **tooldress.drs** dressing tool table provides the following parameters:

Parameter	Meaning
T	Row number in the dressing tool table The tool number allows identifying each tool unambiguously, e.g. for calling a tool. **Further information:** "Tool call by TOOL CALL", Page 277 You can define an index after the period. **Further information:** "Indexed tool", Page 250 The row number must match the tool number in the **tool.t** tool table. Input: **0.0...32767.9**
NAME	**Name of dressing tool** The tool name allows identifying a tool, e.g. for calling a tool. **Further information:** "Tool call by TOOL CALL", Page 277 You can define an index after the period. **Further information:** "Indexed tool", Page 250 Input: **Text width 32**
ZL 	**Tool length 1** Length of the tool in the Z direction, with respect to the tool carrier preset **Further information:** "Tool carrier reference point", Page 245 Input: **-99999.9999...+99999.9999**
XL 	**Tool length 2** Length of the tool in the X direction, with respect to the tool carrier preset **Further information:** "Tool carrier reference point", Page 245 Input: **-99999.9999...+99999.9999**
YL 	**Tool length 3** Length of the tool in the Y direction, with respect to the tool carrier preset **Further information:** "Tool carrier reference point", Page 245 Input: **-99999.9999...+99999.9999**
DZL 	**Tool length oversize 1** Delta value of tool length 1 for tool compensation Is added to the parameter **ZL** Input: **-99999.9999...+99999.9999**
DXL 	**Tool length oversize 2** Delta value of tool length 2 for tool compensation Is added to the parameter **XL** Input: **-99999.9999...+99999.9999**

Parameter	Meaning
DYL 	**Tool length oversize 3** Delta value of tool length 3 for tool compensation Is added to the parameter **YL** Input: **-99999.9999...+99999.9999**
RS 	**Tool tip radius** Input: **0.0000...99999.9999**
DRS 	**Cutter radius oversize** Delta value of the cutter radius for tool compensation Is added to the parameter **RS** Input: **-999.9999...+999.9999**
TO 	**Tool orientation** The control uses the tool orientation to determine the position of the tool's cutting edge. Input: **1...9**
CUTWIDTH	**Width of tool (plate, roll)** Tool width of the tool types **dressing plate** and **dressing roll** Input: **0.0000...99999.9999**
TYPE 	**Type of dressing tool** Depending on the selected dressing tool type, the control displays the suitable tool parameters in the **Form** workspace of tool management. **Further information:** "Types within the dressing tools", Page 257 **Further information:** "Tool management ", Page 270 Selection by means of a selection window Input: **DIAMOND**, **SPINDLE**, **PLATE**, and **ROLL**
N-DRESS	**Speed of the tool (dressing spindle)** Shaft speed of a dressing spindle or dressing roll Input: **0.0000...99999.9999**

Notes

- When dressing a grinding tool, the tool must not be assigned a tool carrier kinematic model.
- Geometry values from the tool table **tool.t**, such as length or radius, are not effective with dressing tools.
- Assign unique tool names!

  If you define identical tool names for multiple tools, the control looks for the tool in the following sequence:
  - Tool that is in the spindle
  - Tool that is in the magazine

    > Refer to your machine manual.
    > If there are multiple magazines, the machine manufacturer can specify the search sequence of the tools in the magazines.

  - Tool that is defined in the tool table but is currently not in the magazine

  If the control, for example, finds multiple available tools in the tool magazine, it inserts the tool with least remaining tool life.
- If you want to archive tool tables, save them with different file names and the corresponding file extension.
- Use the machine parameter **unitOfMeasure** (no. 101101) to define inches as the unit of measure. This does not automatically change the unit of measure in the tool table!

  Further information: "Creating a tool table in inches", Page 1842

33.5.6 Touch probe table tchprobe.tp

Application

The touch probe table **tchprobe.tp** defines the touch probe and data for the probing process, e.g. the probing feed rate. If you use several touch probes, you can save separate data for each touch probe.

Related topics

- Editing tool data in tool management

  Further information: "Tool management ", Page 270
- Touch probe functions

  Further information: "Touch Probe Functions in the Manual Operating Mode", Page 1425
- Programmable touch probe cycles

  Further information: "Programmable Touch Probe Cycles", Page 1449

Description of function

The file name of the touch probe table is **tchprobe.tp** and this table must be stored in the folder **TNC:\table**.

The touch probe table **tchprobe.tp** provides the following parameters:

Parameter	Meaning
NO	**Sequential number of touch probe** You use this number to assign the touch probe to the data in the tool management column **TP_NO**. Input: **1...99**
TYPE	**Selection of the touch probe?** The TS 642 touch probe makes the following values available: ■ **TS642-3**: The touch probe is activated by a conical switch. This mode is not supported. ■ **TS642-6**: The touch probe is activated by an infrared signal. Select this mode. Input: **TS120**, **TS220**, **TS249**, **TS260**, **TS440**, **TS444**, **TS460**, **TS630**, **TS632**, **TS640**, **TS642-3**, **TS642-6**, **TS649**, **TS740**, **TS 760**, **KT130**, **OEM**
CAL_OF1	**TS center misalignmt. ref. axis? [mm]** Offset of the touch probe axis to the spindle axis in the main axis Input: **-99999.9999...+99999.9999**
CAL_OF2	**TS center misalignmt. aux. axis? [mm]** Offset of the touch probe axis to the spindle axis in the secondary axis Input: **-99999.9999...+99999.9999**
CAL_ANG	**Spindle angle for calibration?** Prior to calibrating or probing, the control aligns the touch probe with the spindle orientation angle (if possible). Input: **0.0000...359.9999**
F	**Probing feed rate? [mm/min]** In the machine parameter **maxTouchFeed** (no. 122602), the machine manufacturer defines the maximum probing feed rate. If **F** is greater than the maximum probing feed rate, then the maximum probing feed rate will be used. Input: **0...9999**
FMAX	**Rapid traverse in probing cycle? [mm/min]** Feed rate at which the control pre-positions the touch probe and positions it between the measuring points Input: **-99999...+99999**
DIST	**Maximum measuring range? [mm]** If the stylus is not deflected in a probing process within the defined value, the control will display an error message. Input: **0.00100...99999.99999**

Parameter	Meaning
SET_UP 	**Set-up clearance? [mm]** Distance of touch probe from the defined touch point when pre-positioning The smaller this value is, the more exactly you must define the touch point position. Safety clearances defined in the touch probe cycle are added to this value. Input: **0.00100...99999.99999**
F_PREPOS 	**Pre-position at rapid? ENT/NOENT** Speed for pre-positioning: ■ **FMAX_PROBE**: Pre-position at the speed from **FMAX** ■ **FMAX_MACHINE**: Pre-position at machine rapid traverse Input: **FMAX_PROBE**, **FMAX_MACHINE**
TRACK 	**Probe oriented? Yes=ENT/No=NOENT** Orienting the infrared touch probe in each probing process: ■ **ON**: The control orients the touch probe in the defined probing direction. In this way, the stylus is always deflected in the same direction, improving measuring accuracy. ■ **OFF**: The control will not orient the touch probe. If you change the **TRACK** parameter, you must recalibrate the touch probe. Input: **ON**, **OFF**
SERIAL 	**Serial number?** The control automatically edits this parameter of touch probes with an EnDat interface. Input: **Text width 15**
REACTION	**Reaction? EMERGSTOP=ENT/NCSTOP=NOENT** As soon as touch probes with a collision protection adapter detect a collision, they react by resetting the ready signal. Reaction to resetting the ready signal: ■ **NCSTOP**: Interrupt NC program ■ **EMERGSTOP**: Emergency stop, quick braking of the axes Input: **NCSTOP**, **EMERGSTOP**

Editing the touch probe table

To edit the touch probe table:

- ▶ Select the **Tables** operating mode

- ▶ Select **Add**
- > The control opens the **Quick selection** and the **Open File** workspaces.
- ▶ Select the **tchprobe.tp** file in the **Open File** workspace

- ▶ Select **Open**
- > The control opens the **Touch probes** application.

- ▶ Activate **Edit**
- ▶ Select the desired value
- ▶ Edit the value

Notes

- You can also edit the touch probe table values in the tool management.
- If you want to archive tool tables or use them for simulation, save them with different file names and the corresponding file extension.
- In the machine parameter **overrideForMeasure** (no. 122604), the machine manufacturer defines whether you will be allowed to change the feed rate with the feed-rate potentiometer during probing.

33.5.7 Creating a tool table in inches

To create a tool table in inches:

- ▶ Select the **Manual** operating mode

T

- ▶ Select **T**
- ▶ Select the tool **T0**
- ▶ Press the **NC Start** key
- > The control removes the current tool and does not insert a new tool.
- ▶ Restart the control
- ▶ Do not acknowledge **Power interrupted**
- ▶ Select the **Files** operating mode
- ▶ Open the **TNC:\table** folder
- ▶ Rename the original file (e.g., **tool.t** as **tool_mm.t**)
- ▶ Select the **Tables** operating mode
- ▶ Select **Add**
- ▶ Select **Create new table**
- > The control opens the **Create new table** window.
- ▶ Select a folder with a corresponding file extension (e.g., **t**)

Select a path

- ▶ Select **Select a path**
- > The control opens the **Save as** window.
- ▶ Select the **table** folder
- ▶ Enter a name (e.g., **tool**)

Create

- ▶ Select **Create**

OK

- ▶ Select **OK**
- > The control opens the **Tool table** tab in **Tables** operating mode.
- ▶ Restart the control

CE

- ▶ Acknowledge **Power interrupted** with the **CE** key
- ▶ Select the **Tool table** tab in **Tables** operating mode
- > The control uses the newly created table as a tool table.

33.6 Pocket table tool_p.tch

Application

The **tool_p.tch** pocket table provides the pocket assignment of the tool magazine. The control needs the pocket table in order to change the tool.

Related topics

- Tool call

  Further information: "Tool call", Page 277
- Tool table

  Further information: "Tool table tool.t", Page 1814

Requirement

- The tool is defined in the tool management.

  Further information: "Tool management ", Page 270

Description of function

The file name of the pocket table is **tool_p.tch** and this table must be stored in the folder **TNC:\table**.

The **tool_p.tch** pocket table provides the following parameters:

Parameter	Meaning
P	**Pocket number?** Pocket number of the tool in the tool magazine Input: **0.0...99.9999**
T	**Tool number?** Row number of the tool from the tool table **Further information:** "Tool table tool.t", Page 1814 Input: **1...99999**
TNAME	**Tool name?** Name of the tool from the tool table When you define the tool number, the control will automatically load the tool name. **Further information:** "Tool table tool.t", Page 1814 Input: **Text width 32**
RSV	**Reserve pocket?** When a tool is in the spindle, the control reserves the pocket of this tool in the box magazine. To reserve the pocket for the tool: ■ No value entered: Pocket is not reserved ■ **R**: Pocket is reserved Input: No value, **R**
ST	**Special tool?** Define the tool as a special tool (e.g., with oversize tools): ■ No value entered: No special tool ■ **S**: Special tool Input: No value, **S**

Parameter	Meaning
F	**Fixed pocket?** Always return the tool to the same pocket in the tool magazine (e.g., with special tools) To define a fixed pocket for the tool: ■ No value entered: No fixed pocket ■ **F**: Fixed pocket Input: No value, **F**
L	**Locked pocket?** To lock a pocket for tools (e.g., the pockets next to special tools): ■ No value entered: Do not lock ■ **L**: Lock Input: No value, **L**
DOC	**Pocket comment?** The control automatically loads the tool comment from the tool table. **Further information:** "Tool table tool.t", Page 1814 Input: **Text width 32**
PLC	**PLC status?** Information about this tool pocket, which is transferred to the PLC The machine manufacturer defines the function of this parameter. Refer to your machine manual. Entry: **%00000000...%11111111**
P1 ... P5	**Value?** The machine manufacturer defines the function of this parameter. Refer to your machine manual. Input: **-99999.9999...+99999.9999**
PTYP	**Tool type for pocket table?** Tool type for evaluation in the pocket table The machine manufacturer defines the function of this parameter. Refer to your machine manual. Input: **0...99**
LOCKED_ABOVE	**Lock pocket above?** Box magazine: Lock the pocket above This parameter depends on the machine. Refer to your machine manual. Input: **0...99999**
LOCKED_BELOW	**Lock pocket below?** Box magazine: Lock the pocket below This parameter depends on the machine. Refer to your machine manual. Input: **0...99999**
LOCKED_LEFT	**Lock pocket at left?** Box magazine: Lock the pocket at left This parameter depends on the machine. Refer to your machine manual. Input: **0...99999**

Parameter	Meaning
LOCKED_RIGHT	**Lock pocket at right?** Box magazine: Lock the pocket at right This parameter depends on the machine. Refer to your machine manual. Input: **0...99999**
LAST_USE	**LAST_USE** The control automatically loads the date and time of the last tool call from the tool table. **Further information:** "Tool table tool.t", Page 1814 Refer to your machine manual. Entry: **Text width 20**
S1	**S1** Value for evaluation in the PLC The machine manufacturer defines the function of this parameter. Refer to your machine manual. Entry: **Text width 16**
S2	**S2** Value for evaluation in the PLC The machine manufacturer defines the function of this parameter. Refer to your machine manual. Entry: **Text width 16**

33.7 Tool usage file

Application

The control saves information about the tools of an NC program in a tool usage file (e.g., all the required tools and the tool usage times). The control needs this file for the tool usage test.

Related topics

- Using the tool usage test
  Further information: "Tool usage test", Page 284
- Working with pallet tables
  Further information: "Pallet Machining and Job Lists", Page 1763
- Tool data from the tool table
  Further information: "Tool table tool.t", Page 1814

Requirements

- **Generate tool-usage file** is enabled by your machine manufacturer
  The machine manufacturer uses the machine parameter **createUsageFile** (no. 118701) to define whether the **Generate tool-usage file** function is enabled.
  Further information: "Creating the tool usage file", Page 285
- The **Generate tool-usage file** function setting is set to either **once** or **always**
  Further information: "Channel settings", Page 1915

Description of function

The tool usage file provides the following parameters:

Parameter	Meaning
NR	Row number in the tool usage file Input: **0...99999**
TOKEN	In the **TOKEN** column, the control uses one word to show which information is contained in the respective row: ■ **TOOL**: Data per tool call; listed in chronological order ■ **TTOTAL**: All data of a tool; listed in alphabetical order ■ **STOTAL**: Called NC programs; listed in chronological order ■ **TIMETOTAL**: Total tool usage time of an NC program ■ **TOOLFILE**: Path of the tool table This enables the control during the tool usage test to detect whether you have performed the simulation with the tool table **tool.t** Input: **Text width 17**
TNR	Tool number If the control has not yet inserted a tool, the column contains the value **-1**. Input: **-1...32767**
IDX	Tool index Input: **0...9**
NAME	Tool name Input: **Text width 32**
TIME	Tool usage time in seconds Time during which the tool is cutting a workpiece (excluding rapid traverse movements) Input: **0...9999999**
WTIME	Total tool usage time in seconds Total time between the tool changes, during which the tool is cutting a workpiece Input: **0...9999999**
RAD	Sum of the tool radius **R** and the delta radius **DR** from the tool table Input: **-999999.9999...999999.9999**
BLOCK	NC block number of the tool call Input: **0...999999999**
PATH	Path of the NC program, the pallet table, or the tool table Input: **Text width 300**
T	Tool number, including the tool index If the control has not yet inserted a tool, the column contains the value **-1**. Input: **-1...32767.9**

Parameter	Meaning
OVRMAX	Maximum feed-rate override If you only simulate the machining operation, then the control will enter the value **100**. Input: **0...32767**
OVRMIN	Minimum feed rate override If you only simulate the machining operation, then the control will enter the value **-1**. Input: **-1...32767**
NAMEPRG	Type of tool definition during a tool call: ■ **0**: The tool number is programmed ■ **1**: The tool name is programmed Input: **0**, **1**
LINENR	Row number of the pallet table in which the NC program is defined Input: **-1...99999**

Note

The control creates dependency files (***.dep**); for example, the tool-usage file in order to perform a tool usage test.

In the machine parameter **dependentFiles** (no. 122101) the machine manufacturer defines whether the control displays dependency files.

33.8 T usage order (option 93)

Application

In the **T usage order** table, the control displays the tool call sequence in an NC program. Before starting the program, you can see, for example, when a manual tool change will take place.

Requirements

- Software option 93: Extended Tool Management
- Tool-usage file has been created

  Further information: "Creating the tool usage file", Page 285

  Further information: "Tool usage file", Page 1845

Description of function

When you select an NC program in **Program Run** operating mode, the control will automatically create the **T usage order** table. The control displays the table in the **T usage order** application in **Tables** operating mode. The control lists all the tools called within the active NC program and all the tools called within called NC programs in chronological order. You cannot edit the table.

The **T usage order** table provides the following parameters:

Parameter	Meaning
NR	Sequential number of the table rows
T	Number of the tool used, including an index as needed **Further information:** "Indexed tool", Page 250 May differ from the programmed tool (e.g., when a replacement tool is used)
NAME	Name of the tool used, including an index as needed **Further information:** "Indexed tool", Page 250 May differ from the programmed tool (e.g., when a replacement tool is used)
TOOL INFO	The control displays the following tool information: ■ **OK**: Tool is in order ■ **Locked**: Tool is locked ■ **Not found**: Tool is not defined in the pocket table **Further information:** "Pocket table tool_p.tch", Page 1843 ■ **T no. missing**: Tool is not defined in the tool management **Further information:** "Tool management ", Page 270
T PROG	Number or name of the programmed tool, including an index as needed **Further information:** "Indexed tool", Page 250
USAGE	Total tool usage time from the **WTIME** column of the **tool usage file** (in seconds) Total time between the tool changes, during which the tool is cutting a workpiece **Further information:** "Tool usage file", Page 1845
TOOL TIME	Estimated time of tool change
M3/M4 TIME	Tool usage time from the **TIME** column of the **tool usage file** (in seconds) Time during which the tool is cutting a workpiece (excluding rapid traverse movements) **Further information:** "Tool usage file", Page 1845
MIN OVRD	Minimum value of the feed-rate potentiometer during program run (in percent)
MAX OVRD	Maximum value of the feed-rate potentiometer during program run (in percent)
NC PGM	Path of the NC program in which the tool is programmed
MAGAZINE	In this column, the control writes whether the tool is currently in the magazine or in the spindle. This column remains empty if the tool is a zero tool or not defined in the pocket table. **Further information:** "Pocket table tool_p.tch", Page 1843

33.9 Tooling list (option 93)

Application

In the **Tooling list** table, the control displays information about all the tools called within an NC program. Before starting the program, you can check, for example, whether all tools are contained in the magazine.

Requirements

- Software option 93: Extended Tool Management
- Tool-usage file has been created

  Further information: "Creating the tool usage file", Page 285

  Further information: "Tool usage file", Page 1845

Description of function

When you select an NC program in **Program Run** operating mode, the control will automatically create the **Tooling list** table. The control displays the table in the **Tooling list** application in **Tables** operating mode. The control lists all the tools called within the active NC program and all the tools called within called NC programs in chronological order. You cannot edit the table.

The **Tooling list** table provides the following parameters:

Parameter	Meaning
T	Number of the tool used, including an index as needed **Further information:** "Indexed tool", Page 250 May differ from the programmed tool (e.g., when a replacement tool is used)
TOOL INFO	The control displays the following tool information: ■ **OK**: Tool is in order ■ **Locked**: Tool is locked ■ **Not found**: Tool is not defined in the pocket table **Further information:** "Pocket table tool_p.tch", Page 1843 ■ **T no. missing**: Tool is not defined in the tool management **Further information:** "Tool carrier management", Page 274
T PROG	Number or name of the programmed tool, including an index as needed **Further information:** "Indexed tool", Page 250
M3/M4 TIME	Tool usage time from the **TIME** column of the **tool usage file** (in seconds) Time during which the tool is cutting a workpiece (excluding rapid traverse movements) **Further information:** "Tool usage file", Page 1845
MAGAZINE	In this column, the control writes whether the tool is currently in the magazine or in the spindle. This column remains empty if the tool is a zero tool or not defined in the pocket table. **Further information:** "Pocket table tool_p.tch", Page 1843

33.10 Freely definable tables

Application

In freely definable tables you can save and read any information from the NC program. The Q parameter functions **FN 26** to **FN 28** are provided for this purpose.

Related topics

- Variable functions **FN 26** to **FN 28**

  Further information: "Functions for freely definable tables", Page 1296

Description of function

When you create a freely definable table, the control will provide various table templates for selection.

The machine manufacturers can create their own table templates and store them in the control.

33.10.1 Creating freely definable tables

To create a freely definable table:

- Select the **Tables** operating mode
- Select **Add**
- > The control opens the **Quick selection** and the **Open File** workspaces.
- Select **Create new table**
- > The control opens the **Create new table** window.
- Select the **tab** folder
- Select a table template

Select a path

- Select **Select a path**
- > The control opens the **Save as** window.
- Select a folder
- Enter a name

Create

- Select **Create**
- > The control opens the table.
- Modify the table as needed

  Further information: "Table workspace", Page 1803

Note

The names of tables and table columns must start with a letter and must not contain an arithmetic operator (e.g., **+**). Due to SQL commands, these characters can cause problems when data are input or read.

Further information: "Table access with SQL statements", Page 1316

33.11 Preset table

Application

The **preset.pr** preset table allows you to manage presets, such as the position and misalignment of a workpiece in the machine. The active row in the preset table is used as a workpiece preset in the NC program and as the coordinate origin of the workpiece coordinate system **W-CS**.

Further information: "Presets in the machine", Page 187

Related topics

- Setting and activating presets

  Further information: "Preset management", Page 949

Description of function

The preset table is stored in the **TNC:\table** directory by default and is named **preset.pr**. In the **Tables** operating mode, the preset table is open by default.

> Refer to your machine manual.
> The machine tool builder can define a different path for the preset table.
> In the optional machine parameter **basisTrans** (no. 123903), the machine manufacturer defines a specific preset table for each range of traverse.

Preset table icons

The preset table contains the following icons:

Icon	Function
⌖	Active row
🔒	Write-protected row

Preset table parameters

The preset table contains the following parameters:

Parameter	Meaning
NO	Number of preset table row Input: **0...99999999**
DOC	Comment Entry: **Text width 16**
X	X coordinate of preset Basic transformation relating to the basic coordinate system **B-CS** **Further information:** "Basic coordinate system B-CS", Page 938 Input: **-99999.99999...+99999.99999**
Y	Y coordinate of preset Basic transformation relating to the basic coordinate system **B-CS** **Further information:** "Basic coordinate system B-CS", Page 938 Input: **-99999.99999...+99999.99999**

Parameter	Meaning
Z	Z coordinate of preset Basic transformation relating to the basic coordinate system **B-CS** **Further information:** "Basic coordinate system B-CS", Page 938 Input: **-99999.99999...+99999.99999**
SPA	Spatial angle of preset in the A axis Basic transformation relating to the basic coordinate system **B-CS**, the preset contains a 3D basic rotation in tool axis **Z**. **Further information:** "Basic coordinate system B-CS", Page 938 Input: **-99999.9999999...+99999.9999999**
SPB	Spatial angle of preset in the B axis Basic transformation relating to the basic coordinate system **B-CS**, the preset contains a 3D basic rotation in tool axis **Z**. **Further information:** "Basic coordinate system B-CS", Page 938 Input: **-99999.9999999...+99999.9999999**
SPC	Spatial angle of preset in the C axis Basic transformation relating to the basic coordinate system **B-CS**, the preset contains a basic rotation in tool axis **Z**. **Further information:** "Basic coordinate system B-CS", Page 938 Input: **-99999.9999999...+99999.9999999**
X_OFFS	Position of the X axis for the preset Offset relating to the machine coordinate system **M-CS** **Further information:** "Machine coordinate system M-CS", Page 935 Input: **-99999.99999...+99999.99999**
Y_OFFS	Position of the Y axis for the preset Offset relating to the machine coordinate system **M-CS** **Further information:** "Machine coordinate system M-CS", Page 935 Input: **-99999.99999...+99999.99999**
Z_OFFS	Position of the Z axis for the preset Offset relating to the machine coordinate system **M-CS** **Further information:** "Machine coordinate system M-CS", Page 935 Input: **-99999.99999...+99999.99999**
A_OFFS	Axis angle of the A axis for the preset Offset relating to the machine coordinate system **M-CS** **Further information:** "Machine coordinate system M-CS", Page 935 Input: **-99999.9999999...+99999.9999999**
B_OFFS	Axis angle of the B axis for the preset Offset relating to the machine coordinate system **M-CS** **Further information:** "Machine coordinate system M-CS", Page 935 Input: **-99999.9999999...+99999.9999999**
C_OFFS	Axis angle of the C axis for the preset Offset relating to the machine coordinate system **M-CS** **Further information:** "Machine coordinate system M-CS", Page 935 Input: **-99999.9999999...+99999.9999999**

Parameter	Meaning
U_OFFS	Position of the U axis for the preset Offset relating to the machine coordinate system **M-CS** **Further information:** "Machine coordinate system M-CS", Page 935 Input: **-99999.99999...+99999.99999**
V_OFFS	Position of the V axis for the preset Offset relating to the machine coordinate system **M-CS** **Further information:** "Machine coordinate system M-CS", Page 935 Input: **-99999.99999...+99999.99999**
W_OFFS	Position of the W axis for the preset Offset relating to the machine coordinate system **M-CS** **Further information:** "Machine coordinate system M-CS", Page 935 Input: **-99999.99999...+99999.99999**
ACTNO	Active workpiece preset The control automatically enters **1** in the active row. Input: **0**, **1**
LOCKED	Write-protection of the table row Entry: **Text width 16**

Refer to your machine manual.
In the optional machine parameter **CfgPresetSettings** (no. 204600), the machine manufacturer can block the setting of a preset in individual axes.

Write-protection for table rows

The **LOCKED** column allows protecting any rows of the preset table against overwriting. You can protect the row with or without a password.

The control displays an icon at the beginning of write-protected rows.

NOTICE

Caution: Data may be lost!

Rows protected by a password can be unlocked by entering the selected password exclusively. Forgotten passwords cannot be reset. This locks the protected rows permanently.

- Protecting table rows without a password is recommended
- Note down your passwords

33.11.1 Activating write protection

Protecting table rows without a password

To protect a table row without a password:

- Activate the **Edit** switch
- Select the **LOCKED** column in the desired row
- Enter **L**
- Confirm your input
- > The control protects the row from being edited and displays an icon at the beginning of the row.

Protecting table rows with a password

NOTICE

Caution: Data may be lost!

Rows protected by a password can be unlocked by entering the selected password exclusively. Forgotten passwords cannot be reset. This locks the protected rows permanently.

- Protecting table rows without a password is recommended
- Note down your passwords

To protect a table row with a password:

- Activate the **Edit** switch
- Select the **LOCKED** column in the desired row
- Enter the password
- Confirm your input
- > The control displays the characters **###** in the **LOCKED** column.
- > The control protects the row from being edited and displays an icon at the beginning of the row.

33.11.2 Removing write protection

Unlocking table rows that are protected without a password

To unlock a table row that is protected without a password:

- Activate the **Edit** switch
- Select the **LOCKED** column in the desired row
- Enter **L** again
- Confirm your input
- > The control enables the row for editing and removes the icon at the beginning of the row.

Unlocking table rows that are protected with a password

> **NOTICE**
>
> **Caution: Data may be lost!**
>
> Rows protected by a password can be unlocked by entering the selected password exclusively. Forgotten passwords cannot be reset. This locks the protected rows permanently.
>
> - Protecting table rows without a password is recommended
> - Note down your passwords

To unlock a table row that is protected with a password:

- Activate the **Edit** switch
- Select the **LOCKED** column in the desired row
- Delete **###**
- Enter the password
- Confirm your input
- > The control enables the row for editing and removes the icon at the beginning of the row.

33.11.3 Creating a preset table in inches

If you define inches as the unit of measure in the machine parameter **unitOfMeasure** (no. 101101), the unit of measure of the preset table will not be adjusted automatically.

To create a preset table in inches:

- Select the **Files** operating mode
- Open the **TNC:\table** folder
- Rename the **preset.pr** file (e.g., as **preset_inch.pr**)

- Select the **Tables** operating mode

- Select **Add**

- Select **Create new table**
- > The control opens the **Create new table** window.
- Select the **pr** folder

- Select the desired **prototype**
- > The control opens the **Save as** window.
- Select the **table** folder
- Enter the name **preset.pr**

- Select **Create**

- Select **OK**
- > The control opens the **Presets** tab in **Tables** operating mode.
- Restart the control

- Select the **Presets** tab in **Tables** operating mode
- > The control uses the newly created table as a preset table.

Notes

NOTICE

Caution: Significant property damage!

Undefined fields in the preset table behave differently from fields defined with the value **0**: Fields defined with the value **0** overwrite the previous value when activated, whereas with undefined fields the previous value is kept.

- Before activating a preset, check whether all columns contain values.

- To optimize the file size and the processing speed, keep the preset table as short as possible.
- New rows can be inserted only at the end of the preset table.
- The machine manufacturer uses the optional **initial** machine parameter (no. 105603) to define a default value for each column of a new row.
- If the unit of measure of the preset table is not identical with the unit of measure defined in the machine parameter **unitOfMeasure** (no. 101101), the control displays a message in the diagnostics bar when in the **Tables** operating mode.
- The control may feature a pallet preset table, depending on the machine. When a pallet preset is active, the presets in the preset table are referenced to this pallet preset.

  Further information: "Pallet preset table", Page 1775

33.12 Point table

Application

In a point table, you save randomly distributed points on a workpiece. The control calls a cycle at each point. You can hide individual points and define a clearance height.

Related topics

- Calling point tables, effect with different cycles

  Further information: "Point tables", Page 346

Description of function

Parameters in point tables

The point table provides the following parameters:

Parameter	Meaning
NR	Row number in the point table Input: **0...99999**
X	X coordinate of a point Input: **-99999.9999...+99999.9999**
Y	Y coordinate of a point Input: **-99999.9999...+99999.9999**
Z	Z coordinate of a point Input: **-99999.9999...+99999.9999**
FADE	**Hide? (yes=ENT/no=NO ENT)** **Y**=**Yes:** The point is hidden during machining. Points that have been hidden will remain hidden until they are manually shown again. **N**=**No:** The point is shown for machining. All points of a point table are shown for machining by default. Input: **Y**, **N**
CLEARANCE	**Clearance height?** Safe position in the tool axis to which the control retracts the tool after machining a point. If you do not define a value in the **CLEARANCE** column, the control will use the value of the cycle parameter **Q204 2ND SET-UP CLEARANCE**. If you have defined values in both the **CLEARANCE** column and the **Q204** parameter, the control will use the higher of the two values. Input: **-99999.9999...+99999.9999**

33.12.1 Creating a point table

To create a point table:

- Select the **Tables** operating mode
- Select **Add**
- > The control opens the **Quick selection** and the **Open File** workspaces.
- Select **Create new table**
- > The control opens the **Create new table** window.
- Select the **pnt** folder
- Select the desired **prototype**
- > The control opens the **Save as** window.
- Select a folder
- Enter name
- Select **Create**
- Select **OK**
- > The control opens the point table.

> The names of tables and table columns must start with a letter and must not contain an arithmetic operator (e.g., **+**). Due to SQL commands, these characters can cause problems when data are input or read.
> **Further information:** "Table access with SQL statements", Page 1316

33.12.2 Hiding individual points during machining

In the **FADE** column of the point table, you can specify if the defined point will be hidden during the machining process.

To hide points:

- Select the desired point in the table
- Select the **FADE** column
- Activate **Edit**
- Enter **Y**
- > The control hides the point at the cycle call.

If you enter **Y** in the **FADE** column, you can use the **Skip /** switch to skip this point in **Program Run** operating mode.

Further information: "Icons and buttons", Page 1780

33.13 Datum table

Application

A datum table saves positions on the workpiece. To use a datum table, you must activate it. Within an NC program, the datums can be called, e. g. to execute machining processes on several workpieces at the same position. The active row of the preset table serves as the workpiece preset in the NC program.

- Editing a datum table during a program run
  Further information: "Compensation during program run", Page 1795
- Preset table
  Further information: "Preset table", Page 1851

Description of function

Parameters in datum tables

A datum table provides the following parameters:

Parameter	Meaning
D	Row number in the datum table Input: **0...99999999**
X	X coordinate of the datum Input: **-99999.99999...+99999.99999**
Y	Y coordinate of the datum Input: **-99999.99999...+99999.99999**
Z	Z coordinate of the datum Input: **-99999.99999...+99999.99999**
A	A coordinate of the datum Input: **-360.0000000...+360.0000000**
B	B coordinate of the datum Input: **-360.0000000...+360.0000000**
C	C coordinate of the datum Input: **-360.0000000...+360.0000000**
U	U coordinate of the datum Input: **-99999.99999...+99999.99999**
V	V coordinate of the datum Input: **-99999.99999...+99999.99999**
W	W coordinate of the datum Input: **-99999.99999...+99999.99999**
DOC	**Comment on shift?** Input: **Text width 15**

33.13.1 Creating a datum table

To create a datum table:

- Select the **Tables** operating mode
- Select **Add**
- > The control opens the **Quick selection** and the **Open File** workspaces.
- Select **Create new table**
- > The control opens the **Create new table** window.
- Select the **d** folder
- Select the desired **prototype**
- > The control opens the **Save as** window.
- Select a folder
- Enter a name
- Select **Create**
- Select **OK**
- > The control opens the datum table.

> The names of tables and table columns must start with a letter and must not contain an arithmetic operator (e.g., **+**). Due to SQL commands, these characters can cause problems when data are input or read.
> **Further information:** "Table access with SQL statements", Page 1316

33.13.2 Editing a datum table

You can edit the active datum table during program run.

Further information: "Compensation during program run", Page 1795

To edit a datum table:

- Activate **Edit**
- Select the value
- Edit the value
- Save the edited value, e.g. by selecting a different row

NOTICE

Danger of collision!

The control does not consider the changes made to a datum table or compensation table until the values have been saved. You need to activate the datum or compensation value in the NC program again; otherwise, the control will continue using the previous values.

- Make sure to confirm any changes made to the table immediately, e.g., by pressing the **ENT** key
- Activate the datum or compensation value in the NC program again
- Carefully test the NC program after changing the table values

33.14 Tables for cutting data calculation

Application

The following tables allow you to calculate the cutting data of a tool in the cutting data calculator:

- Table for workpiece materials **WMAT.tab**
  Further information: "Table for workpiece materials WMAT.tab", Page 1861
- Table for tool materials **TMAT.tab**
  Further information: "Table for tool materials TMAT.tab", Page 1861
- Cutting data table ***.cut**
  Further information: "Cutting data table *.cut", Page 1862
- Diameter-dependent cutting data table ***.cutd**
  Further information: "Diameter-dependent cutting data table *.cutd", Page 1863

Related topics

- Cutting data calculator
  Further information: "Cutting data calculator", Page 1397
- Tool management
  Further information: "Tool management ", Page 270

Description of function

Table for workpiece materials WMAT.tab

In the table for workpiece materials **WMAT.tab**, you define the workpiece material. You must save this table in the **TNC:\table** folder.

The table for workpiece materials **WMAT.tab** provides the following parameters:

Parameter	Meaning
WMAT	Workpiece material (e.g., aluminum) Input: **Text width 32**
MAT_CLASS	Material class Categorize the materials into material classes with the same cutting conditions, e.g., in accordance with DIN EN 10027-2. Input: **Text width 32**

Table for tool materials TMAT.tab

In the table for tool materials **TMAT.tab**, you define the tool material. You must save this table in the **TNC:\table** folder.

The table for tool materials **TMAT.tab** provides the following parameters:

Parameter	Meaning
TMAT	Tool material (e.g., solid carbide) Input: **Text width 32**
ALIAS1	Additional designation Input: **Text width 32**
ALIAS2	Additional designation Input: **Text width 32**

Cutting data table *.cut

In the cutting data table ***.cut**, you assign the matching cutting data to the workpiece materials and the tool materials. You must save the table in the **TNC:\system\Cutting-Data** folder.

The cutting data table ***.cut** provides the following parameters:

Parameter	Meaning
NR	Sequential number of the table rows Input: **0...999999999**
MAT_CLASS	Workpiece material from the table **WMAT.tab** **Further information:** "Table for workpiece materials WMAT.tab", Page 1861 Selection by means of a selection window Input: **0...9999999**
MODE	Machining mode (e.g., roughing or finishing) Input: **Text width 32**
TMAT	Tool material from the table **TMAT.tab** **Further information:** "Table for tool materials TMAT.tab", Page 1861 Selection by means of a selection window Input: **Text width 32**
VC	Cutting speed in m/min **Further information:** "Cutting data", Page 280 Input: **0...1000**
FTYPE	Type of feed: ■ **FU**: Feed per revolution **FU** in mm/rev ■ **FZ**: Feed per tooth **FZ** in mm/tooth **Further information:** "Feed rate F", Page 282 Input: **FU**, **FZ**
F	Feed rate value Input: **0.0000...9.9999**

Diameter-dependent cutting data table *.cutd

In the diameter-dependent cutting data table ***.cutd**, you assign the matching cutting data to the workpiece materials and the tool materials. You must save the table in the **TNC:\system\Cutting-Data** folder.

The diameter-dependent cutting data table ***.cutd** provides the following parameters:

Parameter	Meaning
NR	Sequential number of the table rows Input: **0...999999999**
MAT_CLASS	Workpiece material from the table **WMAT.tab** **Further information:** "Table for workpiece materials WMAT.tab", Page 1861 Selection by means of a selection window Input: **0...9999999**
MODE	Machining mode (e.g., roughing or finishing) Input: **Text width 32**
TMAT	Tool material from the table **TMAT.tab** **Further information:** "Table for tool materials TMAT.tab", Page 1861 Selection by means of a selection window Input: **Text width 32**
VC	Cutting speed in m/min **Further information:** "Cutting data", Page 280 Input: **0...1000**
FTYPE	Type of feed: ■ **FU**: Feed per revolution **FU** in mm/rev ■ **FZ**: Feed per tooth **FZ** in mm/tooth **Further information:** "Feed rate F", Page 282 Input: **FU**, **FZ**
F_D_0...**F_D_9999**	Feed rate value for the respective diameter You don't need to define all columns. If a tool diameter is between two defined columns, the control linearly interpolates the feed rate. Input: **0.0000...9.9999**

Note

In the corresponding folders, the control provides sample tables for automatic cutting data calculation. You can customize theses tables and specify your own data, i.e. materials and tools to be used.

33.15 Pallet table

Application

Pallet tables allow you to define the sequence in which the control will machine the pallets and the NC programs to be used.

Without a pallet changer, you can use pallet tables to successively run NC programs with different presets with just one press of **NC Start**. This type of usage is also called job list.

Tool-oriented machining is possible with pallet tables and with job lists. The control will reduce the number of tool changes, thereby reducing the machining time.

Related topics

- Editing and executing a pallet table in the **Job list** workspace
  Further information: "Job list workspace", Page 1764
- Tool-oriented machining
  Further information: "Tool-oriented machining", Page 1772

Requirement

- Software option 22: Pallet Management

Description of function

Pallet tables can be opened in **Tables**, **Editor**, and **Program Run** operating modes. In **Editor** and **Program Run** operating modes, the control opens the pallet table in the **Job list** workspace instead of as a table.

The machine manufacturer defines a prototype for the pallet table. When you create a new pallet table, the control will copy this prototype. This means that the pallet table on your control might not contain all possible parameters.

The prototype can include the following parameters:

Parameter	Meaning
NR	Row number in the pallet table The entry is required for the **Line number** input field of the **BLOCK SCAN** function. **Further information:** "Block scan for mid-program startup", Page 1786 Input: **0...99999999**
TYPE	**Pallet type?** Contents of the table row: ■ **PAL**: Pallet ■ **FIX**: Fixture ■ **PGM**: NC program Selection using a selection menu Input: **PAL**, **FIX**, **PGM**
NAME	**Pallet / NC program / Fixture?** File name of the pallet, fixture or NC program The machine manufacturer specifies the names of pallets and fixtures as needed. You can define the names of your NC programs yourself. Selection by means of a selection window Input: **Text width 32**

Parameter	Meaning
DATUM	**Datum table?** The datum table to be used in the NC program. Selection by means of a selection window Input: **Text width 32**
PRESET	**Preset?** Row number in the preset table for the workpiece preset to be activated. Selection by means of a selection window Input: **0...999**
LOCATION	**Location?** The entry **MA** indicates that there is a pallet or fixture in the working space of the machine and can be machined. Press the **ENT** key to enter **MA**. Press the **NO ENT** key to remove the entry and thus suppress machining. If the column exists, an entry is mandatory. Corresponds to the **Machinable** switch in the **Form** workspace. Selection using a selection menu Input: No value, **MA**
LOCK	**Locked?** By entering the character *****, you can exclude the row of the pallet table from machining. Press the **ENT** key to enter ***** for the row. Press the **NO ENT** key to cancel the lock. You can lock the execution for individual NC programs, fixtures or entire pallets. Unlocked rows (e.g., PGM) in a locked pallet are also not machined. Selection using a selection menu Input: No value, *****
W STATUS	**Machining status?** Relevant to tool-oriented machining The machining status defines the machining progress. Enter BLANK for an unmachined (raw) workpiece. The control changes this entry automatically during machining. The control differentiates between the following entries ■ BLANK / no entry: Workpiece blank, requires machining ■ INCOMPLETE: Partly machined, requires further machining ■ ENDED: Machined completely, no further machining required ■ EMPTY: Empty space, no machining required ■ SKIP: Skip machining **Further information:** "Tool-oriented machining", Page 1772 Input: No value, **BLANK**, **INCOMPLETE**, **ENDED**, **EMPTY**, **SKIP**
PALPRES	**Pallet preset** Row number in the pallet preset table for the pallet preset to be activated Only required if a pallet preset table has been created on the control. Selection by means of a selection window Input: **-1...+999**
DOC	Comment Input: **Text width 15**

Parameter	Meaning
METHOD	**Machining method?** Machining method The control differentiates between the following entries ▪ WPO: Workpiece oriented (standard) ▪ TO: Tool oriented (first workpiece) ▪ CTO: Tool oriented (further workpieces) **Further information:** "Tool-oriented machining", Page 1772 Selection using a selection menu Input: **WPO**, **TO**, **CTO**
CTID	**ID no. geometry context?** Relevant to tool-oriented machining The control automatically generates the ID number for mid-program startup with block scan. If you delete or change the entry, mid-program startup is no longer possible. **Further information:** "Tool-oriented machining", Page 1772 Input: **Text width 8**
SP-X	**Clearance height?** Clearance height in the X axis for tool-oriented machining **Further information:** "Tool-oriented machining", Page 1772 Input: **-999999.99999...+999999.99999**
SP-Y	**Clearance height?** Clearance height in the Y axis for tool-oriented machining **Further information:** "Tool-oriented machining", Page 1772 Input: **-999999.99999...+999999.99999**
SP-Z	**Clearance height?** Clearance height in the Z axis for tool-oriented machining **Further information:** "Tool-oriented machining", Page 1772 Input: **-999999.99999...+999999.99999**
SP-A	**Clearance height?** Clearance height in the A axis for tool-oriented machining **Further information:** "Tool-oriented machining", Page 1772 Input: **-999999.99999...+999999.99999**
SP-B	**Clearance height?** Clearance height in the B axis for tool-oriented machining **Further information:** "Tool-oriented machining", Page 1772 Input: **-999999.99999...+999999.99999**
SP-C	**Clearance height?** Clearance height in the C axis for tool-oriented machining **Further information:** "Tool-oriented machining", Page 1772 Input: **-999999.99999...+999999.99999**
SP-U	**Clearance height?** Clearance height in the U axis for tool-oriented machining **Further information:** "Tool-oriented machining", Page 1772 Input: **-999999.99999...+999999.99999**

Parameter	Meaning
SP-V	**Clearance height?** Clearance height in the V axis for tool-oriented machining **Further information:** "Tool-oriented machining", Page 1772 Input: **-999999.99999...+999999.99999**
SP-W	**Clearance height?** Clearance height in the W axis for tool-oriented machining **Further information:** "Tool-oriented machining", Page 1772 Input: **-999999.99999...+999999.99999**
COUNT	**Number of operations** For rows of the **PAL** type: Current actual value for the pallet counter nominal value defined in the **TARGET** column. For rows of the **PGM** type: Value indicating by how much the pallet counter actual value will be incremented after the execution of the NC program. **Further information:** "Pallet counter", Page 1764 Input: **0...99999**
TARGET	**Total number of operations** Nominal value for the pallet counter in rows of the **PAL** type The control repeats the NC programs of this pallet until the nominal value has been reached. **Further information:** "Pallet counter", Page 1764 Input: **0...99999**

33.15.1 Creating and opening a pallet table

To create a pallet table:

- Select the **Tables** operating mode
- Select **Add**
- The control opens the **Quick selection** and the **Open File** workspaces.
- Select **Create new table**
- The control opens the **Create new table** window.
- Select the **p** folder
- Select table format
- Select a path: Select **Select a path**
- The control opens the **Save as** window.
- Select a folder
- Enter a name
- Create: Select **Create**
- The control opens the table in **Tables** operating mode.

- The file name of a pallet table must always begin with a letter.
- Use the **Select in Program Run** button in **Files** operating mode to open the pallet table in **Program Run** operating mode. In this operating mode, you can edit and execute pallet tables.

  Further information: "Job list workspace", Page 1764

33.16 Compensation tables

33.16.1 Overview

The control provides the following compensation tables:

Table	Further information
Compensation table ***.tco** Compensation in the tool coordinate system **T-CS**	Page 1868
Compensation table ***.wco** Compensation in the working plane coordinate system **WPL-CS**	Page 1870

33.16.2 Compensation table *.tco

Application

The compensation table ***.tco** allows you to define compensation values for the tool in the tool coordinate system **T-CS**.

You can use the compensation table ***.tco** for tools of all types of technologies.

Related topics

- Using compensation tables
  Further information: "Tool compensation with compensation tables", Page 1044
- Contents of the compensation table ***.wco**
  Further information: "Compensation table *.wco", Page 1870
- Editing compensation tables during program run
  Further information: "Compensation during program run", Page 1795
- Tool coordinate system **T-CS**
  Further information: "Tool coordinate system T-CS", Page 946

Description of function

Any compensation in the compensation tables with the ***.tco** file name extension applies to the active tool. The table applies to all tool types. Therefore, columns that you may not need for your specific tool type will be displayed during creation.

Enter only those values that are relevant to your tool. If you compensate for values that are not present with the existing tool, the control issues an error message.

The compensation table ***.tco** provides the following parameters:

Parameter	Meaning
NO	Row number in the table Input: **0...999999999**
DOC	Comment Input: **Text width 16**
DL	**Tool length oversize?** Delta value for parameter **L** of the tool table Input: **-999.9999...+999.9999**
DR	**Tool radius oversize?** Delta value for parameter **R** of the tool table Input: **-999.9999...+999.9999**
DR2	**Tool radius oversize 2?** Delta value for parameter **R2** of the tool table Input: **-999.9999...+999.9999**
DXL	**Oversize in tool length 2?** Delta value for parameter **DXL** of the turning tool table Input: **-999.9999...+999.9999**
DYL	**Tool length oversize 3?** Delta value for parameter **DYL** of the turning tool table Input: **-999.9999...+999.9999**
DZL	**Oversize in tool length 1?** Delta value for parameter **DZL** of the turning tool table Input: **-999.9999...+999.9999**
DL-OVR	**Compensation of the overhang** Delta value for parameter **L-OVR** of the grinding tool table Input: **-999.9999...+999.9999**
DR-OVR	**Compensation of the radius** Delta value for parameter **R-OVR** of the grinding tool table Input: **-999.9999...+999.9999**
DLO	**Compensation of the total length** Delta value for parameter **LO** of the grinding tool table Input: **-999.9999...+999.9999**
DLI	**Compensation of the length to the inner edge** Delta value for parameter **LI** of the grinding tool table Input: **-999.9999...+999.9999**

33.16.3 Compensation table *.wco

Application

The values from the compensation tables with the ***.wco** file name extension are applied as shifts in the working plane coordinate system (**WPL-CS**).

The ***.wco** compensation tables are used mainly for turning (option 50).

Related topics

- Using compensation tables
  Further information: "Tool compensation with compensation tables", Page 1044
- Contents of the compensation table ***.tco**
  Further information: "Compensation table *.tco", Page 1868
- Editing compensation tables during program run
  Further information: "Compensation during program run", Page 1795
- Working plane coordinate system **WPL-CS**
  Further information: "Working plane coordinate system WPL-CS", Page 942

Description of function

The compensation table ***.wco** provides the following parameters:

Parameter	Meaning
NO	Row number in the table Input: **0...999999999**
DOC	Comment Input: **Text width 16**
X	Shift of the working plane coordinate system **WPL-CS** in **X** Input: **-999.9999...+999.9999**
Y	Shift of **WPL-CS** in **Y** Input: **-999.9999...+999.9999**
Z	Shift of **WPL-CS** in **Z** Input: **-999.9999...+999.9999**

33.16.4 Creating a compensation table

To create a compensation table:

- ▶ Select the **Tables** operating mode
- ▶ Select **Add**
- \> The control opens the **Quick selection** and the **Open File** workspaces.
- ▶ Select **Create new table**
- \> The control opens the **Create new table** window.
- ▶ Select the folder **tco** or **wco**

Select a path

- ▶ Select **Select a path**
- \> The control opens the **Save as** window.
- ▶ Select a folder
- ▶ Enter a name

Create

- ▶ Select **Create**
- \> The control opens the table.

33.17 *.3DTC compensation table

Application

In a ***.3DTC** compensation table, the control saves the radius deviation of ball-nose cutters from the nominal value at a defined inclination angle. For workpiece touch probes, the control saves the deflection behavior of the touch probe at a defined probing angle.

The control takes into account the saved data during the execution of NC programs and during probing.

Related topics

- 3D radius compensation depending on the tool's contact angle
  Further information: "3D radius compensation depending on the tool contact angle (option 92)", Page 1062
- 3D calibration of the touch probe
  Further information: "Calibrating the workpiece touch probe", Page 1439

Requirements

- Advanced Functions Set 2 (software option 9)
- 3D-ToolComp (software option 92)

Description of function

The ***.3DTC** compensation tables must be saved in the **TNC:\system\3D-ToolComp** folder. In the **DR2TABLE** tool management column, you can then assign the tables to a tool.

You create a separate table for each tool.

A compensation table provides the following parameters:

Parameter	Meaning
NR	Sequential row number in the compensation table The control evaluates a maximum of 100 rows in the compensation value table. Input: **0...9999999**
ANGLE	Inclination angle of tools or probing angle of workpiece touch probes Input: **-99999.999999...+99999.999999**
DR2	Radius deviation from the nominal value or deflection of the touch probe Input: **-99999.999999...+99999.999999**

33.18 Tables for AFC (option 45)

33.18.1 Basic AFC settings in AFC.tab

Application

In the **AFC.TAB** table, you can enter the feed rate control settings to be used by the control. This table must be saved in the **TNC:\table** directory.

Related topics

- Programming AFC
  Further information: "Adaptive Feed Control (AFC, option 45)", Page 1114

Requirement

- Adaptive Feed Control (AFC, software option 45)

Description of function

The data in this table are default values that are copied into a file belonging to the respective NC program during a teach-in cut. The values act as the basis for feedback control.

Further information: "Description of function", Page 1876

> If you define a tool-specific feedback-control reference power using the **AFC-LOAD** column in the tool table, the control generates the associated file for the relevant NC program without a teach-in cut. The file is created shortly before feedback control becomes effective.

Parameter

The **AFC.tab** table provides the following parameters:

Parameter	Meaning
NR	Row number in the table Input: **0...9999**
AFC	Name of the control setting Enter this name in the **AFC** tool management column. It specifies the assignment of the control parameters to the tool. Input: Text width 10
FMIN	Feed rate at which the control will perform an overload reaction Enter the value in percent of the programmed feed rate Not necessary in turning mode (option 50) If the **AFC.TAB** columns **FMIN** and **FMAX** each have a value of 100%, Adaptive Feed Control is deactivated, but cut-related tool wear monitoring and tool load monitoring remain active. **Further information:** "Monitoring tool wear and tool load", Page 1120 Input: **0...999**
FMAX	Maximum feed rate within the material up to which the control can automatically increase the feed rate Enter the value in percent of the programmed feed rate Not necessary in turning mode (option 50) If the **AFC.TAB** columns **FMIN** and **FMAX** each have a value of 100%, Adaptive Feed Control is deactivated, but cut-related tool wear monitoring and tool load monitoring remain active. **Further information:** "Monitoring tool wear and tool load", Page 1120 Input: **0...999**
FIDL	Feed rate at which the control will traverse the tool outside of the material Enter the value in percent of the programmed feed rate Not necessary in turning mode (option 50) Input: **0...999**
FENT	Feed rate at which the control will move the tool into and out of the material Enter the value in percent of the programmed feed rate Not necessary in turning mode (option 50) Input: **0...999**

<table>
<tr><th>Parameter</th><th>Meaning</th></tr>
<tr><td>OVLD</td><td>Desired reaction of the control to overload:
M: Execution of a macro defined by the machine manufacturer
S: Immediate NC stop
F: NC stop once the tool has been retracted
E: Just display an error message on the screen
L: Disable active tool
-: No overload reaction
If the maximum spindle power is exceeded for more than one second and the feed rate falls below the defined minimum during that time, the control will conduct an overload reaction.
In conjunction with the cut-related tool wear monitoring function, the control will only evaluate the options M, E, and L!
Input: M, S, F, E, L, or -</td></tr>
<tr><td>POUT</td><td>Spindle power at which the control will detect that the tool exits the workpiece
Enter the value in percent of the learned reference load
Recommended input value: 8%
In turning mode: Minimum load Pmin for tool monitoring (option 50)
Input: 0...100</td></tr>
<tr><td>SENS</td><td>Sensitivity (aggressiveness) of feedback control
50 is for slow feedback control, 200 for a very aggressive feedback control. An aggressive feedback control responds quickly and significantly changes the values, but it tends to overshoot.
In turning mode: Activate the monitoring of the minimum load Pmin (option 50):
1: Evaluate Pmin
0: Do not evaluate Pmin
Input: 0...999</td></tr>
<tr><td>PLC</td><td>Value that the control will transfer to the PLC at the beginning of a machining step
The machine manufacturer defines whether and which function will be performed by the control.
Input: 0...999</td></tr>
</table>

Creating an AFC.tab table

You need to create the table only if the table is missing in the **tables** folder.

To create the **AFC.tab** table:

- ▶ Select the **Tables** operating mode
- ▶ Select **Add**
- > The control opens the **Quick selection** and the **Open File** workspaces.
- ▶ Select **Create new table**
- > The control opens the **Create new table** window.
- ▶ Select the **tab** folder
- ▶ Select the **AFC.TAB** format
- ▶ Select **Select a path**
- > The control opens the **Save as** window.
- ▶ Select a folder
- ▶ Enter a name
- ▶ Select **Create**
- > The control opens the table.

Notes

- If there is no AFC.TAB table in the **TNC:\table** directory, the control uses a permanently defined, internal control setting for the teach-in cut. If, alternatively, a tool-dependent reference power value exists, the control uses it immediately. HEIDENHAIN recommends using the AFC.TAB table in order to ensure safe and well-defined operation.
- The names of tables and table columns must start with a letter and must not contain an arithmetic operator (e.g., **+**). Due to SQL commands, these characters can cause problems when data are input or read.

  Further information: "Table access with SQL statements", Page 1316

33.18.2 AFC.DEP settings file for teach-in cuts

Application

With a teach-in cut, the control at first copies the basic settings for each machining step, as defined in the AFC.TAB table, to a file called **<name>.H.AFC.DEP**. **<name>** is the name of the NC program for which you have recorded the teach-in cut. In addition, the control measures the maximum spindle power consumed during the teach-in cut and saves this value to the table.

Related topics

- AFC basic settings in the table **AFC.tab**

  Further information: "Basic AFC settings in AFC.tab", Page 1872
- Setting up and using AFC

  "Adaptive Feed Control (AFC, option 45)"

Requirement

- Adaptive Feed Control (AFC, software option 45)

Description of function

Each row in the **<name>.H.AFC.DEP** file stands for a machining section, that you start with **FUNCTION AFC CUT BEGIN** and complete with **FUNCTION AFC CUT END**. You can edit all data of the **<name>.H.AFC.DEP** file for optimization purposes. If you have optimized the values from the AFC.TAB table, the control places a ***** in front of these control settings in the AFC column.

Further information: "Basic AFC settings in AFC.tab", Page 1872

In addition to the contents from the **AFC.tab** table, the **AFC.DEP** file provides the following information:

Column	Function
NR	Number of the machining step
TOOL	Number or name of the tool with which the machining step was performed (not editable)
IDX	Index of the tool with which the machining step was performed (not editable)
N	Difference for tool call: ■ **0**: Tool was called by its tool number ■ **1**: Tool was called by its tool name
PREF	Reference load of the spindle. The control measures the value in percent with respect to the rated spindle power
ST	Status of the machining step: ■ **L**: In the next program run, a teach-in cut will be recorded for this machining step. The control will overwrite any existing values in this line ■ **C**: The teach-in cut was completed successfully. The next program run can be conducted with automatic feed control
AFC	Name of the control setting

Notes

- Note that the **<name>.H.AFC.DEP** file is locked against editing as long as the NC program **<name>.H** is running.

  The control does not remove the editing lock until one of the following functions has been executed:
  - **M2**
  - **M30**
  - **END PGM**
- In the machine parameter **dependentFiles** (no. 122101), the machine manufacturer defines whether the control will display the dependent files in the file manager.

33.18.3 Log file AFC2.DEP

Application

The control stores various pieces of information for each machining step of a teach-in cut in the **<name>.H.AFC2.DEP** file. **<name>** is the name of the NC program for which you have recorded the teach-in cut. During feedback control, the control updates the data and performs various evaluations.

Related topics

- Setting up and using AFC
  Further information: "Adaptive Feed Control (AFC, option 45)", Page 1114

Requirement

- Adaptive Feed Control (AFC, software option 45)

Description of function

The **AFC2.DEP** file provides the following information:

Column	Function
NR	Number of the machining step
TOOL	Number or name of the tool with which the machining step was performed
IDX	Index of the tool with which the machining step was performed
SNOM	Nominal spindle speed [rpm]
SDIFF	Maximum difference of the spindle speed in % of the nominal speed
CTIME	Machining time (tool in effect)
FAVG	Average feed rate (tool in effect)
FMIN	Smallest occurring feed factor. The control shows the value as a percentage of the programmed feed rate
PMAX	Maximum recorded spindle power during machining. The control shows the value as a percentage of the spindle's rated power.
PREF	Reference load of the spindle. The control shows the value as a percentage of the spindle's rated power.
OVLD	Overload reaction performed by the control: ■ **M**: A macro defined by the machine tool builder has been run ■ **S:** Immediate NC stop was conducted ■ **F**: NC stop was conducted after the tool was retracted ■ **E**: An error message was displayed ■ **L**: The current tool was locked ■ **-**: There was no overload reaction
BLOCK	Block number at which the machining step begins

During feedback control, the control determines the current machining time as well as the resulting time saving in percent. The control enters the results of the evaluation between the key words **total** and **saved** in the last line of the log file. Where the time balance is positive, the percentage value is also positive.

Note

- In the machine parameter **dependentFiles** (no. 122101), the machine manufacturer defines whether the control will display the dependent files in the file manager.

33.18.4 Editing tables for AFC

You can open and, if necessary, edit the tables for AFC during program run. The control offers only the tables for the active NC program.

To open a table for AFC:

- Select the **Program Run** operating mode

AFC settings

- Select **AFC settings**
- > The control displays a selection menu. The control shows all existing tables for this NC program.
- Select a file, e.g. **AFC.TAB**
- > The control opens the file in the **Tables** operating mode.

33.19 Technology table for Cycle 287 Gear Skiving

Application

In Cycle **287 GEAR SKIVING**, you can use the cycle parameter **QS240 NUMBER OF CUTS** to call a table containing technology data. The table is a freely definable table, and as such is in ***.tab** format. The control provides you with a template. In the table, you define the following data for each individual cut:

- Feed rate
- Lateral infeed
- Lateral offset

Requirements

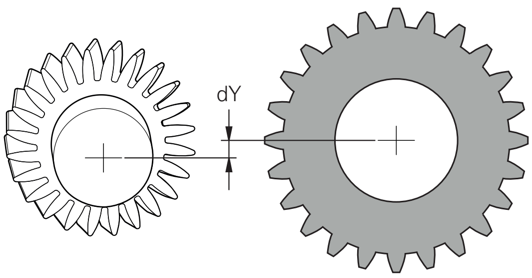
- Software option 157: Gear Cutting

33.19.1 Parameters in the technology table

Parameter in the table

The technology data table contains the following parameters:

Parameter	Function
NR	Number of the cut that also corresponds to the number of the table row
FEED	Feed rate in mm/rev or 1/10 inch/rev for the cut This parameter replaces the following cycle parameters: ■ **Q588 FIRST FEED RATE** ■ **Q589 LAST FEED RATE** ■ **Q580 FEED-RATE ADAPTION** Input: **0...9999.999**
INFEED	Lateral infeed of the cut. This entry is incremental. This parameter replaces the following cycle parameters: ■ **Q586 FIRST INFEED** ■ **Q587 LAST INFEED** Input: **0...99.99999**
dY	Lateral offset of the cut (to improve the removal of chips). Input: **-9.99999...+9.99999**



Notes

- The unit used in the NC program determines whether millimeter or inch units are used.
- In order to avoid contour distortions, HEIDENHAIN recommends that you do not program an offset **dY** in the last cut.
- HEIDENHAIN recommends that you program only minimum offset values **dY** in the individual cuts, because this might result in contour damage.
- The sum of the lateral infeeds (**INFEED**) must result in the tooth height.
  - If the tooth height is greater than the total infeed, the control will display a warning.
  - If the tooth height is less than the total infeed, the control will display an error message.

Example:

- **TOOTH HEIGHT** (**Q563**) = 2 mm
- Number of cuts (**NR**) = 15
- Lateral infeed (**INFEED**) = 0.2 mm
- Total infeed = **NR** * **INFEED** = 3 mm

  In this case, the tooth height is less than the total infeed (2 mm < 3 mm). Reduce the number of cuts to 10.

33.19.2 Creating a technology table

To create a table containing technology data:

- ▶ Select the **Tables** operating mode
- ▶ Select **Add**
- > The control opens the **Quick selection** and the **Open File** workspaces.
- ▶ Select **Create new table**
- > The control opens the **Create new table** window.
- ▶ Select the **tab** folder
- ▶ Select the **Proto_Skiving.TAB** format
- ▶ Select **Select a path**
- > The control opens the **Save as** window.
- ▶ Select a folder
- ▶ Enter name
- ▶ Select **Create**
- > The control opens the technology table.

34

Electronic Handwheel

34.1 Fundamentals

Application

If you want to approach a position in the machine's working space while the guard door is open or if you execute a small infeed movement, you can use the electronic handwheel. The electronic handwheel allows you to traverse the axes and perform various functions provided by the control.

Related topics

- Incremental jog positioning

  Further information: "Incremental jog positioning of axes", Page 183
- Handwheel superimpositioning with GPS (option 44)

  Further information: "Function Handwheel superimp.", Page 1141
- Handwheel superimpositioning with **M118**

  Further information: "Activating handwheel superimpositioning with M118", Page 1239
- Virtual tool axis **VT**

  Further information: "Virtual tool axis VT", Page 1142
- Touch probe functions in **Manual** operating mode

  Further information: "Touch Probe Functions in the Manual Operating Mode", Page 1425

Requirement

- Electronic handwheel (e.g., HR 550FS)

  The control supports the following electronic handwheels:
  - HR 410: Cable-bound handwheel without display
  - HR 420: Cable-bound handwheel with display
  - HR 510: Cable-bound handwheel without display
  - HR 520: Cable-bound handwheel with display
  - HR 550FS: Wireless handwheel with display, data transmission via radio

Description of function

You can use electronic handwheels in **Manual** or **Program Run** operating mode.

The HR 520 and HR 550FS portable handwheels feature a display that allows the control to show different types of information. You can use the handwheel soft keys for setup functions, such as the setting of presets or the activation of miscellaneous functions.

Once you have activated the handwheel with the handwheel activation key or the **Handwheel** switch, you can operate the control only by using the handwheel. If you press the axis keys in this state, the control will display the message **Handwheel active: Handwheel-1, MB0**.

If more than one handwheel is connected to a control, you can activate or deactivate a handwheel only by pressing the handwheel activation key on the respective handwheel. You need to deactivate the active handwheel in order to be able to select another handwheel.

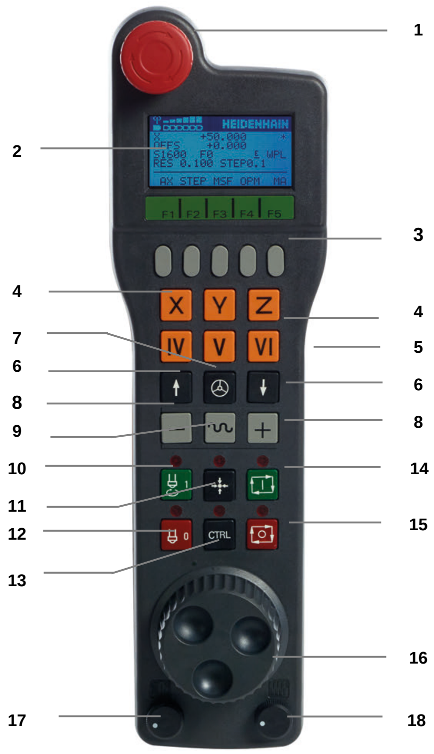
Functions in Program Run operating mode

You can perform the following functions in **Program Run** operating mode:

- The **NC Start** key (**NC Start** handwheel key)
- The **NC Stop** key (**NC Stop** handwheel key)
- After the **NC Stop** key has been pressed: Internal stop (handwheel soft keys **MOP** and then **Stop**)
- After the **NC STOP** key has been pressed: Traverse manual axes (handwheel soft keys **MOP** and then **MAN**)
- Return to the contour after axes were manually traversed during an interruption of the program run (handwheel soft keys **MOP** and then **REPO**). The handwheel soft keys are used for operating.

  Further information: "Returning to the contour", Page 1793
- Switch on/off the "Tilt working plane" function (handwheel soft keys **MOP** and then **3-D**)

Operating elements of an electronic handwheel



An electronic handwheel provides the following operating elements:

1 **EMERGENCY STOP** key
2 Handwheel display for status and for selecting functions
3 Handwheel soft keys
4 Axis keys; can be exchanged by the machine manufacturer depending on the axis configuration
5 Permissive button

The permissive button is on the rear side of the handwheel.

6 Arrow keys for defining the handwheel resolution
7 Handwheel activation key

8 Axis-direction key

Key for the direction of the traverse motion

9 Rapid traverse override for the traverse motion

10 Spindle switch-on (machine-dependent function, key can be exchanged by the machine manufacturer)

11 **Generate NC block** key (machine-dependent function, key can be exchanged by the machine manufacturer)

12 Spindle switch-off (machine-dependent function, key can be exchanged by the machine manufacturer)

13 **CTRL** key for special functions (machine-dependent function, key can be exchanged by the machine manufacturer)

14 **NC START** key (machine-dependent function, key can be exchanged by the machine manufacturer)

15 **NC Stop** key

Machine-dependent function; key can be exchanged by the machine manufacturer

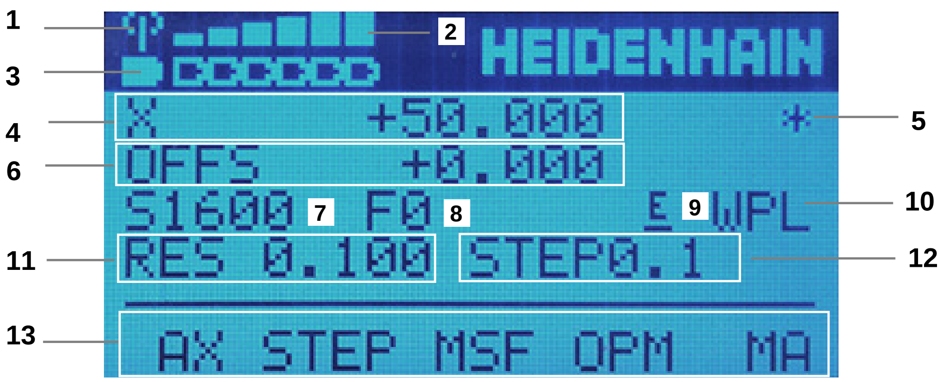
16 Handwheel

17 Spindle speed potentiometer

18 Feed rate potentiometer

19 Cable connection; not required for the HR 550 FS wireless handwheel

Contents of an electronic handwheel display



The display of an electronic handwheel consists of the following areas:

1 Handwheel is in the docking station or radio mode is active

Only with HR 550 FS wireless handwheel

2 Field strength

Six bars = maximum field strength

Only with HR 550 FS wireless handwheel

3 Charging condition of battery

Six bars = maximum charging condition. A bar moves from the left to the right during recharging.

Only with HR 550 FS wireless handwheel

4 **X+50.000**: Position of the selected axis

5 *****: STIB (control in operation); program run has been started or axis is in motion

6 Handwheel superimpositioning from **M118** or the Global Program Settings GPS (option 44)

  Further information: "Activating handwheel superimpositioning with M118", Page 1239

  Further information: "Function Handwheel superimp.", Page 1141

7 **S1000**: Current spindle speed

8 Feed rate at which the selected axis is moving

9 **E**: Error message

  If an error message appears on the control, the handwheel display shows the message **ERROR** for three seconds. Then the letter **E** is shown in the display as long as the error is pending on the control.

10 Active setting in the **3-D rotation** window:

  - **VT**: **Tool axis** function
  - **WP**: **Basic rotation** function
  - **WPL**: **3D ROT** function

  Further information: "3-D rotation window (option 8)", Page 1022

11 Handwheel resolution

  Distance that the selected axis moves per handwheel revolution

  Further information: "Handwheel resolution", Page 1886

12 Incremental jog active or inactive

  If the function is active, the control will display the active traverse step.

13 Soft-key row

  The soft key row provides the following functions:

  - **AX**: Select the machine axis

    Further information: "Creating a positioning block", Page 1888
  - **STEP**: Incremental jog positioning

    Further information: "Incremental jog positioning", Page 1888
  - **MSF**: Execute various functions of **Manual** operating mode (e.g., entering the feed rate **F**)

    Further information: "Entering miscellaneous functions M", Page 1887
  - **OPM**: Select the operating mode
    - **MAN**: **Manual** operating mode
    - **MDI**: **MDI** application in **Manual** operating mode
    - **RUN**: **Program Run** operating mode
    - **SGL**: **Single Block** mode of **Program Run** operating mode
  - **MA**: Switching the magazine pockets

Handwheel resolution

The handwheel sensitivity determines which path an axis takes per revolution of the handwheel. The handwheel sensitivity results from the defined handwheel speed of the axis and the speed level used internally by the control. The speed level describes a percentage of the handwheel speed. The control calculates a specific handwheel sensitivity value for each speed level. The resulting handwheel sensitivity values are directly selectable with the handwheel arrow keys (only if incremental jog is not active).

The handwheel speed indicates the increment (e.g., 0.01 mm) traversed per handwheel detent position. You can change the handwheel speed with the handwheel's arrow keys.

If you have defined a handwheel speed of 1, the following handwheel resolutions are available:

Resulting handwheel sensitivity levels in mm/revolution and degrees/revolution:
0.0001/0.0002/0.0005/0.001/0.002/0.005/0.01/0.02/0.05/0.1/0.2/0.5/1

Resulting handwheel sensitivity levels in in/revolution:
0.000127/0.000254/0.000508/0.00127/0.00254/0.00508/0.0127/0.0254/0.0508/0.127/0.254/0.508

Examples for resulting handwheel sensitivity values:

Defined handwheel speed	Speed level	Resulting handwheel sensitivity
10	0.01 %	0.001 mm/revolution
10	0.01 %	0.001 degrees/revolution
10	0.0127 %	0.00005 in/revolution

Effect of the feed-rate potentiometer when handwheel is active

NOTICE

Caution: Possible damage to the workpiece!

When toggling between the machine operating panel and the handwheel, the feed rate may be reduced. This can cause visible marks on the workpiece.

- Make sure to retract the tool before toggling between the handwheel and the machine operating panel.

The settings of the feed-rate potentiometer on the handwheel may differ from those on the machine operating panel. When you activate the handwheel, the control will automatically activate the feed-rate potentiometer of the handwheel. When you deactivate the handwheel, the control will automatically activate the feed-rate potentiometer of the machine operating panel.

In order to make sure that the feed rate does not increase while you switch over between the potentiometers, the feed rate is either frozen or reduced.

If the feed rate before switching over is higher than the feed rate after switching over, the control automatically reduces the feed rate to the smaller value.

If the feed rate before switching over is less than the feed rate after switching over, the control automatically freezes the feed rate. In this case, you must turn the feed-rate potentiometer back to the previous value because the activated feed-rate potentiometer will only then be effective.

34.1.1 Entering spindle speed S

To enter the spindle speed **S** by using an electronic handwheel:

- Press the **F3** (**MSF**) handwheel soft key
- Press the **F2** (**S**) handwheel soft key
- Select the desired speed by pressing the **F1** or **F2** key
- Press the **NC Start** key
- > The control activates the entered spindle speed.

> If you press and hold the **F1** or **F2** key, each time it reaches a decimal value 0 the control increases the counting increment by a factor of 10.
>
> By also pressing the **CTRL** key, you can increase the counting increment by a factor of 100 when pressing **F1** or **F2**.

34.1.2 Entering the feed rate F

To enter the feed rate **F** by using an electronic handwheel:

- Press the **F3** (**MSF**) handwheel soft key
- Press the **F3** (**F**) handwheel soft key
- Select the desired feed rate by pressing the **F1** or **F2** key
- Confirm the new feed rate F with the **F3** (**OK**) handwheel soft key

> If you press and hold the **F1** or **F2** key, the control will increase the counting increment by a factor of 10 each time it reaches a decimal value of 0.
>
> By additionally pressing the **CTRL** key, you can increase the counting increment by a factor of 100 when pressing **F1** or **F2**.

34.1.3 Entering miscellaneous functions M

To enter a miscellaneous function by using an electronic handwheel:

- Press the **F3** (**MSF**) handwheel soft key
- Press the **F1** (**M**) handwheel soft key
- Select the desired M function number by pressing the **F1** or **F2** key
- Press the **NC Start** key
- > The control activates the miscellaneous function

Further information: "Overview of miscellaneous functions", Page 1225

34.1.4 Creating a positioning block

Refer to your machine manual.

Your machine tool builder can assign any function to the **Generate NC block** handwheel key.

To create a positioning block by using an electronic handwheel:

- Select the **Manual** operating mode
- Select the **MDI** application
- If necessary, select the NC block after which the positioning block should be inserted
- Activate the handwheel
- Press the **Generate NC block** key on the handwheel
- > The control inserts a straight line **L**, including all of the axis positions.

34.1.5 Incremental jog positioning

Incremental jog positioning allows you to move the selected axis by a preset value.

To incrementally position an axis by using an electronic handwheel:

- Press the handwheel soft key F2 (**STEP**)
- Press the handwheel soft key 3 (**ON**)
- > The control activates incremental jog positioning.
- Set the desired jog increment by using the **F1** or **F2** keys

The smallest possible increment is 0.0001 mm (0.00001 inches). The largest possible increment is 10 mm (0.3937 inches)..

- Confirm the selected jog increment by pressing the handwheel soft key F4 (**OK**)
- Use the **+** or **-** handwheel key to move the active handwheel axis in the corresponding direction
- > The control moves the active axis by the entered increment every time the handwheel key is pressed.

If you press and hold the **F1** or **F2** key, each time it reaches a decimal value 0 the control increases the counting increment by a factor of 10.

By also pressing the **CTRL** key, you can increase the counting increment by a factor of 100 when pressing **F1** or **F2**.

Notes

⚠ DANGER
Caution: hazard to the user!
Unsecured connections, defective cables, and improper use are always sources of electrical dangers. The hazard starts when the machine is powered up!
▶ Devices should be connected or removed only by authorized service technicians
▶ Only switch on the machine via a connected handwheel or a secured connection

NOTICE
Caution: Danger to the tool and workpiece!
The wireless handwheel triggers an emergency stop reaction if the radio transmission is interrupted, the battery is fully empty, or if there is a defect. Emergency stop reactions during machining can cause damage to the tool or workpiece.
▶ Place the handwheel in the handwheel holder when it is not in use
▶ Keep the distance between the handwheel and the handwheel holder small (pay attention to the vibration alarm)
▶ Test the handwheel before machining

- The machine manufacturer can provide additional functions for the HR5xx handwheels.

  Refer to your machine manual.
- You can use the axis keys to activate the **X**, **Y**, and **Z** axes, as well as three other axes that can be defined by the machine manufacturer. Your machine manufacturer can also place the virtual axis **VT** on one of the free axis keys.

34.2 HR 550FS wireless handwheel

Application

With the HR 550FS wireless handwheel and its radio transmission characteristics, you can move farther away from the machine operating panel than with other handwheels. The HR 550FS wireless handwheel thus provides an important benefit, in particular for large machines.

Description of function

The HR 550FS wireless handwheel comes fitted with a rechargeable battery. The battery starts charging when you place the handwheel into the holder.

The HRA 551FS handwheel holder and the HR 550FS handwheel together form one function unit.

HR 550FS handwheel

HRA 551FS handwheel holder

The HR 550FS handwheel can be operated by battery for up to eight hours before it needs recharging. A completely discharged handwheel takes approx. three hours for a full charge. When you do not use the HR 550FS, always place it into the handwheel holder. This charges the handwheel battery constantly and a direct connection with the emergency-stop circuit is provided.

When the handwheel is in its holder, it provides the same functionality as during radio mode. This allows you to use a completely discharged handwheel.

> Clean the contacts of the handwheel holder and handwheel regularly to ensure their proper functioning.
>
> If the control has triggered an emergency stop, you must reactivate the handwheel.
>
> **Further information:** "Reactivating the handwheel", Page 1894

If you happen to get close to the limit of the transmission range, the HR 550FS will set off a vibrating alarm. If this occurs, you must reduce the distance to the handwheel holder.

Note

⚠ DANGER

Caution: hazard to the user!

Wireless handwheels, due to their rechargeable batteries and the influence of other wireless devices, are more susceptible to interference than cable-bound connections are. Ignoring the requirements for and information about safe operation leads to endangerment of the user, for example during installation or maintenance work.

- Check the radio connection of the handwheel for possible overlapping with other wireless devices
- Switch off the wireless handwheel and the handwheel holder after an operating time of 120 hours at the latest so that the control can run a functional test when it is restarted
- If more than one wireless handwheel is being used in a workshop, then ensure an unambiguous assignment between the handwheels and the handwheel holders (such as with color-coded stickers)
- If more than one wireless handwheel is being used in a workshop, then ensure an unambiguous assignment between the handwheels and the respective machine (such as with a functional test)

34.3 Configuration of wireless handwheel window

Application

The **Configuration of wireless handwheel** window shows the connection data of the HR 550FS wireless handwheel and provides various functions for optimizing the radio connection, such as setting the radio channel.

Related topics

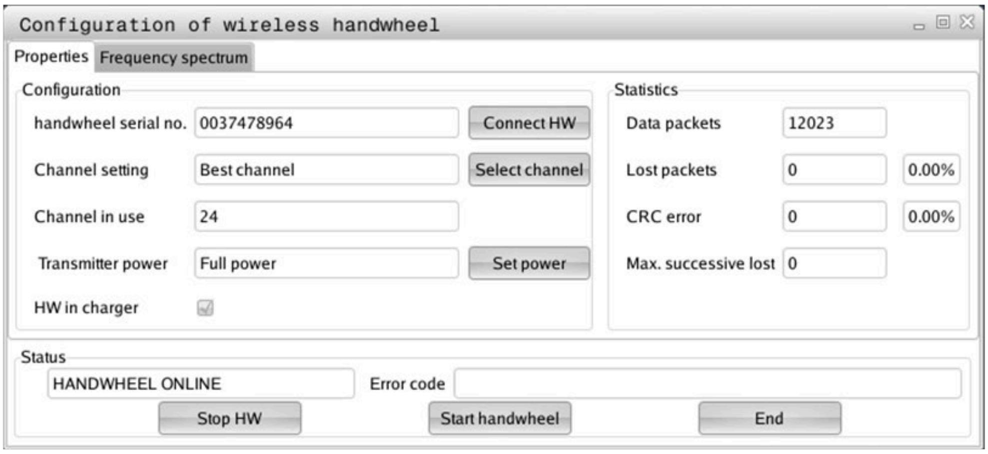
- Electronic handwheel

  Further information: "Electronic Handwheel", Page 1881
- HR 550FS wireless handwheel

  Further information: "HR 550FS wireless handwheel", Page 1889

Description of function

Use the **Set up wireless handwheel** menu item to open the **Configuration of wireless handwheel** window. The menu item is in the **Machine settings** group of the **Settings** application.



Areas of the Configuration of wireless handwheel window

Configuration area

In the **Configuration** area, the control displays different types of information about the connected wireless handwheel, such as the serial number.

Statistics area

In the **Statistics** area, the control displays information about the transmission quality.

If the reception quality is poor so that a proper and safe stop of the axes cannot be ensured anymore, an emergency-stop reaction of the wireless handwheel is triggered.

A high value under **Max. successive lost** is an indication of a limited quality of reception. If the control repeatedly displays values greater than 2 during normal operation of the wireless handwheel within the desired range of use, there is a high risk of undesired disconnection.

If this occurs, try to improve the transmission quality by selecting a different channel or by increasing the transmitter power.

Further information: "Setting the radio channel", Page 1894

Further information: "Selecting the transmission power", Page 1893

Status area

In the **Status** area, the control displays the current status of the handwheel, such as **HANDWHEEL ONLINE** and pending error messages concerning the connected handwheel.

34.3.1 Assigning a handwheel to a handwheel holder

In order to assign a handwheel to a handwheel holder, the handwheel holder must be connected to the control hardware.

To assign a handwheel to a handwheel holder:

- Place the handwheel into the handwheel holder
- Select the **Home** operating mode
- Select the **Settings** application
- Select the **Machine settings** group
- Double-tap or double-click the **Set up wireless handwheel** menu item
- > The control opens the **Configuration of wireless handwheel** window.
- Select the **Connect HW** button
- > The control saves the serial number of the inserted wireless handwheel and displays it in the configuration window to the left of the **Connect HW** button.
- Select the **END** button
- > The control saves the configuration.

34.3.2 Selecting the transmission power

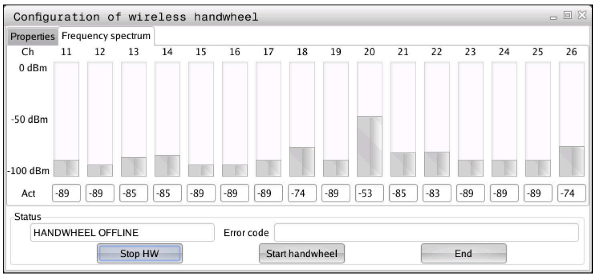
If you reduce the transmission power, the range of the wireless handwheel will decrease.

To set the transmission power of the handwheel:

- Open the **Configuration of wireless handwheel** window
- Select the **Set power** button
- > The control displays the three available power settings.
- Select the desired transmission power setting
- Select the **END** button
- > The control saves the configuration.

34.3.3 Setting the radio channel

If the wireless handwheel is started automatically, then the control tries to select the radio channel providing the best radio signal.



To set the radio channel manually:

- ▶ Open the **Configuration of wireless handwheel** window
- ▶ Select the **Frequency spectrum** tab
- ▶ Select the **Stop HW** button
- > The control stops the connection to the wireless handwheel and determines the current frequency spectrum for all 16 available channels.
- ▶ Note the number of the channel with the least amount of radio traffic

> The smallest bar indicates the channel with the least amount of radio traffic.

- ▶ Select the **Start handwheel** button
- > The control restores the connection to the wireless handwheel.
- ▶ Select the **Properties** tab
- ▶ Select the **Select channel** button
- > The controls shows all available channel numbers.
- ▶ Select the number of the channel with the least amount of radio traffic
- ▶ Select the **END** button
- > The control saves the configuration.

34.3.4 Reactivating the handwheel

To reactivate the handwheel:

- ▶ Open the **Configuration of wireless handwheel** window
- ▶ Use the **Start handwheel** button to reactivate the wireless handwheel
- ▶ Select the **END** button

35

Touch Probes

35.1 Setting up touch probes

Application

The **Device configuration** window allows you to create and manage all the workpiece and tool touch probes of the control.

Touch probes with radio transmission can be created and managed only in the **Device configuration** window.

Related topics

- Creating a workpiece touch probe with cable or infrared transmission by using the touch probe table

  Further information: "Touch probe table tchprobe.tp", Page 1839
- Creating a tool touch probe with cable or infrared transmission by using the machine parameter **CfgTT** (no. 122700)

  Further information: "Machine parameters", Page 1958

Description of function

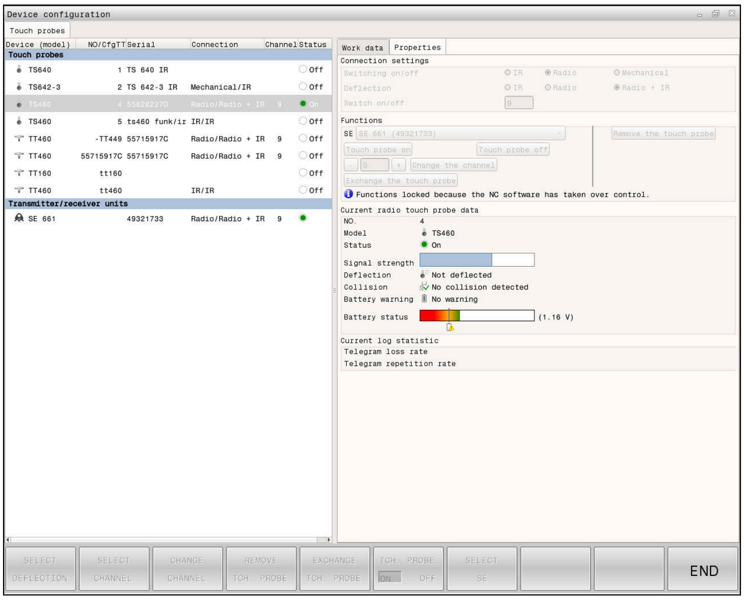
You open the **Device configuration** window in the **Machine settings** group of the **Settings** application. Double-tap or double-click the **Set up touch probes** menu item.

Further information: "Settings Application", Page 1911

Touch probes with radio transmission can be created and managed only in the **Device configuration** window.

In order for the control to recognize the touch probe with radio transmission, you will require an **SE 661** transceiver with EnDat interface.

You define the new values in the **Work data** area.



Areas of the Device configuration window

Touch probes area

In the **Touch probes** area, the control displays all of the defined workpiece and tool touch probes, as well as the transceiver units. All other areas provide detailed information about the selected entry.

Work data area

For a workpiece touch probe, the control displays the values from the touch probe table in the **Work data** area.

For a tool touch probe, the control displays the values from the machine parameter **CfgTT** (no. 122700).

You can select and edit the displayed values. Under **Touch probes**, the control displays information about the active value (e.g., selection options). You can change the values of the tool touch probes only after entering the code number 123.

Properties area

In the **Properties** area, the control displays the connection data and diagnostic functions.

For touch probes with radio connection, the control displays the following information in **Current radio touch probe data**:

Display	Meaning
NO.	Number in the touch probe table
Model	Type of touch probe
Status	Touch probe active or inactive
Signal strength	Display of the signal strength in the bar graphic The control shows the currently best-known connection as a complete bar
Deflection	Stylus deflected or not deflected
Collision	Collision or no collision recognized
Battery status	Display of the battery quality If the charge is less than the displayed bar, then the control outputs a warning.

The **Switching on/off** connection setting is preset based on the type of touch probe. Under **Deflection**, you can select how the touch probe is to transmit the signal when probing.

Deflection	Meaning
IR	Infrared probe signal
Radio	Radio probe signal
Radio + IR	The control selects the probe signal

> If you activate the touch probe's radio connection by using the connection setting **Switch on/off**, then the signal will be retained even after a tool change. You need to use this connection setting to deactivate the radio connection.

Buttons

The control provides the following buttons:

Button	Function
CREATE TS ENTRY	Create a new workpiece touch probe You define the new values in the **Work data** area.
CREATE TT ENTRY	Create a new tool touch probe You define the new values in the **Work data** area.
SELECT DEFLECTION	Select the probe signal
SELECT CHANNEL	Select the radio channel Select the channel with the best radio transmission and pay attention to overlaps with other machines or wireless handwheels.
CHANGE CHANNEL	Change the radio channel
REMOVE TCH. PROBE	Delete the touch probe data The control deletes the entry from the **Device configuration** window and from the touch probe table or the machine parameters.
EXCHANGE TCH. PROBE	Save a new touch probe in the current row The control automatically overwrites the serial number of the replaced touch probe with the new number.
SELECT SE	Select the SE transceiver
SELECT POWER	Select the strength of the infrared signal You only need to change the signal strength if there is interference.
SELECT POWER	Select the strength of the radio signal You only need to change the signal strength if there is interference.

Note

In the machine parameter **CfgHardware** (no. 100102), the machine manufacturer defines whether the control will show or hide the touch probes in the **Device configuration** window. Refer to your machine manual.

36

Embedded Workspace and Extended Workspace

36.1 Embedded Workspace (option 133)

Application

You use Embedded Workspace to operate a Windows PC and display its screen contents on the control's user interface. You use Remote Desktop Manager (option 133) to connect the Windows PC.

Related topics

- Remote Desktop Manager (option 133)

  Further information: "Remote Desktop Manager window (option 133)", Page 1944
- Using Extended Workspace to operate a Windows PC through an additional connected monitor

  Further information: "Extended Workspace", Page 1902

Requirements

- Established RemoteFX connection to the Windows PC through Remote Desktop Manager (option 133)
- Connection defined in the machine parameter **CfgRemoteDesktop** (no. 133500)

  In the optional machine parameter **connections** (no. 133501), the machine manufacturer enters the name of the RemoteFX connection.

  Refer to your machine manual.

Description of function

Embedded Workspace is available on the control as an operating mode and as a workspace. If the machine manufacturer does not define a name, then the operating mode and workspace are both named **RDP**.

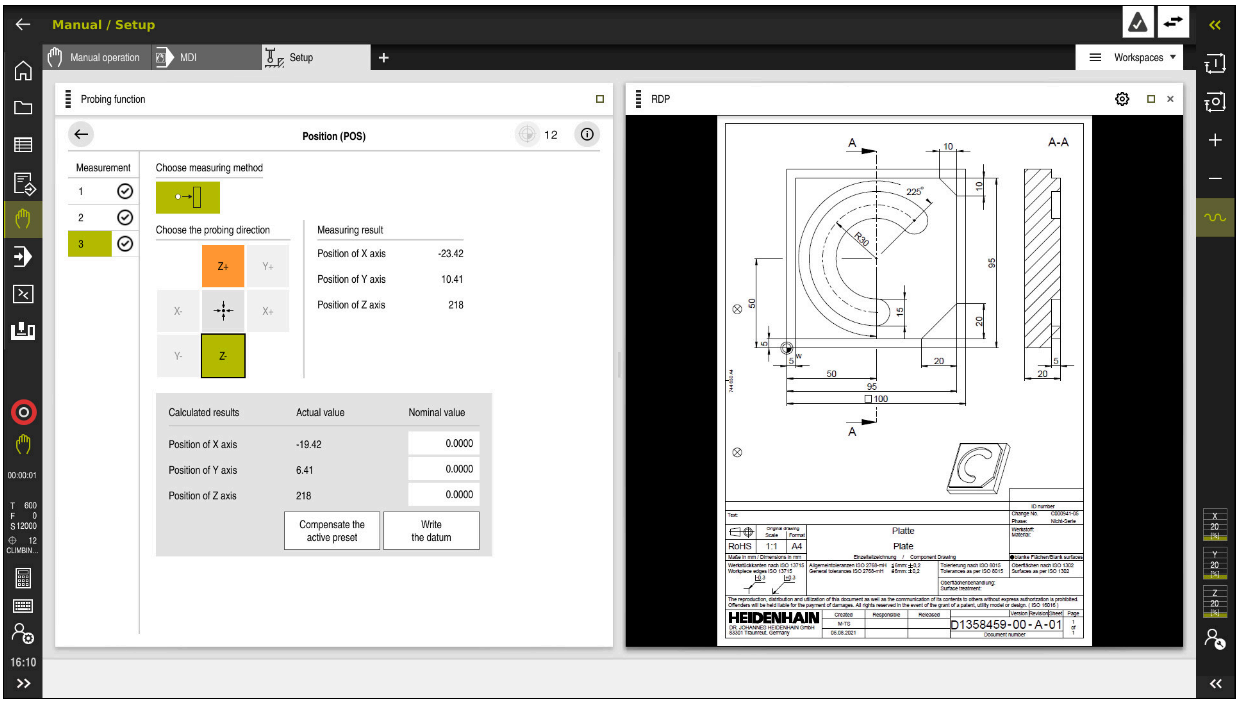
Entries cannot be made through the Windows PC as long as the RemoteFX connection is active. This avoids the problem of conflicting operation.

Further information: "Windows Terminal Service (RemoteFX)", Page 1945

If you open Embedded Workspace as an operating mode, the control displays a full-screen version of the Windows PC user interface in it.

If you open Embedded Workspace as a workspace, you can change the size and position of the workspace as you wish. The control rescales the user interface of the Windows PC after each modification.

Further information: "Workspaces", Page 92



Embedded Workspace as workspace with opened PDF file

RDP settings window

If Embedded Workspace is open as a workspace, you can open the **RDP settings** window.

The **RDP settings** window contains the following buttons:

Button	Meaning
Reconnect	If the control could not establish a connection to the Windows PC, for example due to a timeout, press this button to try again. The control can also display this button in the operating mode and the workspace.
Adjust resolution	With this button the control rescales the user interface of the Windows PC to the size of the workspace.

36.2 Extended Workspace

Application

With Extended Workspace you can use an additional attached monitor as a second screen of the control. That way you can use the additional monitor independently of the control's user interface and also to show the control's applications.

Related topics

- Using Embedded Workspace to operate a Windows PC within the control's user interface (option 133

  Further information: "Embedded Workspace (option 133)", Page 1900
- ITC hardware expansion

  Further information: "Hardware enhancements", Page 87

Requirement

- Additional attached monitor configured by the machine manufacturer as Extended Workspace

  Refer to your machine manual.

Description of function

Here are some functions you can perform with Extended Workspace:

- Opening files from the control (e.g., drawings)
- Opening windows from HEROS functions in addition to the control's user interface

  Further information: "HEROS menu", Page 1964
- Displaying and operating computers connected through Remote Desktop Managers (option 133)

  Further information: "Remote Desktop Manager window (option 133)", Page 1944

37

Integrated Functional Safety (FS)

Application

The safety concept of integrated functional safety (FS) for machines with HEIDENHAIN controls offers supplementary software safety functions in addition to the mechanical safety features of the machine. For example, the integrated safety concept automatically reduces the feed rate when you perform operations with open guard doors. The machine manufacturer can modify or expand the FS safety concept.

Requirements

- Software option 160 (Integrated functional safety (FS), basic version) or software option 161 (Integrated functional safety (FS), full version)
- Software options 162 to 166 or software option 169, if necessary

  Whether you need these software options depends on the machine's number of drives.
- The machine manufacturer must adapt the FS safety concept to the machine.

Description of function

Every machine tool user is exposed to certain risks. While protective devices can prevent access to dangerous locations, the user must also be able to work on the machine without this protection (e.g. guard door opened).

Safety functions

To ensure that the requirements for operator protection are met, integrated functional safety (FS) provides standardized safety functions. The machine manufacturer uses the standardized safety functions for implementing functional safety (FS) for the machine in question.

You can track the active safety functions in the axis status of functional safety (FS).

Further information: "Axis status menu item", Page 1907

Description	Meaning	Short description
SS0, SS1, SS1D, SS1F, SS2	Safe Stop	Safe stopping of drives using different methods
STO	Safe Torque Off	The power supply to the motor is interrupted. Provides protection against unexpected start of the drives
SOS	Safe Operating Stop	Safe operating stop. Provides protection against unexpected start of the drives
SLS	Safely Limited Speed	Safely limited speed. Prevents the drives from exceeding the specified speed limits when the protective door is opened
SLP	Safely Limited Position	Safely limited position. Monitors safe axes to keep them within the limit values of a defined area
SBC	Safe Brake Control	Dual-channel control of the motor holding brakes

Safety-related operating modes of functional safety (FS)

Functional safety (FS) of a control offers various safety-related operating modes. The safety-related operating mode with the lowest number has the highest safety level.

Depending on how the machine manufacturer implements them, the following safety-related operating modes are available:

Refer to your machine manual.
The machine manufacturer must adapt the safety-related operating modes to each machine.

Icon	Safety-related operating mode	Short description
SOM 1	Operating mode **SOM_1**	Safe operating mode 1: Automatic mode, production mode
SOM 2	Operating mode **SOM_2**	Safe operating mode 2: Set-up mode
SOM 3	Operating mode **SOM_3**	Safe operating mode 3: Manual intervention; only for qualified operators
SOM 4	Operating mode **SOM_4** This function must be enabled and adapted by the machine manufacturer.	Safe operating mode 4: Advanced manual intervention, process monitoring, only for qualified users

Functional safety (FS) in the Positions workspace

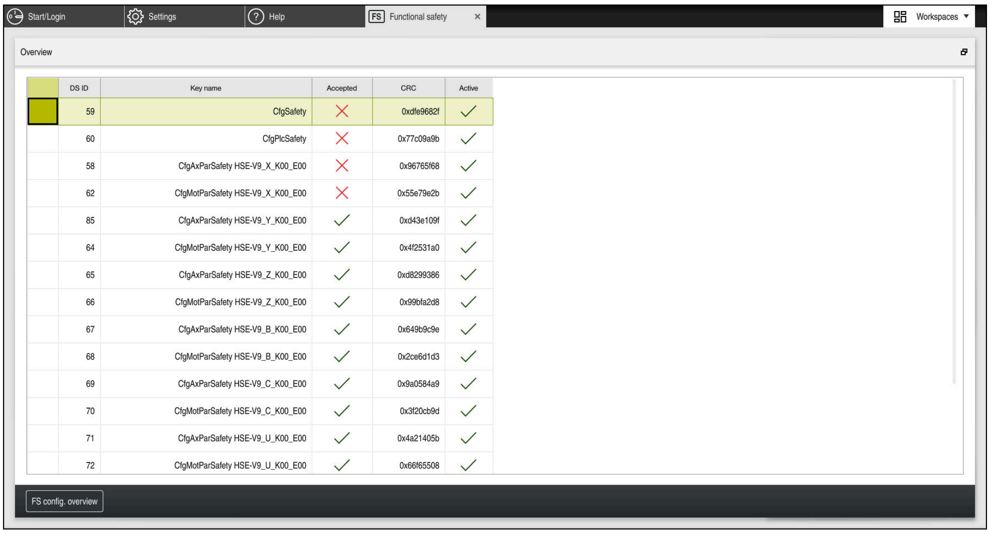
On a control with functional safety (FS), the control displays the monitored operating statuses of the speed **S** and feed rate **F** in the **Positions** workspace. If a safety function is triggered while in a monitored state, the control stops the feed movement and the spindle or reduces the speed (e.g., if a guard door is opened).

Further information: "Axis display and position display", Page 142

Functional safety application

⚙	Refer to your machine manual. The machine manufacturer configures the safety functions in this application.

In the **Functional safety** application in the **Home** operating mode, the control provides information about the status of the individual safety functions. In this application you can see whether individual safety functions are active and have been accepted by the control.

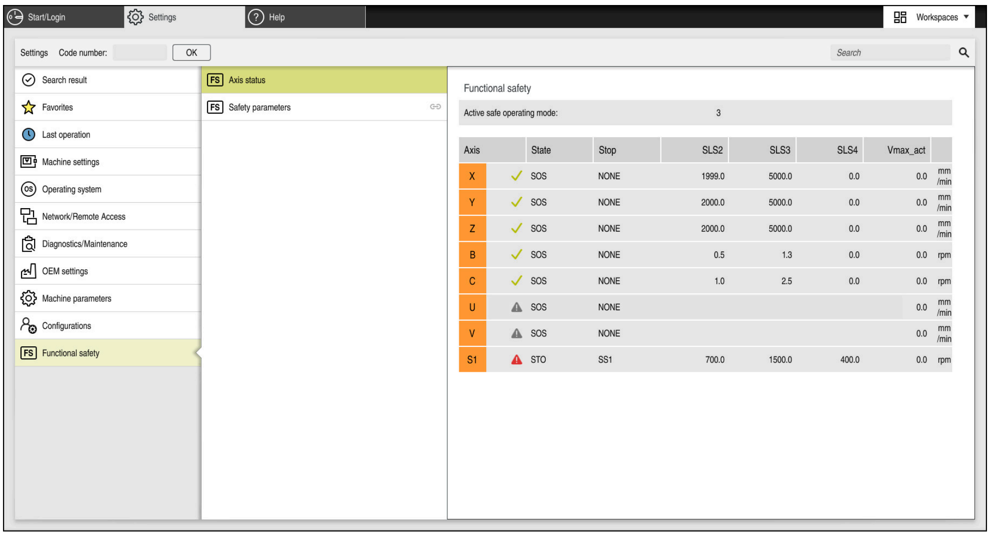


Functional safety application

Axis status menu item

In the **Axis status** menu item of the **Settings** application, the control provides the following information about the status of the individual axes:

Field	Meaning
Axis	Configured axes of the machine
State	Active safety function
Stop	Stop reaction **Further information:** "Functional safety (FS) in the Positions workspace", Page 1905
SLS2	Maximum speed or feed-rate values for **SLS** in the **SOM_2** operating mode
SLS3	Maximum speed or feed-rate values for **SLS** in the **SOM_3** operating mode
SLS4	Maximum speed or feed-rate values for **SLS** in the **SOM_4** operating mode This function must be enabled and adapted by the machine manufacturer.
Vmax_act	Currently valid speed or feed rate limit These are either values from the **SLS** settings or from the SPLC If values are greater than 999 999, the control displays **MAX**.



Axis status menu item in the **Settings** application

Test status of the axes

In order for the control to ensure safe operation of the axes, it checks all monitored axes when the machine is switched on.

The control checks whether the position of an axis matches the position directly after shutdown. If a deviation is detected, the control marks the respective axis in the position display with a red warning triangle.

If checking of individual axes fails when starting the machine, you can check the axes manually.

Further information: "Checking axis positions manually", Page 1909

The control indicates the test status of the individual axes with the following icons:

Icon	Meaning
	The axis has been tested or does not need to be tested.
	The axis has not been tested, but must be tested to ensure safe operation. **Further information:** "Checking axis positions manually", Page 1909
	The axis is not monitored by functional safety (FS) or is not configured as a safe axis.

Feed-rate limiting with functional safety (FS)

> Refer to your machine manual.
> This function must be adapted by your machine manufacturer.

With the **FMAX** button you can prevent the SS1 reaction for safe stopping of drives when the guard door is opened.

By pressing the **FMAX** button, the control limits the speed of the axes and of the spindle(s) to the values defined by the machine manufacturer. The limitation depends on the active safety-related SOM_x operating mode. You can select the safety-related operating mode with the keylock switch.

> In the safety-related operating mode SOM_1, the control stops the axes and spindles when the guard door is opened.

37.1 Checking axis positions manually

Refer to your machine manual.
This function must be adapted by your machine manufacturer.
The machine manufacturer defines the test position.

To check the position of an axis:

- Select the **Manual** operating mode
- Select **Approach test position**
- > The control displays the axes that have not been tested in the **Positions** workspace.
- Select the desired axis in the **Positions** workspace
- Press the **NC start** key
- > The axis moves to the test position.
- > After the test position has been reached, the control issues a message.
- Press the **permissive button** on the machine operating panel
- > The control displays the axis as a tested axis.

NOTICE

Danger of collision!

The control does not automatically check whether collisions can occur between the tool and the workpiece. Incorrect pre-positioning or insufficient spacing between components can lead to a risk of collision while approaching the test positions.

- If necessary, move to a safe position before approaching the test positions
- Watch out for possible collisions

Notes

- Machine tools with HEIDENHAIN controls may be equipped with integrated functional safety (FS) or with external safety. This chapter refers exclusively to machines with integrated functional safety (FS).
- The machine manufacturer defines the behavior of speed-controlled FS-NC axes while the guard door is open in the machine parameter **speedPosCompType** (no. 403129). The machine manufacturer can e.g. allow switching-on of the spindle and thus enable scratching of the workpiece while the guard door is open. Refer to your machine manual.

38

Settings Application

38.1 Overview

The **Settings** application includes the following groups with menu items:

Icon	Category	Menu item

38.2 Code numbers

Application

The top part of the **Settings** application contains the **Code number:** input field and the **unit of measure** switch. These settings are possible and accessible from every group.

Description of function

You can enable the following functions or areas with code numbers:

Code number	Function
123	Editing machine-specific user parameters **Further information:** "Machine parameters", Page 1958
555343	Special functions for programming with variables **Further information:** "Variable Programming", Page 1267

> The control indicates whether the caps lock key is pressed during entry. This helps to avoid incorrect entries.

38.3 Machine settings menu item

Application

In the **Machine settings** menu item of the **Settings** application, you can define the settings for simulation and program run.

Related topics

- Graphic settings for simulation
  Further information: "Simulation settings window", Page 1411

Description of function

Unit of measure area

In the **Unit of measure** area you can choose between mm and inch.

- Metric system: e.g. X = 15.789 (mm), the value is displayed to 3 decimal places
- Inch system: e.g. X = 0.6216 (inches), the value is displayed to 4 decimal places

If the display in inches is active, the control also displays the feed rate in inches/min. In an inch-based program, you must multiply the feed rate by 10.

Channel settings

The control displays the channel settings separately for the **Editor** operating mode and the **Manual** and **Program Run** operating modes.

You can define the following settings:

Setting	Meaning
Active kinematics	Use the **Active kinematics** function to change the kinematics model for the machine and the simulation. This way you can test NC programs that, for example, are programmed for other machines. The control offers a selection menu with all available kinematics models. The machine manufacturer defines which kinematics models you can choose. The control displays the active kinematics model in the **Machine** mode of the **Simulation** workspace.
Generate tool-usage file	The control uses the tool-usage file to check tool usage. **Further information:** "Tool usage test", Page 284 You select when the control should generate a tool-usage file: ■ **Never** The control does not generate a tool-usage file. ■ **Once** The next time you simulate or run an NC program, the control will generate a tool-usage file once. ■ **Always** When you simulate or run an NC program, the control will generate a tool-usage file each time.

Traverse limits

Use the **Traverse limits** function to limit the possible traverse path of an axis. You can define traverse limits for each axis (e.g., to protect an indexing head from collision).

The **Traverse limits** function consists of a table with the following contents:

Column	Meaning
Axis	The TNC displays each axis of the active kinematics model in a row.
Status	If you have defined one or both limits, the control displays the contents **Valid** or **Invalid**.
Lower limit	You define the lower traverse limit of the axis in this column. You can enter up to four decimal places.
Upper limit	You define the upper traverse limit of the axis in this column. You can enter up to four decimal places.

The defined traverse limits are valid across power cycles of the control, until you delete all values from the table.

The following general conditions apply to the traverse limit values:

- The lower limit must be smaller than the upper limit.
- The upper and lower limit may not both equal 0.

Other conditions apply to traverse limits for modulo axes.

Further information: "Notes on software limit switches for modulo axes", Page 1218

Notes

NOTICE
Danger of collision! You can also select any stored kinematics model as the active machine kinematics. The control then executes all manual movements and machining operations using the selected kinematics. All subsequent axis movements pose a risk of collision! ▶ Use the **Active kinematics** function for the simulation only ▶ Use the **Active kinematics** function for selecting the active machine kinematics only if required

- In the optional machine parameter **enableSelection** (no. 205601), the machine manufacturer defines for each kinematics model whether the **Active kinematics** function can be selected.
- You can open the tool-usage file in the **Tables** operating mode.
  Further information: "Tool usage file", Page 1845
- If the control has generated a tool-usage file for an NC program, then there are contents in the **T usage order** and **Tooling list** tables (option 93).
  Further information: "T usage order (option 93)", Page 1847
  Further information: "Tooling list (option 93)", Page 1849

38.4 General information menu item

Application

In the **General information** menu item of the **Settings** application, the control provides the information about the control and the machine.

Description of function

Version information area

The control displays the following information:

Sub-area	Meaning
HEIDENHAIN	■ **Control model** Designation of the control (managed by HEIDENHAIN) ■ **NC-SW** Number of the NC software (managed by HEIDENHAIN) ■ **NCK** Number of the NC software (managed by HEIDENHAIN)
PLC	**PLC-SW** Number or name of the PLC software (managed by the machine manufacturer)

The machine manufacturer can add further software numbers (e.g., that of a connected camera).

Info about machine manufacturer area

The control shows the contents of the optional machine parameter **CfgOemInfo** (no. 131700). The control displays this area only if the machine manufacturer defines this machine parameter.

Further information: "Machine parameters in conjunction with OPC UA", Page 1932

Machine information area (options 56 to 61)

The control shows the contents of the optional machine parameter **CfgMachineInfo** (no. 131600, options 56 to 61). The control displays this area only if the machine operator defines this machine parameter.

Further information: "Machine parameters in conjunction with OPC UA", Page 1932

38.5 SIK menu item

Application

Use the **SIK** menu item of the **Settings** application to view control-specific information (e.g., the serial number and the available software options).

Related topics

- Software options on the control

  Further information: "Software options", Page 74

Description of function

SIK information area

The control displays the following information:

- **Serial number**
- **Control model**
- **Performance class**
- **Features**
- **Status**

OEM key area

In the **OEM key** area the machine manufacturer can define a manufacturer-specific password for the control.

General key area

In the **General key** area the machine manufacturer can enable all software options once for a period of 90 days (e.g., for testing).

The control indicates the status of the general key:

Status	Meaning
NONE	The general key has not yet been used for this software version.
dd.mm.yyyy	Date up to which all software options will be available. Once the general key has expired, it cannot be used again.
EXPIRED	The general key has expired for this software version.

If the software version of the control is increased (e.g., by an update), then the **General key** can be used again.

Software options area

In the **Software options** area the control shows all available software options in a table.

Column	Meaning
#	Number of the software option
Option	Name of the software option
Expiration date	The machine manufacturer can enable software options for a limited time. In this case the control shows in this column the date through which the software option is available.
	The machine manufacturer uses the **Set** button to enable a software option. For enabled software options the control displays the text **Enabled**.

38.5.1 Viewing of software options

To view enabled software options on the control:

- Select the **Home** operating mode
- Select the **Settings** application
- Select **Machine settings**
- Select **SIK**
- Navigate to the **Software options** area
- > For enabled software options the control displays the text **Enabled** at the end of the row.

Definition

Abbreviation	Definition
SIK (System Identification Key)	**SIK** is the designation of the plug-in board for the control hardware. Each control can clearly be identified by the serial number of the **SIK**.

38.6 Machine times menu item

Application

In the **Machine times** menu item of the **Settings** application, the control shows the run times since initial setup.

Related topics

- Date and time of the control
  Further information: "Adjust system time window", Page 1919

Description of function

The control displays the following machine times:

Machine time	Meaning
Control on	Run time of the control since being put into service
Machine on	Run time of the machine tool since being put into service
Program Run	Run time of all program runs since being put into service

Refer to your machine manual.
The machine manufacturer can define up to 20 additional run times.

38.7 Adjust system time window

Application

In the **Adjust system time** window you can set the time zone, date and time manually or by means of an NTP server synchronization.

Related topics

- Run times of the machine tool
  Further information: "Machine times menu item", Page 1918

Description of function

The **Date/Time** menu item opens the **Adjust system time** window. The menu item is in the **Operating system** group of the **Settings** application.

The **Adjust system time** window consists of the following areas:

Area	Function
Set the time manually	Activate this check box to define the following data: ■ Year ■ Month ■ Day ■ Time
Synchronize the time over NTP server	If you activate this check box, the control will automatically synchronize the system time with the defined NTP server. You can add a server with a host name or a URL.
Time zone	You can select your time zone from a list.

38.8 Conversational language of the control

Application

You use the **helocale** window to change the conversational language of the HEROS operating system and the machine parameters to change the NC conversational language of the control's user interface.

The HEROS conversational language only changes after a restart of the control.

Related topics

- Machine parameters of the control

  Further information: "Machine parameters", Page 1958

Description of function

You can't define two different conversational languages for the operating system and control.

The **Language/Keyboards** menu item opens the **helocale** window. The menu item is in the **Operating system** group of the **Settings** application.

The **helocale** window consists of the following areas:

Area	Function
Language	Choose the HEROS conversational language from a selection menu Only if the machine parameter **applyCfgLanguage** (no. 101305) is defined as **FALSE**.
Keyboards	Select the language layout of the keyboard for HEROS functions

38.8.1 Changing the language

By default, the control assumes the NC conversational language for the HEROS conversational language.

To change the NC conversational language:

- ▶ Select the **Settings** application
- ▶ Enter the code number 123
- ▶ Select **OK**
- ▶ Select **Machine parameters**
- ▶ Double-tap or double-click **MPs for setters**
- > The control opens the **MPs for setters** application.
- ▶ Navigate to the machine parameter **ncLanguage** (no. 101301)
- ▶ Select the desired language

- ▶ Select **Save**
- > The control opens the **Configuration data changed. All changes.** window.

- ▶ Select **Save**
- > The control opens the notification menu and displays a "Question type" error.

- ▶ Select **CLOSE CONTROL**
- > The control restarts.
- > Once the control has restarted, the NC conversational language and the HEROS conversational language are changed.

Note

Use the machine parameter **applyCfgLanguage** (no. 101305) to define whether the control assumes the setting for the NC conversational language for the HEROS conversational language.

- **TRUE** (default): The control assumes the NC conversational language. You can change the language only in the machine parameters.

  Further information: "Changing the language", Page 1920
- **FALSE**: The control assumes the HEROS conversational language. You can change the language only in the **helocale** window.

38.9 SELinux security software

Application

SELinux is an extension for Linux-based operating systems in the sense of Mandatory Access Control (MAC). The security software protects the system against the execution of unauthorized processes or functions, i.e. viruses and other malicious software.

The machine manufacturer defines the **SELinux** settings in the **Security Policy Configuration** window.

Related topics

- Security settings with firewall

  Further information: "Firewall", Page 1950

Description of function

The **SELinux** menu item opens the **Security Policy Configuration** window. The menu item is in the **Operating system** group of the **Settings** application.

The access control of **SELinux** is regulated as follows by default:

- The control executes only programs that are installed with the HEIDENHAIN NC software.
- Only explicitly selected programs can modify safety-relevant files, such as **SELinux** system files or HEROS boot files.
- New files created by other programs may not be run.
- USB data carriers can be deselected.
- Only two processes can run new files:
  - Software update: A software update from HEIDENHAIN can replace or modify system files.
  - SELinux configuration: The configuration of **SELinux** with the **Security Policy Configuration** window is usually password-protected by the machine manufacturer (refer to the relevant machine manual).

Note

HEIDENHAIN recommends using **SELinux** as additional protection against attacks from outside the network.

Definition

Abbreviation	Definition
MAC (mandatory access control)	MAC means that the control performs only explicitly permitted actions. **SELinux** is intended as protection in addition to the normal access restriction in Linux. Certain processes and actions can be performed only if the standard functions and access control of **SELinux** permit it.

38.10 Network drives on the control

Application

Use the **Mount Setup** window to connect network drives to the control. If a network drive is connected to the control, the control displays additional drives in the navigation column of the file management.

Related topics

- File management

  Further information: "File management", Page 1066
- Network settings

  Further information: "Ethernet interface", Page 1925

Requirements

- Existing network connection
- Control and computer in same network
- Path and access data of drive to be connected are known

Description of function

The **Shares** menu item opens the **Mount Setup** window. The menu item can be found in the **Network/Remote Access** group of the **Settings** application.

You can also open the window with the **Mount network share** button of the **Files** operating mode.

Further information: "File management", Page 1066

You can define any number of network drives, but only seven can be connected at a time.

Network drive area

In the **Network drive** area, the control shows a list of all defined network drives, as well as the status of each drive.

The control displays the following buttons:

Button	Meaning
Mount	Connect a network drive The control selects the check box in the **Mount** column if an active connection exists.
Unmount	Disconnect a network drive
Auto	Automatically connect the network drive when the control is booting. The control selects the check box in the **Auto** column if an active automatic connection exists.
Add	Define a new connection **Further information:** "Mount assistant window", Page 1924
Remove	Delete an existing connection
Copy	Copy connection **Further information:** "Mount assistant window", Page 1924
Edit	Edit the connection settings **Further information:** "Mount assistant window", Page 1924
Private network drive	User-specific connection if user administration is active The control selects the check box in the **Privat** column if a user-specific connection exists.

Status Log area

In the **Status Log** area, the control shows status information and error messages about connections.

Use the **Clear** button to delete the contents of the **Status Log** area.

Mount assistant window

In the **Mount assistant** window you define the settings for a connection with a network drive.

The **Add**, **Copy** and **Edit** buttons open the **Mount assistant** window.

The **Mount assistant** window contains tabs with the following settings:

Tab	Setting
Drive name	■ **Drive name:** Network drive name in the file management of the control The control permits only capitals, with a colon (**:**) at the end. ■ **Private network drive** When user administration is active, the connection is only visible to the user who created it.
Share type	Transfer protocol ■ **Windows share (CIFS/SMB) or Samba server** ■ **UNIX share (NFS)**
Server and Share	■ **Server name:** Server name or IP address ■ **Share name:** Directory accessed by the control
Automount	**Connect automatically (not possible with the "Ask for password?" option)** The control connects the network drive automatically during the starting process.
User name and password (only with Windows share)	■ **Single Sign On** When user administration is active, the control automatically connects an encrypted network drive when the user logs in. ■ **Windows user name:** ■ **Ask for password? (not possible with the "Connect automatically" option)** Select whether a password is required upon connecting. ■ **Password** ■ **Password verification**
Mounting options	**Parameters for mount option "-o":** Auxiliary parameters for the connection **Further information:** "Examples of Mounting options", Page 1925
Check	The control displays a summary of the defined settings. You can check the settings and save them with **Apply**.

Examples of Mounting options

Enter options without a space, only separated by a comma

Options for SMB

Example	Meaning
domain=xxx	Name of the domain HEIDENHAIN recommends not to write the domain into the user name, but as an option.
vers=2.1	Protocol version

Options for NFS

Example	Meaning
rsize=8192	Packet size in bytes for data reception Input: **512...8192**
wsize=4096	Packet size in bytes for data transmission Input: **512...8192**
soft,timeo=3	Conditional Mount Time in tenths of a second after which the control will try to connect again
sec=ntlm	Authentication method ntlm Use this option if the control displays the **Permission denied** error message upon connecting.
nfsvers=2	Protocol version

Notes

- Have a network specialist configure the control.
- To avoid security gaps, prefer the current versions of the **SMB** and **NFS** protocols.

38.11 Ethernet interface

Application

The control is provided with an Ethernet interface as a standard feature so that you can integrate it into a network.

Related topics

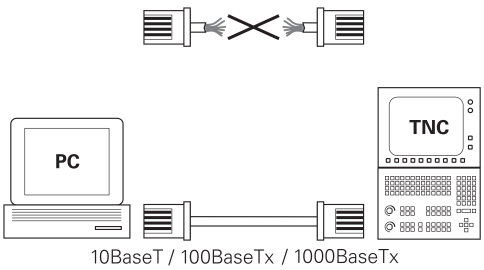
- Firewall settings
  Further information: "Firewall", Page 1950
- Network drives on the control
  Further information: "Network drives on the control", Page 1922
- External access
  Further information: "DNC menu item", Page 1936

Description of function

The control transfers data via the Ethernet interface using the following protocols:

- **CIFS** (common internet file system) or **SMB** (server message block)
  The control supports versions 2, 2.1 and 3 of these protocols.
- **NFS** (network file system)
  The control supports versions 2 and 3 of this protocol.

Connection options



You can integrate the Ethernet interface of the control into the network or connect it directly to a PC through the RJ45 connection X26. The connection is electrically isolated from the control electronics.

Use a Twisted Pair cable to connect the control to your network.

> The maximum cable length permissible between the control and a node depends on the quality grade of the cable, the sheathing, and the type of network.

Ethernet connection icon

Icon	Meaning
	Ethernet connection The control displays the icon at the bottom right in the taskbar. **Further information:** "Taskbar", Page 1967 When you click the icon, the control opens a pop-up window. The pop-up window contains the following information and functions: ▪ Connected networks You can disconnect the network connection. Select the network name to reconnect. ▪ Available networks ▪ VPN connections Currently no function

Notes

- Protect your data and the control by running the machines in a secure network.
- To avoid security gaps, prefer the current versions of the **SMB** and **NFS** protocols.

38.11.1 Network settings window

Application

In the **Network settings** window you define the settings for the control's Ethernet interface.

> Have a network specialist configure the control.

Related topics

- Network configuration

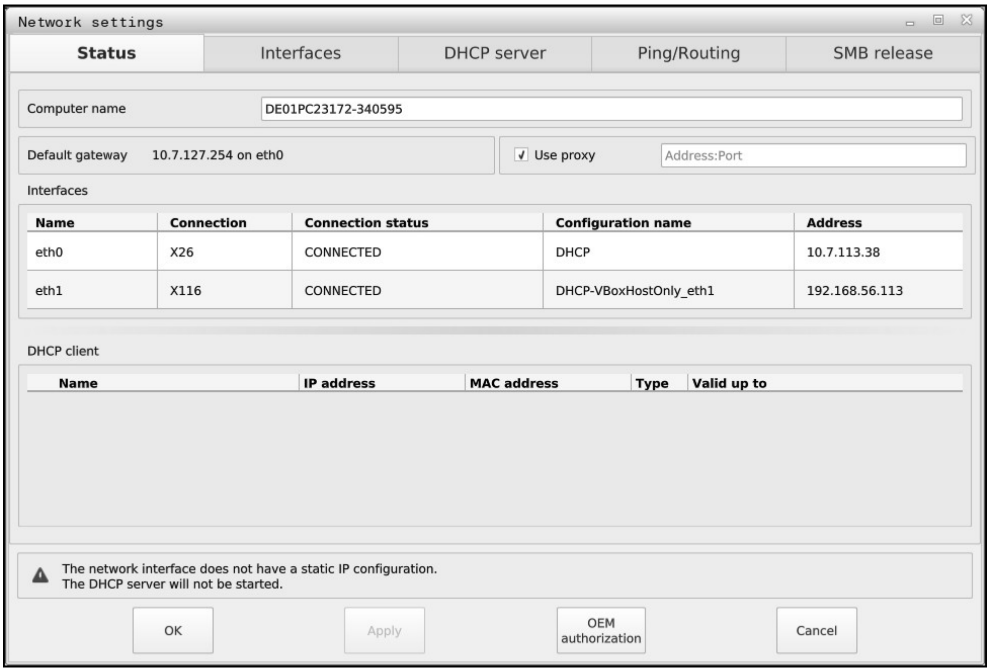
  Further information: "Network configuration with Advanced Network Configuration", Page 1974
- Firewall settings

  Further information: "Firewall", Page 1950
- Network drives on the control

  Further information: "Network drives on the control", Page 1922

Description of function

Open the **Network settings** window via the **Network** menu item. The menu item can be found in the **Network/Remote Access** group of the **Settings** application.



Network settings window

Status tab

The **Status** tab contains the following information and settings:

<table>
<tr><th>Domain</th><th>Information or Setting</th></tr>
<tr><td>Computer name</td><td>The control displays the name under which the control is visible in the company network. You can change the name.</td></tr>
<tr><td>Default gateway</td><td>The control shows the default gateway and the Ethernet interface being used.</td></tr>
<tr><td>Use proxy</td><td>You can define the address and the port of a proxy server in the network.</td></tr>
<tr><td>Interfaces</td><td>The control shows an overview of available Ethernet interfaces. If there is no network connection, the table is empty.
The control displays the following information in the table:
Name, e.g. eth0
Connection, e.g. X26
Connection status, e.g. CONNECTED
Configuration name, e.g. DHCP
Address, e.g. 10.7.113.10
Further information: "Interfaces tab", Page 1929</td></tr>
<tr><td>DHCP client</td><td>The control displays an overview of the devices that have received a dynamic IP address in the machine network. If there are no connections to other network components of the machine network, the table is empty.
The control displays the following information in the table:
Name
Host name and connection status of the device.
The control shows the following connection status:
Green: Connected
Red: No connection
IP address
Dynamically assigned network address of the device
MAC address
Physical address of the device
Type
Type of connection
The control displays the following connection types:
TFTP
DHCP
Valid up to
Time until which the IP address is valid without being renewed
The machine manufacturer can make settings for these devices. Refer to your machine manual.</td></tr>
</table>

Interfaces tab

The control displays the available Ethernet interfaces on the **Interfaces** tab.

The **Interfaces** tab contains the following information and settings:

Column	Information or Setting
Name	The control displays the name of the Ethernet interface. You can activate or deactivate the connection by means of a switch.
Connection	The control displays the number of the network connection.
Connection status	The control displays the connection status of the Ethernet interface. The following connection statuses may be displayed: ■ **CONNECTED** Connected ■ **DISCONNECTED** Connection separated ■ **CONFIGURING** The IP address is being fetched from the server ■ **NOCARRIER** No cable present
Configuration name	You can execute the following functions: ■ Select a profile for the Ethernet interface In the factory default setting, two profiles are available: ■ **DHCP-LAN**: Settings for the standard interface for a standard company network ■ **MachineNet**: Settings for the second, optional Ethernet interface; for configuration of the machine network **Further information:** "Network configuration with Advanced Network Configuration", Page 1974 ■ Reconnect the Ethernet interface with **Reconnect** ■ Edit the selected profile **Further information:** "Network configuration with Advanced Network Configuration", Page 1974

The control additionally offers the following functions:

- **Set standard values**

  The control resets all settings. The control restores the profiles that are available in the factory default setting.
- **Configuration name**

  You can add, edit or remove profiles for the network connection.

  > If you have changed the profile of an active connection, the control will not update the profile being used. Reconnect the corresponding interface with **Reconnect**.

  The control exclusively supports the **Ethernet** connection type.

  Further information: "Network configuration with Advanced Network Configuration", Page 1974

DHCP server tab

The machine manufacturer can use the **DHCP server** tab in the control to configure a DHCP server in the machine network. Using this server, the control can establish connections with other network components of the machine network, e.g. with industrial computers.

Refer to your machine manual.

Ping/Routing tab

You can check the network connection on the **Ping/Routing** tab.

The **Ping/Routing** tab contains the following information and settings:

Domain	Information or Setting
Ping	**Address:Port** and **Address:** You can enter the IP address of the computer and possibly the port number for checking the network connection. Entry: Four numerical values separated by dots, possibly a port number separated by a colon e.g. **10.7.113.10:22** As an alternative, you can enter the name of the computer whose connection you want to check. Starting and stopping the test ■ **Start** button: starts the test The control displays status information in the ping field. ■ **Stop** button: stops the test
Routing	The control displays status information of the operating system about the current routing for network administrators.

SMB share tab

The **SMB share** tab is included only in connection with a VBox programming station.

When the check box is active, the control releases areas or partitions protected by a code number for the Explorer of the Windows PC used, e.g. **PLC**. You can activate or deactivate the check box only by using the machine manufacturer code number.

In the **TNC VBox Control Panel**, select a drive letter within the **NC share** tab for displaying the selected partition and then connect the drive with **Connect**. The host displays the partitions of the programming station.

Further information: Programming station for milling controls

You download the documentation together with the programming station software.

Notes

- Preferably restart the control after making changes in the network settings.
- The HEROS operating system manages the **Network settings** window. If you change the HEROS conversational language, you must restart the control for the change to take effect.

  Further information: "Conversational language of the control", Page 1919

38.12 OPC UA NC Server (options 56 to 61)

38.12.1 Fundamentals

Open Platform Communications Unified Architecture (OPC UA) describes a collection of specifications. These specifications are used to standardize machine-to-machine communication (M2M) in the field of industrial automation. OPC UA enables the data exchange across operating systems between products from different manufacturers, e.g. between a HEIDENHAIN control system and third-party software. Thus, OPC UA has become the data exchange standard for secure, reliable, manufacturer- and platform-independent industrial communication over the last years.

In 2016, the German Federal Office for Information Security (BSI) published a security analysis related to **OPC UA**. The specification analysis performed by the BSI determined that **OPC UA** provides a high level of security as compared to most other industrial protocols.

HEIDENHAIN follows the BSI recommendations and provides SignAndEncrypt, which exclusively features up-to-date IT security profiles. For this purpose, OPC UA-based industrial applications and the **OPC UA NC Server** exchange certificates for authentication. In addition, any transferred data is encrypted. This effectively prevents messages between the communication partners from being intercepted or altered.

Application

Both standard and custom software can be used with the **OPC UA NC Server**. Compared to other established interfaces, significantly less development effort is required for OPC UA connection, thanks to the uniform communication technology.

The **OPC UA NC Server** allows you to access the data and functions of the HEIDENHAIN NC information model exposed in the server address space.

Related topics

- **Information Model** interface documentation with the specification of the **OPC UA NC Server** in English

  ID: 1309365-xx or **OPC UA NC Server interface documentation**

Requirements

- OPC UA NC Server (software options 56 to 61)

  For OPC UA-based communication, the HEIDENHAIN control provides the **OPC UA NC Server**. For each OPC UA client to be connected, you need one of the six available software options (56 to 61).
- Firewall configured

  Further information: "Firewall", Page 1950
- OPC UA client supports the **Security Policy** and the authentication method of the **OPC UA NC Server**:
  - **Security Mode: SignAndEncrypt**
  - **Algorithm: Basic256Sha256**
  - **User Authentication: X509 certificates**

Description of function

Both standard and custom software can be used with the **OPC UA NC Server**. Compared to other established interfaces, significantly less development effort is required for OPC UA connection, thanks to the uniform communication technology.

The control supports the following OPC UA functions:

- Write and read variables
- Subscribe to value changes
- Run methods
- Subscribe to events
- File system access to the **TNC:** drive
- File system access to the **PLC:** drive (a corresponding permission is required)

Machine parameters in conjunction with OPC UA

The **OPC UA NC Server** enables OPC UA client applications to query general machine information, such as the year of construction of the machine or its location.

The following machine parameters are available for the digital identification of your machine:

- For users: **CfgMachineInfo** (no. 131700)

  Further information: "Machine information area (options 56 to 61)", Page 1917
- For the machine tool builder: **CfgOemInfo** (no. 131600)

  Further information: "Info about machine manufacturer area", Page 1917

Access to directories

The **OPC UA NC Server** enables read and write access to the **TNC:** and **PLC:** drives.

The following actions are permitted:

- Creation and deletion of folders
- Reading, editing, copying, moving, creating, and deleting of files.

While the NC software is running, the files referenced in the following machine parameters are locked against write access:

- Tables referenced by the machine manufacturer in the machine parameter **CfgTablePath** (no. 102500)
- Files referenced by the machine manufacturer in the machine parameter **dataFiles** (no. 106303, branch **CfgConfigData** no. 106300)

The **OPC UA NC Server** enables access to the control even if the NC software is switched off. You can e.g. transfer automatically created service files at any time as long as the operating system is active.

NOTICE

Caution: potential damage to property!

The control does not automatically back up the files before editing or deletion. Files that are missing cannot be restored. The removal or editing of system-relevant files, such as the tool table, can negatively affect the control functions.

- ▶ System-relevant files must be edited only by authorized specialists

Required certificates

The **OPC UA NC Server** requires three different types of certificates. The server and the client need two of them, the application instance certificates, in order to establish a secure connection. The third certificate (user certificate) is required for authorization and for starting a session with specific user permissions.

The control automatically generates a two-level certificate chain referred to as the **Chain of Trust** for the server. This certificate chain consists of a self-signed root certificate (including a **revocation list**) and a certificate for the server that is created on the basis of the root certificate.

The client certificate must be added on the **Trusted** tab of the **PKI Admin** function.

All other certificates should be added on the **Issuers** tab of the **PKI Admin** function for verification of the entire certificate chain.

User certificate

The control uses the HEROS functions **Current User** or **UserAdmin** for administration of the user certificate. When you initiate a session, the rights of the associated internal user are active.

To assign a user certificate to a user:

- Open the **Current User** HEROS function
- Select **SSH keys and certificates**
- Press the **Import certificate** soft key
- > The control opens a pop-up window.
- Select the certificate
- Select **Open**
- > The control imports the certificate.
- Press the **Use for OPC-UA** soft key

Self-generated certificates

You can also create and import all of the required certificates yourself.

Self-generated certificates must fulfill the following requirements:

- General requirements
  - File format: *.der
  - Signature with hash SHA256
  - Validity period of at most 5 years is recommended
- Client certificates
  - Host name of the client
  - Application URI of the client
- Server certificates
  - Host name of the control
  - Application URI of the server according to the following structure: urn:<hostname>/HEIDENHAIN/OpcUa/NC/Server
  - Validity period of 20 years maximum

Note

OPC UA is a manufacturer/platform-independent, open communication standard. For this reason, an OPC UA client SDK is not included in the **OPC UA NC Server**.

38.12.2 OPC UA menu item (options 56 to 61)

Application

In the **OPC UA** menu item of the **Settings** application, you can set up the connections to the control and check the status of the OPC UA connections.

Description of function

Select the **OPC UA** menu item in the **Network/Remote Access** group.

The **OPC UA NC Server** area contains the following functions:

Function	Meaning
Status	Shows with an icon whether a connection with the OPC UA NC Server is active: ■ Green icon: connection active ■ Gray icon: connection not active or software option not enabled
OPC UA connection wizard	Open the **OPC UA NC Server connection wizard** window **Further information:** "OPC UA connection wizard function (options 56 to 61)", Page 1934
OPC UA license settings	Open the **OPC UA NC Server - License Settings** window **Further information:** "OPC UA license settings function (options 56 to 61)", Page 1935
Host computer operation	Activate or deactivate host computer operation with a switch **Further information:** "DNC area", Page 1936

38.12.3 OPC UA connection wizard function (options 56 to 61)

Application

For quick and easy setup of an OPC UA client application, you can use the **OPC UA NC Server connection wizard** window. This assistant guides you through the steps that are required to connect an OPC UA client application to the control.

Related topics

- Assigning an OPC UA client to a software option 56 to 61 with the **OPC UA NC Server - License Settings** window
- Managing certificates with the **PKI Admin** menu

Description of function

The **OPC UA connection wizard** function of the **OPC UA** menu item opens the **OPC UA NC Server connection wizard** window.

Further information: "OPC UA menu item (options 56 to 61)", Page 1934

The assistant features the following steps:

- Export **OPC UA NC Server** certificates
- Import the certificates of the OPC UA client application
- Assign each of the available **OPC UA NC Server** software options to an OPC UA client application
- Import user certificates
- Assign user certificates to users
- Configure the firewall

If at least one of the options 56 to 61 is active, then, when booting for the first time, the control creates the server certificate as part of a self-generated certificate chain. The client application or the manufacturer of the application creates the client certificate. The user certificate is linked to the user account. Please contact your IT department.

Notes

- The **OPC UA NC Server connection wizard** also helps you create test or sample certificates for users and the OPC UA client application. Do not use the user and client application certificates created at the control for other purposes than development at the programming station.

38.12.4 OPC UA license settings function (options 56 to 61)

Application

Use the **OPC UA NC Server - License Settings** window to assign an OPC UA client-application to one of the software options 56 to 61.

Related topics

- Setting up an OPC UA client application with the **OPC UA connection wizard** function

  Further information: "OPC UA connection wizard function (options 56 to 61)", Page 1934

Description of function

After using the **OPC UA connection wizard** or the **PKI Admin** menu item to import a certificate of an OPC UA client application, you can choose the certificate from a selection window.

If you activate the **Active** check box for a certificate, the control uses a software option for the OPC UA client application.

38.13 DNC menu item

Application

With the **DNC** menu item you can grant or restrict access to the control (e.g., connections over a network).

Related topics

- Connecting network drives
  Further information: "Network drives on the control", Page 1922
- Setting up a network
  Further information: "Ethernet interface", Page 1925
- TNCremo
  Further information: "PC software for data transfer", Page 1970
- Remote Desktop Manager (option 133)
  Further information: "Remote Desktop Manager window (option 133)", Page 1944

Description of function

The **DNC** area contains the following icons:

Icon	Meaning
	External access to the control is active
	Add computer-specific connection
	Edit computer-specific connection
	Delete computer-specific connection

DNC area

In the **DNC** area you use switches to activate the following functions:

Switches	Meaning
DNC access permitted	Permit or block all accesses to the control through a network or a serial connection
TNCopt full access allowed	Depending on the machine, permit or block access for diagnostics or initial setup software
Host computer operation	Pass command control to an external host computer, for example to transfer data to the control; or end host computer operation If host computer operation is active, the control displays the **Host computer is active** message in the info bar. You cannot use the **Manual** and **Program Run** operating modes. You cannot activate host computer operation while running an NC program.

Computer-specific connections

If the machine manufacturer has defined the optional machine parameter **CfgAccessControl** (no. 123400), then in the **Connections** area you can permit or block access for up to 32 connections defined by you.

The control shows the defined information in a table:

Column	Meaning
Name	Host name of the external computer
Description	Additional information
IP address	Network address of the external computer
Access	■ **Permit** The control permits network access without confirmation. ■ **Inquire** The control asks for confirmation upon a network access attempt. You can choose whether to permit or block the access once or always. ■ **Deny** The control does not permit any network access
Type	■ **Com1** Serial interface 1 ■ **Com2** Serial interface 2 ■ **Ethernet** Network connection
Active	If a connection is active, the control displays a green circle. If a connection is inactive, the control displays a gray circle.

Notes

- In the machine parameter **allowDisable** (no. 129202) the machine manufacturer defines whether the **Host computer operation** switch is available.
- In the optional machine parameter **denyAllConnections** (no. 123403) the machine manufacturer defines whether the control permits computer-specific connections.

38.14 Printers

Application

You add and manage printers through the **Printer** menu item in the **Heros Printer Manager** window.

Related topics

- Using the **FN 16: F-PRINT** function for printing

  Further information: "Outputting text formatted with FN 16: F-PRINT", Page 1285

Requirement

- PostScript-capable printer

  The control can communicate only with printers that understand PostScript emulation such as KPDL3. Some printers enable setting the PostScript emulation in the printer menu.

  Further information: "Note", Page 1940

Description of function

The **Printer** menu item opens the **Heros Printer Manager** window. The menu item can be found in the **Network/Remote Access** group of the **Settings** application.

You can print the following files:

- Text files
- Graphic files
- PDF files

Further information: "File types", Page 1071

Once you have added a printer, the control shows the **PRINTER:** drive in the file management. The drive contains one folder for each defined printer.

Further information: "Creating a printer", Page 1940

There are various methods to start printing:

- Copying the file to be printed to the **PRINTER** drive

  The file to be printed is automatically forwarded to the default printer and deleted from the directory after the print job has been executed.

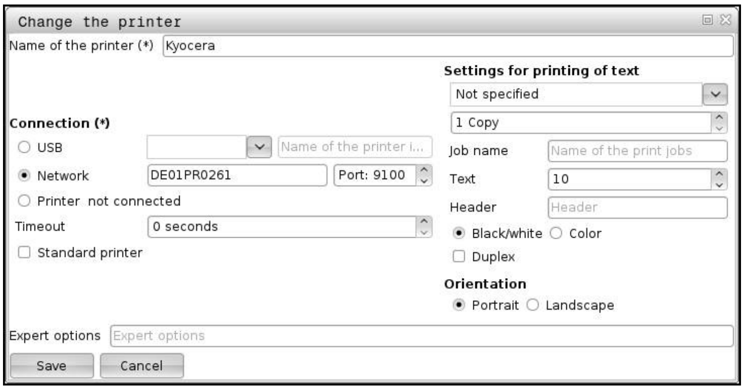
  You may also copy the file into the printer sub-directory if you wish to use a printer other than the default printer.
- Using the **FN 16: F-PRINT** function

Buttons

The **Heros Printer Manager** window contains the following buttons:

Button	Meaning
Create	Creates a printer
CHANGE	Adapts the properties of the selected printer
COPY	Creates a copy of the selected printer setting At first the copy has the same properties as the copied setting. This can be useful if printing both portrait and landscape formats on the same printer
DELETE	Deletes the selected printer
UP **DOWN**	Selects a printer
STATUS	Displays the status information of the selected printer
PRINT A TEST PAGE	Prints a test page on the selected printer

Change the printer window



For each printer, the following properties can be set:

Setting	Meaning
Name of the printer	Customizes the printer name
Connection	Selects the connection ■ **USB**: The control automatically displays the name ■ **Network**: Network name or IP address of the printer Port for the network printer (default: 9001) ■ **Printer %1 not connected**
Timeout	Delays the printing process The control delays the printing process by the pre-set number of seconds after the last change has been made to the file to be printed in **PRINTER:**. Use this setting if the file to be printed is populated with FN functions, e.g. when probing.
Standard printer	Selects the default printer The control automatically assigns this setting to the first printer added.
Settings for printing of text	These settings are applicable when printing text documents: ■ Paper size ■ Number of copies ■ Job name ■ Font size ■ Header ■ Print options (black and white, color, duplex)
Orientation	Portrait or landscape for all printable files
Expert options	Available only to authorized specialists

38.14.1 Creating a printer

To create a new printer:

- ▶ Enter the printer name in the name dialog
- ▶ Select **Create**
- > The control creates a new printer.
- ▶ Press **CHANGE**
- > The control opens the **Change the printer** window.
- ▶ Define the properties
- ▶ Select **Save**
- > The control applies the settings and displays the defined printer in the list.

Note

If your printer does not permit PostScript emulation, change the printer settings if possible.

38.15 VNC menu item

Application

VNC is software that shows the screen contents of a remote computer on a local computer, and also sends keyboard actions and mouse movements of the local computer to the remote computer.

Related topics

- Firewall settings

  Further information: "Firewall", Page 1950
- Remote Desktop Manager (option 133)

  Further information: "Remote Desktop Manager window (option 133)", Page 1944

Description of function

The **VNC** menu item opens the **VNC settings** window. The menu item can be found in the **Network/Remote Access** group of the **Settings** application.

Buttons and icons

The **VNC settings** window contains the following buttons and icons:

Button and icon	Meaning
Add	Add new VNC viewer or client
Remove	Delete the selected client Only possible with manually entered clients.
Edit	Edit the configuration of the selected client
Update	Refresh view Required with connection attempts during which the dialog is open.
Set preferred owner of the focus	Activate the **Preferred owner of the focus** check box
	Another client owns the focus Mouse and keyboard are disabled
	You own the focus Entries can be made
	Prompt by another client to receive the focus Mouse and keyboard are disabled until the focus is assigned.

VNC participant settings area

In the **VNC participant settings** area, the control shows a list of all clients.

The control displays the following contents:

Column	Contents
Computer name	IP address or computer name
VNC	Connection of the client to the VNC viewer
VNC Focus	The client participates in the focus assignment
Type	■ Manual Manually entered client ■ Denied This client is not permitted to connect. ■ Enable TeleService and IPC Client via a TeleService connection ■ DHCP Other computer that retrieves an IP address from this computer.

Global settings area

In the **Global settings** area you can define the following settings:

Function	Meaning
Enable TeleService and IPC	If the check box is selected, the connection is always permitted.
Password verification	Client must enter a password for verification The control opens a window when you select the check box. In this window you define the password for this client. The client must enter the password when establishing the connection.

Enabling other VNC area

In the **Enabling other VNC** area you can define the following settings:

Function	Meaning
Deny	Other VNC clients are not permitted.
Inquire	A dialog opens when another VNC client wants to connect. You must grant permission for this connection.
Permitted	Other VNC clients are permitted.

VNC Focus Settings area

In the **VNC Focus Settings** area, you can make the following settings:

Function	Meaning
Enabling VNC focus	Enables focus assignment for this system When the check box is inactive, the focus owner actively gives away the focus by using the focus symbol. The remaining clients can request the focus only after it was given away.
Reset the CapsLock key when changing the focus	When the check box is active and the focus owner has activated the CapsLock key, the CapsLock key is deactivated in a focus change. Only if the **Enabling VNC focus** check box is active
Enable Concurrency VNC Focus	When the check box is active, every client can request the focus at any time. The focus owner does not need to give away the focus before to enable that. When a client requests the focus, a pop-up window opens for all clients. If no client objects to the request within the pre-set period of time, the focus changes after the defined time limit. Only if the **Enabling VNC focus** check box is active
Timeout Concurrency VNC Focus	Period of time after requesting the focus during which the focus owner can object to the focus change (at most 60 seconds). This period of time is set by moving a slider. When a client requests the focus, a pop-up window opens for all clients. If no client objects to the request within the pre-set period of time, the focus changes after the defined time limit. Only if the **Enabling VNC focus** check box is active

Activate the **Enabling VNC focus** check box only in connection with HEIDENHAIN devices provided especially for this purpose, e.g. ITC industrial computers.

Notes

- The machine manufacturer defines the procedure for assigning the focus with multiple clients or operating units. Focus assignment depends on the setup and operating situation of the machine tool.

  Refer to your machine manual.
- The control displays a message if the firewall settings of the control do not permit the VNC protocol for all clients.

Definition

Abbreviation	Definition
VNC (virtual network computing)	**VNC** is software with which another computer can be controlled over a network connection.

38.16 Remote Desktop Manager window (option 133)

Application

With Remote Desktop Manager you can display external computer units on the control screen that are connected via Ethernet, and operate them through the control. You can also shut down a Windows computer together with the control.

Related topics

- External access

  Further information: "DNC menu item", Page 1936

Requirement

- Remote Desktop Manager (software option 133)
- Existing network connection

  Further information: "Ethernet interface", Page 1925

Description of function

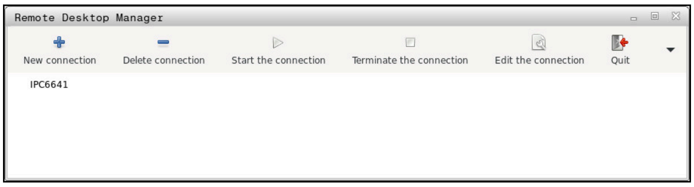
The **Remote Desktop Manager** menu item opens the **Remote Desktop Manager** window. The menu item can be found in the **Network/Remote Access** group of the **Settings** application.

Remote Desktop Manager grants the following connection options:

- **Windows Terminal Service (RemoteFX)**: Display the desktop of an external Windows computer on the control

  Further information: "Windows Terminal Service (RemoteFX)", Page 1945
- **VNC**: Display the desktop of an external Windows, Apple or Unix computer on the control

  Further information: "VNC", Page 1945
- **Switch-off/restart of a computer**: Automatically shut down a Windows computer together with the control
- **World Wide Web**: Only for authorized specialists
- **SSH**: Only for authorized specialists
- **XDMCP**: Only for authorized specialists
- **User-defined connection**: Only for authorized specialists



HEIDENHAIN offers the IPC 6641 as a Windows computer. With the IPC 6641 you can start and operate Windows-based applications directly from within the control.

If the desktop of the external connection or the external computer is active, all inputs from the mouse and the alphabetic keyboard are transmitted there.

When the operating system is shut down, the control automatically terminates all connections. Please note that only the connection is terminated, whereas the external computer or the external system is not shut down automatically.

Buttons

Remote Desktop Manager contains the following buttons:

Button	Function
New connection	Use the **Edit the connection** window to create a new connection **Further information:** "Establishing and starting a connection", Page 1949
Delete connection	Delete the selected connection
Start the connection	Start the selected connection **Further information:** "Establishing and starting a connection", Page 1949
Terminate the connection	Terminate the selected connection
Edit the connection	Use the **Edit the connection** window to modify the selected connection **Further information:** "Connection settings", Page 1946
Exit	Close **Remote Desktop Manager**
Import connections	Restore the selected connection **Further information:** "Exporting and importing connections", Page 1949
Export the connections	Back-up the selected connection **Further information:** "Exporting and importing connections", Page 1949

Windows Terminal Service (RemoteFX)

You don't need any additional software on a computer for a RemoteFX connection, but you might need to change some settings on the computer.

Further information: "Configuring an external computer for Windows Terminal Service (RemoteFX)", Page 1948

For integrating the IPC 6641, HEIDENHAIN recommends using a RemoteFX connection.

With RemoteFX, a separate window opens for the screen of the external computer. The active desktop on the external computer is then locked and the user logged off. This prevents two users from accessing the control simultaneously.

VNC

You need an additional **VNC** server for your external computer when connecting through VNC. Install and configure the VNC server, e.g. TightVNC server, before establishing the connection.

VNC mirrors the screen of the external computer. The active desktop on the external computer is not locked automatically.

With a **VNC** connection you can shut down the external computer through the Windows menu. The computer cannot be restarted through the connection.

Connection settings

General settings

The following settings apply to all connection options:

Setting	Meaning	Intended use
Connection name	Name of the connection in **Remote Desktop Manager** You can use the following characters in the name of the connection: A B C D E F G H I J K L M N O P Q R S T U V W X Y Z a b c d e f g h i j k l m n o p q r s t u v w x y z 0 1 2 3 4 5 6 7 8 9 _	Required
Restarting after end of connection	Behavior after disconnection: ■ **Always restart** ■ **Never restart** ■ **Always after an error** ■ **Ask after an error**	Required
Automatic starting upon login	Connect automatically when starting	Required
Add to favorites	The control displays the connection's icon in the taskbar. Tap or click the icon to start the connection directly.	Required
Move to the following workspace	Number of the desktop for the connection; desktops 0 and 1 are reserved for the NC software. Default setting: Third desktop	Required
Release USB mass memory	Permit access to connected USB mass memory devices	Required
Private connection	Connection can be seen and used only by its creator	Required
Computer	Host name or IP address of the external computer HEIDENHAIN recommends the **IPC6641.machine.net** setting for the IPC 6641. The host name **IPC6641** must be assigned to the IPC in the Windows operating system for this setting.	Required
Password	Password of the user	Required
Entries in the **Advanced options** area	Available only to authorized specialists	Optional

Additional settings for Windows Terminal Service (RemoteFX)

The control offers the following additional connection settings for the **Windows Terminal Service (RemoteFX)** option:

Setting	Meaning	Intended use
User name	Name of the user	Required
Windows domain	Domain of the external computer	Optional
Full-screen mode or **User-defined window size**	Size of the connection window on the control	Required

Additional settings for VNC

The control offers the following additional connection settings for the **VNC** option:

Setting	Meaning	Intended use
Full-screen mode or **User-defined window size:**	Size of the connection window on the control	Required
Permit further connections (share)	Additionally grant other VNC connections access to the VNC server	Required
View only	In display mode, the external computer cannot be operated.	Required

Additional settings for Switch-off/restart of a computer

The control offers the following additional connection settings for the **Switch-off/restart of a computer** option:

Setting	Meaning	Intended use
User name	User name with which the connection should log in.	Required
Windows domain:	If required, domain of the target computer	Optional
Max. waiting time (seconds):	A shutdown of the control causes the Windows computer to shut down as well. Before the control displays the **Now you can switch off.** message, it waits for the number of seconds defined here. While waiting, the control checks whether the Windows computer is still accessible (port 445). If the Windows computer is switched off before the defined number of seconds have expired, the control will wait no longer.	Required
Additional waiting time:	Waiting time after the Windows computer has stopped being accessible. Windows applications may delay the shutdown of the computer after port 445 has been closed.	Required
Force	Close all programs on the Windows computer, even if dialogs are still open. If **Force** is not selected, Windows waits up to 20 seconds. This delays the shutdown process or the Windows computer is switched off before Windows has shut down.	Required
Restart	Restart the windows computer	Required
Run during restart	When the control restarts, restart the Windows computer as well. Effective only if the control is restarted using the shutdown icon at the bottom right in the taskbar or if it is restarted as a result of a change in the system settings (e.g. network settings).	Required
Run during switch-off	Shut down the Windows computer (no restart) when shutting down the control. This is the default behavior. Even the **END** key will then not trigger a restart.	Required

38.16.1 Configuring an external computer for Windows Terminal Service (RemoteFX)

To configure the external computer (e.g., in Windows 10 operating systems):

- Press the Windows key
- Select **Control Panel**
- Select **System and Security**
- Select **System**
- Select **Remote Settings**
- > The computer opens a pop-up window.
- Under **Remote Assistance**, enable **Allow Remote Assistance connections to this computer**
- In the **Remote Desktop** area, enable **Allow Remote Assistance connections to this computer**
- Press **OK** to confirm your settings

38.16.2 Establishing and starting a connection

To establish and start a connection:

- ▶ Open **Remote Desktop Manager**
- ▶ Select **New connection**
- > The control displays a selection menu.
- ▶ Select a connection option
- ▶ Under **Windows Terminal Service (RemoteFX)**, select the operating system
- > The control opens the **Edit the connection** window.
- ▶ Define the connection settings

  Further information: "Connection settings", Page 1946
- ▶ Press **OK**
- > The control saves the settings and closes the window.
- ▶ Select connection
- ▶ Select **Start the connection**
- > The control starts the connection.

38.16.3 Exporting and importing connections

To export a connection:

- ▶ Open **Remote Desktop Manager**
- ▶ Select the desired connection
- ▶ Select the right arrow icon in the menu bar
- > The control displays a selection menu.
- ▶ Select **Export the connections**
- > The control opens the **Select export file** window.
- ▶ Define the name of the saved file
- ▶ Select the target file
- ▶ Select **Save**
- > The control saves the connection data under the name defined in the window.

To import a connection:

- ▶ Open **Remote Desktop Manager**
- ▶ Select the right arrow icon in the menu bar
- > The control displays a selection menu.
- ▶ Select **Import connections**
- > The control opens the **Select file to import** window.
- ▶ Select file
- ▶ Select **Open**
- > The control creates the connection under the name that was defined originally in the **Remote Desktop Manager**.

Notes

NOTICE

Caution: Data may be lost!

If you do not shut down external computers properly, data may be irreversibly damaged or deleted.

- Configure the automatic shutdown of the Windows computer

- When you edit an existing connection, the control will automatically delete all impermissible characters from the name.

Notes in connection with the IPC 6641

- HEIDENHAIN assures a functioning connection between HEROS 5 and the IPC 6641. No guarantee is given for other combinations and connections.
- If you use the computer name **IPC6641.machine.net** to connect an IPC 6641, it is important to enter **.machine.net**.

  With this entry, the control automatically searches the Ethernet interface **X116**, and not the interface **X26**; this reduces the time needed for access.

38.17 Firewall

Application

With the control you can set up a firewall for the primary network interface, and for a sandbox if needed. You can block incoming network traffic for specific senders and services.

Related topics

- Existing network connection

  Further information: "Ethernet interface", Page 1925
- SELinux security software

  Further information: "SELinux security software", Page 1921

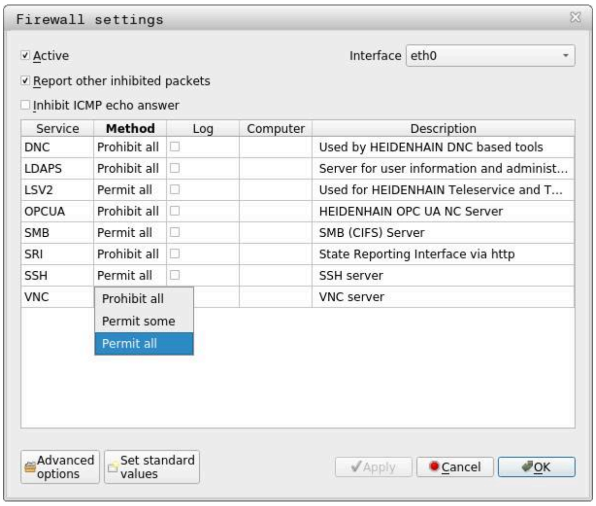
Description of function

The **Firewall** menu item opens the **Firewall settings** window. The menu item can be found in the **Network/Remote Access** group of the **Settings** application.

If you activate the firewall, the control displays an icon at the bottom right in the taskbar. The control displays the following icons, depending on the security level:

Icon	Meaning
	Firewall protection does not yet exist although it has been activated. Example: A dynamic IP address is used in the network inter-face configuration, but the DHCP server has not yet assigned an IP address. **Further information:** "DHCP server tab", Page 1930
	Firewall active with medium security level.
	Firewall active with high security level. All services except for SSH are blocked.

Firewall settings



The **Firewall settings** window contains the following settings:

Setting	Meaning
Active	Activate or deactivate firewall
Interface	Select the interface ■ **eth0**: X26 of the control ■ **eth1**: X116 of the control ■ **brsb0**: Sandbox (optional) If a control has two Ethernet interfaces, then by default the DHCP server for the machine network is active for the second interface. With this setting you cannot activate the firewall for **eth1** because the firewall and DHCP server mutually exclude each other.
Report other inhibit-ed packets	Activate the firewall with a high security level All services except for SSH are blocked.
Inhibit ICMP echo answer	If this check box is selected, the control does not respond to a ping request.

<table>
<tr><th>Setting</th><th>Meaning</th></tr>
<tr><td>Service</td><td>Brief designation of services configured with the firewall. You can change the settings even if the services are not started.
DNC
DNC server using the RPC protocol for external applications that were developed with RemoTools SDK (port 19003)
For more detailed information, consult the RemoTools SDK manual.
LDAPS
Server with user data and configuration of user administration
LSV2
Functionality for TNCremo, TeleService, and other HEIDENHAIN PC tools (port 19000)
OPC UA
Service provided by the OPC UA NC Server (port 4840).
SMB
Only incoming SMB connections, meaning a Windows share on the control. Outgoing SMB connections are not influenced, meaning a Windows share connected to the control.
SSH
SecureShell protocol (port 22) for secure LSV2 handling with active user administration; starting with HEROS 504
VNC
Access to screen contents. If you block this service, then not even TeleService programs from HEIDENHAIN can access the control. If you block this service, the control displays a warning in the VNC settings window.
Further information: "VNC menu item", Page 1940</td></tr>
<tr><td>Method</td><td>Configure accessibility
Prohibit all: Cannot be accessed by anyone
Permit all: Can be accessed by everyone
Permit some: Can be accessed only by specific clients
In the Computer column you must define the computer for which access is permitted. If you do not define a computer, the control activates Prohibit all.</td></tr>
<tr><td>Log</td><td>The control shows the following messages when transmitting network packets:
Red: Network packet blocked
Blue: Network packet accepted</td></tr>
<tr><td>Computer</td><td>IP address or host name of the computers with access rights. Separated by commas, if there are multiple computers
The control converts the host name to an IP address when the control starts. If the IP address changes, you must restart the control or change the setting. The control issues an error message if it cannot convert the host name to an IP address.
Only with the Permit some method</td></tr>
<tr><td>Advanced options</td><td>Only for network specialists</td></tr>
<tr><td>Set standard values</td><td>Reset the settings to the default values recommended by HEIDENHAIN</td></tr>
</table>

Notes

- Have your network specialist check and, if necessary, change the standard settings.
- The firewall does not protect the second network interface **eth1**. Connect only trustworthy hardware to this interface, and do not use this interface for Internet connections.

38.18 Portscan

Application

With the **Portscan** function, the control checks all open, incoming TCP and UDP listen ports at defined intervals or when commanded. The control shows a message if a port is not listed.

Related topics

- Firewall settings

  Further information: "Firewall", Page 1950
- Network settings

  Further information: "Network settings window", Page 1927

Description of function

The **Portscan** menu item opens the **Portscan** window. The menu item is in the **Diagnostics/Maintenance** group of the **Settings** application.

The control searches for all open, incoming TCP and UDP listen ports on the system and compares them to the following whitelists:

- System-internal whitelists **/etc/sysconfig/portscan-whitelist.cfg** and **/mnt/sys/etc/sysconfig/portscan-whitelist.cfg**
- Whitelist for ports with machine-manufacturer-specific functions: **/mnt/plc/etc/sysconfig/portscan-whitelist.cfg**
- Whitelist for ports with customer-specific functions: **/mnt/tnc/etc/sysconfig/portscan-whitelist.cfg**

Each whitelist contains the following information:

- Port type (TCP/UDP)
- Port number
- Offering program
- Comments (optional)

In the **Manual Execution** area, use the **Start** button to start the portscan manually. Use the **Automatic update on** function of the **Automatic Execution** to have the control automatically perform the portscan at a defined interval. You define the interval with a slider.

If the control performs the portscan automatically, then only ports listed in the whitelists my be open. The control shows a message window if a port is not listed.

38.19 Remote servicing

Application

In conjunction with the remote service setup tool, TeleService from HEIDENHAIN offers the possibility to establish encrypted end-to-end connections between a computer and a machine over the Internet.

Related topics

- External access

  Further information: "DNC menu item", Page 1936
- Firewall

  Further information: "Firewall", Page 1950

Requirements

- Existing Internet connection

  Further information: "Network settings window", Page 1927
- **LSV2** connection permitted by the firewall

  Remote diagnosis via the TeleService PC software uses the **LSV2** service. By default, the control's firewall blocks all incoming and outgoing connections. For this reason you must permit a connection for this service.

  You have the following options for permitting the connection:

  - Deactivate the firewall
  - Define the **Permit some** method for the **LSV2** service, and enter the name of the computer under **Computer**

  Further information: "Firewall", Page 1950

Description of function

The **Remote Service** menu item opens the **HEIDENHAIN remote maintenance** window. The menu item is in the **Diagnostics/Maintenance** group of the **Settings** application.

You need a valid session certificate for the servicing session.

Session certificate

During installation of the NC software, a temporary certificate is automatically installed on the control. A new installation or update may only be carried out by a service technician from the machine manufacturer.

A new certificate must be installed if no valid session certificate is installed on the control. Clarify with the service technician which certificate is needed. The service technician will then provide you with a valid certificate file, if necessary, which you must then install.

Further information: "Installing a session certificate", Page 1955

In order to start the servicing session, you must enter the session key from the machine manufacturer.

38.19.1 Installing a session certificate

To install a session certificate on the control:

- Select the **Settings** application
- Select **Network/Remote Access**
- Double-tap or double-click **Network**
- > The control opens the **Network settings** window.
- Select the **Internet** tab

> The machine manufacturer defines the settings in the **Telemaintenance** field.

- Select **Add**
- > The control displays a selection menu.
- Select file
- Select **Open**
- > The control opens the certificate.
- Select **OK**
- Restart the control to load the settings

Notes

- If you've deactivated the firewall, you must reactivate it after the servicing session!
- If you permit the **LSV2** service in the firewall, the access security is ensured through the network settings. The network security is the responsibility of the machine manufacturer or the respective network administrator.

38.20 Backup and restore

Application

With the **NC/PLC Backup** and **NC/PLC Restore** functions you can back up and restore individual folders or the entire **TNC:** drive. You can save the backup files to various types of memory media.

Related topics

- File management, **TNC:** drive

  Further information: "File management", Page 1066

Description of function

You open the backup function through the **NC/PLC Backup** menu item. The menu item is in the **Diagnostics/Maintenance** group of the **Settings** application.

You open the restore function through the **NC/PLC Backup** menu item.

The backup function creates a ***.tncbck** file. The restore function can restore these files as well as files from existing TNCbackup programs. If you double tap or click a ***.tncbck** file in the file manager, the control starts the restore function.

Further information: "File management", Page 1066

Within the backup function you can chose between the following types of backups:

- **Back up the "TNC:" partition**

  Back-up all data on the **TNC:** drive
- **Back up the directory tree**

  Back-up the selected folders and their subfolders on the **TNC:** drive
- **Back up the machine configuration**

  Only for the machine manufacturer
- **Complete backup (TNC: and machine configuration)**

  Only for the machine manufacturer

Backup and restore is subdivided into several steps. Navigate between these steps with the **FORWARD** and **BACK** buttons.

38.20.1 Backing up data

To back-up the data of the **TNC:** drive:

- Select the **Settings** application
- Select **Diagnostics/Maintenance**
- Double-tap or double-click **NC/PLC Backup**
- > The control opens the **Back up the "TNC:" partition** window.
- Specify the type of backup
- Select **Forward**
- If necessary, pause the control with **Stop NC software**
- Select any predefined exclusion rules or ones you have defined yourself
- Select **Forward**
- > The control generates a list of files for backing up.
- Check list
- Deselect files if necessary
- Select **Forward**
- Enter the name of the backup file
- Select the storage path
- Select **Forward**
- > The control generates the backup file.
- Confirm with **OK**
- > The control concludes the backup process and restarts the NC software.

38.20.2 Restoring data

NOTICE

Caution: Data may be lost!

When you restore data (Restore function), any existing data will be overwritten without a confirmation prompt. Existing data is not automatically backed up by the control before running the restore process. Power failures or other problems can interfere with the data restore process. As a consequence, data may be irreversibly damaged or deleted.

- Before starting the data restore process, make a backup of the existing data

To restore data:

- Select the **Settings** application
- Select **Diagnostics/Maintenance**
- Double-tap or double-click **NC/PLC Restore**
- > The control opens the **Restore data - %1** window.
- Select the archive to be restored
- Select **Forward**
- > The control generates a list of files for restoring.
- Check list
- Deselect files if necessary
- Select **Forward**
- If necessary, pause the control with **Stop NC software**
- Select **Extract archive**
- > The control restores the files.
- Confirm with **OK**
- > The control restarts the NC software.

Note

The TNCbackup PC program can also process ***.tncbck** files. TNCbackup is part of TNCremo.

38.21 TNCdiag

Application

The control displays status and diagnostic information of HEIDENHAIN components in the **TNCdiag** window.

Description of function

Only use this function after consultation with your machine manufacturer.

For more information, please refer to the **TNCdiag** documentation.

38.22 Machine parameters

Application

You can configure the behavior of the control with machine parameters. The control offers the applications **MPs for users** and **MPs for setters** for this. You can open the **MPs for users** application at any time without having to enter a code number.

The machine manufacturer defines which machine parameters are in which applications. HEIDENHAIN offers a standard scope of parameters for the **MPs for setters** application. The following contents describe only the standard scope of the **MPs for setters** application.

Related topics

- List of machine parameters in the **MPs for setters** application

  Further information: "Machine parameters", Page 1980

Requirements

- Code number 123

  Further information: "Code numbers", Page 1914
- Contents of the **MPs for setters** application are defined by the machine manufacturer

Description of function

The **MPs for setters** menu item opens the **MPs for setters** application. The menu item is in the **Machine parameters** group of the **Settings** application.

In the **Machine parameters** group the control shows only those menu items that you can choose with the current access rights.

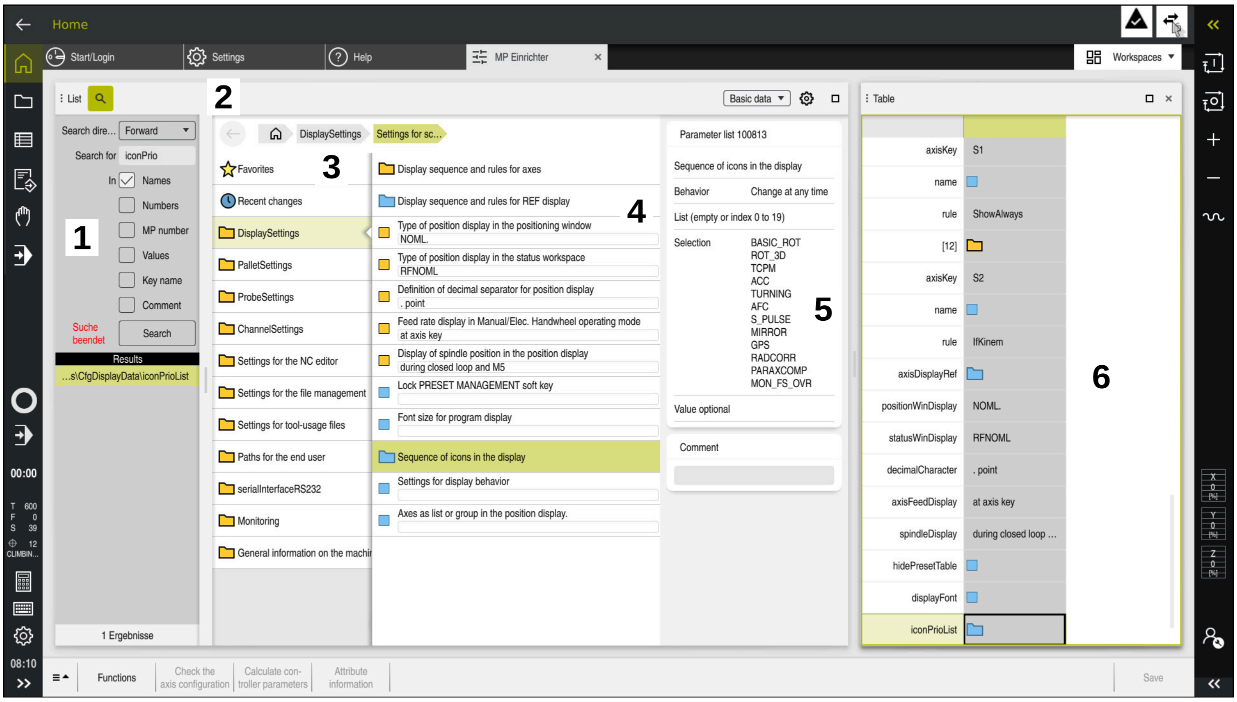
If you open an application for machine parameters, the control displays the configuration editor.

The configuration editor offers the following workspaces:

- **List**
- **Table**

You can't close the **List** workspace.

Areas of the configuration editor



MPs for setters application with selected machine parameter

The configuration editor shows the following areas:

1 **Search** column

You can search forward or backward with the following characteristics:

- Name

  This is the language-neutral name used for machine parameters in the User's Manual.
- Number

  This is the unique number used for machine parameters in the User's Manual.
- MP number of the iTNC 530
- Value
- Key name

  Machine parameters for axes or channels exist more than once. In order to avoid ambiguity, each axis and each channel is identified with a key name (e.g., **X1**)
- Comment

The control displays the results.

2 Title bar of the **List** workspace

You can show and hide the **Search** column, use a selection menu to filter the contents, and open the **Configuration** window.

Further information: "Configuration window", Page 1962

3 Navigation column

The control provides the following options for navigation:

- Navigation path
- Favorites
- 21 most recent changes
- Structure of the machine parameters

4 Content column

In the content column the control displays objects, machine parameters, or changes that you select using the search function or navigation column.

5 Information area

The control displays information about the selected machine parameter or change.

Further information: "Information area", Page 1962

6 **Table** workspace

In the **Table** workspace the control shows the selected contents within the structure. In order to do so, in the **Configuration** window the **Synchronized navigation in list and table** switch must be set to active.

The control displays the following information:

- Name of the objects
- Icon of the objects
- Value of the machine parameters

Icons and buttons

The configuration editor contains the following icons and buttons:

Icon or button	Meaning
	Open the **Configuration** window **Further information:** "Configuration window", Page 1962
	Select **Recent changes**
	Object exists ■ Data object ■ Directory ■ Parameter list
	Object empty
	Machine parameter exists
	Optional machine parameter does not exist
	Machine parameter invalid
	Machine parameter readable but not editable
	Machine parameter unreadable and uneditable
	Changes to the machine parameter not yet saved
Functions	Open the context menu **Further information:** "Context menu", Page 1392
Check the axis configuration	Only for the machine manufacturer
Calculate controller parameters	Only for the machine manufacturer
Attribute information	Only for the machine manufacturer
Save	The control opens a window with all of the changes since the most recent saving. You can save or discard the changes.

Configuration window

In the **Configuration** window you define the settings for displaying the machine parameters in the configuration editor.

The **Configuration** window consists of the following areas:

- **List**
- **Table**

The **List** area contains the following settings:

Setting	Meaning
Show MP descriptive texts	If the switch is active, the control displays a description of the machine parameter in the active conversational language. If the switch is not active, the control displays the language-neutral name of the machine parameter.
Show details	Hide or show the information area with this switch.

The **Table** area contains the following settings:

Setting	Meaning
Show details when table displayed	If the switch is active, the control shows the information area even if the **Table** workspace is open. If the switch is not active, the control shows the information area only if the **Table** workspace is closed.
Synchronized navigation in list and table	If the switch is active, the control always shows in the **Table** workspace the object that is marked in the **List** workspace, and vice versa. If the switch is not active, the contents of the two workspaces do not synchro-nize.

Information area

If you select contents from the favorites or the structure, the control will display some of the information below in the information area:

- Type of object, such as data object list or parameter, perhaps with number
- Descriptive text of machine parameter
- Information about the effect
- Permitted or required input
- Behavior, such as program run disabled
- MP number of the iTNC 530 for machine parameters
- Machine parameter optional

If you select content from one of the recent changes, the control will display the information below in the information area:

- Sequential number of the change
- Previous value
- New value
- Date and time of change
- Descriptive text of machine parameter
- Information about the effect

39

HEROS Operating System

39.1 Fundamentals

HEROS is the fundamental basis for all NC controls from HEIDENHAIN. The HEROS operating system is based on Linux, and was adapted for the purposes of NC controls.

The TNC7 features the version HEROS 5.

39.2 HEROS menu

Application

In the HEROS menu the control shows information about the operating system. You can change settings or use HEROS functions.

By default you open the HEROS menu through the taskbar at the bottom edge of the screen

Related topics

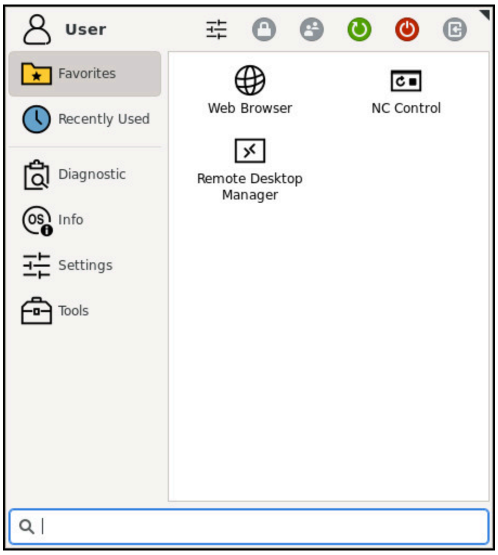
- Opening HEROS functions through the **Settings** application

  Further information: "Settings Application", Page 1911

Description of function

You open the HEROS menu with the green DIADUR icon in the taskbar or with the **DIADUR** key.

Further information: "Taskbar", Page 1967



Standard view of the HEROS menu

The HEROS menu contains the following functions:

Area	Function
Header	■ User name: Currently no function ■ User-specific settings ■ Lock display ■ Switch user: Currently no function ■ Restart ■ Shut down ■ Log out: Currently no function

Area	Function

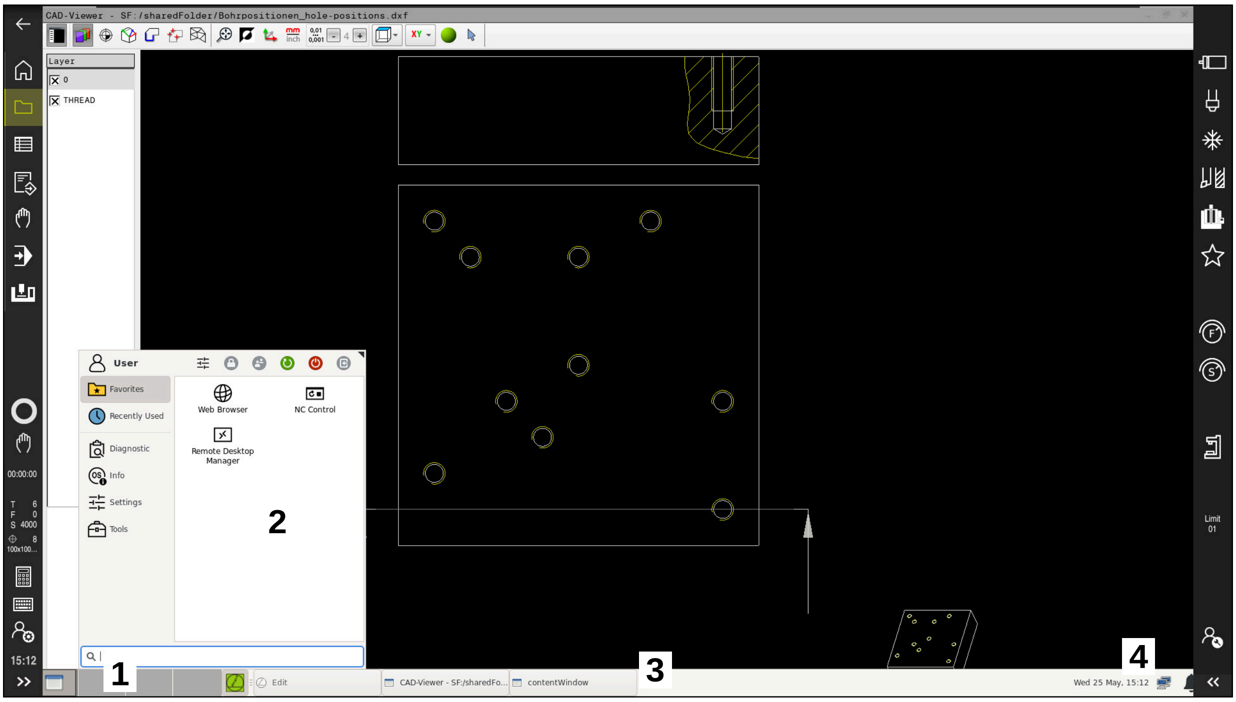
Searching	Full-text search of individual functions

Taskbar



CAD-Viewer opened in the third desktop with taskbar shown and active HEROS menu

The taskbar consists of the following areas:

1 Workspaces
2 HEROS menu
  Further information: "Description of function", Page 1964
3 Opened applications, e.g.:
  - Control interface
  - **CAD-Viewer**
  - Window of HEROS functions

  You can move the opened applications into any other workspaces.
4 Widgets
  - Calendar
  - Status of the firewall
    Further information: "Firewall", Page 1950
  - Network status
    Further information: "Ethernet interface", Page 1925
  - Notifications
  - Shut down or restart the operating system

Window Manager

With the Window Manager you manage functions of the HEROS operating system as well as windows opened in the third desktop, such as the **CAD-Viewer**.

The control features the Xfce window manager. Xfce is a standard application for UNIX-based operating systems, and is used to manage graphical user interfaces. The following functions are possible with the window manager:

- Display a taskbar for switching between various applications (user interfaces)
- Manage an additional desktop, on which special applications from your machine manufacturer can run
- Control the focus between NC software applications and those of the machine manufacturer
- You can change the size and position of pop-up windows. It is also possible to close, minimize and restore pop-up windows

If a window is opened in the third desktop, the control displays the **Window Manager** icon in the information bar. You can switch between the open applications by selecting the icon.

You can minimize the control's user interface by pulling down from the information bar. The TNC bar and the OEM bar remain visible.

Further information: "Areas of the control's user interface", Page 89

Notes

- If a window is opened in the third desktop, the control displays an icon in the information bar.

  Further information: "Areas of the control's user interface", Page 89
- The machine manufacturer determines the scope of function and behavior of the window manager.
- The control shows a star in the upper left of the screen if an application of the window manager or the window manager itself has caused an error. In this case, switch to the window manager and correct the problem. If required, refer to your machine manual.

39.3 Serial data transfer

Application

The TNC7 automatically uses the LSV2 transmission protocol for serial data transfer. All parameters of the LSV2 protocol are invariably fixed except for the baud rate in the machine parameter **baudRateLsv2** (no. 106606).

Description of function

The machine parameter **RS232** (no. 106700) allows you to define another transmission type (interface). The settings described below are effective only for the respective newly defined interface.

Further information: "Machine parameters", Page 1958

In the machine parameters that then appear you can define the following settings:

Machine parameters	Setting
baudRate (no. 106701)	Data transfer rate (baud rate) Input: **BAUD_110**, **BAUD_150**, **BAUD_300 BAUD_600**, **BAUD_1200**, **BAUD_2400**, **BAUD_4800**, **BAUD_9600**, **BAUD_19200**, **BAUD_38400**, **BAUD_57600**, **BAUD_115200**
protocol (no. 106702)	Communications protocol ■ **STANDARD**: Standard data transmission, line-by-line ■ **BLOCKWISE**: Packet-based data transfer ■ **RAW_DATA**: Transmission without protocol (purely character-by-character) Input: **STANDARD**, **BLOCKWISE**, **RAW_DATA**
dataBits (no. 106703)	Data bits in each transferred character Input: **7 Bit**, **8 Bit**
parity (no. 106704)	Parity bit used to check for transmission errors ■ **NONE**: No parity, no error detection ■ **EVEN**: Even parity, error if the number of bits set is odd ■ **ODD**: Odd parity, error if the number of bits set is even Input: **NONE**, **EVEN**, **ODD**
stopBits (no. 106705)	The start bit and one or two stop bits enable the receiver to synchronize each transmitted character during serial data transmission. Input: **1 Stop-Bit**, **2 Stop-Bits**
flowControl (no. 106706)	By handshaking, two devices control data transfer between them. A distinction is made between software handshaking and hardware handshaking. ■ **NONE**: No data-flow check ■ **RTS_CTS**: Hardware handshaking, transmission stop is active through RTS ■ **XON_XOFF**: Software handshaking, transmission stop is active through DC3 Input: **NONE**, **RTS_CTS**, **XON_XOFF**
fileSystem (no. 106707)	File system for the serial interface ■ **EXT**: Minimum file system for printers or non-HEIDENHAIN transmission software ■ **FE1**: Communication with TNCserver or an external floppy disk unit If you require no special file system, this machine parameter is not needed. Input: **EXT**, **FE1**
bccAvoidCtrlChar (no. 106708)	The BCC is a block check character. The BCC is optionally added to a transfer block to simplify error detection. ■ **TRUE**: The BCC does not correspond to any control character ■ **FALSE**: Function not active Input: **TRUE**, **FALSE**

Machine parameters	Setting
rtsLow (no. 106709)	This optional parameter determines the level of the RTS line in the idle state. ■ **TRUE**: Level is **LOW** in idle state ■ **FALSE**: Level is **HIGH** in idle state Input: **TRUE**, **FALSE**
noEotAfterEtx (no. 106710)	This optional parameter sets whether an EOT character (End of Transmission) is to be transmitted after receiving an ETX character (End of Text). ■ **TRUE**: The EOT character is not sent ■ **FALSE**: The EOT character is sent Input: **TRUE**, **FALSE**

Example

In order to use the TNCserver PC software for data transfer, define the following settings in the machine parameter **RS232** (no. 106700):

Parameters	Selection
Data transfer rate in baud	Has to match the setting in TNCserver
Data transmission protocol	BLOCKWISE
Data bits in each transferred character	7 bits
Type of parity checking	EVEN
Number of stop bits	1 stop bit
Type of handshake	RTS_CTS
File system for file operations	FE1

TNCserver is part of the TNCremo software for PCs.
"PC software for data transfer"

39.4 PC software for data transfer

Application

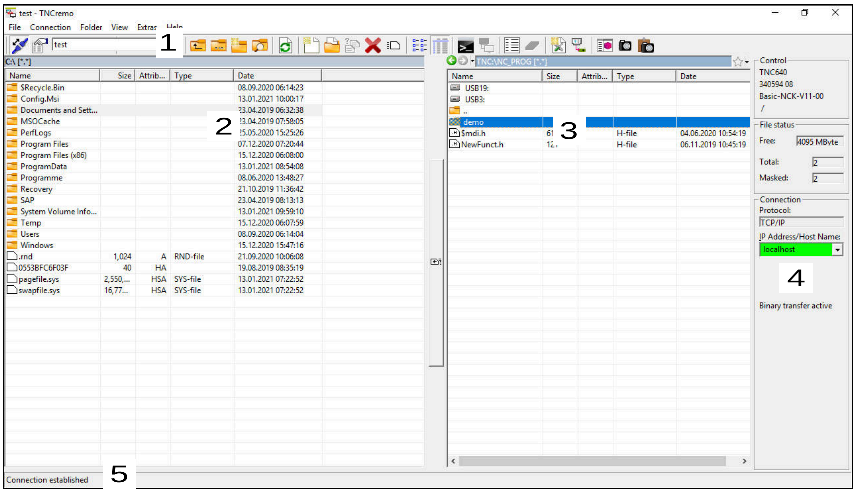
HEIDENHAIN offers the TNCremo software for connecting a Windows PC to a HEIDENHAIN control in order to transfer data.

Requirements

- PC operating system:
  - Windows 7
  - Windows 8
  - Windows 10
- PC RAM: 2 GB
- Free PC hard-disk space: 15 MB
- An available serial interface or connection to the control's network

Description of function

The TNCremo data transfer software provides the following areas:



1 Toolbar

This area provides the most important TNCremo functions.

2 File list of PC

In this area, TNCremo displays all of the folders and files of the connected drive (e.g., hard disk of a Windows PC or a USB flash drive).

3 File list of control

In this area, TNCremo displays all of the folders and files of the connected drive of the control.

4 Status display

In the status display, TNCremo shows information about the current connection.

5 Connection status

The connection status indicates whether a connection is currently active.

> For more information, refer to the integrated help system of TNCremo.
>
> You can open the context-sensitive help function of the TNCremo software by pressing the **F1** key.

Notes

- When user administration is active, you can set up only secure network connections via SSH. The control automatically disables the LSV2 connections via the serial interfaces (COM1 and COM2) and the network connections without user identification.
- You can download the current version of the TNCremo software from the **HEIDENHAIN website**.

39.5 Data backup

Application

If you create or modify files on the control, then you should back up these files periodically.

Related topics

- File management
  Further information: "File management", Page 1066

Description of function

With the functions **NC/PLC Backup** and **NC/PLC Restore** you can create back-up files for specific directories or even an entire drive, and restore them as needed. You should store these backup files on an external storage medium.

Further information: "Backup and restore", Page 1955

You have the following options for transferring files from the control:

- TNCremo
  With TNCremo you can transfer files from the control to a computer.
  Further information: "PC software for data transfer", Page 1970
- External drive
  You can transfer files from the control directly to an external drive.
  Further information: "Network drives on the control", Page 1922
- External data carriers
  You can store the files on external data carriers or use external data carriers to transfer the files.
  Further information: "USB devices", Page 1077

Notes

- You should back-up all machine-specific data, such as the PLC program or machine parameters. Consult your machine manufacturer about this.
- You must transmit files with the extensions PDF, XLS, ZIP, BMP, GIF, JPG and PNG in binary format from the PC to the control's hard disk.
- Backing up all files of the internal memory can take several hours. If required, perform the backup during a time when you don't need the machine.
- Periodically delete files that are no longer required. This ensures that the control has enough memory available for system files, such as the tool table.
- HEIDENHAIN recommends having the hard disk inspected after three to five years. After this time, and depending on the operating conditions (e.g., vibration loads), you must expect increased failure rates.

39.6 Opening files with additional software

Application

The control provides several additional software programs for opening and editing standard file types:

Related topics

- File types
  Further information: "File types", Page 1071

Description of function

The control offers tools for the following file types:

File type	Tool
PDF	Document Viewer
XSLX (XSL) CSV	Gnumeric
INI A TXT	Leafpad
HTM/HTML	Web browser For networks and the Internet, the machine manufacturer or network administrator must guarantee that the control is protected against viruses and malware (e.g., by a firewall).
ZIP	Xarchiver
BMP GIF JPG/JPEG PNG	Ristretto or Geeqie Ristretto can only open graphics files. Geeqie can also edit and print graphics.
OGG	Parole With Parole you can open the file types OGA, OGG, OGV and OGX. The Fuendo Codec Pack (available for payment) is needed only for other formats, such as MP4 files.

If you double-tap or double-click a file in the file manager, the control automatically starts the file with the correct tool. If more than one tool is possible for a file, the control displays a selection window.

The control opens the tools in the third desktop.

39.6.1 Opening tools

To open a tool:

- ▶ Select the HEIDENHAIN icon in the taskbar
- > The control opens the HEROS menu.
- ▶ Select **Tools**
- ▶ Select the tool, e.g. Leafpad
- > The control opens the tool in its own workspace.

Notes

- You can also open several tools from the **Desktop menu** workspace.
- Use the **ALT+TAB** key combination to switch between open workspaces.
- More information on how to use the various tools is provided within the respective tool under Help.
- After starting, the **web browser** checks at regular intervals whether updates are available.

  If you want to update the **web browser**, then you must deactivate the SELinux security software during this time and establish a connection to the Internet. Reactivate SELinux after the update!

  Further information: "SELinux security software", Page 1921

39.7 Network configuration with Advanced Network Configuration

Application

Using the **Advanced Network Configuration**, you can add, edit or remove profiles for the network connection.

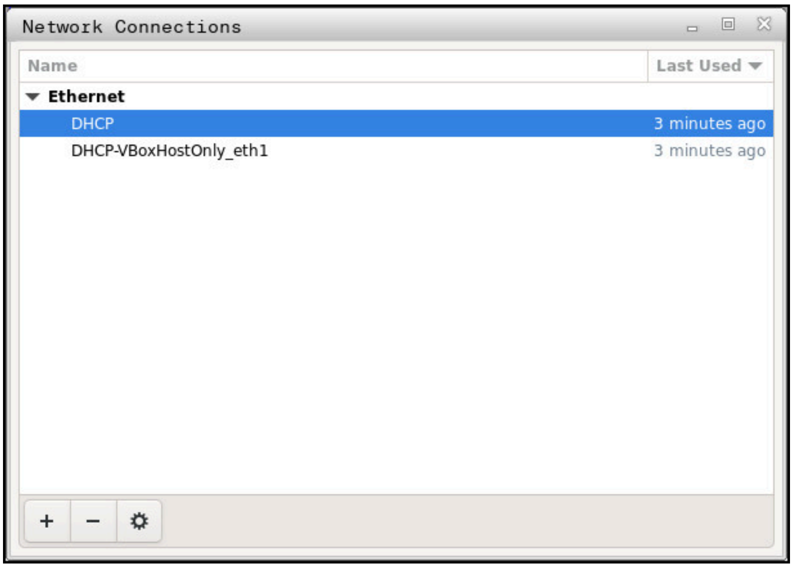
Related topics

- Network settings

  Further information: "Network settings window", Page 1927

Description of function

When you select the **Advanced Network Configuration** application in the HEROS menu, the control opens the **Network connections** window.



Network connections window

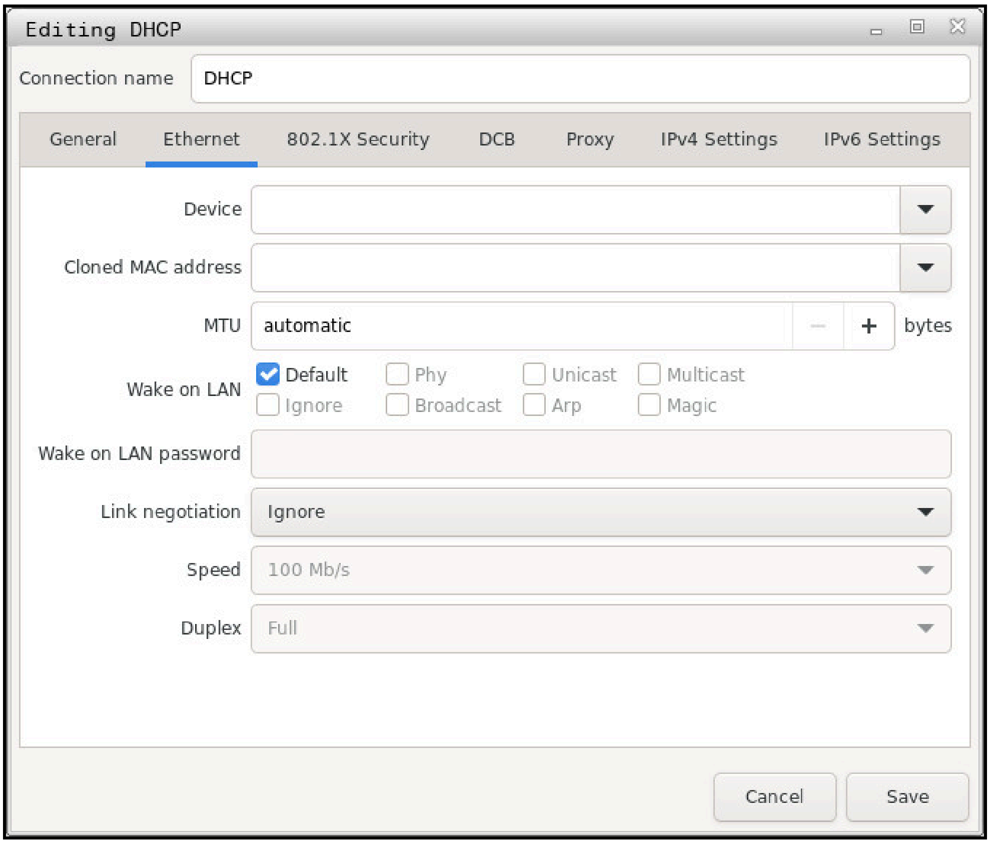
Symbols in the Network connections window

The following symbols are shown in the **Network connections** window:

Symbol	Function
+	Add network connection
−	Remove network connection
	Edit network connection The control opens the Editing network connection window. **Further information:** "Editing network connection window", Page 1975

39.7.1 Editing network connection window

In the **Editing network connection** window, the control shows the connection name of the network connection in the upper area. You can change the name.



Editing network connection window

General tab

The **General** tab contains the following settings:

Setting	Meaning
Connect automatically with priority	If you are using several profiles, you can define an order of priority for the connection here. The control connects the network with the highest priority first. Input: **-999...999**
All users may connect to this network	Here you can enable the selected network for all users.
Automatically connect to VPN	Currently no function
Metered connection	Currently no function

Ethernet tab

The **Ethernet** tab contains the following settings:

Setting	Meaning
Device	Here you can select the Ethernet interface. If you do not select an Ethernet interface, this profile can be used for any Ethernet interface. Selection by means of a selection window
Cloned MAC address	Currently no function
MTU	Here you can define the maximum package size in bytes. Input: **Automatic**, **1...10000**
Wake on LAN	Currently no function
Wake on LAN password	Currently no function
Link negotiation	Here you have to configure the settings for the Ethernet connection: ■ **Ignore** Retain the configurations already existing on the device. ■ **Automatic** The speed and duplex settings are configured automatically for the connection. ■ **Manual** Configure the speed and duplex settings for the connection manually. Selection by means of a selection window
Speed	Here you have to select the speed settings: ■ **10 Mb/s** ■ **100 Mb/s** ■ **1 Gb/s** ■ **10 Gb/s** Only with selection **Link negotiation Manual** Selection by means of a selection window
Duplex	Here you have to select the duplex setting: ■ **Half** ■ **Full** Only with selection **Link negotiation Manual** Selection by means of a selection window

802.1X Security tab

Currently no function

DCB tab

Currently no function

Proxy tab

Currently no function

IPv4 Settings tab

The **IPv4 Settings** tab contains the following settings:

Setting	Meaning
Method	Here you have to select a network connection method: ■ **Automatic (DHCP)** If the network uses a DHCP server for IP address assignment ■ **Automatic (DHCP) addresses only** If the network uses a DHCP server for IP address assignment, but you are assigning the DNS server manually ■ **Manual** Assign the IP address manually ■ **Link-Local Only** Currently no function ■ **Shared to other computers** Currently no function ■ **Disabled** Deactivate IPv4 for this connection
Additional static addresses	Here you can add static IP addresses that will be set up in addition to the IP addresses that are assigned automatically. Only with **Method Manual**
Additional DNS servers	Here you can add the IP addresses of DNS servers that are used to resolve computer names. Separate multiple IP addresses by commas. Only with **Methods Manual** and **Automatic (DHCP) addresses only**
Additional search domains	Here you can add domains used by computer names. Separate multiple domains by commas. Only with **Method Manual**
DHCP client ID	Currently no function
Require IPv4 addressing for this connection to complete	Currently no function

IPv6 Settings tab

Currently no function

40.2.2 Details about the user parameters

Explanations about the detailed view of user parameters:

- The indicated path corresponds to the machine parameter structure that you see after entering the machine manufacturer code number. With this information you can also find the desired machine parameter in the alternative structure. With the machine parameter numbers you can search for the machine parameters independently of the structure.
- The entry after iTNC shows the machine parameter number on the iTNC 530.

DisplaySettings

CfgDisplayData	100800
Settings for screen displays	
Path:	System ▶ DisplaySettings ▶ CfgDisplayData
Structural element:	

axisDisplay	100810
Sequence and rules for displayed axes	
Path:	System ▶ DisplaySettings ▶ CfgDisplayData ▶ axisDisplay
Input:	Up to 24 lists with parameters **MP_axisKey**, **MP_name** and **MP_rule**. Specifies sequence and rules for the display of an axis.

axisKey	100810. [Index].01501
Key name of the axis	
Path:	System ▶ DisplaySettings ▶ CfgDisplayData ▶ axisDisplay ▶ [Index] ▶ axisKey
Input:	Select the key name of the axis for which this display setting is valid. The key names of the axes are taken from the configuration entity CfgAxis and displayed in a selection menu.

name	100810. [Index].01502
Axis designation	
Path:	System ▶ DisplaySettings ▶ CfgDisplayData ▶ axisDisplay ▶ [Index] ▶ name
Input:	max. 2 Characters Defines the axis name, also used for the display alternatively to the key name from CfgAxis. If the parameter is not set, the TNC7 displays the key name.

rule	100810. [Index].01503
Display rule for the axes	
Path:	System ▶ DisplaySettings ▶ CfgDisplayData ▶ axisDisplay ▶ [Index] ▶ rule
Input:	Specifies the condition under which the axis is displayed: **ShowAlways** Axis is always shown. The display location remains reserved even if no values for the axis can be displayed, for example if the axis is not contained in the current kinematic model.

IfKinem

The axis is only shown if used as axis or spindle in the active kinematic model.

IfKinemAxis

Axis only shown if used as axis in the active kinematics model.

IfNotKinemAxis

The axis is only shown if it is not used as an axis in the active kinematics model (e.g. as spindle).

Never

The axis is not shown.

axisDisplayRef		100811
Sequence and rules for display axes before crossing the reference marks		
	Path:	System ► DisplaySettings ► CfgDisplayData ► axisDisplayRef
	Input:	Up to 24 lists with parameters **MP_axisKey**, **MP_name** and **MP_rule**. Specifies the sequence and the rules for the display of axes if the position display is set to REF values (also applies when traversing to the reference point). If this list is empty, the entries from axisDisplay will be used. The top-most entry corresponds to the top-most position.

axisKey		100811.[Index].01501
Key name of the axis		
	Path:	System ► DisplaySettings ► CfgDisplayData ► axisDisplayRef ► [Index] ► axisKey
	Input:	Select the key name of the axis for which this display setting is valid. The key names of the axes are taken from the configuration entity CfgAxis and displayed in a selection menu.

name		100811.[Index].01502
Axis designation		
	Path:	System ► DisplaySettings ► CfgDisplayData ► axisDisplayRef ► [Index] ► name
	Input:	max. 2 Characters Defines the axis name, also used for the display alternatively to the key name from CfgAxis. If the parameter is not set, the TNC7 displays the key name.

rule		100811.[Index].01503
Display rule for the axes		

Path:	System ▶ DisplaySettings ▶ CfgDisplayData ▶ axisDisplayRef ▶ [Index] ▶ rule
Input:	Specifies the condition for displaying the axis: **ShowAlways** Axis is always shown. **IfKinem** Axis only shown if used as axis or spindle in the active kinematics model. **IfKinemAxis** Axis only shown if used as axis in the active kinematics model. **IfNotKinemAxis** The axis is only shown if it is not used as an axis in the active kinematics model (e.g. as spindle). **Never** The axis is not shown.

positionWinDisplay 100803

Type of position display in the positioning window

Path:	System ▶ DisplaySettings ▶ CfgDisplayData ▶ positionWinDisplay
Input:	**NOML** Nominal position **ACTL** Actual position **REF ACTL** Actual position referenced to the machine datum **REF NOML** Nominal position referenced to the machine datum **LAG** Following error (servo lag) **ACTDST** Distance-to-go in the input system **REFDST** Distance-to-go in the machine system **M118** Traverse paths that were carried out with handwheel superimpositioning (M118)

statusWinDisplay 100804

Type of position display in the status display

Path:	System ▶ DisplaySettings ▶ CfgDisplayData ▶ statusWinDisplay
Input:	**NOML** Nominal position **ACTL**

Actual position

REF ACTL

Actual position referenced to the machine datum

REF NOML

Nominal position referenced to the machine datum

LAG

Following error (servo lag)

ACTDST

Distance-to-go in the input system

REFDST

Distance-to-go in the machine system

M118

Traverse paths that were carried out with handwheel superimpositioning (M118)

decimalCharacter 100805

Definition of decimal separator for position display

Path:	System ▶ DisplaySettings ▶ CfgDisplayData ▶ decimalCharacter
Input:	"." ","
iTNC 530:	7280

axisFeedDisplay 100806

Display of the feed rate in **Manual Operation** and **El. Handwheel** modes of operation

Path:	System ▶ DisplaySettings ▶ CfgDisplayData ▶ axisFeedDisplay
Input:	**at axis key** Display of the feed rate only if an axis direction key is pressed. The axis-specific feed rate from CfgFeedLimits/**MP_manualFeed** is displayed. **always minimum** Display of the feed rate also before an axis direction key is pressed (lowest value from CfgFeedLimits/**MP_manualFeed**) for all axes.
iTNC 530:	7270

spindleDisplay 100807

Display of spindle position in the position display

Path:	System ▶ DisplaySettings ▶ CfgDisplayData ▶ spindleDisplay
Input:	**during closed loop** Display of spindle position only if the spindle is servo controlled **during closed loop and M5**

Display of spindle position if the spindle is servo controlled and M5 is active

during closed loop or M5 or tapping

Display of spindle position if the spindle is servo controlled or M5 is active or when tapping

hidePresetTable	100808

Disable the **PRESET MANAGEMENT** soft key

Path:	System ▶ DisplaySettings ▶ CfgDisplayData ▶ hidePresetTable
Input:	**TRUE** Access to the preset table is locked; the soft key is dimmed **FALSE** The preset table can be accessed via soft key

displayFont	100812

Font size for program display in the operating modes Program Run Full Sequence, Program Run Single Block, and Positioning with Manual Data Input.

Path:	System ▶ DisplaySettings ▶ CfgDisplayData ▶ displayFont
Input:	**FONT_APPLICATION_SMALL** Small font size. Same font size as in the Programming and Test Run operating modes. **FONT_APPLICATION_MEDIUM** Big font size.

iconPrioList	100813

Sequence of icons in the display

Path:	System ▶ DisplaySettings ▶ CfgDisplayData ▶ iconPrioList
Input:	**BASIC_ROT** **ROT_3D** **TCPM** **ACC** **TURNING** **AFC** **S_PULSE** **MIRROR** **GPS** **RADCORR** **PARAXCOMP**

MON_FS_OVR

compatibilityBits	100815
Settings for display behavior	
Path:	System ▶ DisplaySettings ▶ CfgDisplayData ▶ compatibilityBits
Input:	Bit ■ 0: in the small PLC window with half the width and without a bar graph, the characters are always shown in the small font size. ■ 1: in the small PLC window with half the width and with a bar graph, the characters are always shown in the large font size.

axesGridDisplay	100816
Axes as list or group in the position display.	
Path:	System ▶ DisplaySettings ▶ CfgDisplayData ▶ axesGridDisplay
Input:	The parameter specifies whether the axes in the position display are shown as a list or as a two-column grid. Possible settings: 0 to **0** Axis display as list (default) **Quantity (n)** Axis display as two-column grid with groups of n x 2 axes
iTNC 530:	7270

CfgPosDisplayPace	101000
Display step for the individual axes	
Path:	System ▶ DisplaySettings ▶ CfgPosDisplayPace
Structural element:	

displayPace	101001
Display step for position display in [mm] or [°]	
Path:	System ▶ DisplaySettings ▶ CfgPosDisplayPace ▶ [Key name of the axis] ▶ displayPace
Input:	**0.1** **0.05** **0.01** **0.005** **0.001** **0.0005** **0.0001**

	0.00005
	0.00001
	0.000005
	0.000001
iTNC 530:	7290.0-8

displayPaceInch 101002

Display step for position display in [inch]

Path:	System ▶ DisplaySettings ▶ CfgPosDisplayPace ▶ [Key name of the axis] ▶ displayPaceInch
Input:	**0.005** **0.001** **0.0005** **0.0001** **0.00005** **0.00001** **0.000005** **0.000001**
iTNC 530:	7290.0-8

CfgUnitOfMeasure 101100

Definition of unit of measure in effect for display

Path:	System ▶ DisplaySettings ▶ CfgUnitOfMeasure
Structural element:	

unitOfMeasure 101101

Unit of measure for display and user interface

Path:	System ▶ DisplaySettings ▶ CfgUnitOfMeasure ▶ unitOfMeasure
Input:	**metric** Metric measurement system **inch** Inches

CfgProgramMode 101200

Format of the NC programs and cycle display

Path:	System ▶ DisplaySettings ▶ CfgProgramMode
Structural element:	

programInputMode 101201

MDI: Program entry in HEIDENHAIN Klartext format or ISO format

Path:	System ▶ DisplaySettings ▶ CfgProgramMode ▶ programInputMode
Input:	**HEIDENHAIN** Program entry with HEIDENHAIN Klartext **ISO** Program entry according to ISO

CfgDisplayLanguage 101300

Definition of the NC and PLC conversational language

Path:	System ▶ DisplaySettings ▶ CfgDisplayLanguage
Structural element:	

ncLanguage 101301

NC conversational language

Path:	System ▶ DisplaySettings ▶ CfgDisplayLanguage ▶ ncLanguage
Input:	**ENGLISH** **GERMAN** **CZECH** **FRENCH** **ITALIAN** **SPANISH** **PORTUGUESE** **SWEDISH** **DANISH** **FINNISH** **DUTCH** **POLISH** **HUNGARIAN** **RUSSIAN** **CHINESE** **CHINESE_TRAD** **SLOVENIAN** **KOREAN** **NORWEGIAN** **ROMANIAN** **SLOVAK** **TURKISH**

iTNC 530:	7230.0

applyCfgLanguage 101305

Load the language of the NC control

Path:	System ▶ DisplaySettings ▶ CfgDisplayLanguage ▶ applyCfgLanguage
Input:	When booting, the control checks whether the language settings of the operating system and the NC are the same. If the settings differ, the NC applies the language setting of the operating system. If the language defined in the machine parameters of the NC is to be used, then you must the set the parameter applyCfgLanguage to TRUE.

plcDialogLanguage 101302

PLC conversational language

Path:	System ▶ DisplaySettings ▶ CfgDisplayLanguage ▶ plcDialogLanguage
Input:	**ENGLISH** **GERMAN** **CZECH** **FRENCH** **ITALIAN** **SPANISH** **PORTUGUESE** **SWEDISH** **DANISH** **FINNISH** **DUTCH** **POLISH** **HUNGARIAN** **RUSSIAN** **CHINESE** **CHINESE_TRAD** **SLOVENIAN** **KOREAN** **NORWEGIAN** **ROMANIAN** **SLOVAK** **TURKISH**
iTNC 530:	7230.1

plcErrorLanguage 101303

PLC error message language

Path:	System ▶ DisplaySettings ▶ CfgDisplayLanguage ▶ plcErrorLanguage
Input:	**ENGLISH** **GERMAN** **CZECH** **FRENCH** **ITALIAN** **SPANISH** **PORTUGUESE** **SWEDISH** **DANISH** **FINNISH** **DUTCH** **POLISH** **HUNGARIAN** **RUSSIAN** **CHINESE** **CHINESE_TRAD** **SLOVENIAN** **KOREAN** **NORWEGIAN** **ROMANIAN** **SLOVAK** **TURKISH**
iTNC 530:	7230.2

helpLanguage 101304

Language for online help

Path:	System ▶ DisplaySettings ▶ CfgDisplayLanguage ▶ helpLanguage
Input:	**ENGLISH** **GERMAN** **CZECH** **FRENCH** **ITALIAN** **SPANISH** **PORTUGUESE** **SWEDISH** **DANISH**

	FINNISH
	DUTCH
	POLISH
	HUNGARIAN
	RUSSIAN
	CHINESE
	CHINESE_TRAD
	SLOVENIAN
	KOREAN
	NORWEGIAN
	ROMANIAN
	SLOVAK
	TURKISH
iTNC 530:	7230.3

CfgStartupData 101500

Behavior during control startup

Path:	System ▶ DisplaySettings ▶ CfgStartupData
Structural element:	

powerInterruptMsg 101501

Acknowledge the **Power interrupted** message

Path:	System ▶ DisplaySettings ▶ CfgStartupData ▶ powerInterruptMsg
Input:	**TRUE** Start-up is only continued after the message has been acknowledged. **FALSE** The **Power interrupted** message does not appear

opMode 101503

Operating mode that is switched to when the control has fully booted

Path:	System ▶ DisplaySettings ▶ CfgStartupData ▶ opMode
Input:	Enter here the GUI designator of the desired operating mode. See the Technical Manual for an overview of the permissible GUI designators. max. 500 Characters

subOpMode 101504

Submode to be activated for the operating mode entered in 'opMode'

Path:	System ▶ DisplaySettings ▶ CfgStartupData ▶ subOpMode

Input:	Enter here the GUI designator of the desired operating submode. See the Technical Manual for an overview of the permissible GUI designators. max. 500 Characters

CfgClockView 120600

Display mode for time of day

Path:	System ▶ DisplaySettings ▶ CfgClockView
Structural element:	

displayMode 120601

Display mode for time of day on the screen

Path:	System ▶ DisplaySettings ▶ CfgClockView ▶ displayMode
Input:	**Analog** Analog clock **Digital** Digital clock **Logo** OEM logo **Analog and logo** Analog clock and OEM logo **Digital and logo** Digital clock and OEM logo **Analog on logo** Analog clock that superimposes the OEM logo **Digital on logo** Digital clock that superimposes the OEM logo

timeFormat 120602

Time format of digital clock

Path:	System ▶ DisplaySettings ▶ CfgClockView ▶ timeFormat
Input:	Possible settings: **12 h format** Time in 12 hours format **24 h format** Time in 24 hours format

CfgInfoLine 120700

Link row on/off

Path:	System ▶ DisplaySettings ▶ CfgInfoLine
Structural element:	

infoLineEnabled 120701

Enable/disable info line

Path:	System ▶ DisplaySettings ▶ CfgInfoLine ▶ infoLineEnabled
Input:	**OFF** The info line is disabled **ON** The info line below the operating mode display is enabled

CfgGraphics 124200

Settings for 3-D simulation graphics

Path:	System ▶ DisplaySettings ▶ CfgGraphics
Structural element:	

modelType 124201

Model type of the 3D simulation graphics

Path:	System ▶ DisplaySettings ▶ CfgGraphics ▶ modelType
Input:	**No Model** The model depiction is deactivated. Only the 3D line graphics are shown (lowest processor load, e.g. for fast testing of the NC program and ascertainment of program run times) **3D** Model depiction for complex operations (highest processor load, e.g. for turning or undercuts) **2.5D** Model depiction for 3-axis operations (medium processor load)

modelQuality 124202

Model quality of the 3D simulation graphics

Path:	System ▶ DisplaySettings ▶ CfgGraphics ▶ modelQuality
Input:	**very high** Very high model quality, the production result can be precisely judged. This setting requires the highest computing power. Block numbers and block end points can only be displayed in the 3D line graphics with this setting. **high** High model quality **medium** Medium model quality **low** Low model quality

clearPathAtBlk 124203

Reset tool paths for new BLK FORM

Path:	System ▶ DisplaySettings ▶ CfgGraphics ▶ clearPathAtBlk
Input:	**ON** With a new BLK FORM in the Test Run graphic, the tool paths are reset **OFF** With a new BLK FORM in the Test Run graphic, the tool paths are not reset

extendedDiagnosis 124204

Write graphics journal files after restart

Path:	System ▶ DisplaySettings ▶ CfgGraphics ▶ modelType
Input:	Activate diagnostic information for HEIDENHAIN (journal files) for the analysis of graphics problems. **OFF** Do not create journal files (default). **ON** Create journal files.

CfgPositionDisplay 124500

Settings for the digital readout

Path:	System ▶ DisplaySettings ▶ CfgPositionDisplay
Structural element:	

progToolCallDL 124501

Position display with TOOL CALL DL

Path:	System ▶ DisplaySettings ▶ CfgPositionDisplay ▶ progToolCallDL
Input:	**As Tool Length** Default behavior of the TNC7. The oversize DL programmed in the TOOL CALL block is taken into account as part of the tool length in the nominal position display. **As Workpiece Oversize** iTNC 530-compatible setting. The oversize DL programmed in the TOOL CALL block is not considered in the nominal position display. Thus, it is effective as workpiece oversize.

CfgTableEditor 125300

Table editor configuration

Path:	System ▶ TableSettings ▶ CfgTableEditor

Structural element:	Specifies properties and settings for the table editor.

deleteLoadedTool 125301

Behavior when deleting tools from the pocket table

Path:	System ▶ TableSettings ▶ CfgTableEditor ▶ deleteLoadedTool
Input:	Possible settings: **DISABLED** Tool deletion is not possible **WITH_WARNING** Tool deletion is possible; Note must be confirmed **WITHOUT_WARNING** Tool deletion is possible without confirmation
iTNC 530:	7263 Bit4, 7263 Bit5

indexToolDelete 125302

Behavior when deleting a tool's index entries

Path:	System ▶ TableSettings ▶ CfgTableEditor ▶ indexToolDelete
Input:	Possible settings: **ALWAYS_ALLOWED** Deletion of index entries is always possible **TOOL_RULES** Behavior depends on the setting of the parameter deleteLoadedTool
iTNC 530:	7263 Bit6

showResetColumnT 125303

Show the **RESET T** soft key

Path:	System ▶ TableSettings ▶ CfgTableEditor ▶ showResetColumnT
Input:	The parameter specifies whether the **RESET T** soft key will be offered when a pocket table is open in the table editor. **TRUE** The soft key is displayed. All tools can be deleted from the tool memory by the user. **FALSE** The soft key is not displayed.
iTNC 530:	7263 Bit3

CfgDisplayCoordSys 127500

Setting the coordinate systems for the display

Path:	System ▶ DisplaySettings ▶ CfgDisplayCoordSys

Structural element:	

transDatumCoordSys 127501

Coordinate system for the datum shift

Path:	System ▶ DisplaySettings ▶ CfgDisplayCoordSys ▶ transDatumCoordSys
Input:	The parameter specifies the coordinate system in which the datum shift is displayed. **WorkplaneSystem** Datum is displayed in the system of the tilted plane (WPL-CS) **WorkpieceSystem** Datum is displayed in the workpiece coordinate system (W-CS)

CfgGlobalSettings 128700

GPS display settings

Path:	System ▶ DisplaySettings ▶ CfgGlobalSettings
Structural element:	

enableOffset 128702

Show offset in the GPS dialog

Path:	System ▶ DisplaySettings ▶ CfgGlobalSettings ▶ enableOffset
Input:	**OFF** Offset is not displayed **ON** Offset is displayed

enableBasicRot 128703

Show an additive basic rotation in the GPS dialog

Path:	System ▶ DisplaySettings ▶ CfgGlobalSettings ▶ enableBasicRot
Input:	**OFF** Additive basic rotation is not displayed **ON** Additive basic rotation is displayed

enableShiftWCS 128704

Show shift of W-CS in the GPS dialog

Path:	System ▶ DisplaySettings ▶ CfgGlobalSettings ▶ enableShiftWCS

Input:	**OFF** Shift of W-CS (workpiece coordinate system) is not displayed **ON** Shift of W-CS (workpiece coordinate system) is displayed

enableMirror 128712

Show mirror image in the GPS dialog

Path:	System ▶ DisplaySettings ▶ CfgGlobalSettings ▶ enableMirror
Input:	**OFF** Mirroring is not displayed **ON** Mirroring is displayed

enableShiftMWCS 128711

Show shift of mW-CS in the GPS dialog

Path:	System ▶ DisplaySettings ▶ CfgGlobalSettings ▶ enableShiftMWCS
Input:	**OFF** Shift of mW-CS (modified workpiece coordinate system) is not displayed **ON** Shift of the mW-CS (modified workpiece coordinate system) is displayed

enableRotation 128707

Show rotation in the GPS dialog

Path:	System ▶ DisplaySettings ▶ CfgGlobalSettings ▶ enableRotation
Input:	**OFF** Rotation is not displayed **ON** Rotation is displayed

enableFeed 128708

Show feed rate the GPS dialog

Path:	System ▶ DisplaySettings ▶ CfgGlobalSettings ▶ enableFeed
Input:	**OFF** Feed rate is not displayed **ON** Freed rate is displayed

enableHwMCS 128709

M-CS coordinate system is selectable

Path:	System ▶ DisplaySettings ▶ CfgGlobalSettings ▶ enableHwMCS
Input:	**OFF** Coordinate system M-CS (machine coordinate system) cannot be selected **ON** Coordinate system M-CS (machine coordinate system) can be selected

enableHwWCS 128710

W-CS coordinate system is selectable

Path:	System ▶ DisplaySettings ▶ CfgGlobalSettings ▶ enableHwWCS
Input:	**OFF** Coordinate system W-CS (workpiece coordinate system) cannot be selected **ON** Coordinate system W-CS (workpiece coordinate system) can be selected

enableHwMWCS 128711

mW-CS coordinate system is selectable

Path:	System ▶ DisplaySettings ▶ CfgGlobalSettings ▶ enableHwMWCS
Input:	**OFF** Coordinate system mW-CS (modified workpiece coordinate system) cannot be selected **ON** Coordinate system mW-CS (modified workpiece coordinate system) can be selected

enableHwWPLCS 128712

WPL-CS coordinate system is selectable

Path:	System ▶ DisplaySettings ▶ CfgGlobalSettings ▶ enableHwWPLCS
Input:	**OFF** Coordinate system WPL-CS (working plane coordinate system) cannot be selected **ON** Coordinate system WPL-CS (working plane coordinate system) can be selected

CfgRemoteDesktop 133500

Settings for Remote Desktop connections

Path:	System ▶ DisplaySettings ▶ CfgRemoteDesktop

Structural element:

connections 133501

List of Remote Desktop connections to be displayed

Path:	System ▶ DisplaySettings ▶ CfgRemoteDesktop ▶ connections
Input:	Enter here the name of a RemoteFX connection from Remote Desktop Manager. max. 80 Characters

title 133502

Name of the OEM operating mode

Path:	System ▶ DisplaySettings ▶ CfgRemoteDesktop ▶ title
Input:	Specifies the name of the OEM operating mode for display on the TNC and in the information bar.

dialogRes 133502.00501

Name of a text

Path:	System ▶ DisplaySettings ▶ CfgRemoteDesktop ▶ title ▶ dialogRes
Input:	If the text is not meant to be language-sensitive, then it must be available with this name in a text resource file. In this case, enter the text at the “text” attribute. max. 40 Characters

text 133502.00502

Language-sensitive text

Path:	System ▶ DisplaySettings ▶ CfgRemoteDesktop ▶ title ▶ text
Input:	This text is loaded from a text resource file and should not be changed here. If the text is not language-sensitive, then you must directly provide the text here. In this case, do not enter anything at the “dialogRes” attribute. max. 60 Characters

icon 133503

Path/name for optional icon graphic file

Path:	System ▶ DisplaySettings ▶ CfgRemoteDesktop ▶ icon
Input:	max. 260 Characters

locations 133504

List with positions where this Remote Desktop connection is displayed

Path:	System ▶ DisplaySettings ▶ CfgRemoteDesktop ▶ locations

Input:

opMode 133504.[Index].133401

Operating mode

Path:	System ▶ DisplaySettings ▶ CfgRemoteDesktop ▶ locations ▶ [Index] ▶ opMode
Input:	max. 80 Characters

subOpMode 133504.[Index].133402

Optional submode for the operating mode specified in 'opMode'

Path:	System ▶ DisplaySettings ▶ CfgRemoteDesktop ▶ locations ▶ [Index] ▶ subOpMode
Input:	max. 80 Characters

ProbeSettings

CfgTT 122700

Configuration of the tool calibration

Path:	System ▶ ProbeSettings ▶ CfgTT
Structural element:	

spindleOrientMode 122704

M function for spindle orientation

Path:	System ▶ ProbeSettings ▶ CfgTT ▶ [Key name of the TT] ▶ spindleOrientMode
Input:	-1 to 999 ■ **-1** Spindle orientation directly by NC ■ **0** Function inactive ■ **1 to 999** Number of the M function for spindle orientation by the PLC
iTNC 530:	MP6560

probingRoutine 122705

Probing routine

Path:	System ▶ ProbeSettings ▶ CfgTT ▶ [Key name of the TT] ▶ probingRoutine
Input:	**MultiDirections** The probe contact is probed from several directions. **SingleDirection** The probe contact is probed from one direction.
iTNC 530:	6500 Bit 8

probingDirRadial 122706

Probing direction for tool radius measurement

Path:	System ▶ ProbeSettings ▶ CfgTT ▶ [Key name of the TT] ▶ probingDirRadial
Input:	**X_Positive** **Y_Positive** **X_Negative** **Y_Negative** **Z_Positive** **Z_Negative**

iTNC 530:	MP6505

offsetToolAxis 122707

Distance from lower edge of tool to upper edge of stylus

Path:	System ▶ ProbeSettings ▶ CfgTT ▶ [Key name of the TT] ▶ offsetToolAxis
Input:	0.001 to 99.9999 [mm], max. 4 decimal places
iTNC 530:	MP6530

rapidFeed 122708

Rapid traverse in probing cycle for TT tool touch probe

Path:	System ▶ ProbeSettings ▶ CfgTT ▶ [Key name of the TT] ▶ rapidFeed
Input:	10 to 300000
iTNC 530:	MP6550

probingFeed 122709

Probing feed rate for tool measurement with non-rotating tool

Path:	System ▶ ProbeSettings ▶ CfgTT ▶ [Key name of the TT] ▶ probingFeed
Input:	1 to 3000
iTNC 530:	6520

probingFeedCalc 122710

Calculation of the probing feed rate

Path:	System ▶ ProbeSettings ▶ CfgTT ▶ [Key name of the TT] ▶ probingFeedCalc
Input:	**ConstantTolerance** Calculation of the probing feed rate with constant tolerance **VariableTolerance** Calculation of the probing feed rate with variable tolerance **ConstantFeed** Constant probing feed rate
iTNC 530:	6507

spindleSpeedCalc 122711

Speed determination method

Path:	System ▶ ProbeSettings ▶ CfgTT ▶ [Key name of the TT] ▶ spindleSpeedCalc
Input:	**Automatic** Automatically determine speed **MinSpindleSpeed** Always use minimum spindle speed

iTNC 530:	6500 Bit4

maxPeriphSpeedMeas 122712

Maximum permissible surface speed of the tool edge for radius measurement

Path:	System ▶ ProbeSettings ▶ CfgTT ▶ [Key name of the TT] ▶ maxPeriphSpeedMeas
Input:	1 to 129 [m/min], max. 4 decimal places
iTNC 530:	6570

maxSpeed 122714

Maximum permissible speed during tool measurement

Path:	System ▶ ProbeSettings ▶ CfgTT ▶ [Key name of the TT] ▶ maxSpeed
Input:	0 to 1000
iTNC 530:	6572

measureTolerance1 122715

Maximum permissible measuring error for tool measurement with rotating tool (first measurement error)

Path:	System ▶ ProbeSettings ▶ CfgTT ▶ [Key name of the TT] ▶ measureTolerance1
Input:	0.001 to 0.999 [mm], max. 3 decimal places
iTNC 530:	6510.0

measureTolerance2 122716

Maximum permissible measuring error for tool measurement with rotating tool (second measurement error)

Path:	System ▶ ProbeSettings ▶ CfgTT ▶ [Key name of the TT] ▶ measureTolerance2
Input:	0.001 to 0.999 [mm], max. 3 decimal places
iTNC 530:	6510.1

stopOnCheck 122717

NC stop during tool check

Path:	System ▶ ProbeSettings ▶ CfgTT ▶ [Key name of the TT] ▶ stopOnCheck
Input:	**TRUE** If the breakage tolerance is exceeded, the NC program is stopped and the error message **Tool broken** is displayed. **FALSE** The NC program is not stopped when the breakage tolerance is exceeded

iTNC 530:	6500 Bit5

stopOnMeasurement 122718

NC stop during tool measurement

Path:	System ▶ ProbeSettings ▶ CfgTT ▶ [Key name of the TT] ▶ stopOnMeasurement
Input:	**TRUE** If the breakage tolerance is exceeded, the NC program is stopped and the error message **Touch point inaccessible** is displayed **FALSE** The NC program is not stopped when the breakage tolerance is exceeded
iTNC 530:	6500 Bit6

adaptToolTable 122719

Change the tool table during tool check and tool measurement

Path:	System ▶ ProbeSettings ▶ CfgTT ▶ [Key name of the TT] ▶ adaptToolTable
Input:	**AdaptNever** The tool table is not changed after tool check and tool measurement. **AdaptOnBoth** The tool table is changed after tool check and tool measurement. **AdaptOnMeasure** The tool table is changed after tool measurement.
iTNC 530:	6500 Bit11

CfgTTRoundStylus 114200

Configuration of a round stylus

Path:	System ▶ ProbeSettings ▶ CfgTTRoundStylus
Structural element:	

centerPos 114201

Coordinates of the TT tool touch probe stylus contact center with respect to the machine datum

Path:	System ▶ ProbeSettings ▶ CfgTTRoundStylus ▶ [Key name of the TT] ▶ centerPos
Input:	-99999.9999 to 99999.9999 [mm], max. 4 decimal places [0]: X coordinate [1]: Y coordinate [2]: Z coordinate

iTNC 530:	6580, 6581, 6582

safetyDistToolAx 114203

Safety clearance around the probe contact of the TT tool touch probe for pre-positioning in the tool-axis direction

Path:	System ▶ ProbeSettings ▶ CfgTTRoundStylus ▶ [Key name of the TT] ▶ safetyDistToolAx
Input:	0.001 to 99999.9999 [mm], max. 4 decimal places
iTNC 530:	6540.0

safetyDistStylus 114204

Safety zone around the stylus for pre-positioning

Path:	System ▶ ProbeSettings ▶ CfgTTRoundStylus ▶ [Key name of the TT] ▶ safetyDistStylus
Input:	0.001 to 99999.9999 [mm], max. 4 decimal places Safety clearance in the plane perpendicular to the tool axis
iTNC 530:	6540.1

CfgTTRectStylus 114300

Configuration of a rectangular stylus

Path:	System ▶ ProbeSettings ▶ CfgTTRectStylus
Structural element:	

centerPos 114313

Coordinates of the stylus center

Path:	System ▶ ProbeSettings ▶ CfgTTRectStylus ▶ [Key name of the TT] ▶ centerPos
Input:	Coordinates of the stylus center with respect to the machine datum -99999.9999 to 99999.9999 [mm], max. 4 decimal places
iTNC 530:	6580, 6581, 6582

safetyDistToolAx 114317

Set-up clearance above the stylus for pre-positioning

Path:	System ▶ ProbeSettings ▶ CfgTTRectStylus ▶ [Key name of the TT] ▶ safetyDistToolAx
Input:	0.001 to 99999.9999 [mm], max. 4 decimal places Safety clearance in tool axis direction
iTNC 530:	6540.0

safetyDistStylus 114318

Safety zone around the stylus for pre-positioning

Path:	System ► ProbeSettings ► CfgTTRectStylus ► [Key name of the TT] ► safetyDistStylus
Input:	0.001 to 99999.9999 [mm], max. 4 decimal places
iTNC 530:	6540.1

ChannelSettings

CfgActivateKinem	204000
Active kinematics	
Path:	Channels ▶ ChannelSettings ▶ CfgActivateKinem
Structural element:	

kinemToActivate	204001
Kinematics to be activated / Active kinematics	
Path:	Channels ▶ ChannelSettings ▶ [Key name of the machining channel] ▶ CfgActivateKinem ▶ kinemToActivate
Input:	max. 18 Characters Key names from Channels/Kinematics/**CfgKinComposModel**. Select the key name of the kinematics configuration to be activated. You can also see from this parameter which kinematics model is currently active.

kinemAtStartup	204002
The kinematics to be activated during control start-up	
Path:	Channels ▶ ChannelSettings ▶ CfgActivateKinem ▶ [Key name of the machining channel] ▶ kinemAtStartup
Input:	max. 18 Characters Here, you can enter the key name of a default kinematic model (from **CfgKinComposModel**) that is activated during every start-up of the control (regardless of which key name has been entered in CfgActivateKinem/kinemToActivate).
iTNC 530:	7506

CfgNcPgmBehaviour	200800
Specify the behavior of the NC program.	
Path:	Channels ▶ ChannelSettings ▶ CfgNcPgmBehaviour
Structural element:	

operatingTimeReset	200801
Reset the machining time when program starts.	
Path:	Channels ▶ ChannelSettings ▶ [Key name of the machining channel] ▶ CfgNcPgmBehaviour ▶ operatingTimeReset
Input:	**TRUE** The machining time is reset at each program start. **FALSE**

The machining time is totaled.

plcSignalCycle		200803
PLC signal for the number of the pending machining cycle		
	Path:	Channels ▶ ChannelSettings ▶ [Key name of the machining channel] ▶ CfgNcPgmBehaviour ▶ plcSignalCycle
	Input:	max. 500 Characters Name or number of a PLC word marker

CfgGeoTolerance		200900
Geometry tolerances		
	Path:	Channels ▶ ChannelSettings ▶ CfgGeoTolerance
	Structural element:	

circleDeviation		200901
Permissible deviation of the radius		
	Path:	Channels ▶ ChannelSettings ▶ [Key name of the machining channel] ▶ CfgGeoTolerance ▶ circleDeviation
	Input:	0.0001 to 0.016 [mm], max. 4 decimal places Enter the permissible deviation of the radius between the end point and starting point of the arc.
	iTNC 530:	7431

threadTolerance		200902
Permissible deviation in successive threads		
	Path:	Channels ▶ ChannelSettings ▶ [Key name of the machining channel] ▶ CfgGeoTolerance ▶ threadTolerance
	Input:	0.0001 to 999.9999 [mm], max. 9 decimal places Permissible deviation of the dynamically smoothed contour from the programmed thread contour.

moveBack		200903
Reserve for retraction movements		
	Path:	Channels ▶ ChannelSettings ▶ [Key name of the machining channel] ▶ CfgGeoTolerance ▶ moveBack
	Input:	0.0001 to 10 [mm], max. 9 decimal places

With this parameter you specify how far before a limit switch or a collision object a retraction movement should end.

CfgGeoCycle	201000
Configuration of the fixed cycles	
Path:	Channels ▶ ChannelSettings ▶ CfgGeoCycle
Structural element:	

pocketOverlap	201001
Overlap factor for pocket milling	
Path:	Channels ▶ ChannelSettings ▶ [Key name of the machining channel] ▶ CfgGeoCycle ▶ pocketOverlap
Input:	0.001 to 1.414, max. 3 decimal places
iTNC 530:	7430

posAfterContPocket	201007
Traverse after machining the contour pocket	
Path:	Channels ▶ ChannelSettings ▶ [Key name of the machining channel] ▶ CfgGeoCycle ▶ posAfterContPocket
Input:	**PosBeforeMachining** Move to the position from which the SL cycle was started. **ToolAxClearanceHeight** Move the tool axis to clearance height.
iTNC 530:	7420 Bit 4

displaySpindleErr	201002
Display the **Spindle is not rotating** error message if M3/M4 is not active	
Path:	Channels ▶ ChannelSettings ▶ [Key name of the machining channel] ▶ CfgGeoCycle ▶ displaySpindleErr
Input:	**on** The error message is displayed **off** The error message is not displayed
iTNC 530:	7441

displayDepthErr	201003
Display the **Check the depth sign** error message	
Path:	Channels ▶ ChannelSettings ▶ [Key name of the machining channel] ▶ CfgGeoCycle ▶ displayDepthErr

Input:	**on** Error message is displayed **off** Error message is not displayed
iTNC 530:	7441

apprDepCylWall 201004

Behavior when moving to wall of slot in the cylinder surface

Path:	Channels ▶ ChannelSettings ▶ [Key name of the machining channel] ▶ CfgGeoCycle ▶ apprDepCylWall
Input:	Defines the behavior for cutter movements to the wall of a slot in the cylinder surface when machining the slot with a milling cutter whose diameter is less than the slot diameter (e.g. Cycle 28). **LineNormal** The slot wall is approached and departed linearly. **CircleTangential** The slot wall is approached and departed tangentially; at the beginning and end of the slot a rounding arc with a diameter equal to the slot width is inserted.
iTNC 530:	7680 Bit 12

mStrobeOrient 201005

M function for spindle orientation in machining cycles

Path:	Channels ▶ ChannelSettings ▶ [Key name of the machining channel] ▶ CfgGeoCycle ▶ mStrobeOrient
Input:	-1 to 999 -1: Spindle orientation directly through the NC 0: Function not active 1 to 999: Number of the M function for spindle orientation through the PLC.
iTNC 530:	7442

suppressPlungeErr 201006

Do not show 'Plunging type is not possible' error message

Path:	Channels ▶ ChannelSettings ▶ [Key name of the machining channel] ▶ CfgGeoCycle ▶ suppressPlungeErr
Input:	**on** Error message is not displayed **off** Error message is displayed

restoreCoolant 201008

Behavior of M7 and M8 with Cycles 202 and 204

Path:	Channels ▶ ChannelSettings ▶ [Key name of the machining channel] ▶ CfgGeoCycle ▶ restoreCoolant
Input:	**TRUE** At the end of Cycles 202 and 204, the status of M7 and M8 is restored to that before the cycle call. **FALSE** At the end of Cycles 202 and 204, the status of M7 and M8 is not restored automatically.
iTNC 530:	7682

facMinFeedTurnSMAX 201009

Automatic feed rate reduction after attaining SMAX

Path:	Channels ▶ ChannelSettings ▶ [Key name of the machining channel] ▶ CfgGeoCycle ▶ facMinFeedTurnSMAX
Input:	1 to 100 [%], max. 1 decimal places If the maximum spindle speed SMAX is reached, the turning operation can no longer maintain the constant surface speed (VCONST:ON). The parameter determines whether the feed should be automatically reduced from this point to the center of rotation. Possible settings: ■ Factor = 100% (default value): Feed rate reduction deactivated. The feed rate from the turning cycle is used. ■ 0 < factor < 100%: Feed rate reduction is activated. The minimum feed rate Fmin is: Fmin = feed rate from turning cycle * factor

suppressResMatlWar 201010

Do not show "Residual material" warning

Path:	Channels ▶ ChannelSettings ▶ [Key name of the machining channel] ▶ CfgGeoCycle ▶ suppressResMatlWar
Input:	**Never** The "Residual material due to cutter geometry" warning is never suppressed **NCOnly** The “Residual material due to cutter geometry” warning is suppressed only in the Machine operating modes. **Always** The "Residual material due to cutter geometry" warning is always suppressed.

CfgStretchFilter 201100

Geometry filter for filtering out linear elements

Path:	Channels ▶ ChannelSettings ▶ CfgStretchFilter
Structural element:	

filterType 201101

Type of stretch filter

Path:	Channels ▶ ChannelSettings ▶ [Key name of the machining channel] ▶ CfgStretchFilter ▶ filterType
Input:	**Off** The filter is switched off. **ShortCut** Individual points on the polygon are omitted. If the connecting line from the middle point to the previous point or to the next point of three subsequent points on a polygon is within the tolerance band, the middle point will be omitted. **Average** The geometry filter smooths corners. This method moves the contour points in such a way that changes in direction are less distinct.

tolerance 201102

Maximum distance of the filtered to the unfiltered contour

Path:	Channels ▶ ChannelSettings ▶ [Key name of the machining channel] ▶ CfgStretchFilter ▶ tolerance
Input:	0 to 10 [mm], max. 5 decimal places Points that lie within this tolerance on the resulting new path will be filtered out. **0**: Stretch filter is off

maxLength 201103

Maximum length of the distance resulting from filtering

Path:	Channels ▶ ChannelSettings ▶ [Key name of the machining channel] ▶ CfgStretchFilter ▶ maxLength
Input:	0 to 1000 [mm], max. 3 decimal places **0**: Stretch filter is off

CfgThreadSpindle 113600

Path:	Channels ▶ ChannelSettings ▶ CfgThreadSpindle

Structural element:

sourceOverride 113603

Effective override potentiometer for feed rate during thread cutting

Path:	Channels ▶ ChannelSettings ▶ [Key name of machining channel] ▶ CfgThreadSpindle ▶ sourceOverride
Input:	The adjusted potentiometer is effective during thread cutting for shaft speed and feed rate. **FeedPotentiometer** (previous behavior of the TNC 640) During thread cutting, the potentiometer is effective for the feed rate knob. The potentiometer for the spindle speed knob is not active. **SpindlePotentiometer** (iTNC 530-compatible setting) During thread cutting, the potentiometer is effective for the spindle speed knob. The potentiometer for the feed rate override is disabled.

thrdWaitingTime 113601

Waiting time at reversal point in thread base

Path:	Channels ▶ ChannelSettings ▶ [Key name of machining channel] ▶ CfgThreadSpindle ▶ thrdWaitingTime
Input:	0 to 1 000 [s], max. 9 decimal places The spindle stops for this time at the bottom of the thread before starting again in the opposite direction of rotation.
iTNC 530:	7120.0

thrdPreSwitchTime 113602

Advanced switching time of spindle

Path:	Channels ▶ ChannelSettings ▶ [Key name of machining channel] ▶ CfgThreadSpindle ▶ thrdPreSwitchTime
Input:	0 to 1 000 [s], max. 9 decimal places The spindle is stopped at this time before reaching the bottom of the thread.
iTNC 530:	7120.1

limitSpindleSpeed 113604

Limit of spindle speed with Cycles 17, 207 and 18

Path:	Channels ▶ ChannelSettings ▶ [Key name of machining channel] ▶ CfgThreadSpindle ▶ limitSpindleSpeed
Input:	**TRUE**

	Spindle speed is limited so that it runs with constant speed approx. 1/3 of the time **FALSE** Limit not active
iTNC 530:	7160, Bit1

CfgEditorSettings

CfgEditorSettings	105400
Settings for the NC editor	
Path:	System ▶ EditorSettings ▶ CfgEditorSettings
Structural element:	

createBackup	105401
Generate a backup file *.bak	
Path:	System ▶ EditorSettings ▶ CfgEditorSettings ▶ createBackup
Input:	**TRUE** After you have edited a file, a backup file *.bak is automatically created before you save the file and exit the NC editor. **FALSE** No backup file *.bak is created. Select this setting if you do not need any backup files and want to save memory space.

deleteBack	105402
Behavior of the cursor after deletion of lines	
Path:	System ▶ EditorSettings ▶ CfgEditorSettings ▶ deleteBack
Input:	**TRUE** Behavior as with iTNC 530, the cursor is on the previous line **FALSE** The cursor is on the next line

cursorAround	105403
Behavior of the cursor on the first or last line	
Path:	System ▶ EditorSettings ▶ CfgEditorSettings ▶ cursorAround
Input:	**TRUE** Cursor jumps to the last or first line **FALSE** Cursor stands ready at the first or last line. Jumping not possible.

lineBreak	105404
Line break on NC blocks with more than one line	
Path:	System ▶ EditorSettings ▶ CfgEditorSettings ▶ lineBreak
Input:	**ALL** Always break and display lines completely (multiline) **ACT** Only display the selected NC block completely (multiline)

	NO Only display all lines when the selected NC block is edited
iTNC 530:	7281.0

stdTNChelp 105405

Activate help graphics when entering cycle data

Path:	System ▶ EditorSettings ▶ CfgEditorSettings ▶ stdTNChelp
Input:	**TRUE** Behavior as with iTNC 530: the help graphics are displayed automatically during cycle entry. **FALSE** The help graphics have to be called via the **CYCLE HELP ON/OFF** soft key.

toggleCyclDef 105406

Behavior of the cycle soft key row after a cycle entry

Path:	System ▶ EditorSettings ▶ CfgEditorSettings ▶ toggleCyclDef
Input:	**TRUE** The cycle soft key row remains active after the cycle entry **FALSE** The cycle soft key row is hidden after the cycle entry

warningAtDEL 105407

Confirmation request when deleting an NC block.

Path:	System ▶ EditorSettings ▶ CfgEditorSettings ▶ warningAtDEL
Input:	**TRUE** The confirmation request is displayed and must be confirmed by pressing DEL again. **FALSE** iTNC 530 behavior: The NC block is deleted without any request for confirmation.
iTNC 530:	7246

maxLineGeoSearch 105408

Line number up to which a test of the NC program is to be run.

Path:	System ▶ EditorSettings ▶ CfgEditorSettings ▶ maxLineGeoSearch
Input:	The available value range depends on the performance of the control. For the TNC7, you can enter a value between 100 and 100 000. If the parameter is not part of the configuration, the minimal value 100 becomes effective.

iTNC 530:	7229

blockIncrement 105409

ISO programming: Block number increment

Path:	System ▶ EditorSettings ▶ CfgEditorSettings ▶ blockIncrement
Input:	0 to 250
iTNC 530:	7220

useProgAxes 105410

Specify programmable axes

Path:	System ▶ EditorSettings ▶ CfgEditorSettings ▶ useProgAxes
Input:	**TRUE** Use the axis configuration defined in the CfgChannelAxes/**progAxis** parameter (200301). On machines with traverse range switchover, the editor offers all axes that are included in at least one kinematic model of the machine. **FALSE** Use the default axis configuration XYZABCUVW.

enableStraightCut 105411

Allow or lock paraxial positioning blocks

Path:	System ▶ EditorSettings ▶ CfgEditorSettings ▶ enableStraightCut
Input:	**TRUE** Paraxial positioning blocks are allowed. When an orange axis key is pressed, and in DIN/ISO when G07 is programmed, a paraxial positioning block is generated. **FALSE** Paraxial positioning blocks are locked. When an orange axis key is pressed, the TNC7 generates a straight-line interpolation (L block) instead of a paraxial positioning block.
iTNC 530:	7246

maxLineCommandSrch 105412

Number of lines for searching for identical syntax elements

Path:	System ▶ EditorSettings ▶ CfgEditorSettings ▶ maxLineCommandSrch
Input:	The available value range depends on the performance of the control. For the TNC7, you can enter a value between 500 and 400 000. If the parameter is not part of the configuration, the initial value 20 000 becomes effective.

noParaxMode 105413

Allow/lock **FUNCTION PARAXCOMP/PARAXMODE** via soft key

Path:	System ▶ EditorSettings ▶ CfgEditorSettings ▶ noParaxMode
Input:	The input possibility over **SPEC FCT** → soft key **PROGRAM FUNCTIONS** → soft key **FUNCTION PARAX** is permitted or locked using **MP_noParaxMode**. (Machine parameter not part of the configuration means that the behavior is the same as FALSE) **FALSE** The **FUNCTION PARAX** soft key is displayed **TRUE** The **FUNCTION PARAX** soft key is not displayed

CfgPgmMgt

CfgPgmMgt 122100

Settings for the file management

Path:	System ▶ ProgramManager ▶ CfgPgmMgt
Structural element:	

dependentFiles 122101

Display of dependent files

Path:	System ▶ ProgramManager ▶ CfgPgmMgt ▶ dependentFiles
Input:	**AUTOMATIC** Dependent files are not displayed **MANUAL** Dependent files are displayed

CfgProgramCheck

CfgProgramCheck	129800
Settings for tool-usage files	
Path:	System ▶ ToolSettings ▶ CfgProgramCheck
Structural element:	

autoCheckTimeOut	129803
Timeout for creation of tool-usage files	
Path:	System ▶ ToolSettings ▶ CfgProgramCheck ▶ autoCheckTimeOut
Input:	Automatic creation of the tool-usage file is aborted if this time is exceeded. 1 to 500

autoCheckPrg	129801
Create tool-usage file for NC program	
Path:	System ▶ ToolSettings ▶ CfgProgramCheck ▶ autoCheckPrg
Input:	**NoAutoCreate** No tool-usage list will be generated upon selection of a program **OnProgSelectionIfNotExist** A tool-usage list will be generated upon program selection if the list does not already exist **OnProgSelectionIfNecessary** A tool-usage list will be generated upon program selection if the list does not already exist or if it contains obsolete data **OnProgSelectionAndModify** A tool usage list will be generated upon program selection if the list does not already exist, if it contains obsolete data, or if the NC program is modified afterwards using an editor

autoCheckPal	129802
Create pallet-usage files	
Path:	System ▶ ToolSettings ▶ CfgProgramCheck ▶ autoCheckPal
Input:	**NoAutoCreate** No tool-usage files will be generated upon pallet selection **OnProgSelectionIfNotExist** Upon pallet selection, those tool-usage lists that do not already exist will be generated **OnProgSelectionIfNecessary** Upon pallet selection, those tool-usage lists that do not already exist or that contain obsolete data will be generated **OnProgSelectionAndModify**

Upon pallet selection, tool-usage lists will be generated that do not already exist, that contain obsolete data, or whose NC programs are modified via the editor

CfgUserPath

CfgUserPath		102200
Paths for the end user		
Path:	System ▶ Paths ▶ CfgUserPath	
Structural element:		

ncDir		102201
List of drives and/or directories		
Path:	System ▶ Paths ▶ CfgUserPath ▶ ncDir	
Input:	max. 260 Characters This parameter is available only on the Windows programming stations of the TNC7. The parameter is not evaluated on a programming station with virtualization software (VBox) or on the TNC target system. The drives and/or directories entered here are visible in the file manager, provided that you have the required access rights. These paths may contain NC programs or tables. Possible entries are, for example: floppy-disk, HDR and CFR directories as well as network drives.	

fn16DefaultPath		102202
Default output path for the **FN16: F-PRINT** function in the Program Run operating modes		
Path:	System ▶ Paths ▶ CfgUserPath ▶ fn16DefaultPath	
Input:	max. 260 Characters Select the folder in the dialog window and confirm it with the **SELECT** soft key Default path for output with **FN 16: F-PRINT**. If no path is defined for the FN 16 function in the NC program, the output destination is in the directory specified here.	

fn16DefaultPathSim		102203
Default output path for the **FN16: F-PRINT** function in the Programming and Test Run operating modes		
Path:	System ▶ Paths ▶ CfgUserPath ▶ fn16DefaultPathSim	
Input:	max. 260 Characters Select the folder in the dialog window and confirm it with the **SELECT** soft key Default path for output with **FN 16: F-PRINT**. If no path is defined for the FN 16 function in the NC program, the output destination is in the directory specified here.	

serialInterfaceRS232

CfgSerialPorts	106600
Data record belonging to the serial port	
Path:	System ▶ Network ▶ Serial ▶ CfgSerialPorts
Structural element:	

activeRs232	106601
Enable the RS-232 interface in the program manager	
Path:	System ▶ Network ▶ Serial ▶ CfgSerialPorts ▶ activeRs232
Input:	**TRUE** The RS-232 interface is enabled in the program manager and shown as a drive icon (**RS232:**). **FALSE** The RS-232 interface cannot be accessed via the program manager.

baudRateLsv2	106606
Data transfer rate for LSV2 communication in baud	
Path:	System ▶ Network ▶ Serial ▶ CfgSerialPorts ▶ baudRateLsv2
Input:	Use a selection menu to define the transfer rate for the LSV2 communication. Minimum value is 110 baud, maximum value 115200 baud. **BAUD_110** **BAUD_150** **BAUD_300** **BAUD_600** **BAUD_1200** **BAUD_2400** **BAUD_4800** **BAUD_9600** **BAUD_19200** **BAUD_38400** **BAUD_57600** **BAUD_115200**

CfgSerialInterface	106700
Definition of data records for the serial ports	
Path:	System ▶ Network ▶ Serial ▶ CfgSerialInterface

Structural element:

baudRate 106701

Data transfer rate for communication in baud

Path:	System ▶ Network ▶ Serial ▶ CfgSerialInterface ▶ [Key names of the interface parameters] ▶ baudRate
Input:	Use a selection menu to define the transfer rate for the data transmission. Minimum value is 110 baud, maximum value 115200 baud. **BAUD_110** **BAUD_150** **BAUD_300** **BAUD_600** **BAUD_1200** **BAUD_2400** **BAUD_4800** **BAUD_9600** **BAUD_19200** **BAUD_38400** **BAUD_57600** **BAUD_115200**
iTNC 530:	5040

protocol 106702

Communications protocol

Path:	System ▶ Network ▶ Serial ▶ CfgSerialInterface ▶ [Key names of the interface parameters] ▶ protocol
Input:	**STANDARD** Standard data transfer. Data transferred line-by-line. **BLOCKWISE** Packet-based data transfer, ACK/NAK protocol. The control characters ACK (Acknowledge) and NAK (not Acknowledge) are used to control block-wise data transfer. **RAW_DATA** Data transferred without protocol. Transfer of characters without control characters. Protocol intended for transfer of data of the PLC.
iTNC 530:	5030

dataBits 106703

Data bits in each transferred character

Path:	System ▶ Network ▶ Serial ▶ CfgSerialInterface ▶ [Key names of the interface parameters] ▶ dataBits

Input:	**7 bits** 7 data bits are transferred for each character transferred. **8 bits** 8 data bits are transferred for each character transferred.
iTNC 530:	5020 Bit0

parity 106704

Type of parity checking

Path:	System ▶ Network ▶ Serial ▶ CfgSerialInterface ▶ [Key names of the interface parameters] ▶ parity
Input:	**NONE** No parity **EVEN** Even parity **ODD** Odd parity
iTNC 530:	5020 Bit4/5

stopBits 106705

Number of stop bits

Path:	System ▶ Network ▶ Serial ▶ CfgSerialInterface ▶ [Key names of the interface parameters] ▶ stopBits
Input:	**1 stop bit** 1 stop bit is appended after each transferred character. **2 stop bits** 2 stop bits are appended after each transferred character.
iTNC 530:	5020 Bit6/7

flowControl 106706

Type of data-flow checking

Path:	System ▶ Network ▶ Serial ▶ CfgSerialInterface ▶ [Key names of the interface parameters] ▶ flowControl
Input:	Configure here whether there is to be a data-flow check (handshake). **NONE** No data-flow check; handshake not active **RTS_CTS** Hardware handshake. Transmission stop through RTS active **XON_XOFF** Software handshake; Transfer stop by DC3 (XOFF) active
iTNC 530:	5020 Bit2/3

fileSystem 106707

File system for file operation via serial interface

Path:	System ▶ Network ▶ Serial ▶ CfgSerialInterface ▶ [Key names of the interface parameters] ▶ fileSystem
Input:	**EXT** Minimum file system for external devices. Corresponds to the EXT1 and EXT2 modes of earlier TNC controls. Use these settings if you are using printers, punches, or non-HEIDENHAIN data transfer software. **FE1** Use this setting for communication with the external HEIDENHAIN FE 401 B or FE 401 floppy disk unit as of software 230626-03, or for communication with the "TNCserver" PC software from HEIDENHAIN.

bccAvoidCtrlChar 106708

Avoid control characters in the block check character (BCC)

Path:	System ▶ Network ▶ Serial ▶ CfgSerialInterface ▶ [Key names of the interface parameters] ▶ bccAvoidCtrlChar
Input:	**TRUE** Ensures that the check sum does not correspond to a control character **FALSE** Function not active
iTNC 530:	5020 Bit1

rtsLow 106709

Idle state of the RTS line

Path:	System ▶ Network ▶ Serial ▶ CfgSerialInterface ▶ [Key names of the interface parameters] ▶ rtsLow
Input:	**TRUE** The idle state of the RTS line is logical LOW **FALSE** The idle state of the RTS line is at logical HIGH
iTNC 530:	5020 Bit8

noEotAfterEtx 106710

Behavior after reception of an ETX control character

Path:	System ▶ Network ▶ Serial ▶ CfgSerialInterface ▶ [Key names of the interface parameters] ▶ noEotAfterEtx
Input:	**TRUE** No EOT control character is sent after reception of an ETX control character. **FALSE** The control sends an EOT control character after reception of an ETX control character.

iTNC 530:	5020 Bit9

Monitoring

CfgMonUser 129400

Monitoring settings for the user

Path:	System ▶ Monitoring ▶ ComponentMonitoring ▶ CfgMonUser
Structural element:	

enforceReaction 129401

The configured error reactions are enforced

Path:	System ▶ Monitoring ▶ ComponentMonitoring ▶ CfgMonUser ▶ enforceReaction
Input:	**TRUE** **FALSE**

showWarning 129402

Display warnings of monitoring tasks

Path:	System ▶ Monitoring ▶ ComponentMonitoring ▶ CfgMonUser ▶ showWarning
Input:	**TRUE** **FALSE**

CfgMonMbSection 133700

CfgMonMbSection defines monitoring tasks for a certain section of an NC program

Path:	System ▶ Monitoring ▶ ProcessMonitoring ▶ CfgMonMbSection
Structural element:	

tasks 133701

List of monitoring tasks to be performed

Path:	System ▶ Monitoring ▶ ProcessMonitoring ▶ CfgMonMbSection ▶ [Key name] ▶ tasks
Input:	

CfgMachineInfo

CfgMachineInfo		131700
General information of the machine operator		
Path:	System ▶ CfgMachineInfo	
Structural element:	Defines general information about this machine: ■ Settable by the user of the machine ■ Can be queried (e.g., via the OPC UA NC Server)	

machineNickname		131701
Custom name (nickname) of the machine		
Path:	System ▶ CfgMachineInfo ▶ machineNickname	
Input:	max. 64 Characters Machine designation freely selectable by the user.	

inventoryNumber		131702
Inventory number or ID		
Path:	System ▶ CfgMachineInfo ▶ inventoryNumber	
Input:	max. 64 Characters Internal inventory number of the operator's machine.	

image		131703
Photo or image of the machine		
Path:	System ▶ CfgMachineInfo ▶ image	
Input:	max. 260 Characters Path to an image file (*.jpg or *.png).	

location		131704
Machine location		
Path:	System ▶ CfgMachineInfo ▶ location	
Input:	max. 64 Characters	

department		131705
Department or division		
Path:	System ▶ CfgMachineInfo ▶ department	
Input:	max. 64 Characters	

responsibility		131706
Responsible for the machine		
Path:	System ▶ CfgMachineInfo ▶ responsibility	
Input:	max. 64 Characters	

Contact partner responsible for the machine, can be a person or a department.

contactEmail		131707
Contact email address		
Path:	System ▶ CfgMachineInfo ▶ contactEmail	
Input:	max. 64 Characters E-mail address of the responsible person or department.	

contactPhoneNumber		131708
Contact phone number		
Path:	System ▶ CfgMachineInfo ▶ contactPhoneNumber	
Input:	max. 32 Characters Telephone number of the responsible person or department.	

40.3 Preassigned error numbers for FN 14: ERROR

With the **FN 14** function you can issue error messages in the NC program.

Further information: "Output error messages with FN 14: ERROR", Page 1284

The following error messages are preassigned by HEIDENHAIN:

Error number	Text
1000	Spindle?
1001	Tool axis is missing
1002	Tool radius too small
1003	Tool radius too large
1004	Range exceeded
1005	Start position incorrect
1006	ROTATION not permitted
1007	SCALING FACTOR not permitted
1008	MIRROR IMAGE not permitted
1009	Datum shift not permitted
1010	Feed rate is missing
1011	Input value incorrect
1012	Incorrect sign
1013	Entered angle not permitted
1014	Touch point inaccessible
1015	Too many points
1016	Contradictory input
1017	CYCL incomplete
1018	Plane wrongly defined
1019	Wrong axis programmed
1020	Wrong rpm
1021	Radius comp. undefined
1022	Rounding-off undefined
1023	Rounding radius too large
1024	Program start undefined
1025	Excessive nesting
1026	Angle reference missing
1027	No fixed cycle defined
1028	Slot width too small
1029	Pocket too small
1030	Q202 not defined
1031	Q205 not defined
1032	Q218 must be greater than Q219
1033	CYCL 210 not permitted
1034	CYCL 211 not permitted

Error number	Text
1035	Q220 too large
1036	Q222 must be greater than Q223
1037	Q244 must be greater than 0
1038	Q245 must not equal Q246
1039	Angle range must be under 360°
1040	Q223 must be greater than Q222
1041	Q214: 0 not permitted
1042	Traverse direction not defined
1043	No datum table active
1044	Position error: center in axis 1
1045	Position error: center in axis 2
1046	Hole diameter too small
1047	Hole diameter too large
1048	Stud diameter too small
1049	Stud diameter too large
1050	Pocket too small: rework axis 1
1051	Pocket too small: rework axis 2
1052	Pocket too large: scrap axis 1
1053	Pocket too large: scrap axis 2
1054	Stud too small: scrap axis 1
1055	Stud too small: scrap axis 2
1056	Stud too large: rework axis 1
1057	Stud too large: rework axis 2
1058	TCHPROBE 425: length exceeds max
1059	TCHPROBE 425: length below min
1060	TCHPROBE 426: length exceeds max
1061	TCHPROBE 426: length below min
1062	TCHPROBE 430: diameter too large
1063	TCHPROBE 430: diameter too small
1064	No measuring axis defined
1065	Tool breakage tolerance exceeded
1066	Enter Q247 unequal to 0
1067	Enter Q247 greater than 5
1068	Datum table?
1069	Enter Q351 unequal to 0
1070	Thread depth too large
1071	Missing calibration data
1072	Tolerance exceeded
1073	Block scan active

Error number	Text
1074	ORIENTATION not permitted
1075	3-D ROT not permitted
1076	Activate 3-D ROT
1077	Enter depth as negative
1078	Q303 in meas. cycle undefined!
1079	Tool axis not allowed
1080	Calculated values incorrect
1081	Contradictory meas. points
1082	Incorrect clearance height
1083	Contradictory plunge type
1084	This fixed cycle not allowed
1085	Line is write-protected
1086	Oversize greater than depth
1087	No point angle defined
1088	Contradictory data
1089	Slot position 0 not allowed
1090	Enter an infeed not equal to 0
1091	Switchover of Q399 not allowed
1092	Tool not defined
1093	Tool number not permitted
1094	Tool name not permitted
1095	Software option not active
1096	Kinematics cannot be restored
1097	Function not permitted
1098	Contradictory workpc. blank dim.
1099	Measuring position not allowed
1100	Kinematic access not possible
1101	Meas. pos. not in traverse range
1102	Preset compensation not possible
1103	Tool radius too large
1104	Plunging type is not possible
1105	Plunge angle incorrectly defined
1106	Angular length is undefined
1107	Slot width is too large
1108	Scaling factors not equal
1109	Tool data inconsistent
1110	MOVE not possible
1111	Presetting not allowed!
1112	Thread angle too small!

Error number	Text
1113	3-D ROT status is contradictory!
1114	Configuration is incomplete
1115	No turning tool is active
1116	Tool orientation is inconsistent
1117	Angle not possible!
1118	Radius too small!
1119	Thread runout too short!
1120	Contradictory meas. points
1121	Too many limits
1122	Machining strategy with limits not possible
1123	Machining direction not possible
1124	Check the thread pitch!
1125	Angle cannot be calculated
1126	Eccentric turning not possible
1127	No milling tool is active
1128	Insufficient length of cutting edge
1129	Gear definition is inconsistent or incomplete
1130	No finishing allowance provided
1131	Line does not exist in table
1132	Probing process not possible
1133	Coupling function not possible
1134	Machining cycle is not supported by this NC software
1135	Touch probe cycle is not supported by this NC software
1136	NC program aborted
1137	Touch probe data incomplete
1138	LAC function not possible
1139	Rounding radius or chamfer is too large!
1140	Axis angle not equal to tilt angle
1141	Character height not defined
1142	Excessive character height
1143	Tolerance error: Workpiece rework
1144	Tolerance error: Workpiece scrap
1145	Faulty dimension definition
1146	Illegal entry in compensation table
1147	Transformation not possible
1148	Tool spindle incorrectly configured
1149	Offset of the turning spindle unknown
1150	Global program settings are active
1151	Faulty configuration of OEM macros

Error number	Text
1152	The combination of programmed oversizes is not possible
1153	Measured value not captured
1154	Check the monitoring of the tolerance
1155	Hole is smaller than the stylus tip
1156	Preset cannot be set
1157	Alignment of a rotary table is not possible
1158	Alignment of rotary axes is not possible
1159	Infeed limited to length of cutting edge
1160	Machining depth defined as 0
1161	Tool type is unsuitable
1162	Finishing allowance not defined
1163	Machine datum could not be written
1164	Spindle for synchronization could not be ascertained
1165	Function is not possible in the active operating mode
1166	Oversize defined too large
1167	Number of teeth not defined
1168	Machining depth does not increase monotonously
1169	Infeed does not decrease monotonously
1170	Tool radius not defined correctly
1171	Mode for retraction to clearance height not possible
1172	Gear wheel definition incorrect
1173	Probing object contains different types of dimension definition
1174	Dimension definition contains impermissible characters
1175	Actual value in dimension definition faulty
1176	Starting point of hole too deep
1177	Dimension def.: Nominal value missing for manual pre-positioning
1178	A replacement tool is not available
1179	OEM macro is not defined
1180	Measurement not possible with auxiliary axis
1181	Start position not possible with modulo axis
1182	Function only possible if door is closed
1183	Number of possible records exceeded
1184	Inconsistent machining plane due to axis angle with basic rotation
1185	Transfer parameter contains an impermissible value
1186	Tooth width RCUTS is defined too large
1187	Usable length LU of the tool is too small
1188	The defined chamfer is too large

Error number	Text
1189	Chamfer angle cannot be machined with the active tool
1190	The allowances do not define any stock removal
1191	Spindle angle not unique

40.4 System data

40.4.1 List of FN functions

Group name	Group number ID...	System data number NO....	Index IDX...	Description
Program information				
	10	3	-	Number of the active machining cycle
		6	-	Number of the most recently executed touch probe cycle –1 = None
		7	-	Type of calling NC program: –1 = None 0 = Visible NC program 1 = Cycle/macro, main program is visible 2 = Cycle/macro, there is no visible main program
		8	1	Unit of measure of the directly calling NC program (may also be a cycle). Return codes: 0 = mm 1 = inch –1 = there is no corresponding program
			2	Unit of measure of the NC program visible in the block display from which the current cycle was called directly or indirectly. Return codes: 0 = mm 1 = inch –1 = there is no corresponding program
		9	-	Within an M function macro: Number of the M function. Otherwise –1
		103	Q parameter number	Relevant within NC cycles; for inquiry as to whether the Q parameter given under IDX was explicitly stated in the associated CYCLE DEF.
		110	QS parameter number	Is there a file with the name QS(IDX)? 0 = No, 1 = Yes This function resolves relative file paths.
		111	QS parameter number	Is there a directory with the name QS(IDX)? 0 = no, 1 = Yes Only absolute directory paths are possible.

Group name	Group number ID...	System data number NO....	Index IDX...	Description
System jump addresses				
	13	1	-	Label number or label name (string or QS) jumped to during M2/M30 instead of ending the current NC program. Value = 0: M2/M30 have the normal effect
		2	-	Label number or label name (string or QS) jumped to in the event of FN14: ERROR with the NC CANCEL reaction instead of aborting the NC program with an error message. The error number programmed in the FN14 command can be read under ID992 NR14. Value = 0: FN14 has the normal effect.
		3	-	Label number or label name (string or QS) jumped to in the event of an internal server error (SQL, PLC, CFG) or with erroneous file operations (FUNCTION FILECOPY, FUNCTION FILEMOVE, or FUNCTION FILEDELETE) instead of aborting the NC program with an error message. Value = 0: Error has the normal effect.
Indexed access to Q parameters				
	15	11	Q parameter number	Reads Q(IDX)
		12	QL parameter no.	Reads QL(IDX)
		13	QR parameter no.	Reads QR(IDX)
Machine status				
	20	1	-	Active tool number
		2	-	Prepared tool number
		3	-	Active tool axis 0 = X 6 = U 1 = Y 7 = V 2 = Z 8 = W
		4	-	Programmed spindle speed
		5	-	Active spindle condition -1 = spindle condition not defined 0 = M3 active 1 = M4 active 2 = M5 active after M3 3 = M5 active after M4
		7	-	Active gear range
		8	-	Active coolant status 0 = off, 1 = on
		9	-	Active feed rate

Group name	Group number ID...	System data number NO....	Index IDX...	Description
		10	-	Index of prepared tool
		11	-	Index of active tool
		14	-	Number of active spindle
		20	-	Programmed cutting speed in turning operation
		21	-	Spindle mode in turning mode: 0 = constant speed 1 = constant cutting speed
		22	-	Coolant status M7: 0 = inactive, 1 = active
		23	-	Coolant status M8: 0 = inactive, 1 = active

		14	Tool no.	Maximum plunge angle ANGLE
		15	Tool no.	TT: Number of tool teeth CUT
		16	Tool no.	TT: Wear tolerance for length, LTOL
		17	Tool no.	TT: Wear tolerance for radius, RTOL
		18	Tool no.	TT: Direction of rotation DIRECT 0 = positive, –1 = negative
		19	Tool no.	TT: Offset in plane R-OFFS R = 99999.9999
		20	Tool no.	TT: Offset in length L-OFFS
		21	Tool no.	TT: Breakage tolerance for length, LBREAK
		22	Tool no.	TT: Breakage tolerance for radius, RBREAK

Group name	Group number ID...	System data number NO....	Index IDX...	Description
		28	Tool no.	Maximum speed NMAX
		32	Tool no.	Point angle TANGLE
		34	Tool no.	LIFTOFF allowed (0 = No, 1 = Yes)
		35	Tool no.	Wear tolerance for radius R2TOL
		36	Tool no.	Tool type TYPE (miller = 0, grinder = 1, ... touch probe = 21)
		37	Tool no.	Corresponding line in the touch-probe table
		38	Tool no.	Timestamp of last use
		39	Tool no.	ACC
		40	Tool no.	Pitch for thread cycles
		41	Tool no.	AFC: reference load
		42	Tool no.	AFC: overload early warning
		43	Tool no.	AFC: overload NC stop
		44	Tool no.	Exceeding the tool life
		45	Tool no.	Front-face width of indexable insert (RCUTS)
		46	Tool no.	Usable length of the milling cutter
		47	Tool no.	Neck radius of the milling cutter (RN)

Group name	Group number ID...	System data number NO....	Index IDX...	Description
Data from the pocket table				
	51	1	Pocket number	Tool number
		2	Pocket number	0 = no special tool 1 = special tool
		3	Pocket number	0 = no fixed pocket 1 = fixed pocket
		4	Pocket number	0 = pocket not locked 1 = pocket locked
		5	Pocket number	PLC status
Determine the tool pocket				
	52	1	Tool no.	Pocket number
		2	Tool no.	Tool magazine number
File information				
	56	1	-	Number of lines of the tool table
		2	-	Number of lines of the active datum table
		4	-	Number of lines in a freely definable table that has been opened with FN26: TABOPEN
Tool data for T and S strobes				
	57	1	T code	Tool number IDX0 = T0 strobe (store tool), IDX1 = T1 strobe (load tool), IDX2 = T2 strobe (prepare tool)
		2	T code	Tool index IDX0 = T0 strobe (store tool), IDX1 = T1 strobe (load tool), IDX2 = T2 strobe (prepare tool)
		5	-	Spindle speed IDX0 = T0 strobe (store tool), IDX1 = T1 strobe (load tool), IDX2 = T2 strobe (prepare tool)
Values programmed in TOOL CALL				
	60	1	-	Tool number T
		2	-	Active tool axis 0 = X 1 = Y 2 = Z 6 = U 7 = V 8 = W
		3	-	Spindle speed S
		4	-	Oversize for tool length DL
		5	-	Tool radius oversize DR
		6	-	Automatic TOOL CALL 0 = Yes, 1 = No

Group name	Group number ID...	System data number NO....	Index IDX...	Description
		7	-	Tool radius oversize DR2
		8	-	Tool index
		9	-	Active feed rate
		10	-	Cutting speed [mm/min]
Values programmed in TOOL DEF				
	61	0	Tool no.	Read the number of the tool change sequence: 0 = Tool already in spindle, 1 = Change between external tools, 2 = Change from internal to external tool, 3 = Change from special tool to external tool, 4 = Load external tool, 5 = Change from external to internal tool, 6 = Change from internal to internal tool, 7 = Change from special tool to internal tool, 8 = Load internal tool, 9 = Change from external tool to special tool, 10 = Change from special tool to internal tool, 11 = Change from special tool to special tool, 12 = Load special tool, 13 = Unload external tool, 14 = Unload internal tool, 15 = Unload special tool
		1	-	Tool number T
		2	-	Length
		3	-	Radius
		4	-	Index
		5	-	Tool data programmed in TOOL DEF 1 = Yes, 0 = No

Group name	Group number ID...	System data number NO....	Index IDX...	Description
Values programmed with FUNCTION TURNDATA				
	62	1	-	Tool length oversize DXL
		2	-	Tool length oversize DYL
		3	-	Tool length oversize DZL
		4	-	Cutting radius oversize DRS
Values for LAC and VSC				
	71	0	0	Index of the NC axis for which the LAC weighing run will be performed or was last performed (X to W = 1 to 9)
			2	Total inertia determined by the LAC weighing run in [kgm²] (with A/B/C rotary axes) or total mass in [kg] (with X/Y/Z linear axes)
		1	0	Cycle 957 Retraction from thread
Freely available memory area for OEM cycles				
	72	0-39	0 to 30	Freely available memory area for OEM cycles. The values are only reset by the control during a control reboot (= 0). With “Cancel,” the values are not reset to the value that they had at the time of execution. Up to and including 597110-11: only NR 0-9 and IDX 0-9 Starting with 597110-12: NR 0-39 and IDX 0-30
Freely available memory area for user cycles				
	73	0-39	0 to 30	Freely available memory area for user cycles The values are only reset by the control during a control reboot (= 0). With “Cancel,” the values are not reset to the value that they had at the time of execution. Up to and including 597110-11: only NR 0-9 and IDX 0-9 Starting with 597110-12: NR 0-39 and IDX 0-30
Read minimum and maximum spindle speed				
	90	1	Spindle ID	Minimum spindle speed of the lowest gear stage. If no gear stages are configured, CfgFeedLimits/minFeed of the first parameter set of the spindle is evaluated. Index 99 = active spindle
		2	Spindle ID	Maximum spindle speed from the highest gear stage. If no gear stages are configured, CfgFeedLimits/maxFeed of the first parameter set of the spindle is evaluated. Index 99 = active spindle

Group name	Group number ID...	System data number NO....	Index IDX...	Description
Tool compensation				
	200	1	1 = without oversize 2 = with oversize 3 = with oversize and oversize from TOOL CALL	Active radius
		2	1 = without oversize 2 = with oversize 3 = with oversize and oversize from TOOL CALL	Active length
		3	1 = without oversize 2 = with oversize 3 = with oversize and oversize from TOOL CALL	Rounding radius R2
		6	Tool no.	Tool length Index 0= active tool
Coordinate transformations				
	210	1	-	Basic rotation (manual)
		2	-	Programmed rotation
		3	-	Active mirror axis. Bits 0 to 2 and 6 to 8: Axes X, Y, Z and U, V, W
		4	Axis	Active scaling factor Index: 1 - 9 (X, Y, Z, A, B, C, U, V, W)
		5	Rotary axis	3D-ROT Index: 1 - 3 (A, B, C)
		6	-	Tilt working plane in Program Run operating modes 0 = Not active –1 = Active
		7	-	Tilt working plane in Manual operating modes 0 = Not active –1 = Active
		8	QL parameter no.	Angle of misalignment between spindle and tilted coordinate system. Projects the angle specified in the QL parameter from the input coordinate

Group name	Group number ID...	System data number NO....	Index IDX...	Description
				system to the tool coordinate system. If IDX is omitted, the angle 0 is used for projection.
		10	-	Type of definition of the active tilt: 0 = no tilt—is returned if, both in **Manual Operation** and in the automatic modes, no tilt is active. 1 = axial 2 = spatial angle
		11	-	Coordinate system for manual movements: 0 = Machine coordinate system **M-CS** 1 = Working plane coordinate system **WPL-CS** 2 = Tool coordinate system **T-CS** 4 = Workpiece coordinate system **W-CS**
		12	Axis	Correction in working plane coordinate system **WPL-CS** (FUNCTION TURNDATA CORR WPL or FUNCTION CORRDATA WPL) Index: 1 to 9 (X, Y, Z, A, B, C, U, V, W)

Group name	Group number ID...	System data number NO....	Index IDX...	Description
Active coordinate system				
	211	–	-	1 = input system (default) 2 = REF system 3 = tool change system
Special transformations in turning mode				
	215	1	-	Angle for the precession of the input system in the XY plane in turning mode. To reset the transformation the value 0 must be entered for the angle. This transformation is used in connection with Cycle 800 (parameter Q497).
		3	1-3	Reading out of the spatial angle written with NR2 Index: 1 - 3 (rotA, rotB, rotC)
Current datum shift				
	220	2	Axis	Current datum shift in [mm] Index: 1 - 9 (X, Y, Z, A, B, C, U, V, W)
		3	Axis	Read the difference between reference point and preset. Index: 1 - 9 (X, Y, Z, A, B, C, U, V, W)
		4	Axis	Read values for OEM offset.. Index: 1 - 9 (X_OFFS, Y_OFFS, Z_OFFS,...)
Traverse range				
	230	2	Axis	Negative software limit switches Index: 1 - 9 (X, Y, Z, A, B, C, U, V, W)
		3	Axis	Positive software limit switches Index: 1 - 9 (X, Y, Z, A, B, C, U, V, W)
		5	-	Software limit switch on or off: 0 = on, 1 = off For modulo axes, either both the upper and lower limits or no limit at all must be set.
Read the nominal position in the REF system				
	240	1	Axis	Current nominal position in the REF system
Read the nominal position in the REF system, including offsets (handwheel, etc.)				
	241	1	Axis	Current nominal position in the REF system
Read the current position in the active coordinate system				
	270	1	Axis	Current nominal position in the input system When called while tool radius compensation is active, the function supplies the uncompensated positions for the principal axes X, Y, and Z. If the function is called for a rotary axis and tool radius

Group name	Group number ID...	System data number NO....	Index IDX...	Description
				compensation is active, an error message is issued. Index: 1 to 9 (X, Y, Z, A, B, C, U, V, W)
Read the current position in the active coordinate system, including offsets (handwheel, etc.)				
	271	1	Axis	Current nominal position in the input system
Read information to M128				
	280	1	-	M128 active: –1 = Yes, 0 = No
		3	-	Condition of TCPM after Q No.: Q No. + 0: TCPM active, 0 = no, 1 = yes Q No. + 1: AXIS, 0 = POS, 1 = SPAT Q No. + 2: PATHCTRL, 0 = AXIS, 1 = VECTOR Q No. + 3: Feed rate, 0 = F TCP, 1 = F CONT
Machine kinematics				
	290	5	-	0: Temperature compensation not active 1: Temperature compensation active
		7	-	KinematicsComp: 0: Compensations by KinematicsComp not active 1: Compensations by KinematicsComp active
		10	-	Index of the machine kinematics from Channels/ChannelSettings/CfgKin-List/kinCompositeModels programmed in FUNCTION MODE MILL or FUNCTION MODE TURN –1 = Not programmed.
Read data of the machine kinematics				
	295	1	QS parameter no.	Read the axis names of the active 3-axis kinematics. The axis names are written according to QS(IDX), QS(IDX+1), and QS(IDX+2). 0 = Operation successful
		2	0	Is FACING HEAD POS function active? 1 = Yes, 0 = No
		4	Rotary axis	Read whether the defined rotary axis participates in the kinematic calculation. 1 = Yes, 0 = No (A rotary axis can be excluded from the kinematics calculating using M138.) Index: 4, 5, 6 (A, B, C)
		5	Secondary axis	Read whether the given secondary axis is used in the kinematics model. –1 = Axis not in the kinematics model 0 = Axis is not included in the kinematics calculation:

Group name	Group number ID...	System data number NO....	Index IDX...	Description
		6	Axis	Angle head: Displacement vector in the basic coordinate system B-CS through angle head Index: 1, 2, 3 (X, Y, Z)
		7	Axis	Angle head: Direction vector of the tool in the basic coordinate system B-CS Index: 1, 2, 3 (X, Y, Z)
		10	Axis	Determine programmable axes. Determine the axis ID associated with the specified axis index (index from CfgAxis/axisList). Index: 1 - 9 (X, Y, Z, A, B, C, U, V, W)
		11	Axis ID	Determine programmable axes. Determine the index of the axis (X = 1, Y = 2, ...) for the specified axis ID Index: Axis ID (index from CfgAxis/axisList)

Group name	Group number ID...	System data number NO....	Index IDX...	Description
Modify the geometrical behavior				
	310	20	Axis	Diameter programming: –1 = on, 0 = off
		126	-	M126: –1 = on, 0 = off
Current system time				
	320	1	0	System time in seconds that have elapsed since 01.01.1970, 00:00:00 (real time).
			1	System time in seconds that have elapsed since 01.01.1970, 00:00:00 (look-ahead calculation).
		3	-	Read the processing time of the current NC program.
Formatting of system time

TS touch trigger probe				
	350	50	1	Touch probe type: 0: TS120, 1: TS220, 2: TS440, 3: TS630, 4: TS632, 5: TS640, 6: TS444, 7: TS740
			2	Line in the touch-probe table
		51	-	Effective length
		52	1	Effective radius of the stylus tip
			2	Rounding radius
		53	1	Center offset (reference axis)
			2	Center offset (minor axis)
		54	-	Spindle-orientation angle in degrees (center offset)
		55	1	Rapid traverse
			2	Measuring feed rate
			3	Feed rate for pre-positioning: FMAX_PROBE or FMAX_MACHINE
		56	1	Maximum measuring range
			2	Set-up clearance
		57	1	Spindle orientation possible 0=No, 1=Yes
			2	Angle of spindle orientation in degrees

Group name	Group number ID...	System data number NO....	Index IDX...	Description
TT tool touch probe for tool measurement				
	350	70	1	TT: Touch probe type
			2	TT: Line in the tool touch probe table
		71	1/2/3	TT: Touch probe center (REF system)
		72	-	TT: Touch probe radius
		75	1	TT: Rapid traverse
			2	TT: Measuring feed rate with stationary spindle
			3	TT: Measuring feed rate with rotating spindle
		76	1	TT: Maximum probing path
			2	TT: Safety clearance for linear measurement
			3	TT: Safety clearance for radius measurement
			4	TT: Distance from the lower edge of the cutter to the upper edge of the stylus
		77	-	TT: Spindle speed
		78	-	TT: Probing direction
		79	-	TT: Activate radio transmission
			-	TT: Stop probing movement upon stylus deflection

Group name	Group number ID...	System data number NO....	Index IDX...	Description
Preset from touch probe cycle (probing results)				
	360	1	Coordinate	Last preset of a manual touch probe cycle, or last touch point from Cycle 0 (input coordinate system). Compensations: length, radius, and center offset
		2	Axis	Last preset of a manual touch probe cycle, or last touch point from Cycle 0 (machine coordinate system, only axes from the active 3-D kinematics are allowed as index). Compensation: only center offset
		3	Coordinate	Result of measurement in the input system of touch probe Cycles 0 and 1. The measurement result is read out in the form of coordinates. Compensation: only center offset
		4	Coordinate	Last preset of a manual touch probe cycle, or last touch point from Cycle 0 (workpiece coordinate system). The measurement result is read in the form of coordinates. Compensation: only center offset
		5	Axis	Axis values, not compensated
		6	Coordinate / axis	Readout of the measurement results in the form of coordinates / axis values in the input system from probing operations. Compensation: only length
		10	-	Oriented spindle stop
		11	-	Error status of probing: 0: Probing was successful –1: Touch point not reached –2: Touch probe already deflected at the start of the probing process

Group name	Group number ID...	System data number NO....	Index IDX...	Description
Read values from or write values to the active datum table				
	500	Row number	Column	Read values
Read values from or write values to the preset table (basic transformation)				
	507	Row number	1-6	Read values
Read axis offsets from or write axis offsets to the preset table				
	508	Row number	1-9	Read values
Data for pallet machining				
	510	1	-	Active line
		2	-	Current pallet number. Read value of the NAME column of the last PAL-type entry. If the column is empty or does not contain a numerical value, a value of –1 is returned.
		3	-	Active row of the pallet table.
		4	-	Last line of the NC program for the current pallet.
		5	Axis	Tool-oriented editing: Clearance height is programmed: 0 = No, 1 = Yes Index: 1 - 9 (X, Y, Z, A, B, C, U, V, W)
		6	Axis	Tool-oriented editing: Clearance height The value is invalid if ID510 NR5 returns the value 0 with the corresponding IDX. Index: 1 - 9 (X, Y, Z, A, B, C, U, V, W)
		10	-	Row number up to which the pallet table is to be searched during block scan.
		20	-	Type of pallet editing? 0 = Workpiece-oriented 1 = Tool oriented
		21	-	Automatic continuation after NC error: 0 = Locked 1 = Active 10 = Abort continuation 11 = Continuation with the rows in the pallet table that would have been executed next if not for the NC error 12 = Continuation with the row in the pallet table in which the NC error arose 13 = Continuation with the next pallet

Group name	Group number ID...	System data number NO....	Index IDX...	Description
Read data from the point table				
	520	Row number	10	Read value from active point table.
			11	Read value from active point table.
			1-3 X/Y/Z	Read value from active point table.
Read or write the active preset				
	530	1	-	Number of the active preset in the active preset table.
Active pallet preset				
	540	1	-	Number of the active pallet preset. Returns the number of the active preset. If no pallet preset is active, the function returns the value –1.
		2	-	Number of the active pallet preset. As with NR1.
Values for the basic transformation of the pallet preset				
	547	Row number	Axis	Read values of the basic transformation from the pallet preset table. Index: 1 to 6 (X, Y, Z, SPA, SPB, SPC)
Axis offsets from the pallet preset table				
	548	Row number	Offset	Read values of the axis offsets from the pallet preset table. Index: 1 - 9 (X_OFFS, Y_OFFS, Z_OFFS,...)
OEM offset				
	558	Row number	Offset	Read values for OEM offset. Index: 1 - 9 (X_OFFS, Y_OFFS, Z_OFFS,...)
Read and write the machine status				
	590	2	1-30	Freely available; not deleted during program selection.
		3	1-30	Freely available; not deleted during a power failure (persistent storage).
Read/write look-ahead parameter of a single axis (at machine level)				
	610	1	-	Minimum feed rate (**MP_minPathFeed**) in mm/min
		2	-	Minimum feed rate at corners (**MP_minCornerFeed**) in mm/min
		3	-	Feed-rate limit for high speeds (**MP_maxG1Feed**) in mm/min
		4	-	Max. jerk at low speeds (**MP_maxPathJerk**) in m/s^3
		5	-	Max. jerk at high speeds (**MP_maxPathJerkHi**) in m/s^3
		6	-	Tolerance at low speeds (**MP_pathTolerance**) in mm

Group name	Group number ID...	System data number NO....	Index IDX...	Description
		7	-	Tolerance at high speeds (**MP_pathToleranceHi**) in mm
		8	-	Max. derivative of jerk (**MP_maxPathYank**) in m/s^4
		9	-	Tolerance factor for curve machining (**MP_curveTolFactor**)
		10	-	Factor for max. permissible jerk at curvature changes (**MP_curveJerkFactor**)
		11	-	Maximum jerk with probing movements (**MP_pathMeasJerk**)
		12	-	Angle tolerance for machining feed rate (**MP_angleTolerance**)
		13	-	Angle tolerance for rapid traverse (**MP_angleToleranceHi**)
		14	-	Max. corner angle for polygons (**MP_maxPolyAngle**)
		18	-	Radial acceleration with machining feed rate (**MP_maxTransAcc**)
		19	-	Radial acceleration with rapid traverse (**MP_maxTransAccHi**)
		20	Index of physical axis	Max. feed rate (**MP_maxFeed**) in mm/min
		21	Index of physical axis	Max. acceleration (**MP_maxAcceleration**) in m/s^2
		22	Index of physical axis	Maximum transition jerk of the axis in rapid traverse (**MP_axTransJerkHi**) in m/s^2
		23	Index of physical axis	Maximum transition jerk of the axis during machining free rate (**MP_axTransJerk**) in m/s^3
		24	Index of physical axis	Acceleration feedforward control (**MP_compAcc**)
		25	Index of physical axis	Axis-specific jerk at low speeds (**MP_axPathJerk**) in m/s^3
		26	Index of physical axis	Axis-specific jerk at high speeds (**MP_axPathJerkHi**) in m/s^3
		27	Index of physical axis	More precise tolerance examination in corners (**MP_reduceCornerFeed**) 0 = deactivated, 1 = activated
		28	Index of physical axis	DCM: Maximum tolerance for linear axes in mm (**MP_maxLinearTolerance**)
		29	Index of physical axis	DCM: Maximum angle tolerance in [°] (**MP_maxAngleTolerance**)
		30	Index of physical axis	Tolerance monitoring for successive threads (**MP_threadTolerance**)

Group name	Group number ID...	System data number NO....	Index IDX...	Description
		31	Index of physical axis	Form (**MP_shape**) of the **axisCutterLoc** filter 0: Off 1: Average 2: Triangle 3: HSC 4: Advanced HSC
		32	Index of physical axis	Frequency (**MP_frequency**) of the **axisCutterLoc** filter in Hz
		33	Index of physical axis	Form (**MP_shape**) of the **axisPosition** filter 0: Off 1: Average 2: Triangle 3: HSC 4: Advanced HSC
		34	Index of physical axis	Frequency (**MP_frequency**) of the **axisPosition** filter in Hz
		35	Index of physical axis	Order of the filter for **Manual** operating mode (**MP_manualFilterOrder**)
		36	Index of physical axis	HSC mode (**MP_hscMode**) of the **axisCutterLoc** filter
		37	Index of physical axis	HSC mode (**MP_hscMode**) of the **axisPosition** filter
		38	Index of physical axis	Axis-specific jerk for probing movements (**MP_axMeasJerk**)
		39	Index of physical axis	Weighting of the filter error for calculating filter deviation (**MP_axFilterErrWeight**)
		40	Index of physical axis	Maximum filter length of position filter (**MP_maxHscOrder**)
		41	Index of physical axis	Maximum filter length of CLP filter (**MP_maxHscOrder**)
		42	-	Maximum feed rate of the axis at machining feed rate (**MP_maxWorkFeed**)
		43	-	Maximum path acceleration at machining feed rate (**MP_maxPathAcc**)
		44	-	Maximum path acceleration at rapid traverse (**MP_maxPathAccHi**)
		45	-	Shape of the smoothing filter (**CfgSmoothingFilter/shape**) 0 = Off 1 = Average 2 = Triangle
		46	-	Order of smoothing filter (only odd-numbered values) (**CfgSmoothingFilter/order**)

Group name	Group number ID...	System data number NO....	Index IDX...	Description
		47	-	Type of acceleration profile (**CfgLaPath/profileType**) 0 = Bellshaped 1 = Trapezoidal 2 = Advanced Trapezoidal
		48	-	Type of acceleration profile for rapid traverse (**CfgLaPath/profileTypeHi**) 0 = Bellshaped 1 = Trapezoidal 2 = Advanced Trapezoidal
		51	Index of physical axis	Compensation of following error in the jerk phase (**MP_IpcJerkFact**)
		52	Index of physical axis	kv factor of the position controller in 1/s (**MP_kvFactor**)

Group name	Group number ID...	System data number NO....	Index IDX...	Description
Measure the maximum utilization of an axis				
	621	0	Index of physical axis	Conclude measurement of the dynamic load and save the result in the specified Q parameter.
Read SIK contents				
	630	0	Option no.	You can explicitly determine whether the SIK option given under **IDX** has been set or not. 1 = option is enabled 0 = option is not enabled
		1	-	You can determine whether a Feature Content Level (for upgrade functions) is set, and which one. –1 = No FCL is set <No.> = FCL that is set
		2	-	Read serial number of the SIK -1 = No valid SIK in the system
		10	-	Define the type of control: 0 = iTNC 530 1 = NCK-based control (TNC7, TNC 640, TNC 620, TNC 320, TNC 128, PNC 610, ...)
General data of the grinding wheel				
	780	2	-	Width
		3	-	Overhang
		4	-	Alpha angle (optional)
		5	-	Gamma angle (optional)
		6	-	Depth (optional)
		7	-	Rounding radius at the "Further" edge (optional)
		8	-	Rounding radius at the "Nearer" edge (optional)
		9	-	Rounding radius at the "Nearest" edge (optional)
		10	-	Active edge:
		11	-	Type of grinding wheel (straight / angular)
		12	-	External or internal wheel?
		13	-	Compensation angle of the B axis (with respect to the base angle of the location)
		14	-	Type of angular wheel
		15	-	Total length of the grinding wheel
		16	-	Length of the inner edge of the grinding wheel
		17	-	Minimum wheel diameter (wear limit)
		18	-	Minimum wheel width (wear limit)

Group name	Group number ID...	System data number NO....	Index IDX...	Description
		19	-	Tool number
		20	-	Cutting speed
		21	-	Maximum permissible cutting speed
		27	-	Wheel basic type: with relief cut
		28	-	Relief cut on the outside
		29	-	Relief cut on the inside
		30	-	Definition status
		31	-	Radius compensation
		32	-	Compensation of total length
		33	-	Compensation of overhang
		34	-	Compensation for the length to the innermost edge
		35	-	Radius of the shaft of the grinding wheel
		36	-	Initial dressing performed?
		37	-	Dresser location for initial dressing
		38	-	Dresser tool for initial dressing
		39	-	Has the grinding wheel been measured?
		51	-	Dresser tool for dressing on the diameter
		52	-	Dresser tool for dressing on the outer edge
		53	-	Dresser tool for dressing on the inner edge
		54	-	Dressing of the diameter according to the number of calls
		55	-	Dressing of the outer edge according to the number of calls
		56	-	Dressing of the inner edge according to the number of calls
		57	-	Dressing counter of the diameter
		58	-	Dressing counter of the outer edge
		59	-	Dressing counter of the inner edge
		101	-	Radius of grinding wheel

Group name	Group number ID...	System data number NO....	Index IDX...	Description
Detailed geometry (contour) of the grinding wheel				
	783	1	1	Chamfer width of the outer side of the wheel
			2	Chamfer width of the inner side of the wheel
		2	1	Chamfer angle of the outer side of the wheel
			2	Chamfer angle of the inner side of the wheel
		3	1	Corner radius of the outer side of the wheel
			2	Corner radius of the inner side of the wheel
		4	1	Side length of the outer side of the wheel
			2	Side length of the inner side of the wheel
		5	1	Relief length of the outer side of the wheel
			2	Relief length of the inner side of the wheel
		6	1	Relief angle of the outer side of the wheel
			2	Relief angle of the inner side of the wheel
		7	1	Recess length of the outer side of the wheel
			2	Recess length of the inner side of the wheel
		8	1	Departing radius of the outer side of the wheel
			2	Departing radius of the inner side of the wheel
		9	1	Total depth on the outside
			2	Total depth on the inside

Group name	Group number ID...	System data number NO....	Index IDX...	Description
Read Functional Safety (FS) information				
	820	1	-	FS limitations: 0 = No Functional Safety (FS) 1 = Guard door open (SOM1) 2 = Guard door open (SOM2) 3 = Guard door open (SOM3) 4 = Guard door open (SOM4) 5 = All guard doors closed
Write data for unbalance monitoring				
	850	10	-	Activate and deactivate unbalance monitoring 0 = unbalance monitoring not active 1 = unbalance monitoring active
Counter				
	920	1	-	Planned workpieces. In **Test Run** operating mode the counter generally generates the value 0.
		2	-	Already machined workpieces. In **Test Run** operating mode the counter generally generates the value 0.
		12	-	Workpieces still to be machined. In **Test Run** operating mode the counter generally generates the value 0.
Read and write data of current tool				
	950	1	-	Tool length L
		2	-	Tool radius R
		3	-	Tool radius R2
		4	-	Oversize for tool length DL
		5	-	Tool radius oversize DR
		6	-	Tool radius oversize DR2
		7	-	Tool locked TL 0 = not locked, 1 = locked
		8	-	Number of the replacement tool RT
		9	-	Maximum tool age TIME1
		10	-	Maximum tool age TIME2 at TOOL CALL
		11	-	Current tool age CUR.TIME
		12	-	PLC status
		13	-	Tooth length in the tool axis LCUTS
		14	-	Maximum plunge angle ANGLE
		15	-	TT: Number of tool teeth CUT
		16	-	TT: Wear tolerance for length LTOL
		17	-	TT: Wear tolerance for radius RTOL

Group name	Group number ID...	System data number NO....	Index IDX...	Description
		18	-	TT: Direction of rotation DIRECT 0 = positive, –1 = negative
		19	-	TT: Offset in plane R-OFFS R = 99999.9999
		20	-	TT: Offset in length L-OFFS
		21	-	TT: Break tolerance for length LBREAK
		22	-	TT: Break tolerance for radius RBREAK
		28	-	Maximum spindle speed [rpm] NMAX
		32	-	Point angle TANGLE
		34	-	LIFTOFF allowed (0 = No, 1 = Yes)
		35	-	Wear tolerance for radius R2TOL
		36	-	Tool type TYPE (miller = 0, grinder = 1, ... touch probe = 21)
		37	-	Corresponding line in the touch-probe table
		38	-	Timestamp of last use
		39	-	ACC
		40	-	Pitch for thread cycles
		41	-	AFC: reference load
		42	-	AFC: overload early warning
		43	-	AFC: overload NC stop
		44	-	Exceeding the tool life
		45	-	Front-face width of indexable insert (RCUTS)
		46	-	Usable length of the milling cutter
		47	-	Neck radius of the milling cutter (RN)

Group name	Group number ID...	System data number NO....	Index IDX...	Description
Read and write data of current turning tool				
	951	1	-	Tool number
		2	-	Tool length XL
		3	-	Tool length YL
		4	-	Tool length ZL
		5	-	Tool length oversize DXL
		6	-	Oversize in tool length DYL

		8	-	Cutter radius
		9	-	Cutting position
		13	-	Cutter width for plate or roll
		14	-	Type (e.g. diamond, plate, spindle, roll)
		19	-	Cutter radius oversize
		20	-	Shaft speed of a dressing spindle or roll

Group name	Group number ID...	System data number NO....	Index IDX...	Description
Freely available memory area for tool management				
	956	0-9	-	Freely available data area for tool management. The data is not reset when the program is aborted.
Tool usage and tooling				
	975	1	-	Tool usage test for the current NC program: Result –2: Test not possible, function disabled in the configuration Result –1: Test not possible, tool usage file missing Result 0: Test OK, all tools available Result 1: Test not OK
		2	Line	Check availability of the tools required in the pallet from line IDX in the current pallet table. –3 = No pallet is defined in row IDX, or function was called outside of pallet editing –2 / –1 / 0 / 1 see NR1
Lift off the tool at NC stop				
	980	3	-	(This function is obsolete—HEIDENHAIN recommends not to use it any longer. ID980 NR3 = 1 is equivalent to ID980 NR1 = –1, ID980 NR3 = 0 has the same effect as ID980 NR1 = 0. Other values are not permissible.) Enable lift-off to the value defined in CfgLiftOff: 0 = Lock lift-off function 1 = Enable lift-off function
Touch probe cycles and coordinate transformations				
	990	1	-	Approach behavior: 0 = Standard behavior 1 = Approach probing position without compensation. Effective radius, set-up clearance is zero
		2	16	Automatic / Manual machine operating modes
		4	-	0 = Stylus not deflected 1 = Stylus deflected
		6	-	TT tool touch probe active? 1 = Yes 0 = No
		8	-	Momentary spindle angle in [°]
		10	QS parameter no.	Determine the tool number from the tool name. The return value depends on the rules configured for the search of the replacement tool.

Group name	Group number ID...	System data number NO....	Index IDX...	Description
				If there are multiple tools with the same name, the first tool from the tool table will be selected. If the tool selected by these rules is locked, a replacement tool will be returned. –1: No tool with the specified name found in the tool table or all qualifying tools are locked.
		16	0	0 = Transfer control over the channel spindle to the PLC, 1 = Assume control over the channel spindle
			1	0 = Pass tool spindle control to the PLC, 1 = Take control of the tool spindle
		19	-	Suppress touch prove movement in cycles: 0 = Movement will be suppressed (CfgMachineSimul/simMode parameter not equal to FullOperation or **Test Run** operating mode is active) 1 = Movement will be performed (CfgMachineSimul/simMode parameter = FullOperation, can be programmed for testing purposes)

Group name	Group number ID...	System data number NO....	Index IDX...	Description
Status of execution				
	992	10	-	Block scan active 1 = yes, 0 = no
		11	-	Block scan—information on block scan: 0 = NC program started without block scan 1 = Iniprog system cycle is run before block scan 2 = Block scan is running 3 = Functions are being updated –1 = Iniprog cycle was canceled before block scan –2 = Cancellation during block scan –3 = Cancellation of the block scan after the search phase, before or during the update of functions –99 = Implicit cancellation
		12	-	Type of canceling for interrogation within the OEM_CANCEL macro: 0 = No cancellation 1 = Cancellation due to error or emergency stop 2 = Explicit cancellation with internal stop after stop in the middle of the block 3 = Explicit cancellation with internal stop after stop at the end of a block
		14	-	Number of the last FN14 error
		16	-	Real execution active? 1 = execution, 0 = simulation
		17	-	2-D graphics during programming active? 1 = yes 0 = no
		18	-	Live programming graphics (**AUTO DRAW** soft key) active? 1 = Yes 0 = No
		20	-	Information on combined milling/turning mode of operation: 0 = Milling (after **FUNCTION MODE MILL**) 1 = Turning (after **FUNCTION MODE TURN**) 10 = Execute the operations for the turning-to-milling transition 11 = Execute the operations for the milling-to-turning transition
		30	-	Interpolation of multiple axes permitted? 0 = No (e.g. for straight cut control) 1 = yes

Group name	Group number ID...	System data number NO....	Index IDX...	Description
		31	-	R+/R– possible/permitted in MDI mode? 0 = No 1 = Yes
		32	0	Cycle call possible/permitted? 0 = No 1 = Yes
			Cycle number	Single cycle enabled: 0 = No 1 = Yes
		40	-	Copy tables in **Test Run** operating mode? Value 1 will be set when a program is selected and when the **RESET+START** soft key is pressed. The **iniprog.h** system cycle will then copy the tables and reset the system datum. 0 = no 1 = yes
		101	-	M101 active (visible condition)? 0 = no 1 = yes
		136	-	M136 active? 0 = no 1 = yes

Group name	Group number ID...	System data number NO....	Index IDX...	Description
Activate machine parameter subfile				
	1020	13	QS parameter no.	Has a machine parameter subfile with path from QS number (IDX) been loaded? 1 = Yes 0 = No
Configuration settings for cycles				
	1030	1	-	Display the **Spindle does not rotate** error message? **(CfgGeoCycle/displaySpindleErr)** 0 = no, 1 = yes
		2	-	Display the **Check the algebraic sign for depth!** error message? **(CfgGeoCycle/displayDepthErr)** 0 = no, 1 = yes
Data transfer between HEIDENHAIN cycles and OEM macros				
	1031	1	0	Component monitoring: counter of the measurement. Cycle 238 Measure machine data automatically increments this counter.
			1	Component monitoring: Type of measurement –1 = No measurement. Writing of the value with FN17 concludes Cycle 238. 0 = Circular test 1 = Waterfall diagram 2 = Frequency response 3 = Envelope curve spectrum
			2	Component Monitoring: Index of the axis from **CfgAxes\MP_axisList**
			3 – 9	Component monitoring: further arguments depend on the measurement
		100	-	Component monitoring: optional names of the monitoring tasks, as specified in **System\Monitoring\CfgMonComponent**. After completion of the measurement, the monitoring tasks stated here are executed consecutively. When assigning the input parameters, remember to separate the listed monitoring tasks by commas.
User settings for the user interface				
	1070	1	-	Feed rate limit of soft key FMAX; 0 = FMAX is inactive
Bit test				
	2300	Number	Bit number	This function checks whether a bit has been set in a number. The number to be checked is transferred as NR, the bit to be searched for as IDX, with IDX0 designating the least significant bit. To call this function for large numbers, make sure to

Group name	Group number ID...	System data number NO....	Index IDX...	Description
				transfer NR as a Q parameter. 0 = Bit not set 1 = Bit set
Read program information (system string)				
	10010	1	-	Path of the current main program or pallet program.
		2	-	Path of the NC program shown in the block display.
		3	-	Path of the cycle selected with **SEL CYCLE** or **CYCLE DEF 12 PGM CALL**, or path of the currently active cycle
		10	-	Path of the NC program selected with **SEL PGM "..."**.
Indexed access to QS parameters				
	10015	20	QS parameter no.	Reads QS(IDX)
		30	QS parameter no.	Returns the string that you obtain if you replace anything except for letters and digits in QS(IDX) by '_'.
Read channel data (system string)				
	10025	1	-	Name of machining channel (key)
Read data for SQL tables (system string)				
	10040	1	-	Symbolic name of the preset table.
		2	-	Symbolic name of the datum table.
		3	-	Symbolic name of the pallet preset table.
		10	-	Symbolic name of the tool table.
		11	-	Symbolic name of the pocket table.
		12	-	Symbolic name of the turning tool table

Group name	Group number ID...	System data number NO....	Index IDX...	Description
Values programmed in the tool call (system string)				
	10060	1	-	Tool name
Read machine kinematics (system strings)				
	10290	10	-	Symbolic name of the machine kinematics from Channels/ChannelSettings/CfgKinList/kinCompositeModels programmed in **FUNCTION MODE MILL** or **FUNCTION MODE TURN**.
Traverse range switchover (system string)				
	10300	1	-	Key name of the last active range of traverse
Read current system time (system string)				
	10321	1 - 16	-	1: DD.MM.YYYY hh:mm:ss 2: D.MM.YYYY h:mm 3: DD.MM.YY hh:mm 4: YYYY-MM-DD hh:mm:ss 5: YYYY-MM-DD hh:mm 6: YYYY-MM-DD h:mm 7: YY-MM-DD h:mm 8: DD.MM.YYYY 9: D.MM.YYYY 10: D.MM.YY 11: YYYY-MM-DD 12: YY-MM-DD 13: hh:mm:ss 14: h:mm:ss 15: h:mm 16: DD.MM.YYYY hh:mm 20: Calender week as per ISO 8601 As an alternative, you can use **DAT** in **SYSSTR(...)** to specify a system time in seconds that is to be used for formatting.
Read data of touch probes (TS, TT) (system string)				
	10350	50	-	Type of TS probe from TYPE column of the touch probe table (**tchprobe.tp**)
		70	-	Type of TT tool touch probe from CfgTT/type.
		73	-	Key name of the active tool touch probe TT from **CfgProbes/activeTT**.
Read and write data of touch probes (TS, TT) (system string)				
	10350	74	-	Serial number of the active tool touch probe TT from **CfgProbes/activeTT**.
Read the data for pallet machining (system string)				
	10510	1	-	Pallet name
		2	-	Path of the selected pallet table.
Read version ID of the NC software (system string)				

Group name	Group number ID...	System data number NO....	Index IDX...	Description
	10630	10	-	The string corresponds to the format of the version ID shown, e.g. **340590 09** or **817601 05 SP1**.
General data of the grinding wheel				
	10780	1	-	Name of wheel
Read information on unbalance cycle (system string)				
	10855	1	-	Path of the unbalance calibration table belonging to the active kinematics
Read data of the current tool (system string)				
	10950	1	-	Current tool name
		2	-	Entry from the DOC column of the active tool
		3	-	AFC control setting
		4	-	Tool-carrier kinematics
		5	-	Entry from the DR2TABLE column – file name of the compensation value table for 3D-ToolComp
Read data from FUNCTION MODE SET (system string)				
	11031	10	-	Returns the selection of the FUNCTION MODE SET <OEM mode> macro as a string.

40.5 Keycaps for keyboard units and machine operating panels

The keycaps with IDs 12869xx-xx and 1344337-xx are suitable for use on the following keyboard units and machine operating panels:

- TE 361 (FS)

The keycaps with ID 679843-xx are suitable for use on the following keyboard units and machine operating panels:

- TE 360 (FS)

41 NC error messages

Applies to:
81762x-16, 34059x-16, 81760x-16, 68894x-16, 54843x-16

Date:
02/2022

List of All Error Messages

Error number	Description
120-0006	**Error message** Configuration of soft key not readable **Cause of error** The specified soft key is not contained in the configuration data. **Error correction** Check the configuration data.
120-0007	**Error message** Configuration of layer not readable **Cause of error** The configured soft-key row (layer) canot be read. **Error correction** Check the configuration data.
120-0008	**Error message** Cycle or query %1 unknown **Cause of error** The specified cycle or cycle dialog was not found in the configuration data. **Error correction** Check the configuration data.
120-000A	**Error message** Cannot generate menu **Cause of error** Software problem in the user interface **Error correction** Inform your service agency.

Error number	Description
120-000B	**Error message** Q Parameter %1: Cannot read or write value **Cause of error** Software problem in the user interface **Error correction** Inform your service agency.
120-000C	**Error message** Soft-key group without first element **Cause of error** In the configuration data a soft-key group is specified, but no soft key is marked as "first." **Error correction** Edit the configuration data.
120-000D	**Error message** Soft-key type is not supported **Cause of error** An illegal soft-key type was used within a cycle dialog. **Error correction** Edit the configuraiton data.
120-000E	**Error message** Invalid resource ID **Cause of error** Software problem in the user interface **Error correction** Inform your service agency.
120-000F	**Error message** Invalid configuration data for cycle **Cause of error** Too many soft keys defined in a cycle dialog **Error correction** Inform your service agency.
120-0013	**Error message** Error in the user interface **Cause of error** Software problem in the user interface. **Error correction** Inform your service agency.

Error number	Description
120-0016	**Error message** **Cause of error** Internal software error with front end/dialogs. **Error correction** Inform your service agency.
120-001E	**Error message** Can't connect to network: %1 %2 %3 **Cause of error** Unable to connect with a network drive defined in the network management. **Error correction** - Use the program manager to open the network management (NETWORK soft key) - Press the MOD key and enter the network code number NET123. - Enter all required data for the network connection (DEFINE NETWORK CONNECTN. soft key). - Check the correctness and spelling of the input data for the network connection
120-001F	**Error message** File '%1' not found **Cause of error** A required file could not be found at the specified location. **Error correction** Check the spelling of the path and file name, for example. If possible, copy the file to the required directory.
120-002E	**Error message** Path '%1' not found **Cause of error** A required drive or directory was not found. **Error correction** Check the spelling of the path.

Error number	Description
120-0041	**Error message** No files available for online help (*.CHM) **Cause of error** No context-sensitive help can be displayed because no files are available for the *.CHM online help. You have to download the *.CHM files from the HEIDENHAIN Homepage and save them on the control in the subfolder for your language. Note the information in the User's Manual. **Error correction** - Download the help files from the HEIDENHAIN homepage (www.heidenhain.de): > www.heidenhain.de > Documentation and information > User's documentation - Unpack the ZIP file and transfer the *.CHM files to the control
125-0067	**Error message** Error when saving the screen content in the file %1 **Cause of error** There was an error when saving the screen content in the file. **Error correction** Delete all unneeded files to increase memory capacity, or inform the service agency for your control.
125-0068	**Error message** Source file %1 not found **Cause of error** A file in the list of example files cannot be addressed as source **Error correction** Inform your service agency
125-0069	**Error message** Example file %1 could not be copied. Error code %2 **Cause of error** A file in the list of example files could not be copied **Error correction** Inform your service agency
125-006A	**Error message** List for copying the example files not available %1 **Cause of error** The file containing the list of example files is not available **Error correction** Inform your service agency

Error number	Description
125-006C	**Error message** Error during software update: %1 **Cause of error** **Error correction**
125-006D	**Error message** The update rules are not fulfilled **Cause of error** One or more update rules were not complied with. **Error correction** Inform your machine tool builder
125-006E	**Error message** Update file invalid or does not exist **Cause of error** The update file was not found or it does not contain a valid update. **Error correction** Inform your machine tool builder
125-006F	**Error message** Checksum error during update **Cause of error** The checksums do not match the update files. **Error correction** Inform your machine tool builder
125-0070	**Error message** Invalid signature entry during update **Cause of error** An invalid signature entry was found in the update file. **Error correction** Inform your machine tool builder
125-0071	**Error message** Not enough memory. Update not possible. **Cause of error** There is not enough free memory on the data medium to save the update there. **Error correction** Vacate some memory space

Error number	Description
125-0072	**Error message** Backup file not found **Cause of error** During the software update, the control automatically makes a backup file for restoring the previous software level. The backup file was not found on the data medium. **Error correction** Change to the directory in which the backup file was saved.
125-0075	**Error message** ZIP file contains no control setup **Cause of error** A .zip file was selected for the software update that does not contain any setup files for the control. **Error correction** - Check the .zip file
125-00D4	**Error message** In the configuration data, no operating times are released for editing. **Cause of error** Although the code number was entered correctly, the operating times cannot be edited because all fields of the operating times locked against editing in the configuration data. **Error correction** Release the required fields in the configuration data.
125-0117	**Error message** The connection list is full **Cause of error** The maximum number of configurable connections has been reached. **Error correction** Please delete a connection before you add another one.
125-0149	**Error message** Traverse limits were not adopted. **Cause of error** The input for one or more traverse ranges could not be loaded. Possible cause: Value range for modulo axis was entered to be greater than 360° - An NC program is being run **Error correction** - Adapt the input values and load them again - Load the traverse limits again after program run

Error number	Description
125-014A	**Error message** Input not in effect **Cause of error** The input was not accepted. Possible causes: - You have entered an illegal character. The following characters are allowed: 1234567890.- - You have entered too many characters before or after the decimal separator. **Error correction** Check and correct the entered values.
125-014B	**Error message** Kinematic model was not switched over **Cause of error** The kinematic model was not selected. Possible causes: - An NC program is being run - Tilting of the working plane is active (3D ROT soft key, PLANE function, Cycle 19) - The kinematic model is faulty **Error correction** - Switch the kinematics again after program run - Deactivate the "Tilt Working Plane" function: - Use the 3D ROT soft key to set manual tilting to inactive, or - Use the PLANE function or Cycle 19 to deactivate tilting under program control - Inform your service agency
125-0163	**Error message** Unit of measure was not switched **Cause of error** The unit of measure for the position display could not be changed. Possible cause: - An NC program is being processed **Error correction** - Switch the unit of measure again after program run
126-0072	**Error message** Error during self-test **Cause of error** An invalid message was received during the self test. **Error correction** Inform your service agency

Error number	Description
126-0075	**Error message** Error during self-test **Cause of error** An error occurred during the self test. **Error correction** - Check the emergency-stop circuits -ES.A and -ES.B for correct wiring and proper function - Inform your service agency.
126-0076	**Error message** Error during self test **Cause of error** An error occurred during the self test. **Error correction** - Check the emergency-stop circuits -ES.A and -ES.B for correct wiring and proper function - Inform your service agency
126-007F	**Error message** Self-test cannot be started **Cause of error** Before the self-test (emergency stop test), an error occurred that prevents the test from starting: - Emergency stop error has occurred - Emergency stop button was pressed - Emergency-stop circuit is defective - Internal temperature of an HSCI component is too high - Internal temperature of an HSCI component is too low - The fan of an HSCI component is defective - The power supply to the component is missing, too low or too high - HSCI cabling is missing or defective **Error correction** - Note further messages. - Use the HSCI bus diagnostics to find out which components are reporting an error - Check the emergency-stop circuit - Check the power supply to the affected HSCI components - Check the HSCI cabling - If necessary, exchange the HSCI component - Generate the service files and inform your service agency

Error number	Description
126-010F	**Error message** The CC only runs with 500 MHz **Cause of error** IThere is at least one CC controller unit in the system that is clocked only with 500 MHz. This results in performance problems in combination with the use of adaptive control functions. **Error correction** - Check the CCs and exchange them if required. - Contact your machine tool builder
126-0110	**Error message** NC software not released for FS applications **Cause of error** - The control system (hardware) was detected as a system with functional safety (FS) from HEIDENHAIN. However, the installed NC software has not been approved for applications that use integrated functional safety (FS) from HEIDENHAIN. - The installed software is a test software or an NC software that has not been released for the application of integrated functional safety (FS) **Error correction** - Install an NC software version of your control that has been approved for applications with integrated functional safety (FS) from HEIDENHAIN. - Inform your service agency.
126-0111	**Error message** Too many switch-off ports defined **Cause of error** In the IOC file, more than one output was defined for switching the machine off after shutdown. This is not allowed. No more that one output can be defined. **Error correction** - Check the IO configuration and correct it if required
126-0112	**Error message** Switch-off port on incorrect bus system **Cause of error** The output for switching off the machine after the control shutdown was defined for the wrong bus system. The permitted bus systems are external PL assemblies with HSCI interface or internal PL assemblies. **Error correction** - Check the IO configuration and correct it if required

Error number	Description
126-0113	**Error message** PLC output for shutdown has multiple definitions **Cause of error** A PLC output for shutting down the control (switch-off port) is defined both in the IOC file as well as in the configuration data (machine parameters). Note that the entry in the configuration data has priority. **Error correction** - Check the IO configuration. - Check the configuration datum DisplaySettings->CfgShut-down (Maschinen-Parameternummer 101600) - Inform your service agency
126-0114	**Error message** Automatic switch-off not possible **Cause of error** Machine switch-off after control shutdown cannot be activated because the IO configuration does not match the actual hardware configuration. - The control will be operated in simulation mode - The IOC file does not match the hardware configuration - The options in the configuration are incorrectly set. **Error correction** - Check the hardware configuration - Check the IO configuration - Check the options - Inform your service agency
126-0115	**Error message** PLC output for switch-off is improperly defined **Cause of error** The output for switching off the machine after the control has been shutdown was incorrectly configured. - An output on the internal PL was addressed (e.g. with UEC, UMC), although no internal PL exists. - The address of the output is outside of the permissible range O0 to O30. **Error correction** Check the configuration data (machine parameter number 101600).

Error number	Description
126-0116	**Error message** PLC output for switch-off is improperly configured **Cause of error** The PLC output for switching off the machine after the control has been shutdown was incorrectly configured. - An output on an HSCI device was address, although not device is connected to the control over HSCI. - The addressed HSCI device is not a PL. - The addressed output does not exist on the PL. **Error correction** - Check the configuration data (machine parameter number 101600) - Inform your service agency
126-0117	**Error message** PLC output for switch-off is improperly configured **Cause of error** The PLC output for switching off the machine after the control has been shutdown was incorrectly configured. The settings in the configuration datum CfgShutdown are not applicable for an integrated PL (e.g. with UEC, UMC) nor for a PL connected over HSCI (e.g. PLB 62xx). Settings for output on internal PL: - powerOffDevice: Unassigned - powerOffSlot: Unassigned - powerOffPort: Number of the output on internal PL (value range: 0 to 30) Settings for output on a PL connected over HSCI: - powerOffDevice: Bus address of the PL - powerOffSlot: Slot number of the module (0 for system module and UEC11x) - powerOffPort: Number of the output to be switched **Error correction** - Check the configuration data (machine parameter number 101600) - Inform your service agency
126-0118	**Error message** PLC output for switch-off is improperly configured **Cause of error** Automatic machine switch-off after control shutdown has been selected. However, no PlC output was defined for it in the configuration file nor in the IOC file. **Error correction** - Define a PLC output for switch-off in the IOC file or in the configuration file - Inform your service agency

Error number	Description
126-0119	**Error message** Key name %1 for OEM script is too long **Cause of error** - The key name used for Python script to be started during start-up is too long. Maximum of 10 characters allowed. **Error correction** - Change the configuration datum
126-011A	**Error message** Hardware combination not permitted **Cause of error** The detected hardware configuration includes an impermissible combination of CC or PL components. Examples: - CC 6106 and CC 306 - CC 306 and UEC 112 - CC 306 and older PLB, MB, or TE (not "Gen 3 ready" or not "Gen 3 exclusive") **Error correction** - Reconfigure the hardware - Inform your machine tool builder
126-011B	**Error message** Self-test error was not detected on %2 with HSCI address %3 No reaction during self-test on %2 with HSCI address %3 Self-test was not executed on %2 with HSCI address %3 **Cause of error** During the device self-test, an expected message was not received. **Error correction** - Check all cable connections from and to this device - Check the device and, if necessary, exchange it - Inform your service agency
126-011E	**Error message** Missing authorization **Cause of error** You do not have the right to execute the Commissioning mode (current controller adjustment / capturing the field angle). **Error correction** - Acquire the NC.SetupDrive right, for example by entering the password of an authorized user - Then start the function again

Error number	Description
126-011F	**Error message** Safety not ensured **Cause of error** Configuration data relevant to safety functions of the system were changed and have not been accepted yet. **Error correction** Please pay attention to the following information about parameter sets in which configuration data was changed. Perform an acceptance test of the functional safety for this system according to the guidelines of the OEM when the respective parameter sets are active. Shut the system down; while doing so, confirm that the functional safety was successfully tested and accepted.
126-0120	**Error message** Safe configuration data %1 changed **Cause of error** Configuration data relevant to safety functions of the system were changed in the indicated parameter set and have not been accepted yet. **Error correction** Perform an acceptance test of the functional safety for this system according to the guidelines of the OEM while the indicated parameter set is active. Shut the system down; while doing so, confirm that the functional safety was successfully tested and accepted.
126-0129	**Error message** Automatic switchover in simulation mode DriveSimul **Cause of error** The control was automatically switched to the "DriveSimul" simulation mode. Possible causes: - There is no controller unit (CC) in the system. - Components of drive generation 3 with external safety are being used but without a PAE module. **Error correction** - Check the hardware components installed. - Restart the control. - Set the CfgMachineSimul/MP_simMode setting to "DriveSimul". - Inform your service agency.

Error number	Description
126-012A	**Error message** Automatic switchover in simulation mode DriveAndEmS-topSimul **Cause of error** The control was automatically switched to the "DriveAn-dEmStopSimul" simulation mode. Possible cause: - No system PL was detected **Error correction** - Check the hardware components installed - Restart the control. - Set the CfgMachineSimul/MP_simMode setting to "Drive-AndEmStopSimul". - Inform your service agency.
126-012B	**Error message** Automatic switchover in simulation mode FullSimul **Cause of error** The control was automatically switched to the "FullSimul" simulation mode. Possible causes: - Neither a PL nor a machine operating panel was detected in the system. - No devices were detected at the HSCI bus. - The CfgMachineSimul/MP_simMode setting does not match the real hardware components installed. **Error correction** - Check the hardware components installed, especially the HSCI cabling and the supply voltages of the HSCI compo-nents. - Restart the control. - Set the CfgMachineSimul/MP_simMode setting to "FullSimul". - Inform your service agency.
126-012E	**Error message** Too many UM units connected to one CC: CC index %1 **Cause of error** - Too many UM inverters are connected to the stated CC controller unit. - For each CC, the maximum number of UM inverters (or motor connections) is limited to the number of axes possible on the CC. **Error correction** - Distribute the UM inverters over other CC controller units or adapt the configuration - Remove UM inverters that aren't being used (or use one-axis modules instead of two-axis modules) - Inform your service agency

Error number	Description
126-012F	**Error message** Component: %1 with serial number: %2 not planned in project **Cause of error** In a system with the Gen 3 generation of drives, all components connected to the HSCI bus and all power modules must be included in the IOconfig project. **Error correction** Add the missing component to your IOconfig project.
126-0130	**Error message** Project planning with IOconfig incomplete **Cause of error** In a system with the Gen 3 drives, all components connected to the HSCI bus and all power modules must be included in the IOconfig project. **Error correction** Add the missing components in your IOconfig project, and restart the control.
126-0131	**Error message** TNCdiag cannot be started **Cause of error** Internal error **Error correction** Inform your service agency
126-0132	**Error message** Too many HSCI devices connected. Current: %1; permitted: %2 **Cause of error** Too many devices are connected to the HSCI bus. **Error correction** - Modify the machine configuration in order to avoid exceeding the maximum number of HSCI participants - Inform your machine manufacturer
126-0133	**Error message** Too many CC/UxC devices connected. Current: %1; permitted: %2 **Cause of error** Too many CC, UEC, or UMC units are connected to the HSCI bus. **Error correction** - Modify the machine configuration in order to avoid exceeding the maximum number of HSCI participants - Inform your machine manufacturer

Error number	Description
126-0134	**Error message** Too many PLB/MB/TE/UxC devices connected. Current: %1; perm.: %2 **Cause of error** Too many PLB, MB, TE, UEC, or UMC units are connected to the HSCI bus. **Error correction** - Modify the machine configuration in order to avoid exceeding the maximum number of HSCI participants - Inform your machine manufacturer
126-0135	**Error message** Too many MB/TE devices connected. Current: %1; permitted: %2 **Cause of error** Too many MB or TE operating panels are connected to the HSCI bus. **Error correction** - Modify the machine configuration in order to avoid exceeding the maximum number of HSCI participants - Inform your machine manufacturer
126-0136	**Error message** Too many UVR devices connected. Current: %1; permitted: %2 **Cause of error** Too many UVR devices are connected to the HSCI bus. **Error correction** - Modify the machine configuration in order to avoid exceeding the maximum number of HSCI participants - Inform your machine manufacturer
126-0137	**Error message** Too many I/O terminals present. Current: %1; permitted: %2 **Cause of error** There are too many I/O terminals present on the PLB, MB, TE, UEC, or UMC units. Functionally safe terminals count as one terminal. Perhaps more terminals were detected than are actually present on the units. Some units contain internal terminals that are included in this count for technical reasons. **Error correction** - Modify the machine configuration in order to avoid exceeding the maximum number of terminals - Inform your machine manufacturer

Error number	Description
130-0001	**Error message** Processor check error **Cause of error** System error **Error correction** Inform your service agency.
130-0002	**Error message** **Cause of error** System error **Error correction** Inform your service agency.
130-0066	**Error message** **Cause of error** Arithmetical error. Value too small. **Error correction** Inform your service agency.
130-0067	**Error message** **Cause of error** Arithmetical error. Value too large. **Error correction** Inform your service agency.
130-0068	**Error message** **Cause of error** System error **Error correction** Inform your service agency.
130-0069	**Error message** **Cause of error** System error **Error correction** Inform your service agency.
130-006A	**Error message** **Cause of error** System error **Error correction** Inform your service agency.

Error number	Description
130-006B	**Error message** **Cause of error** System error **Error correction** Inform your service agency.
130-006C	**Error message** **Cause of error** System error **Error correction** Inform your service agency.
130-006D	**Error message** **Cause of error** System error **Error correction** Inform your service agency.
130-006F	**Error message** **Cause of error** System error **Error correction** Inform your service agency.
130-0070	**Error message** **Cause of error** System error **Error correction** Inform your service agency.
130-0096	**Error message** **Cause of error** System error with cancellation of machining **Error correction** Inform your service agency.
130-0097	**Error message** **Cause of error** System error **Error correction** Inform your service agency.

Error number	Description
130-0098	**Error message** **Cause of error** System error **Error correction** Inform your service agency.
130-0099	**Error message** File access was successful **Cause of error** Information for the user that file access was successful. **Error correction**
130-009A	**Error message** File system error **Cause of error** 1.) The path name contains more than six subdirectories. 2.) The path name contains a directory or file name with more than 16 characters. 3.) The path name contains two or more file name extensions or a file extension with more that 3 characters. 4.) A system error occurred during file access. **Error correction** 1.) and 2.) Save the file in another directory or under another, shorter name. 3.) Save the file with only one file name extension with no more than 3 characters. 4.) Inform your service agency.
130-009B	**Error message** File not found File not found: %1 **Cause of error** The named path has no file. **Error correction** Correct the given path name.
130-009C	**Error message** Illegal file name **Cause of error** An invalid path name was given (e.g. a path name containing illegal characters). **Error correction** Correct the given path name.

Error number	Description
130-009D	**Error message** Too many files open **Cause of error** The file couldn't be opened because too many files are already opened. There is a limit to the number of simultaneously open files. **Error correction** Close the files that you no longer need.
130-009E	**Error message** File access not possible **Cause of error** 1.) Access to the file was denied. 2.) The file is already being written to by another application. **Error correction** 1.) Check the access rights to the file and remove any existing write protection. 2.) Close the file in the application that has blocked access to the file.
130-009F	**Error message** File access not possible **Cause of error** The file was opened only for reading and cannot be written to. **Error correction** Save the files under another name.
130-00A0	**Error message** Directory could not be erased **Cause of error** The current directory cannot be deleted. **Error correction** Please select another directory first.
130-00A1	**Error message** Further file entry impossible **Cause of error** The TNC cannot save any more files. **Error correction** Delete any files that you no longer need.

Error number	Description
130-00A2	**Error message** File access not possible **Cause of error** The drive doesn't allow positioning in the file, or the positioning is not at the begining of a line. **Error correction** Inform your service agency.
130-00A3	**Error message** Drive not ready **Cause of error** Hardware error during file access. **Error correction** Check whether the device, e.g. a network adapter, is connected correctly.
130-00A4	**Error message** File access not possible **Cause of error** The file is already in use by another application. **Error correction** Close the file in the application that has access to the file.
130-00A5	**Error message** File access not possible **Cause of error** Access to a certain area of the file was blocked by another application. **Error correction** Close the file in the application that has blocked access to the file.
130-00A6	**Error message** Further file entry impossible **Cause of error** The file could not be saved because the data medium is full. **Error correction** Delete unneeded files on the data medium.
130-00A7	**Error message** Program incomplete **Cause of error** Unexpected end of file found. **Error correction** Ensure that the file is complete.

Error number	Description
130-00A8	**Error message** Directory access not possible **Cause of error** Access to the directory was denied. **Error correction** Check the access privileges to the file and, if required, cancel an existing write protection.
130-012C	**Error message** **Cause of error** The system is no longer consistent. **Error correction** Inform your service agency.
130-012D	**Error message** **Cause of error** The system cannot be started, since not all objects are available. **Error correction** Inform your service agency.
130-012E	**Error message** **Cause of error** The system cannot be started, since not all objects are available. **Error correction** Inform your service agency.
130-012F	**Error message** **Cause of error** The system cannot be started, since not all objects are available. **Error correction** Inform your service agency.
130-0130	**Error message** **Cause of error** Error in communication within the system **Error correction** Inform your service agency.

Error number	Description
130-0131	**Error message** **Cause of error** The system cannot be started, since not all objects are available. **Error correction** Inform your service agency.
130-0132	**Error message** **Cause of error** The system cannot be started, since not all objects are available. **Error correction** Inform your service agency.
130-0133	**Error message** **Cause of error** The system cannot be started, since not all objects are available. **Error correction** Inform your service agency.
130-0134	**Error message** **Cause of error** The system cannot be started, since not all objects are available. **Error correction** Inform your service agency.
130-0135	**Error message** **Cause of error** The system cannot be started because not all objects are available. **Error correction** Inform your service agency.

Error number	Description
130-0137	**Error message** Error: Unexpected end of process %1 **Cause of error** A started process ended irregularly. Possible causes: - Faulty script or error in implementation - Memory assigned for script is exhausted - Other system resources are exhausted **Error correction** - Check the log files of the script for clues. If required, edit the script. - You might find further information in the log files of the control and the operating system. - Increase the memory assigned for the script.
130-0190	**Error message** ClientQueue (%1) could not be opened **Cause of error** **Error correction**
130-0191	**Error message** Log file could not be saved. **Cause of error** The log file could not be saved under the specified path/file name. **Error correction** Enter another path/file name for saving.
130-0192	**Error message** ASSERTION: Consistency condition not fulfilled **Cause of error** System error **Error correction** Inform your service agency.
130-0193	**Error message** INFO: %1 **Cause of error** **Error correction**
130-0194	**Error message** **Cause of error** Error in communication within the system **Error correction** Inform your service agency.

Error number	Description
130-0195	**Error message** **Cause of error** No further time job could be started. **Error correction** Inform your service agency.
130-0196	**Error message** **Cause of error** Not enough memory available. **Error correction** Inform your service agency.
130-0197	**Error message** Invalid event class in the following error! **Cause of error** System error **Error correction** Inform your service agency.
130-0199	**Error message** OEM error without additional information **Cause of error** Error text was not found. **Error correction** Enter the error text in the error-text file and/or save the error text file in the corresponding directory.
130-019A	**Error message** Cycle error without additional information **Cause of error** Error text was not found. **Error correction** Enter the error text in the error-text file and/or save the error-text file in the corresponding directory.
130-019B	**Error message** %1 **Cause of error** **Error correction**

Error number	Description
130-019C	**Error message** Saving service files... **Cause of error** Service files are being saved for diagnostic purposes. **Error correction** Inform your service agency.
130-019D	**Error message** The error log could not be opened. NOTE: No error messages or info messages will be logged. **Cause of error** The log is write-protected. **Error correction** Remove the write protection, or rename or delete the log.
130-01A1	**Error message** Error while saving the service file **Cause of error** An error occurred while saving the service files. **Error correction** Generate the service files again. If required, use the SAVE SERVICE FILES soft key.
130-01FA	**Error message** Incorrect condition in switch statement **Cause of error** **Error correction**
130-01FB	**Error message** No acknowledgment from application %1 **Cause of error** The application does not confirm closing the trace files for diagnostic purposes. **Error correction** No error correction possible.
130-01FC	**Error message** System error System error **Cause of error** An as yet unimplemented function of a server was called. **Error correction** Inform your service agency

Error number	Description
130-01FD	**Error message** System error System error **Cause of error** A server cannot find the sender of a message. **Error correction** Inform your service agency
130-01FE	**Error message** System error System error **Cause of error** A server cannot reach the sender of a message. **Error correction** Inform your service agency
130-01FF	**Error message** System error System error **Cause of error** A software error has occurred. **Error correction** Inform your service agency
130-0201	**Error message** Configuration datum %1 - %2 contains errors **Cause of error** The given configuration datum has errors. The erroneous values were replaced by default values. **Error correction** Correct the given configuration datum or inform your machine manufacturer.
130-0202	**Error message** NC program cancelled **Cause of error** The NC program was cancelled because of an error. **Error correction** Note further error messages. If no further error messages appear, inform your service agency.

Error number	Description
130-03EE	**Error message** File exists already **Cause of error** The file cannot be generated because a file with the same name already exists. **Error correction** Save the file under another name.
130-03EF	**Error message** File access not possible **Cause of error** The file contains data in an illegible format. **Error correction** Select another file or inform your service agency.
130-03F0	**Error message** Directory not found **Cause of error** The specified directory does not exist or was deleted. **Error correction** Select another directory.
130-03F1	**Error message** Drive not found **Cause of error** The specified drive is not connected. **Error correction** Select another drive.
130-0414	**Error message** Service files could not be saved **Cause of error** An error occurred while saving the service files. **Error correction** Try to save again. If required, restart the control beforehand. Notify your service agency if the problem recurs.
130-0415	**Error message** There is no online help for the error! **Cause of error** **Error correction**

Error number	Description
130-07D1	**Error message** Error when opening/closing a zip file (%1) **Cause of error** The TNC was not able to create or close the zip file. The file might be corrupt. **Error correction** Try again to create the zip file.
130-07D2	**Error message** There was an error when saving a (zip) file **Cause of error** When creating the service files, the TNC was unable to save at least one file. **Error correction** No remedy possible.
130-07D4	**Error message** Key might be jammed **Cause of error** On or more keys were pressed for more than 5 seconds. **Error correction** If the problem continues, inform your service agency. Press the keys SHIFT, CTRL and ALT.
130-07D5	**Error message** Parameter transfer not possible **Cause of error** Could not write machine parameters because the background activity blocked access to the machine configuration. **Error correction** - Conclude the background activities. - Ensure during offset adjustment that the axis is in servo control and that the control window is reached.
130-07D6	**Error message** No response from drive "%1"! **Cause of error** The network drive is no longer ready or no longer reacts. **Error correction** - Check the network - Check whether the connected computer is active - Check the network cables and connectors - Check the activity of the Ethernet data interface. LEDs should light up or blink. - Have a network specialist check the network settings.

Error number	Description
130-07D7	**Error message** Program start or program selection has failed **Cause of error** The action was prevented by a simultaneous reconfiguration or a configuration error. **Error correction** - End the current simulation in the Test Run operating mode - Correct the configuration error
130-07D8	**Error message** The application cannot be started **Cause of error** The authorization necessary in order to run the application is missing. **Error correction**
140-0001	**Error message** Backup copy of the configuration data cannot be created. **Cause of error** When configuration data are written, a backup copy of the parameter file is created. This file could not be created. – File is write-protected - Drive is full - Problem with the hard disk **Error correction** - Remove the write protection - Delete unneeded files on the hard disk or memory card to make space.
140-0002	**Error message** Configuration file '%1' cannot be written. **Cause of error** The file cannot be opened for writing. - File is write-protected - Drive is full - Problem with the hard disk **Error correction** - Remove the write protection. - Delete unneeded files on the hard disk to make space.

Error number	Description
140-0004	**Error message** Configuration file '%1' not found. **Cause of error** A parameter file specified in the "configfiles.cfg" file was not found. - Incorrect parameter file entered - Incorrect directory for the parameter file entered - Parameter file deleted **Error correction** - Correct the "configfiles.cfg" or "configfile.cfg" file. - Specify the correct file in the update rule. - Create a parameter file or copy it into the desired directory.
140-0005	**Error message** Data object '%1' '%2' not complete **Cause of error** A configuration object in a configuration file is incomplete. One or more configuration parameters are missing. The incomplete configuration object is designated by object name and object key. Possible causes: - The existing configuration data belong to an older software version - The data file was edited manually **Error correction** - Define the update rule or inform your service agency - Use the configuration editor to completely fill out the parameter object
140-0006	**Error message** Key of the data object '%1' not initialized. **Cause of error** The key of a parameter object is missing. **Error correction** Enter the key for all parameter objects.

Error number	Description
140-000A	**Error message** Cycle ini file '%1' not found. **Cause of error** The cycle file specified in the parameter object "CfgJhPath" or "CfgOemPath" was not found. The name of the unfound file is given. - Incorrect file entered - Incorrect object entered - File deleted If the file is present, the problem could be caused by incorrect entries. - Incorrect or incomplete entries - Incorrect cycle, parameter, or text definitions **Error correction** - Correct the file information. - Create a file or copy one into the corresponding directory. - Use CycleDesign to correct the cycle definitions.
140-000B	**Error message** Unknown code word '%1' in cycle ini file. **Cause of error** An unknown keyword was found in a cycle file. - Incorrect cycle file - Incorrect version of CycleDesign - Incomplete or incorrect cycle definition **Error correction** - Use the correct cycle file. - Use the correct version of CycleDesign. - Use CycleDesign to correct the cycle definition.
140-000D	**Error message** No text found for text name '%1' **Cause of error** In a parameter file, the text name entered for a language-dependent text was not found. - Text is not yet defined - Text file is not compiled - Text file was not copied onto the target system - Incorrect name entered **Error correction** If no text has been entered: - Define the text in a resource file - Compile the text file - Copy the text file onto the target system Otherwise, enter an existing text name or correct the text name in question.

Error number	Description
140-000F	**Error message** Module '%1' not open. **Cause of error** A module is not logged on with the configuration server. - This task requires that you be logged on. - You attempted to log off. **Error correction** Inform your service agency.
140-0010	**Error message** Module '%1' has no general write access. **Cause of error** An attempt was made to set the general write protection on the configuration server. However, the write protection is already active and cannot be set again. **Error correction** Inform your service agency.
140-0011	**Error message** '%1' has no general write access. **Cause of error** A module is trying to cancel the general write protection, which however was not reserved by this module. **Error correction** Inform your service agency.
140-0012	**Error message** Unknown message '%1' for configuration server. **Cause of error** Internal software error **Error correction** Inform your service agency.
140-0013	**Error message** Write access for '%1' '%2' not reserved. **Cause of error** Internal software error **Error correction** Inform your service agency.
140-0014	**Error message** Incorrect file type '%1' with '%2'. **Cause of error** Internal software error **Error correction** Inform your service agency.

Error number	Description
140-0015	**Error message** Character string '%1' not found in '%2'. **Cause of error** An incorrect character string was found in a cycle file. - The file is defective - Incorrect version of CycleDesign in use **Error correction** - Use CycleDesign to create a new cycle file. - Use the correct version of CycleDesign.
140-0016	**Error message** ZERO message '%1' **Cause of error** - Insufficient main memory - Internal control error **Error correction** Inform your service agency.
140-0017	**Error message** Machine parameters were changed. Shut down the control and restart. **Cause of error** Configuration files have been changed that require a control reset for the changed data to take effect. **Error correction** - Stop NC programs and all traverse. - Press the emergency stop button. - Restart the control.
140-0018	**Error message** Data object '%1' '%2' already exists in file **Cause of error** A configuration data object with the specified key already exists. **Error correction** - Check whether the correct configuration data files are being used, e.g. whether one of the files is being used twice. - Check whether a data object is already available in another file. - Change the key of one of the redundant configuration data objects. - Delete one of the redundant objects.

Error number	Description
140-0019	**Error message** Internal software error **Cause of error** Internal software error. **Error correction** Inform your service agency.
140-001A	**Error message** Configuration object '%1' / '%2' not found **Cause of error** A configuration data object that is necessary for the control start does not exist. **Error correction** – Check the configuration in use – Check the configuration data
140-001B	**Error message** No change acknowledgment obtained from '%1' **Cause of error** Internal control error. Configuration data were changed. After notification of the change not all returned an acknowledgment within the required time. The module that did not acknowledge will be listed in the additional text. **Error correction** Inform your service agency.
140-001D	**Error message** Parameter change during program run or macro run **Cause of error** You attempted to change configuration data during a program run. These data cannot be changed during a program run (applies to reset, run or ref. errors). The additional information shows the name of the data object that cannot be changed during program run. **Error correction** Select NC stop for the running programs in Program Run Single Block, Test Run and programming graphics, and then an internal stop. Then save the data again.

Error number	Description
140-001E	**Error message** Parameter locked from editing **Cause of error** There are two possible causes: 1. An attempt was made to change configuration data while a notification of change is still pending. The last change and notification is still in progress. 2. An attempt was made to start a program while a notification of configuration change is still in progress. **Error correction** 1. Try again to save. 2. Restart the program.
140-001F	**Error message** Program start: Data objects with write protection not allowed **Cause of error** An attempt was made to start a program although data objectsare still write-protected or writing access was reserved for data objects. At program start, writing access must be allowed for all objects. **Error correction** Restart the program.
140-0020	**Error message** Module name missing or unknown '%1' **Cause of error** Internal software error. During a request a module did not enter its identification or entered it incorrectly. **Error correction** Inform your service agency.
140-0021	**Error message** Data object '%1' renamed to '%2' key '%3' **Cause of error** The read configuration data belong to an older level of the control. The specified data object was renamed by the control due to a rule. **Error correction** Check the values of the specified data object. If the data object is incorrect, correct it. Then save the data.

Error number	Description
140-0022	**Error message** Data object '%1' '%2' removed **Cause of error** The read configuration data belong to an older level of the control. The data object is no longer supported and was removed by the control due to a rule. **Error correction** Save the changed data.
140-0023	**Error message** Data type changed with data object '%1' '%2' Attribute '%3' **Cause of error** The read configuration data belong to an older version of control. The data type of a data object attribute was changed by the control due to a rule. **Error correction** Check the value of the specified attribute in the data object. If the value is incorrect, correct it. Then save the data.
140-0024	**Error message** Attribute renamed in data object '%1' '%2' Attribute '%3' **Cause of error** The read configuration data belong to an older level of the control. In the specified data object, the control renamed an attribute due to a rule. **Error correction** Check the value of the specified attribute in the data object. If the value is not correct, correct it. Then save the data.
140-0025	**Error message** Attribute in data object '%1' '%2' removed Attribute '%3' **Cause of error** The read configuration data belong to an older level of the control. In the specified data object, the control removed an attribute due to a rule. **Error correction** Check the values of the specified data object. If the data object is incorrect, correct it. Then save the data.

Error number	Description
140-0026	**Error message** Attribute inserted in data object '%1' '%2' Attribute '%3' **Cause of error** The read configuration data belong to an older level of the control. The specified data object is incomplete. Due to a rule, the control control inserted the missing attribute(s). **Error correction** Check the values of the specified data object. If the data object is incorrect, correct it. Then save the data.
140-0027	**Error message** Data object '%1' '%2' removed **Cause of error** The read configuration data belong to an older level of the control. The data object is still supported by the control, but was removed due to a rule. **Error correction** Save the changed data.
140-0028	**Error message** Data object '%1' '%2' inserted **Cause of error** The read configuration data belong to an older level of the control. The data object is missing in the given configuration data and was inserted due to a rule. **Error correction** Check the values of the specified data object. If the data object is incorrect, correct it. Then save the data.
140-0029	**Error message** Incorrect insertion value in data object '%1' '%2' Attribute '%3' **Cause of error** The read configuration data belong to an older level of the control. The specified data object is incomplete. Due to a rule, the control inserted the missing attribute. The value to be inserted as specified in the rule is incorrect. **Error correction** - The attribute is initialized with a default value. Check the value and correct it if necessary. - Correct the rule.

Error number	Description
140-002B	**Error message** Data file not saved **Cause of error** This warning is issued for information and appears if: - the configuration data have uncorrected syntax errors - or the configuration data were updated but the update was not yet saved - or default data were copied or a data backup was restored but the control was not yet restarted. In this condition, no configuration data are written to the data files. **Error correction** - Manually correct the fatal errors in the configuration editor by selecting the FIX SYNTAX ERROR soft key. - Fix the errors that are corrected by an update rule by selecting the CONFIG DATA soft key in the configuration editor and then saving. - Restart the control.
140-002C	**Error message** Unknown object name '%1' **Cause of error** An object name is unkown. The name might be incorrectly written, or it might not be supported by the version. **Error correction** - If the name comes from a configuration file, correct it there. - Otherwise, inform your service agency.
140-002D	**Error message** Maximum list size exceeded **Cause of error** The maximum list size has been reached. Too many configuration data objects have been added. **Error correction** - Delete configuration data objects - If this is not possible, inform your service agency

Error number	Description
140-002E	**Error message** SIK control identification faulty: %1 **Cause of error** The SIK (System Identification Key) is not suitable for this software. With this software, the control can be operated only as a programming station. Possible causes: - Control is an export version - Wrong SIK - Incorrect or unconfigured control type - Error while accessing the SIK. **Error correction** - Inform your service agency
140-002F	**Error message** General key expired **Cause of error** The machine tool builder can use a master keyword (general key) for putting the control into service that will unlock all options for a duration of 90 days. The general key has expired and is therefore no longer valid. Now the options will be active only with the fiting keywords. **Error correction** Order the required software option(s) from your service agency.
140-0030	**Error message** General key is active **Cause of error** The machine tool builder can use a master keyword (general key) for putting the control into service that will unlock all options for a duration of 90 days. This message is displayed after every start-up if the general key is active. After the time period is over, the options can be used only with the fitting keywords. If an NC program is running when the general key expires, an NC stop is issued! **Error correction** Contact the machine manufacturer. He can check in the SIK menu how long the general key will be valid, or deactivate the general key.
140-0031	**Error message** '%1' entered as password **Cause of error** **Error correction**

Error number	Description
140-0032	**Error message** Incorrect software version **Cause of error** The export code does not match this software version. **Error correction** You have to switch from the standard version to the export version or vice versa.
140-0033	**Error message** Job cannot run **Cause of error** The configuration server cannot run a job. For more information about the job, refer to the additional information. **Error correction** - Check other entries in the log: there might be additional entries that provide more information for troubleshooting. - Check the machine parameter System > PLC > CfgPlcOptions > noConfigDataLock: if the parameter is not set or is FALSE, then parameter changes are not permissible while executing a program. Set noConfigDataLock to TRUE in order to permit changes to parameters while executing a program. Refer to the Technical Manual for more information about noConfigDataLock. - Inform your service agency
140-0034	**Error message** Data object '%1' '%2' moved to file '%3' **Cause of error** The downloaded configuration data belong to an older NC software level. The data object was saved in an incorrect file and was moved to another file according to a rule. **Error correction** Save the modified data.
140-0035	**Error message** Data object '%1' '%2' divided into '%3' **Cause of error** The downloaded configuration data belong to an old NC software level. The data object was divided into one or more data objects. **Error correction** Save the modified data.

Error number	Description
140-0036	**Error message** Value of data object '%1' '%2' was changed. Attribute '%3'. **Cause of error** The downloaded configuration data belong to an old NC software level. The control modified one or more values of a data object on the basis of a rule. **Error correction** Check the values of the given attributes in the data object. If the value is incorrect, correct it. Then save the data.
140-0037	**Error message** Attribute of data object '%1' '%2' was moved. Attribute '%3'. **Cause of error** The downloaded configuration data belong to an older NC software level. The control moved an attribute of the given data object on the basis of a rule. **Error correction** Check the values of the given data object. If the data object is incorrect, correct it. Then save the data.
140-0038	**Error message** Data object '%1': Key was changed from '%2' to '%3' **Cause of error** The downloaded configuration data belong to an older version of the control. The objekt key of a data object was changed on the basis of a rule. **Error correction** Check the values of the given data object. If the data object is incorrect, correct the object. Then save the data.
140-0042	**Error message** Faulty cycle data **Cause of error** - Too many soft keys in one level - Error in menu tree - Other error **Error correction** - Distribute the soft keys over multiple levels - Configure the menu tree correctly - Note the additional information

Error number	Description
140-0043	**Error message** Too much data **Cause of error** You changed too many data objects or loaded an MP subfile that is too large. Not all changed data objects will become effective immediately. **Error correction** - Shut down and restart the control. - Divide the MP subfile
140-0044	**Error message** Shut down and restart the control **Cause of error** The trial license was deactivated. However, the temporarily enabled options remain active until the control is shut down. **Error correction** The control must be shut down and restarted.
140-0045	**Error message** Error while opening file '%1' **Cause of error** - File does not exist - Access to file failed - File is not a valid backup file **Error correction** - Select an existing file - The file must not be opened by another file - The selected file must first be created by the control as a backup file
140-0046	**Error message** Data change without effect **Cause of error** More than one MP subfile is loaded, or parameters were changed by a PLC module. An attempt was made to edit data, but the changes have no effect during control operation because they are covered over by MP subfiles or PLC changes. **Error correction** Check the active data in the 'effective data' data record. If they do not have the desired values: - Reload the MP subfile in which the changes were made - Unload other MP subfiles - Edit the data in the 'temporary files' data record

Error number	Description
140-0047	**Error message** Error while loading the backup **Cause of error** - Program Run is active - The files belong to an older software version - A file has a syntax error - The files from the backup were restored but could not be activated because they contain reset parameters with other values. **Error correction** - Stop the program - The data must be updated. Refer to the instructions for updating configuration data. - Use the "REMOVE SYNTAX ERROR"REMOVE SYNTAX ERROR" soft key to make a manual correction - The control must be shut down and restarted. If you have to restore the old data, activate the file %OEM%:\config_LastKnownGoodConfig_.zip
140-0048	**Error message** Error while creating the backup **Cause of error** - Not allowed in this data record - File cannot be created **Error correction** - Select the basis data record - Select another file
140-0049	**Error message** The software option for OEM cycles has not yet been enabled **Cause of error** An OEM cycle tree was configured, but the software option has not been enabled. **Error correction** Order the required software option from your service agency.
140-004A	**Error message** The software option for '%1' has not been enabled **Cause of error** The language selected for the required software option is not enabled. **Error correction** Order the required software option from your service agency.

Error number	Description
140-004B	**Error message** Error in finding the current control parameters **Cause of error** There was an error in the automatic calculation of the current controller parameters. **Error correction** The current controller parameters must be acquired manually.
140-004C	**Error message** System settings deleted **Cause of error** The system settings in non-volatile memory, e.g. which programs were last opened, were deleted. When the control is started it reinitializes these system settings. **Error correction** Shut the control down and restart it.
140-004D	**Error message** Password %1 defined twice **Cause of error** The entered coder number or password already exist. The double definition is not allowed. **Error correction** - Replace the entered password in the configuration (CfgOemPassword or CfgChangePassword). Use a password that has not yet been used.
140-004E	**Error message** Password %1 replaced by machine manufacturer **Cause of error** The machine manufacturer replaced the entered password with another one. **Error correction** Use the password defined by the machine manufacturer. Refer to the machine manual or contact your machine manufacturer to receive the password.

Error number	Description
140-004F	**Error message** Update of the configuration data **Cause of error** The active machine configuration is not compatible with the current version of the NC software. The configuration files belong to an older software version. **Error correction** - After a configuration backup is loaded you have to close the control down and restart it. - The code number prompt is shown during start-up. Enter the code number for the Machine Parameter Editing operating mode. - The control implements the configuration data according to the update rules. Check the changes in the machine configuration and save the edited configuration data. - Also also read the instructions for updating configuration data in the Technical Manual.
140-0050	**Error message** Impermissible data object for file **Cause of error** The data object was saved in a impermissible location. The data object either cannot be saved in a parameter file or it has to be located in a file of the PLC: or SYS: drive. **Error correction** Remove the data object completely from the file or move it into a file on another drive. Note also which access is defined for the data object.
140-0051	**Error message** Data object "%1" is faulty **Cause of error** A configuration object in a configuration file is faulty or incomplete. Possible causes: - The existing configuration data belong to an older software version. - The data file was edited manually. **Error correction** - Reset the config version and run the update again. - Use the configuration editor to correct or completely fill out the parameter object

Error number	Description
140-0052	**Error message** Installation of setup in PLCE drive failed **Cause of error** The installation of setup files into the encrypted PLCE drive has failed. **Error correction** Possible causes: - An incorrect password was entered for encrypting the setup file in PLCdesign. Make a new setup.zip file in PLCdesign with the correct password. - A target file name or target directory was entered in PLCdesign that contains illegal characters. Use only ASCII characters for target paths in "PLCE:". Make a new setup.zip file with PLCdesign. - The image file for "PLCE:" is too small for the update. Save the contents of "PLCE:", generate a larger image file, restore the backup and try the update again. - There is no encrypted "PLCE:" partition on the control. Make an encrypted partition and retry the update. - No password was found for the encrypted partition or the incorrect password was entered. Enter a correct password in the settings for the "PLCE:" partition (PLC Programming mode).
140-0053	**Error message** Configuration data object not found **Cause of error** A configuration data object that is necessary for a software update does not exist The update of the configuration data might therefore be incomplete. **Error correction** Check the machine configuration and correct it if required.
140-0054	**Error message** Error while loading the default data **Cause of error** An error occurred while loading the default data: - One or more files are still being accessed by the control - The default data incomplete or incorrect. **Error correction** - Check whether there are any more messages in the log file that indicate the possible cause of the error. - Restart the control and stop the start-up by immediately pressing the MOD key. Then load the default data - If this does not help, inform your service agency

Error number	Description
140-0055	**Error message** Faulty update rule **Cause of error** The update rule given in the additional data is faulty. The machine configuration cannot be updated with this rule. **Error correction** - Check all settings in the update rule. - If a file is named in the rule: Check whether this file is part of the present configuration. - Correct the update rule so that the machine configuration can be updated successfully.
140-0056	**Error message** Error while saving configuration data **Cause of error** An error occurred while saving the configuration data. **Error correction** - Please note the additional section shown in the internal information. - Inform your service agency.
140-0057	**Error message** Illegal value **Cause of error** - The test of the entered value found that it is incorrect or invalid. - Whether the value is valid can also depend on other machine parameters (plausibility). **Error correction** - Check the entered value and change it if necessary. If the parameter depends on other parameters, you must consider them as well. - Inform your service agency
140-0058	**Error message** Data object '%1' does not exist **Cause of error** - Error when writing data. - Given key name does not exist. **Error correction** - Check the key name and correct if necessary, or enter an existing key name. - First create a data object with this key name. - Inform your service agency.

Error number	Description
140-0059	**Error message** Too many MP partial files **Cause of error** The maximum number of subfiles was exceeded while MP subfiles were loading. **Error correction** - Unload all MP subfiles using the config editor - Restart the control - Inform your service agency
140-005A	**Error message** Faulty data in update rule **Cause of error** The data object given in the update rule is faulty. **Error correction** Check the spelling of the data object shown under “object” and correct it if necessary: - Check the spelling of all names. - Check the syntax of parentheses for completeness. Opening parentheses must be closed again. - Check the syntax of all machine parameters or attributes. Attributes must be separated by commas. Important: A comma must not precede a parenthesis! - Check the syntax of character strings. Character strings must be enclosed by quotation marks. - If quotation marks are used, they must be preceded by a backslash. Example: \”A name\” - If there is a backslash, it must be preceded by another. Example: \\ - Inform your service agency.
140-005B	**Error message** Updating of system data not permitted **Cause of error** - You tried to use the update rules to change or overwrite write-protected data/files or configuration data. - Update rules must not edit write-protected data or system data. **Error correction** - Remove the faulty update rule. You will find the faulty update rule in the error message’s additional information by pressing the INTERNE INFO soft key. - Inform your service agency.

Error number	Description
140-005C	**Error message** Faulty value for machine parameter **Cause of error** - Syntax error in the value for a machine parameter in the update rule. - Entered value has a spelling error or in not allowed for the parameter that is to be changed by the update rule. **Error correction** - Check the spelling of the value. - Check the type of value. A numerical value can contain only one number. An enumerated list must be given an existing enumeration name. - Inform your service agency.
140-005D	**Error message** Unknown name in update rule **Cause of error** - Unknown attribute name or machine parameter entered in the update rule. **Error correction** - Check the name for spelling errors. - Check the data object for whether the attribute or machine parameter really exists. - Inform your service agency.
140-005E	**Error message** Incorrect list index **Cause of error** - No index or excessively large index entered for the list in the update rule. **Error correction** - If no index was entered, enter one. - Check whether the entered index is larger than the maximum index of the associated list. Change the index if necessary. - Inform your service agency.

Error number	Description
140-005F	**Error message** Unknown file '%1' in update rule '%2' **Cause of error** - In the update rule, a file is given that is either nonexistent or is not listed in the list of configuration files. - You can find more information on the error message by pressing the INTERNAL INFO soft key. **Error correction** - The file does not exist or is not in the list of configuration files: - The control will automatically create a file and save the new data in the file. - If you do not want to use the new file, move the data to another one and delete the existing file from the list of configuration files. - Incorrect path or file name in the update rule: - Press the UPDATE RULES soft key, then check the update rule and correct it if necessary. - Configuration file exists, but is not in the list of configuration files: - Press the “CONFIG FILE LIST” soft key and add the file to the list. - Inform your service agency.
140-0060	**Error message** Unit of measure “%1” not defined **Cause of error** - Unknown unit of measure given in the attribute information. **Error correction** - Check the unit for mass and change it if necessary. Use only the default units of math. Only the measuring unit’s name can be entered, not the measuring unit itself. - Note that, depending on the unit of measure, the displayed value is converted to the unit of measure used by the control. - With machine parameters CfgOemInt and CfgOemPosition, no units of measure can be used that require conversion.
140-0062	**Error message** Configuration error while logging the user on or off **Cause of error** A configuration error occurred in the operating system when logging the user on or off. **Error correction** - Ensure that all required configuration data is available to the user, particularly the data on HOME: - Stop all NC programs - Log the user off and then on again. If errors are still being reported, please contact your service agency.

Error number	Description
140-0063	**Error message** Function with encrypted data not allowed **Cause of error** If encrypted configuration files are used, no configuration backup or restore can be executed. **Error correction** Start the backup or restore with PC tools, such as TNCremo.
140-0064	**Error message** Software option '%1' is disabled by the configuration **Cause of error** - The software option is locked by configuration. The software option is therefore not available, although it has been enabled in the SIK. - Observe any changed machine behavior (for example, when DCM collision monitoring is locked)! **Error correction** - Re-enable the software option in the SIK dialog to restore the original behavior. - Inform your service agency.
140-0065	**Error message** Load subfile through NC program **Cause of error** The selected MP subfile was loaded by an NC program from one of the simulation operating modes (e.g. Test Run). Such an MP subfile is indicated with a prefixed pound sign (#). This MP subfile can only be unloaded from the same simulation operating mode. **Error correction** - Switch to the simulation operating mode from which the MP subfile was loaded. - Start an NC program there that unloads the MP subfile. - Inform your service agency.
140-0066	**Error message** Configuration files adapted as the result of an update **Cause of error** For informational purposes: At least one of the files indicated under CfgConfigUpdate/baseFiles or CfgConfigUpdate/portionFiles was automatically adapted due to a software update. **Error correction** HEIDENHAIN recommends checking the changes that were performed automatically.

Error number	Description
140-0067	**Error message** Error while re-reading the configuration data **Cause of error** Errors occurred while reloading the configuration data. Refer to the additional information in the error window opened by the INTERNAL INFO soft key: HAS_FATAL: The data that was read includes syntax errors HAS_UPD: The data must be updated Please note: the previous configuration data of the control is still active. It is no longer possible to change the configuration data. **Error correction** Restart the control
140-0068	**Error message** File '%1' listed more than once **Cause of error** A file is listed more than once in CfgConfigDataFiles. Please note: The file can also be listed under SYS: in CfgJhConfigDataFiles. **Error correction** - Change the file name and entry in CfgConfigDataFiles
141-0003	**Error message** Key already exists **Cause of error** A data object with the entered key already exists. Therefore no new data object can be created with this key. **Error correction** - Delete old data object - or enter another key
141-0005	**Error message** Data was not fully saved **Cause of error** Some of the changed data could not be saved because it is locked from write access or an NC program is still running. **Error correction** - Stop NC program run - Try again to save, because the lock on write access might have been removed in the meantime.

Error number	Description
141-0006	**Error message** Value out of range %1 to %2 **Cause of error** The entered value is invalid or lies outside the permitted limit values. **Error correction** Enter another value.
141-0025	**Error message** Insufficient access rights for data change '%1' '%2' **Cause of error** You do not have the access rights to change data. Perhaps you are running a cycle or NC program from a drive for which you do not have access rights. The message shows the data object for which more access rights are required. **Error correction** - The data cannot be saved. - Another code number must be entered. Run the cycle or NC program from a drive for which you do have the necessary access rights. - For a software update the system code number is required.
141-0030	**Error message** No further password entries possible **Cause of error** An incorrect password was entered repeatedly to enable an option. After 10 incorrect entries no further entry is accepted. **Error correction** Inform your service agency.
141-0048	**Error message** Selection is not an MP subfile **Cause of error** You selected a directory instead of a file. This function supports the selection of only one file. **Error correction** - Either select an MP subfile (no directory) - Or use the soft key FILE / UPDATE DIRECTORY to update all the files in the directory

Error number	Description
141-004B	**Error message** Required value missing **Cause of error** A required value was not entered. **Error correction** - Enter a value at the indicated position
141-004C	**Error message** Invalid input range or incorrect format **Cause of error** The entered value does not fit the parameter format. **Error correction** - Enter a value from the valid value range for input in the associated parameter
141-004D	**Error message** Value must not be changed **Cause of error** You have entered attribute information that cannot be changed by the machine manufacturer. This input might have happened directly in a parameter file. **Error correction** Enter only the data that are offered in the dialog window for editing attribute information.
141-004E	**Error message** No line has been selected **Cause of error** Under "Selection," you have not chosen a field from the table. **Error correction** - Use the cursor to select a line in the table under "Selection." Note: It depends on the type of parameter whether a selection can be entered!
141-004F	**Error message** Function possible only with basic data **Cause of error** TEST EN **Error correction** TEST EN

Error number	Description
141-0050	**Error message** Software option [%1] cannot be disabled **Cause of error** You tried to lock a software option listed in the SIK dialog using the LOCK OPTION soft key. The selected option belongs to the control's factory default setting. Options that are available as standard cannot be locked. **Error correction** Select a software option available for this control for the LOCK OPTION function. You can find the list of available software options in the Technical Manual.
141-0141	**Error message** Copy default configuration to \\CONFIG ? **Cause of error** **Error correction**
141-0142	**Error message** Previous data are saved in \\CONFIG.BAK **Cause of error** **Error correction**
145-0001	**Error message** Circular arc not fully defined **Cause of error** The start angle of the circular arc is not defined. **Error correction**
145-0002	**Error message** Circular arc not fully defined **Cause of error** The stopping angle of the circular arc is not defined. **Error correction**
145-0003	**Error message** Circular arc not fully defined **Cause of error** Starting and stopping angles of the circular arc are not defined. **Error correction**

Error number	Description
145-0004	**Error message** System error in the geometry **Cause of error** The position of a circular spatial arc is not explicitly defined. **Error correction** Inform your service agency
145-0005	**Error message** System error in the geometry **Cause of error** Message must not contain a transformation matrix **Error correction** Inform your service agency
145-0006	**Error message** Invalid scaling factor **Cause of error** You defined different axis-specific scaling factors for the same circle. For circles, use identical axis-specific scaling factors. **Error correction**
145-0008	**Error message** Incorrect tangent **Cause of error** The specified tangent end point lies too closely to the arc. **Error correction** Correct the end point of the tangent.
145-0009	**Error message** Incorrect tangent **Cause of error** The specified tangent point lies on the circular arc. **Error correction** Correct the end point of the tangent.
145-000A	**Error message** Incorrect tangent **Cause of error** The specified tangent point lies inside the circular arc. **Error correction** Correct the end point of the tangent.

Error number	Description
145-000C	**Error message** Incorrect point **Cause of error** The given point does not line on the circular arc. **Error correction** Correct the coordinates of the point.
145-000D	**Error message** Function not yet implemented **Cause of error** Function not yet implemented. **Error correction**
145-000E	**Error message** Incorrect circular arc **Cause of error** Start point and end point of the circular arc are at different distances from the center. **Error correction** Correct the coordinates of the end point and center.
145-000F	**Error message** Incorrect circular arc **Cause of error** The distance between the start point and end point of the circular arc is too small. **Error correction** Correct the point.
145-0010	**Error message** Incorrect circular arc **Cause of error** The specified radius is too small to connect the start point and end point. **Error correction** Correct the coordinates.
145-0011	**Error message** Incorrect circular arc **Cause of error** The tangents at the start poine and end point of the circular arc are parallel. **Error correction** Correct the coordinates.

Error number	Description
145-0012	**Error message** No intersection **Cause of error** The specified curves have not intersection. **Error correction** Correct the coordinates.
145-0013	**Error message** Incorrect chamfer **Cause of error** Length of chamfer is undefined **Error correction** Enter the chamfer length
145-0014	**Error message** Incorrect chamfer **Cause of error** Chamfer too long **Error correction** Correct the chamfer length.
145-0015	**Error message** Incorrect chamfer **Cause of error** Chamfer is possible only between straight lines **Error correction** Delete the chamfer block
145-0016	**Error message** Error in rounding arc (RND) **Cause of error** Radius of rounding arc is undefined **Error correction** Correct the rounding arc
145-0017	**Error message** Error in rounding arc (RND) **Cause of error** Rounding arc radius too large **Error correction** Correct the rounding arc radius

Error number	Description
145-0018	**Error message** Incorrect approach movement (APPR) **Cause of error** Undefined length of approach movement **Error correction**
145-0019	**Error message** Incorrect approach movement (APPR) **Cause of error** Undefined side of approach **Error correction**
145-001A	**Error message** Incorrect approach movement (APPR) **Cause of error** Undefined radius of approach **Error correction**
145-001B	**Error message** Incorrect approach movement (APPR) **Cause of error** Undefined traverse angle of approach **Error correction**
145-001C	**Error message** Incorrect approach movement (APPR) **Cause of error** Radius of the transition arc in approach too large **Error correction**
145-001D	**Error message** Incorrect departure movement (DEPT) **Cause of error** Length of departure movement is undefined **Error correction**
145-001E	**Error message** Incorrect departure movement (DEPT) **Cause of error** Departure side undefined **Error correction**

Error number	Description
145-001F	**Error message** Incorrect departure movement (DEPT) **Cause of error** Radius of departure is undefined **Error correction**
145-0020	**Error message** Incorrect departure movement (DEPT) **Cause of error** Traverse angle of departure movement is undefined **Error correction**
145-0021	**Error message** Incorrect departure movement (DEPT) **Cause of error** Radius of the transitional arc in the departure movement is too large **Error correction**
145-0022	**Error message** Incorrect departure movement (DEPT) **Cause of error** End point of departure movement is undefined **Error correction**
145-0023	**Error message** System error in the geometry **Cause of error** Access to a vector component with invalid index **Error correction** Inform your service agency.
145-0024	**Error message** System error in the geometry **Cause of error** An attempt was made to normalize a null vector. **Error correction** Inform your service agency.
145-0025	**Error message** System error in the geometry **Cause of error** Access to a matrix element with invalid index. **Error correction** Inform your service agency.

Error number	Description
145-0026	**Error message** System error in the geometry **Cause of error** Access to the column of a matrix with invalid index. **Error correction** Inform your service agency.
145-0027	**Error message** System error in the geometry **Cause of error** You attempted to invert a singular matrix. **Error correction** Inform your service agency.
145-0028	**Error message** System error in the geometry **Cause of error** No conversion possible **Error correction** Inform your service agency.
145-002F	**Error message** Translation error **Cause of error** The definition of the orientation in a coordinaten transformation is incorrect. **Error correction** Correct the definition.
145-0030	**Error message** Translation error **Cause of error** In a cordinaten transformation the Y direction cannot be calculated. **Error correction** Correct the definition.
145-0031	**Error message** Geometry error **Cause of error** The distance between two points is too small for one calculation. **Error correction**

Error number	Description
145-0032	**Error message** System error in the geometry **Cause of error** Division by zero during an internal calculation **Error correction** Inform your service agency.
145-0033	**Error message** System error in the geometry **Cause of error** An internal calculation resulted in a circle with negative radius. **Error correction** Inform your service agency.
145-0034	**Error message** System error in the geometry **Cause of error** For an ellipse or an elliptical arc, a function was called that is permitted only for circles or circular arcs. **Error correction** Inform your service agency.
145-0035	**Error message** System error in the geometry **Cause of error** Internal software error. **Error correction** Inform your service agency.
145-0036	**Error message** System error in the geometry **Cause of error** Two points are so close together in a geometric figure that the polar vector is too inexact. **Error correction** Inform your service agency.
145-0037	**Error message** Circle incorrectly programmed **Cause of error** No circle is defined through the given point. **Error correction** Correct the coordinates of the points.

Error number	Description
145-0038	**Error message** System error in the geometry **Cause of error** In an internal calculation, an ellipse has degenerated into a line segment. Some operations cannot be performed for such degenerated ellipses. **Error correction** Inform your service agency.
145-0039	**Error message** Error in rounding arc (RND) **Cause of error** An attempt was made to place a rounding radius between two directionally opposed parallel lines. **Error correction** Correct the coordinates of the lines.
145-003A	**Error message** Undefined rotational direction of contour **Cause of error** You tried to learn the rotational direction of a contour that has none defined. **Error correction** Ensure that the contour is closed and free of gaps.
160-0001	**Error message** System error in interpreter **Cause of error** Internal software error **Error correction** Inform your service agency.
160-0003	**Error message** Block format incorrect **Cause of error** Keyword or G function not programmed. **Error correction** Edit the NC program.
160-0004	**Error message** System error in interpreter **Cause of error** Internal software error **Error correction** Inform your service agency.

Error number	Description
160-0007	**Error message** System error in interpreter **Cause of error** Error in internal cycle **Error correction** Inform your service agency.
160-000B	**Error message** CYCL DEF not defined **Cause of error** You have programmed a cycle call without first defining the cycle, or you tried to call a DEF-active cycle. **Error correction** Define the cycle before calling it.
160-000D	**Error message** Error when opening the file '%1' **Cause of error** An error occurred while a file was being opened. **Error correction** Ensure that the file exists, that the given path is correct, and that the file has a readable format.
160-0018	**Error message** Jump to label 0 not permitted **Cause of error** In a LBL CALL (ISO: L 0,0) block of a part program or in a jump instruction (parametric calculation) you attempted to program a jump to the label 0. **Error correction** Edit the part program.
160-001A	**Error message** Block format incorrect **Cause of error** The program section repeat was incorrectly programmed. **Error correction** Edit the NC program.

Error number	Description
160-001B	**Error message** Label number not found **Cause of error** With LBL CALL (ISO: L x,x), you tried to call a label that does not exist. **Error correction** Change the number in the LBL CALL block or insert the missing label (LBL SET).
160-001C	**Error message** Label number already assigned **Cause of error** You attempted to program the same label number in several LBL SET (ISO: G98 Lxx) blocks in a part program. **Error correction** Edit the part program.
160-001D	**Error message** Block format incorrect **Cause of error** A positioning movement was programmed without type of interpolation. **Error correction** Edit the NC program.
160-001F	**Error message** Wrong axis programmed **Cause of error** An axis programmed in the NC block is not configured. **Error correction** Edit the NC program.
160-0020	**Error message** Wrong axis programmed **Cause of error** No nominal/actual position could be found for the axis specified in the FN18 block (ISO: D18). **Error correction** Check the index of the system data.

Error number	Description
160-0021	**Error message** Pole incorrectly defined **Cause of error** In the NC program both coordinates of a pole must be programmed in the plain. Either you forgot one coordinate, entered more than two coordinates, or programmed one coordinate twice. **Error correction** Check the pole programming in the NC program.
160-0022	**Error message** Block format incorrect **Cause of error** In a linear block, you programmed the polar radius twice **Error correction** Edit the NC program
160-0023	**Error message** Block format incorrect **Cause of error** A radius was programmed in a polar circular interpolation CP (ISO:G12/G13/G15), but the radius is defined by the distance of the starting point to the pole. **Error correction** Edit the NC program.
160-0024	**Error message** Block format incorrect **Cause of error** The radius is missing for a Circle with Radius block (CR, ISO: G02, G03). **Error correction** Edit the part program.
160-0025	**Error message** Block format incorrect **Cause of error** The arc direction of rotation was incorrectly programmed. **Error correction** Edit the NC program.

Error number	Description
160-0026	**Error message** Direction of rotation missing **Cause of error** A circle was programmed without direction of rotation. **Error correction** Always program a direction of rotation (DR).
160-0028	**Error message** Invalid Q parameter **Cause of error** The given index for a Q parameter is out of range. **Error correction** Edit the NC program.
160-0029	**Error message** Block format incorrect **Cause of error** The programmed NC syntax is not supported. **Error correction** Edit the NC program.
160-002A	**Error message** Block format incorrect **Cause of error** The programmed NC syntax is not supported. **Error correction** Edit the NC program.
160-002B	**Error message** Block format incorrect **Cause of error** The programmed NC syntax is not supported. **Error correction** Edit the NC program.
160-002C	**Error message** Block format incorrect **Cause of error** A syntactically incorrect NC block was programmed. **Error correction** Edit the NC program.

Error number	Description
160-0032	**Error message** Arithmetical error **Cause of error** Incorrect Q parameter calculation: Division by 0, square root of a negative number, or similar error **Error correction** Check the input values.
160-0036	**Error message** NC block not found **Cause of error** The block specified for mid-program startup was not found. **Error correction** Enter another target for the mid-program startup.
160-003C	**Error message** CYCL DEF incomplete **Cause of error** You programmed an incomplete cycle definition or inserted other NC blocks between cycle blocks. **Error correction** Edit the NC program.
160-003D	**Error message** Block format incorrect **Cause of error** The programmed syntax element is not allowed in this NC block. **Error correction** Edit the NC program.
160-003E	**Error message** Block format incorrect **Cause of error** The programmed syntax element is not allowed in this NC block. **Error correction** Edit the NC program.
160-0048	**Error message** Block format incorrect **Cause of error** The programmed NC syntax is not supported by this control. **Error correction** Edit the NC program.

Error number	Description
160-0049	**Error message** Touch point inaccessible **Cause of error** No signal came from the touch probe within the measuring distance. **Error correction** Pre-position as appropriate and repeat the probing process.
160-0054	**Error message** Block format incorrect **Cause of error** An incorrect system data number was entered in the function FN18 ID2000. **Error correction** Edit the NC program.
160-0055	**Error message** Tool change faulty **Cause of error** An incorrect tool was enabled. **Error correction** Inform your machine tool builder.
160-0056	**Error message** Tool axis is missing **Cause of error** You programmed a positioning block with tool radius compensation without first calling a tool. **Error correction** Edit the NC program.
160-0058	**Error message** Cycle for TOOL CALL not defined **Cause of error** The tool definition cycle was not defined. **Error correction** Inform your machine tool builder.
160-0059	**Error message** Cycle for TOOL DEF not defined **Cause of error** The tool definition cycle was not defined. **Error correction** Inform your machine tool builder.

Error number	Description
160-005A	**Error message** Unknown tool type '%1' **Cause of error** An undefined tool type was found in function FN17 ID950. **Error correction** Inform your machine tool builder.
160-005D	**Error message** Block format incorrect **Cause of error** The data type of the column given in an SQL BIND command does not agree with that of the given parameter. **Error correction** Check the table definition and edit the NC program.
160-0060	**Error message** Parameter not connected with a column **Cause of error** An attempt was made to use SQL BIND to dissolve a link that does not exist. **Error correction** Edit the NC program.
160-0061	**Error message** System error in interpreter **Cause of error** Internal software error **Error correction** Inform your service agency.
160-0063	**Error message** Block format incorrect **Cause of error** The programmed syntax element is not allowed in this NC block. **Error correction** Edit the NC program.

Error number	Description
160-0064	**Error message** Table access failed **Cause of error** - The syntax of the programmed SQL statement is incorrect - The given table could not be opened - The given table is incorrectly defined - The symbolic name of the table is not defined - The table does not contain the given columns - A data record could not be read because it is locked **Error correction** Check the table definition and edit the NC program
160-0065	**Error message** Block format incorrect **Cause of error** An unfulfillable condition was given in the FN20 function. **Error correction** Edit the NC program.
160-0067	**Error message** Faulty access to table **Cause of error** An internal control error has occurred. **Error correction** Inform your service agency.
160-0068	**Error message** Block format incorrect **Cause of error** A syntactically incorrect SQL statement was programmed. **Error correction** Edit the NC program.
160-0069	**Error message** Feed rate is missing **Cause of error** No feed rate was programmed, or the feed rate 0 was programmed. **Error correction** Edit the NC program.

Error number	Description
160-006B	**Error message** Feed rate for tool is missing **Cause of error** In an NC block you programmed F AUTO, but you did not program a feed rate in the TOOL CALL block. **Error correction** - Enter the feed rate directly in the NC block - Program a TOOL CALL block with feed rate
160-0073	**Error message** SQL handles at program end not yet released **Cause of error** A program was ended although table access was still active. **Error correction** Before closing the program, end all SQL table access with SQL COMMIT or SQL ROLLBACK.
160-0082	**Error message** Axis double programmed **Cause of error** You programmed an axis twice in a single positioning block. **Error correction** Edit the part program.
160-0083	**Error message** Axis double programmed **Cause of error** You programmed an axis twice in the Mirror Image cycle. **Error correction** Edit the part program.
160-0084	**Error message** Axis double programmed **Cause of error** While defining Cycle 26 (axis-specific scaling factor) you programmed the scaling factor or the scaling datum twice in one axis. **Error correction** Edit the part program.

Error number	Description
160-0085	**Error message** Axis double programmed **Cause of error** A axis was double-programmed in an approach or departure block. **Error correction** Edit the NC program.
160-0086	**Error message** Axis double programmed **Cause of error** An axis was double-programmed in a coordinate transformation cycle. **Error correction** Edit the NC program.
160-0087	**Error message** Axis double programmed **Cause of error** In a "TCH PROBE" probing cycle an axis was double programmed. **Error correction** Edit the NC program.
160-0089	**Error message** Incorrect number for FN17/FN18 **Cause of error** The number combination for the system data (FN17/FN18) is not allowed. **Error correction** Check the number and index of the system data.
160-008A	**Error message** Incorrect axis index for FN17/FN18 **Cause of error** An incorrect axis index was specified while reading from/writing to system data (FN17/FN18). **Error correction** Check the index of the system date.
160-008B	**Error message** Block format incorrect **Cause of error** A radius was programmed at an illegal location. **Error correction** Edit the NC program.

Error number	Description
160-008C	**Error message** Block format incorrect **Cause of error** A direction of rotation was programmed at an illegal location. **Error correction** Edit the NC program.
160-008F	**Error message** Block format incorrect **Cause of error** Too many axis positions programmed in the NC block. **Error correction** Edit the NC program.
160-0091	**Error message** Block format incorrect **Cause of error** In the NC block APPR/DEP more than 3 axis positions were programmed. **Error correction** Edit the NC program.
160-0092	**Error message** Block format incorrect **Cause of error** In the FN29 block more than 8 values programmed. **Error correction** Edit the NC program.
160-0093	**Error message** Block format incorrect **Cause of error** In a datum shift cycle you programmed too many positions. **Error correction** Edit the NC program
160-0094	**Error message** Block format incorrect **Cause of error** Too many positions programmed in the axis-specific scaling cycle. **Error correction** Edit the NC program.

Error number	Description
160-0095	**Error message** Block format incorrect **Cause of error** In the axis-specific scaling factor cycle you programmed too many center coordinates. **Error correction** Edit the NC program
160-0096	**Error message** Block format incorrect **Cause of error** Too many axes programmed in the mirroring cycle. **Error correction** Edit the NC program.
160-0099	**Error message** Column already assigned to a parameter **Cause of error** In the NC program, the SQL BIND command was used to assign a column name more than once to a parameter. **Error correction** Edit the NC program.
160-009A	**Error message** Table column is not connected with a parameter **Cause of error** Before a table column can accept SQL UPDATE commands (SQL "SELECT...", SQL UPDATE, SQL FETCH), it must be connected with a value by SQL BIND, SQL SYSBIND or by corresponding configuration data. **Error correction** Edit the NC program.
160-009B	**Error message** Column not defined **Cause of error** Description missing for a table column. **Error correction** Check the definition of the table.

Error number	Description
160-009C	**Error message** Block format incorrect **Cause of error** The FN function programmed in the NC program is not supported. **Error correction** Edit the NC program.
160-009E	**Error message** Wrong axis programmed **Cause of error** Incorrect value for FN17:SYSWRITE ID 212 **Error correction** Edit the NC program.
160-009F	**Error message** Block format incorrect **Cause of error** Too many axes were programmed for setting a preset value. **Error correction** Edit the NC program.
160-00A0	**Error message** Spindle is not rotating **Cause of error** A machining cycle was called although the spindle is stopped. **Error correction** Edit the NC program.
160-00A1	**Error message** Incorrect tool index programmed **Cause of error** Invalid tool index programmed. **Error correction** Edit the NC program.
160-00A2	**Error message** Block format incorrect **Cause of error** Faulty workpiece blank definition **Error correction** Edit the NC program.

Error number	Description
160-00A3	**Error message** Axis double programmed **Cause of error** One axis was programmed twice in the workpiece blank definition. **Error correction** Edit the NC program.
160-00A4	**Error message** Wrong axis programmed **Cause of error** Invalid axis in the workpiece blank definition. **Error correction** Edit the NC program.
160-00A5	**Error message** Block format incorrect **Cause of error** The specified sytax element is not allowed in the NC block. **Error correction** Edit the NC program.
160-00A6	**Error message** Cycle is not installed **Cause of error** The programmed cycle is not installed. **Error correction** Check the installed cycles and edit the NC program.
160-00A7	**Error message** System error in interpreter **Cause of error** Internal software error. **Error correction** Inform your service agency.
160-00A8	**Error message** Recursive label call **Cause of error** Within a subprogram, you tried to call the label with which the subprogram begins. **Error correction** Correct the NC program. A subprogram cannot call itself.

Error number	Description
160-00A9	**Error message** Unsuitable touch probe **Cause of error** The desired measuring cycle cannot be performed with the currently selected probe. **Error correction** Edit the NC program.
160-00AA	**Error message** Excessive program nesting **Cause of error** Program nesting through CALL LBL or CALL PGM is too deep, presumably because of a recursive call. **Error correction** Edit the NC program.
160-00AB	**Error message** Recursive program call **Cause of error** Within an NC program, you tried to call the NC program itself as a subprogram. Maybe you tried to call one of the NC programs that called the current NC program. **Error correction** Correct the NC program. An NC program cannot call itself.
160-00AC	**Error message** Not possible on this machine **Cause of error** The desired command cannot be performed on this machine, or the configuration is faulty. **Error correction** Inform the machine tool builder or (if the error occured in an NC program), edit the NC program.
160-00AD	**Error message** Block format incorrect **Cause of error** You programmed an invalid syntax element within a contour definition. Only traversing commands are allowed with the exception of APPR/DEPT and Q parameter calculation. **Error correction** Edit the part program.

Error number	Description
160-00AE	**Error message** Invalid value **Cause of error** You attempted to assign an illegal value to a variable. **Error correction** Edit the NC program.
160-00AF	**Error message** Undeclared string variable **Cause of error** You used a string variable without first declaring it. **Error correction** Edit the NC program. Before it's first use, every string variable must be declared with DECLARE STRING.
160-00B0	**Error message** Block format incorrect **Cause of error** You concluded a contour definition improperly. **Error correction** Edit the NC program. Contours defined by label must end with label 0.
160-00B1	**Error message** Cannot write **Cause of error** You attempted to use FN17:SYSREAD or SQL SYSBIND and SQL FETCH to write to a read-only system parameter. **Error correction** Edit the NC program.
160-00B2	**Error message** String too long **Cause of error** In a table you attempted to write a string that is too long for the corresponding column. **Error correction** Edit the NC program.
160-00B3	**Error message** Block format incorrect **Cause of error** A mandatory syntax element is missing in the NC block. **Error correction** Edit the NC program.

Error number	Description
160-00B4	**Error message** Format file defective **Cause of error** The format file for FN16: F-PRINT (DIN/ISO: D16) has the wrong format. **Error correction** Correct the format file.
160-00B5	**Error message** Format file defective **Cause of error** The format file for FN16: F-PRINT (DIN/ISO: D16) has the wrong format: The Q parameters and other keywords in the specified lined do not fit to the replacement characters in the format string. Remember: - If an %% character in the format string is not to be understood as format information, you must write \%%. - Each line must begin with all keywords that generate an output (such as HOUR, Q14, ...), only then followed by those that do not generate an output (such as M_CLOSE). **Error correction** Correct the format file.
160-00B6	**Error message** Format file defective **Cause of error** The format file for FN16: F-PRINT (DIN/ISO: D16) has the wrong format: The specified line contains the keywords for several different languages. **Error correction** Correct the format file. Each line can contain no more than one keyword for a language.
160-00B7	**Error message** Format file defective **Cause of error** The format file for FN16: F-PRINT (DIN/ISO: D16) has the wrong format: The specified line contains an unknown code word. **Error correction** Correct the format file.

Error number	Description
160-00B8	**Error message** Format file defective **Cause of error** The text generated by FN16: F-PRINT (ISO: D16) is too long. Maximum permissible length: 1024 characters. **Error correction** Change the format file. If necessary, divide the output over several FN16 commands.
160-00B9	**Error message** %1 **Cause of error** **Error correction**
160-00BA	**Error message** File access not possible **Cause of error** You tried to access a file that is reserved for the control manufacture or machine tool builder. **Error correction** Edit the NC program.
160-00BB	**Error message** Faulty CFGREAD **Cause of error** Failed attempt to read a configuration datum via CFGREAD. The desired configuration datum may not exist or it has another type. **Error correction** Check that the name (TAG), key (KEY) and desired attribute (ATTR) is written correctly and that the desired datum has the correct type: In numerical formulas, enter only datum that can be converted to a numerical value (numbers and Boolean variables). In string formulas, enter only data that can be converted to a string (string, Boolean and enumeration).
160-00BD	**Error message** Block format incorrect **Cause of error** A coordinate is required in the specified NC block, but you did not enter one. **Error correction** Edit the NC program.

Error number	Description
160-00BE	**Error message** Illegal probe type **Cause of error** An invalid number was entered for the touch probe model. The probe data or a cycle are probably in error. **Error correction** Correct the type of the touch probe (if necessary through your customer service).
160-00BF	**Error message** CYCL DEF faulty **Cause of error** The Q parameters entered in a cycle as calling parameters are contradictory. The cycle is probably incorrectly defined, or maybe you simply programmed it incorrectly. **Error correction** Correct the NC program with the NC editor. If this does not remedy the error, contact your machine tool builder.
160-00C0	**Error message** %1 **Cause of error** An error was provoked by the function FN14 (ISO: D14) in an NC program or cycle. **Error correction** Look for a description of the error in the machine manual. Then fix the error and restart the program.
160-00C1	**Error message** FN14 error without text **Cause of error** With the FN14 (ISO: D14) function you provoked an error in the NC program or cycle. The string variable to be shown as an error text does not exist. **Error correction** Correct the FN14 function in the NC program. Inform the machine manufacturer if an error message is generated from a cycle.

Error number	Description
160-00C2	**Error message** FN14 error without text **Cause of error** With the FN14 (ISO: D14) function you provoked an error in the NC program or cycle. The additional information is missing for the given error number. **Error correction** Correct the FN14 function in the NC program. Inform the machine manufacturer if an error message is generated from a cycle.
160-00C3	**Error message** M function not permitted **Cause of error** An M function was programmed with a number that is not permitted on this control. **Error correction** Correct the number of the M function.
160-00C4	**Error message** No program selected **Cause of error** An attempt was made to call an NC program with CALL SELECTED, although no program was selected. **Error correction** Correct the NC program.
160-00C6	**Error message** Incorrect tool data **Cause of error** Incorrect tool data **Error correction** Correct the tool table.
160-00C7	**Error message** Invalid value **Cause of error** An invalid value was entered for a parameter in a function. **Error correction** Correct the NC program.

Error number	Description
160-00C8	**Error message** Cycle defective **Cause of error** An incorrect system jump address was entered in a cycle. **Error correction** Inform your machine tool builder.
160-00C9	**Error message** Invalid value for table **Cause of error** You tried to write an invalid value in an SQL table. **Error correction** Correct the NC program.
160-00CA	**Error message** Invalid SQL handle **Cause of error** An invalid SQL handle was entered for the transaction. Maybe the transaction was never successfully opened, or it was already ended through COMMIT or ROLLBACK. **Error correction** Correct the NC program.
160-00CB	**Error message** Error when opening a selected file **Cause of error** Error while opening a file. **Error correction** Ensure that the file exists, that the given path is correct, and that the file has a readable format.
160-00CC	**Error message** Error when opening a system file **Cause of error** Error while opening a system file. **Error correction** Inform your service agency.
160-00CD	**Error message** Block format incorrect **Cause of error** In a NC program you used a syntax element that is allowed only within a contour-definition program. **Error correction** Create a contour definition program and select with SEL CONTOUR.

Error number	Description
160-00CE	**Error message** ID for FN17/FN18 not available **Cause of error** The given ID in the system datum (FN17/FN18) is not available for this channel because the corresponding configuration data are missing. **Error correction** Check the ID of the system datum or run the NC program in another channel. If you really do need a system datum with this ID in this channel, ask your service agency.
160-00CF	**Error message** NC command not available **Cause of error** The given command is not available because the corresponding configuration data are missing. It is probably not supported on this machine. **Error correction** Change the NC program or inform your machine tool builder.
160-00D0	**Error message** M128 / M129 not allowed here **Cause of error** No switch-over of the TCPM is possible while the radius compensation is active (RR/RL, or G41/G42). **Error correction** Activate or deactivate TCPM before beginning or after end of radius compensation.
160-00D1	**Error message** 3-D tool compensation incorrect **Cause of error** LN blocks (face milling) are not possible together with simple radius compensation. **Error correction** If you want face milling, switch off the radius compensation. If you want peripheral milling, switch on TCPM (M128).
160-00D2	**Error message** Only allowed in subprogram **Cause of error** The syntax used is allowed only in subprograms that are called with CALL PGM and in cycles, not in the main program. **Error correction** Correct the NC program.

Error number	Description
160-00D3	**Error message** Variable in calling program not defined **Cause of error** In a subprogram, you tried to change a variable that is not declared in the calling program. **Error correction** Correct the NC program.
160-00D4	**Error message** Tool axis of touch probe not defined **Cause of error** You called a probing cycle without first defining the tool axis of the touch probe. **Error correction** Run the TOOL CALL with the corrent tool axis.
160-00D5	**Error message** OEM system cycle '%3' not defined **Cause of error** You tried to call a non-configured OEM system cycle. **Error correction** Complete the missing OEM system cycle configuration, or correct the NC program containing the call.
160-00D7	**Error message** Inconsistent status of the SQL server **Cause of error** Open transactions to the SQL server exist in the interpreter, even though they have already been closed. **Error correction** Check if the data in the SQL tables matches your expectations.
160-00D8	**Error message** Option not enabled **Cause of error** The function programmed is not allowed on this control or is available only as an option. **Error correction** - Enable the option - Correct the NC program

Error number	Description
160-00D9	**Error message** Only allowed in cycle **Cause of error** The syntax used is allowed only in cycles, not in main programs or subprograms. **Error correction** Correct the NC program.
160-00DA	**Error message** Access to PLC variable has failed **Cause of error** The attempt to access a PLC variable has failed. It may be that the desired variable does not exist. **Error correction** Check that the symbolic name of the variable is spelled correctly and that the variable is defined in the PLC.
160-00DB	**Error message** Access to PLC variable has failed **Cause of error** The attempt to access a PLC variable has failed because it is not of the expected type. **Error correction** Edit the NC program.
160-00DE	**Error message** Program was edited **Cause of error** The current NC program was changed, or one of the NC programs that have called the current NC program. It is therefore not possible to go back into the program. **Error correction** Use the GOTO function or the mid-program startup function to select the desired location to return to in the program.
160-00DF	**Error message** R+ (G43) or R- (G44) not allowed here **Cause of error** The radius compensation R+ or R- cannot be used during active RR or RL. **Error correction** Edit the NC program.

Error number	Description
160-00E0	**Error message** FZ was programmed in conjunction with the number of teeth 0 **Cause of error** You used FZ to define a feed per tooth, although no tooth number is defined in the tool table. **Error correction** Add to the CUT column in the tool table for the active tool.
160-00E1	**Error message** Combination of FU/FZ with M136 not allowed in inch programs **Cause of error** You tried to use FU or FZ (feed rate in inch/rev or inch/tooth) in conjunction with M136 (feed rate in 0.1 inch/rev). **Error correction** Edit the NC program.
160-00E2	**Error message** PGM CALL not allowed **Cause of error** Calling subprograms over CALL PGM is not allowed in the Positioning with MDI mode of operation. **Error correction** Edit the NC program.
160-00E3	**Error message** Spindle speed S is greater than NMAX from the tool table **Cause of error** You entered a spindle speed S greater than the maximum speed defined for this tool in the tool table. **Error correction** - Enter a lower spindle speed S. - Change the maximum spindle speed in the NMAX column of the tool table.
160-00E4	**Error message** Probe cycle started with stylus already deflected **Cause of error** You tried to start a probing cycle although the stylus is still deflected. **Error correction** Increase the retraction path

Error number	Description
160-00E5	**Error message** Axis positions could not be determined **Cause of error** The position of the touch point could not be read. **Error correction** Inform your service agency
160-00E6	**Error message** Missing tool data! **Cause of error** The data for the current tool are not available; the tool is not in the table. Do not run any programs with this condition! **Error correction** - Ensure that the desired tool is entered in the tool table. If required, correct the tool table. - Acknowledge the error message - Conduct a TOOL CALL with an existing tool
160-00E7	**Error message** Incremental input not allowed **Cause of error** In the PATTERN DEF block, you used incremental coordinates to define the first position or a position after a pattern definition. **Error correction** In PATTERN DEF, always use absolute coordinates to program - the first position, - the next position after a pattern
160-00E8	**Error message** Point table has been changed **Cause of error** A pocket table defined with SEL PATTERN has changed during the program run. This is not allowed because the geometry is calculated ahead of time and the changes can then sometimes no longer be considered. **Error correction** Restart the program
160-00E9	**Error message** M function not allowed in a CYCL CALL PAT block **Cause of error** In CYCL CALL PAT block an M function was programmed that is not allowed there. **Error correction** Edit the NC program

Error number	Description
160-00EA	**Error message** CYCL CALL PAT not possible with selected cycle **Cause of error** The selected cycle is not allowed for execution with CYCL CALL PAT. **Error correction** Edit the NC program
160-00EB	**Error message** Recursive call of CYCL CALL PAT **Cause of error** Another CYCL CALL PAT block was found within a point pattern operation. **Error correction** Correct the NC program
160-00EC	**Error message** Radius compensation not allowed before CYCL CALL PAT **Cause of error** The control cannot approach the points of a pattern and compensate the tool radius. Radius compensation must not be switched on before a CYCL CALL PAT block or at the end of the cycle called by this block. **Error correction** Edit the NC program
160-00ED	**Error message** Point pattern call or definition faulty **Cause of error** A CYCL CALL PAT or PATTERN DEF block could not be executed because: - The machining plane programmed with TOOL CALL is not supported or - The point table or a pattern definition with PATTERN DEF is faulty. **Error correction** Check the NC program or point table and correct if necessary
160-00EE	**Error message** No point pattern defined **Cause of error** CYCL CALL PAT can only work if beforehand a point pattern was selected with SEL PATTERN or PATTERN DEF. **Error correction** Edit the NC program

Error number	Description
160-00EF	**Error message** M136 not allowed **Cause of error** M136 is not allowed in combination with the selected cycle. **Error correction** Correct the NC program
160-00F0	**Error message** Faulty call of READ KINEMATICS or WRITE KINEMATICS **Cause of error** You programmed the READ KINEMATICS or WRITE KINEMATICS command incorrectly. Possible causes: - The character string entered under KEY contains an unknown element or an incorrect number of elements - Writing the programmed data to the machine kinematics is not allowed or is not supported **Error correction** Edit the NC program
160-00F1	**Error message** FUNCTION PARAXCOMP or PARAXMODE is faulty **Cause of error** You programmed FUNCTION PARAXCOMP DISPLAY or FUNCTION PARAXCOMP MOVE without indicating an axis, or in FUNCTION PARAXMODE you entered fewer than three axes. **Error correction** - Enter at least one axis in FUNCTION PARAXCOMP DISPLAY or FUNCTION PARAXCOMP MOVE - Enter exactly three axes in FUNCTION PARAXMODE - Correct the NC program
160-00F2	**Error message** M118/M128 at the same time is not allowed **Cause of error** You tried to use M118 to activate a handwheel superimposition during active TCPM. **Error correction** M118 and M128 must not be active at the same time. Edit the NC program.

Error number	Description
160-00F3	**Error message** M118/M128 at the same time is not allowed **Cause of error** You tried to use M118 to activate a handwheel superimposition during active TCPM. The TNC has deactivated the handwheel superimpositioning. **Error correction** M118 and M128 must not be active at the same time. Edit the NC program.
160-00F4	**Error message** Active program was changed **Cause of error** You have changed the active NC program and not yet saved it. **Error correction** Save the unsaved NC program and restart.
160-00F5	**Error message** Called program was changed **Cause of error** You have edited and not yet saved an NC program that was called by another program during program run. **Error correction** Save the called NC program and restart the main program.
160-00F6	**Error message** NC block not allowed in milling mode **Cause of error** You programmed an NC block that is not permitted in milling mode. **Error correction** Correct the NC program.
160-00F7	**Error message** NC block not allowed in turning mode **Cause of error** You tried to execute a function that is not allowed in turning mode. - Fixed cycles for cylindrical surface - Fixed cycles that are locked for turning mode - These manual operation functions are not allowed for turning **Error correction** If necessary, correct the NC program.

Error number	Description
160-00F8	**Error message** Switching to milling or turning operation not allowed **Cause of error** You tried to switch between milling and turning mode while tool radius compensation was active. **Error correction** Cancel the tool radius compensation before switching to milling or turning mode.
160-00F9	**Error message** FUNCTION TURNDATA not allowed on active tool **Cause of error** You tried to use FUNCTION TURNDATA to activate a turning-tool compensation for a milling cutter. **Error correction** Call a turning tool before programming a FUNCTION TURNDATA.
160-00FA	**Error message** M136 not allowed **Cause of error** You attempted with active M136 to make an automatic swing-in movement in connection with Cycle 19 or the PLANE function. **Error correction** Deactivate M136 before swing-in.
160-00FB	**Error message** Spindle speed programmed without configured spindle **Cause of error** You tried to program a spindle speed, although no spindle is configured for the active kinematic configuration. **Error correction** Select a kinematic configuration with spindle, or edit the NC program.
160-00FC	**Error message** 0 rpm not permitted **Cause of error** You called a Rigid Tapping or Tapping cycle with a programmed spindle speed of 0. **Error correction** Program a spindle speed greater than 0.

Error number	Description
160-00FD	**Error message** Feed rate FT or FMAXT not allowed **Cause of error** You defined a feed rate with FT or FTMAX although that is not allowed in connection with APPR LN, LT, CT, PLN, PLT, PCT. **Error correction** Use other feed rate definitions than FT or FTMAX
160-00FE	**Error message** Global Q parameter not defined **Cause of error** A program run (test run) showed that a globally effective Q parameter is not defined. **Error correction** Check whether all required global parameters are in the program head and add more if required.
160-00FF	**Error message** M function not allowed in a CYCL CALL POS block **Cause of error** In the CYCL CALL POS block you programmed an M function that is not allowed there. **Error correction** Edit the NC program
160-0100	**Error message** CYCL CALL POS not allowed with active cycle **Cause of error** The active machining cycle is not allowed in combination with CYCL CALL POS. **Error correction** Call the cycle with M99 or CYCL CALL
160-0101	**Error message** CYCL CALL POS with radius compensation not allowed **Cause of error** You defined a CYCL CALL POS block even though tool-radius compensation is active. **Error correction** Cancel the tool-radius compensation before the CYCL CALL POS block

Error number	Description
160-0102	**Error message** CYCL CALL PAT or CYCL CALL POS: No working direction defined **Cause of error** You did not define a unique working direction in a cycle definition. **Error correction** Check the recent cycle definitions (parameters Q201, Q249, Q356 or Q358).
160-0103	**Error message** Axis angle not equal to tilt angle **Cause of error** - Datum setting inactive with tilted working plane: the position of the tilting axes is not 0°. - Datum setting active with tilted working plane: the position of the tilting axes does not agree with the active angle values. **Error correction** - Move the tilted axes into the default position. - Move the tilting axes to the correct position or adapt the angular values of the tilted axes' position.
160-0104	**Error message** Configuration data cannot be loaded or unloaded **Cause of error** This function is not supported in the Test Run operating mode or by the editor graphics. **Error correction**
160-0105	**Error message** Preset not possible with current machine state **Cause of error** The active preset contains at least one value unequal to zero, which is not allowed because of the present machine condition. The control did not activate this preset. **Error correction** Check the current preset and change if required.

Error number	Description
160-0106	**Error message** NC function not permitted **Cause of error** The block scan evaluated an NC function that cannot be used with mid-program startup (e.g. M142, M143). **Error correction** - If possible, remove the NC function from the program and then restart the block scan. - If this is a control program for calling various part programs, start the desired part program individually in the block scan.
160-0107	**Error message** Impermissible compensation for turning tools **Cause of error** You programmed M128 (TCPM) together with an RL (G41)/ RR (G42) radius compensation or an LN block. This function is not supported in connection with turning tools. **Error correction** Edit the NC program.
160-0108	**Error message** 0 rpm not allowed **Cause of error** You programmed a spindle speed of 0. **Error correction** Always define S to be greater than 0.
160-0109	**Error message** 0 rpm not allowed **Cause of error** Turning mode is active: - You programmed a spindle speed of 0 with FUNCTION TURNDATA SPIN. - You programmed a constant surface speed VC with FUNCTION TURNDATA SPIN, but did not define the cutting speed VC. - You programmed a constant rotational speed (VCONST:OFF) with FUNCTION TURNDATA, but did not define the rotational speed S. **Error correction** - Always program S to be greater than 0. - For constant surface speed (VCONST:ON), always define a surface speed VC. - For constant rotational speed (VCONST:OFF), always define a rotational speed S.

Error number	Description
160-010A	**Error message** Number of program part repeats is defined as 0 **Cause of error** In a CALL LBL statement (DIN/ISO: L x,y), you defined the number of program part repeats with 0. **Error correction** - Define a number of repeats between 1 and 9999. - Define a subprogram call without entering repetitions.
160-010B	**Error message** No turning tool is active **Cause of error** The TNC cannot execute the function with the data of the active tool. **Error correction** - Insert a turning tool. - Check the TYPE column of the lathe tool table.
160-010C	**Error message** Contradictory tool data **Cause of error** You tried to call a lathe tool with data that are allowed only for milling tools, e.g. - Spindle speed S - Oversizes DL, DR, DR2 **Error correction** Correct the NC program.
160-010D	**Error message** Tool data are contradictory during active turning operation **Cause of error** The following functions are not allowed during active turning operation (FUNCTION MODE TURN): - Definition of the spindle speed for the tool spindle (TOOL CALL S, DIN/ISO: S) - Definition of the tool axis direction (e.g. TOOL CALL Z, DIN/ISO: G17/G18/G19) **Error correction** Correct the NC program.
160-010E	**Error message** Incorrect file type **Cause of error** The type of entered data is not permissible in this application. **Error correction** Please check whether the file has the correct extension.

Error number	Description
160-010F	**Error message** Spline interpolation is not supported **Cause of error** You tried to run an NC block that was described as a spline. This block format is not supported by the control. **Error correction** Select an NC program without spline interpolation or edit the NC program.
160-0110	**Error message** FN27/FN28: No table selected **Cause of error** You attempted to use FN27 to write to a table, or FN28 to read from a table, although no table was open. **Error correction** Use FN26 to open the desired table.
160-0111	**Error message** FN27/FNF28: Field is not numerical **Cause of error** You attempted to use an FN27 or FN28 function to write to or read from a non-numerical field. **Error correction** Writing and reading operations are possible only with numerical fields.
160-0112	**Error message** MDI: Radius compensation not possible **Cause of error** No tool radius compensation is allowed in MDI mode. **Error correction** Correct the NC block
160-0113	**Error message** Label is missing Label is missing **Cause of error** You used Cycle 14 to call a nonexistent label. **Error correction** Change the number or name in Cycle 14 or insert the missing label

Error number	Description
160-0114	**Error message** Label is missing Label is missing **Cause of error** You used FUNCTION TURNDATA BLANK LBL to call a nonexistent label. **Error correction** Change the number or name in FUNCTION TURNDATA BLANK LBL or insert the missing label
160-0115	**Error message** Too many vertical profiles programmed **Cause of error** The selected surface profile contains too many vertical profiles. **Error correction** Edit the NC program
160-0116	**Error message** Type of interpolation invalid **Cause of error** No interpolation type or an unsupported interpolation type was programmed. **Error correction** Edit the NC program
160-0117	**Error message** Too many axes programmed **Cause of error** You programmed too many axes for paraxial interpolation. **Error correction** Edit the NC program
160-0118	**Error message** Plane profile incorrectly defined **Cause of error** The selected contour cannot be used as the plane profile of a profile surface. The plane profile must consist only of a subcontour. **Error correction** Edit the NC program

Error number	Description
160-0119	**Error message** Circle calculation failed **Cause of error** It was not possible to calculate a circle from the given coordinates. **Error correction** Edit the NC program
160-011A	**Error message** No tool touch probe active **Cause of error** You tried to switch a tool touch probe without first activating it. **Error correction** Activating the tool touch probe.
160-011B	**Error message** At least one parameter within the contour is not initialized **Cause of error** The QL parameters of this program cannot be accessed in the contour defined in the current program. **Error correction** Define the QL parameters used within the contour definition or use globally effective Q parameters.
160-011F	**Error message** Range of traverse not defined **Cause of error** You tried to switch to a traverse range that was not defined in the configuration through CfgWorkingRange. **Error correction** Inform your machine tool builder
160-0120	**Error message** DATA ACCESS has failed **Cause of error** An incorrect path was used for DATA ACCESS or there are no access rights. **Error correction** - Correct the programmed path for DATA ACCESS - Move the NC program to the PLC partition

Error number	Description
160-0121	**Error message** Label is missing **Cause of error** A workpiece blank definition (NC block: BLK FORM ROTATION) refers to a nonexistent label. **Error correction** - Correct the NC program: Change the reference to the label or insert the missing label.
160-0122	**Error message** Contradictory M functions **Cause of error** In the same block, you tried to output multiple effective M functions that cancel each other. For example, you cannot program M3 and M4 in the same NC block because both go into effect at beginning of the block. On the other hand, M3 and M5 are allowed in the same block because M3 goes into effect at the block beginning and M5 at block end. The machine tool builder specifies which M functions cancel each other. **Error correction** Correct the NC program.
160-0123	**Error message** Alias strobe of type %1 not configured **Cause of error** The entered command is not available because the corresponding configuration data are missing. Presumably it is not supported on this machine. The config object CfgPlcStrobeAlias is missing or has not been entered in the CfgPlcStrobes/aliasStrobes list. **Error correction** Edit the NC program or contact your machine tool builder.
160-0124	**Error message** CFGWRITE incorrect **Cause of error** The attempt to use CFGWRITE to write a configuration datum has failed. It might have another type, or the the write axis is not allowed. **Error correction** Check the spelling of TAG, KEY, attribute (ATR) and the type of value to be written (DAT). If required, move the program from the TNC to the PLC partition.

Error number	Description
160-0125	**Error message** Demo version **Cause of error** This software is a demo version. With the demo version you can edit and run NC programs with a maximum length of 100 lines. With the demo version you are not entitled to service support from HEIDENHAIN. **Error correction** - If you would like to purchase the licensed version of the product, please contact the service agency for the control. - Check whether the keyboard of the programming station (or the dongle) is connected.
160-0126	**Error message** M90 is not supported by this NC software **Cause of error** The M90 function is no longer available with this NC software. **Error correction** Use Cycle 32 TOLERANCE in order to influence accuracy, surface quality and machining speed.
160-0127	**Error message** M105 and M106 are not supported with this NC software **Cause of error** The M105 and M106 function is not available with this NC software. **Error correction**
160-0128	**Error message** M104 is not supported with this software **Cause of error** M104 is not supported by this NC software. The datum set manually most recently is saved in row 0 of the preset table. **Error correction** - Use Cycle 247 SET DATUM to activate a preset from the preset table.
160-0129	**Error message** M112 and M113 are not supported with this NC software **Cause of error** The M115 and M113 functions are not available with this NC software. **Error correction** Use Cycle 32 TOLERANCE in order to influence accuracy, surface quality and machining speed.

Error number	Description
160-012A	**Error message** M114 and M115 are not supported with this NC software **Cause of error** M114 und M115 are not supported by this NC software. **Error correction** - Use M144/145 or M128/129 in order to take the positions of rotary and tilting axes into consideration.
160-012B	**Error message** M124 is not supported with this NC software **Cause of error** M124 is not supported by this NC software. The contour filter cannot be programmed in the NC program. **Error correction** - Use CfgStretchFilter to configure the contour filter in the machine configuration.
160-012C	**Error message** M132 is not supported with this NC software **Cause of error** M132 is not supported by this NC software. **Error correction** - Use Cycle 32 TOLERANCE in order to influence accuracy, surface quality and machining speed.
160-012D	**Error message** M134 and M135 are not supported with this NC software **Cause of error** This NC software does not support M134 and M135 for a precision stop at non-tangential transitions for positioning moves with rotary axes. **Error correction** - Use machine-specific funtions to activate or deactivate automatic clamping. - If required, contact your machine tool builder
160-012E	**Error message** M142 is not supported with this NC software **Cause of error** The deletion of modal program functions through M124 is not supported by this NC software. **Error correction**

Error number	Description
160-012F	**Error message** M150 is not supported with this NC software **Cause of error** This NC software does not support the suppression of limit-switch messages through M150. **Error correction**
160-0130	**Error message** M200 to M204 are not supported with this NC software **Cause of error** This NC software does not support M200-M204 for laser cutting. **Error correction**
160-0136	**Error message** SL1 cycles are not supported with this NC software **Cause of error** The SL1 cycles 6, 15 and 16 are not supported by this NC software. **Error correction** - Adapt the NC program: Replace SL1 cycles by the new, improved SL2 cycles 20, 21, 22, 23 and 24.
160-0137	**Error message** The touch probe cycle is not supported with this NC software **Cause of error** The programmed touch probe cycle is not supported by this NC software. **Error correction** - Adapt the NC program: Replace the touch probe cycle 2 or 9 by the newer cycles 461, 462 or 463.
160-0138	**Error message** Cycle 30 is not supported with this NC software **Cause of error** Cycle 30 is not supported by this NC software. **Error correction**

Error number	Description
160-0139	**Error message** Tool must not be changed Tool must not be altered **Cause of error** A change of tool number or tool index is not allowed at present. This test was activated by the machine tool builder within the TOOL CALL macro. **Error correction** Inform your machine tool builder
160-013A	**Error message** Mid-program startup to area with active RTC function not possible **Cause of error** You tried to run a mid-program startup on an area in the NC program in which the RTC function (Real-Time Coupling) is active. This is not possible. **Error correction** - Adapt the target position for the block search - Choose a target position so that the mid-program startup ends before activation of the RTC function.
160-013B	**Error message** Function locked **Cause of error** You have programmed a function that has not been enabled by the machine manufacturer. **Error correction** - Edit the NC program or contact your machine tool builder
160-013C	**Error message** Function not possible with current tool **Cause of error** A function is incompatible with the properties of the current tools. **Error correction** - Edit the NC program - Check the tool data

Error number	Description
160-013D	**Error message** File %1 for tool carrier kinematics could not be opened **Cause of error** The given file for a tool carrier kinematic model could be found neither under TNC:\system\Toolkinematics nor under OEM:\config\Toolkinematics. **Error correction** - Add the file in one of the appropriate directories or delete the corresponding entry under "KINEMATIC" in the tool table if no tool-carrier kinematic model is to be used for the tool. - Inform your service agency.
160-013E	**Error message** Data of the tool carrier kinematics is faulty **Cause of error** The tool-carrier kinematic data for the current tool are faulty. Note: Do not run any NC programs in this condition and be careful if you move the axes manually! **Error correction** - Ensure under "KINEMATICS" that a valid file for the tool-carrier kinematics is entered for the desired tool in the tool table. - Acknowledge the error message - Run a TOOL CALL for a tool that has no tool-carrier kinematics assigned or one that has a valid tool-carrier kinematic model. - Inform your service agency.
160-0142	**Error message** Axis positioning not possible **Cause of error** - An auxiliary axis movement was moved before the last movement of this axis was completed **Error correction** Check the PLC program. - Wait explicitly for the end of the previous positioning movement or cancel it - Inform your service agency.
160-0143	**Error message** Axis movement canceled **Cause of error** The positioning movement of an auxiliary axis was canceled. **Error correction** - If necessary, check other pending error messages - Check the PLC program and status marker of the axis - Inform your service agency

Error number	Description
160-0144	**Error message** The configuration datum %2 is missing for the tool touch probe %1 **Cause of error** The appropriate configuration datum is missing for the TT tool touch probe activated with the CfgProbes/activeTT parameter. **Error correction** Add the missing configuration datum or activate another TT tool touch probe.
160-0145	**Error message** No active touch probe **Cause of error** You started a probing cycle without first activating the touch probe. **Error correction** - Insert the TS touch probe, or - switch to the TT tool touch probe.
160-0146	**Error message** Alias strobe of type %1 is incorrectly configured **Cause of error** The entered command is not available because the corresponding configuration data are faulty. Presumably it is not supported on this machine. The M function referenced in CfgPlcStrobeAlias is not configured. **Error correction** - Inform your machine tool builder
160-0155	**Error message** Ambiguity: DR2 and DR2TABLE defined in the tool table **Cause of error** Ambiguous DR2 data are entered in the tool table. Only DR2 or DR2TABLE can set for a tool at any given time. **Error correction** In order to use 3-D radius compensation, enter the desired DR2 value and leave the DR2TABLE entry empty In order to use the 3D-ToolComp option, enter in DR2TABLE the file name (without extension) of the compensation value table and set DR2 to zero (0)

Error number	Description
160-0156	**Error message** Radius compens. impossible with milling cutter (TCPM TIP-CENTER) **Cause of error** An attempt has been made to program a radius compensation using a milling tool and active TCPM REFPNT TIP CENTER. Radius compensation with this preset is possible only for turning tools. **Error correction** Insert a turning tool.
160-0157	**Error message** Activation of TCPM REFPNT TIP-CENTER is not allowed **Cause of error** An attempt was made to activate TCPM REFPNT TIP-CENTER. This is not allowed in the current program context. TCPM REFPNT TIP-CENTER cannot be used in the following program states: - Active tool radius compensation - Active 3-D tool compensation **Error correction** If necessary, deactivate the active tool radius compensation or 3-D tool compensation
160-0158	**Error message** TCPM TIP-CENTER active **Cause of error** TCPM REFPNT TIP-CENTER is active. The following functions cannot be used with this TCPM reference point: - 3-D tool compensation - Radius compensation R+ and R- **Error correction** Deactivate TCPM TIP-CENTER (using FUNCTION TCPM RESET or M129) or select TIP-TIP or CENTER-CENTER for the TCPM preset before activating the tool compensation.
160-015A	**Error message** TCPM TIP-CENTER is active with tool radius compensation **Cause of error** TCPM REFPNT TIP-CENTER with tool radius compensation is active. The following functions are not possible in this state: - M128 - M129 / FUNCTION TCPM RESET - FUNCTION TCPM REFPNT: Change of TCPM preset **Error correction** Deactivate tool radius compensation first with R0

Error number	Description
160-0160	**Error message** M2/M30 in subprogram **Cause of error** The NC program was ended by a call from M2 or M30 in a subprogram called with CALL PGM. **Error correction** - If this behavior is desired, no further measures are required. - If you want to return from the subprogram, edit the NC program and jump to the last line of the subprogram.
160-0162	**Error message** File with 3D-ToolComp compensation values not available **Cause of error** The file with the name provided in the tool-table column DR2TABLE could not be opened. **Error correction** - Check the spelling of the file name in the tool table. - Check whether the file is located in the intended folder on the control. - Inform your service agency.
160-0163	**Error message** NC command not allowed during tool-oriented machining **Cause of error** - NC command was executed that is not supported with tool-oriented machining. In this mode, for example, no change is allowed of the preset table through traverse-range switchover. **Error correction** - Correct the NC program, or - use workpiece-oriented machining
160-0164	**Error message** Parameter not permissible in macro **Cause of error** In an OEM macro, TOOL CALL was programmed with invalid parameters. - With TOOL CALL, no parameters are allowed in the macro for tool-oriented pallet machining. - In the TOOL CALL, only number, step index and spindle speed are allowed in the tool change macros. **Error correction**

Error number	Description
160-0165	**Error message** Facing slide: M148 not allowed **Cause of error** Automatic tool lift-off not allowed with an active facing slide. **Error correction** - Check the NC program and adapt it if necessary.
160-0166	**Error message** Function locked **Cause of error** The machine tool builder disabled this function with a configuration setting. **Error correction** Edit the NC program or contact your machine tool builder.
160-0167	**Error message** Cannot continue program **Cause of error** In rare cases, a program resumption with GOTO is no longer possible. **Error correction** - Restart the NC program - If required, try a mid-program startup
160-0168	**Error message** Preset not allowed **Cause of error** The activated preset contains at least one value not equal to zero. This is not allowed due to a limitation defined by the machine tool builder. The limitation could have been activated by the following causes: - Globally by configuration - Dependency on a machine condition, through an NC syntax. The control did not activate the impermissible value of this preset. **Error correction** - Check the current preset and change it if required - In the Test Run operating mode, machining preset loading can be aided using the blank-in-workspace function - Inform your service agency

Error number	Description
160-0169	**Error message** OEM offset for X, Y, or Z axis not permissible **Cause of error** You tried to define an OEM offset for one of the principal axes X, Y or Z. That is not allowed. **Error correction**
160-016A	**Error message** Automatic tool change not possible **Cause of error** An automatic tool change is supported at preset only for milling operations. **Error correction** - In the AFC settings, specify a strategy that does not have the overload response OVLD = M (macro). - Contact your service agency if this message did not occur due to an AFC overload reaction.
160-016B	**Error message** Switching the machining mode is not allowed **Cause of error** You tried to switch the operating mode while tool radius compensation was active. **Error correction** Cancel the tool radius compensation before switching the operating mode.
160-016C	**Error message** NC block in grinding mode is not allowed **Cause of error** You tried to execute a function that is not allowed in grinding mode. - Machining cycles for cylindrical surface - Machining cycles that are disabled for grinding mode - Functions of manual operation that are not permitted for grinding **Error correction** - Correct the NC program

Error number	Description
160-016D	**Error message** NC block in dressing mode is not allowed **Cause of error** You tried to execute a function that is not permitted in dressing mode. - Machining cycles for cylindrical surface - Machining cycles that are disabled for dressing mode - Functions of manual operation that are not permitted for dressing **Error correction** - Correct the NC program
160-016E	**Error message** M function not permitted **Cause of error** In the M function dialog you indicated an M function that is only permitted in the NC program. **Error correction** - Correct the number of the M function - Output the function via an MDI block.
160-016F	**Error message** Execution request for NC syntax missing **Cause of error** You do not have the rights to perform this specific function (e.g. FN22). **Error correction** Edit the NC program.
160-0170	**Error message** M89 not supported in combination with FK **Cause of error** It was attempted to execute an FK block while M89 was active. This is not supported. **Error correction** - Edit the NC program. - In order to execute the selected cycle, program M99 for the respective FK blocks instead of M89.
160-0171	**Error message** FN27/FN28 type of field not supported **Cause of error** You tried to use an FN27 or FN28 function to access a field that does not match the type of parameter. **Error correction** - For numerical fields you must use a Q, QL, or QR parameter as the source or target. - A QS parameter must be used for text fields.

Error number	Description
160-0177	**Error message** Grinding tool not defined completely **Cause of error** - You have called a griding tool that is not defined in the griding tool table, or at least not completely. - The griding tool table does not exist or is faulty. **Error correction** - Add the missing tool to the griding tool table. - Create or correct the griding tool table.
160-0179	**Error message** Traverse range not defined **Cause of error** You tried to deactivate a traverse range that is not defined in the configuration through CfgWorkingRange. **Error correction** Inform your machine tool builder.
160-017A	**Error message** Maximum number of configuration changes was exceeded **Cause of error** Too many configuration changes were buffered with WRITE CFG PREPARE. **Error correction** Write the already prepared changes with WRITE CFG COMMIT before any further PREPARE instructions.
160-017B	**Error message** NC program faulty: WRITE CFG COMMIT without PREPARE **Cause of error** You programmed WRITE CFG COMMIT without a preceding WRITE CFG PREPARE, or the most recently programmed WRITE CFG PREPARE is no longer valid. **Error correction** Edit the NC program
160-017C	**Error message** Parameter type is incorrect **Cause of error** The result type in a Q parameter formula does not match the parameter on the left side: - On the left is a Q, QR, or QL parameter but the result of the formula is a string - On the left is a QS parameter but the result of the formula is a number **Error correction** Correct the formula

Error number	Description
160-017D	**Error message** Probing movement was prevented by DCM **Cause of error** The collision monitoring function shortened the length of the probing movement to 0. **Error correction** - Check the configuration of the touch probe being used - Check whether a collision object must be deactivated for the probing operation
160-017E	**Error message** Block scan not permitted **Cause of error** You began a mid-program startup while dressing mode was active or the target of a mid-program startup is at a position in the dressing mode. This is not allowed. **Error correction** Adapt the target position for the block search
160-017F	**Error message** Handwheel superimpositioning not allowed in dressing mode **Cause of error** You attempted to switch to dressing mode even though handwheel superimpositioning is still active. **Error correction** Switch off handwheel superimpositioning before switching to dressing mode.
160-030A	**Error message** No technology data record available for contour machining **Cause of error** A Cycle 271 must be programmed before every fixed cycle 272, 273, or 274. **Error correction** - Adapt the NC program - Program Cycle 271
160-030B	**Error message** Block scan not permitted **Cause of error** The target position of the mid-program startup is within an active reciprocating movement. This is not allowed. **Error correction** Adapt the target position for the block search

Error number	Description
160-030E	**Error message** Preset not defined **Cause of error** An attempt was made to select a preset that is not defined. **Error correction** Correct the name or the preset or expand the preset table.
160-030F	**Error message** File type not permissible for the tool-model file **Cause of error** Für das einzuwechselnde Werkzeug wurde eine Datei angegeben, die keinen zulässigen Dateityp hat. Zulässig sind *.stl-Dateien. **Error correction** Ersetzten Sie die Datei durch eine zulässige Datei.
160-0310	**Error message** File with tool model is missing **Cause of error** Die in der Werkzeugtabelle angegebene Datei zur Beschreibung des Werkzeugmodells ist nicht vorhanden **Error correction** - Schreibweise des Dateinamens in der Werkzeugtabelle kontrollieren - Datei in den dafür vorgesehenen Ordner auf der Steuerung kopieren (Angaben im Benutzerhandbuch beachten)
1A0-0001	**Error message** System error in internal path calculation Invalid message %1 **Cause of error** System error **Error correction** Inform your service agency.
1A0-0002	**Error message** System error in the geometry chain: %1 **Cause of error** System error **Error correction** Inform your service agency.

Error number	Description
1A0-0003	**Error message** Function not yet implemented: %1 **Cause of error** You tried to use a function that is not available in this version of the NC software. **Error correction** Edit the NC program.
1A0-0004	**Error message** System error in the geometry chain: %1 **Cause of error** System error in the geometry chain **Error correction** Inform your service agency.
1A0-0005	**Error message** System error in the geometry chain: %1 **Cause of error** System error in internal path calculation **Error correction** Inform your service agency
1A0-0006	**Error message** System error in the geometry chain: %1 **Cause of error** System error in internal path calculation **Error correction** Inform your service agency
1A0-0007	**Error message** System error in the geometry chain: %1 **Cause of error** System error in the geometry chain **Error correction** Inform your service agency.

Error number	Description
1A0-0008	**Error message** Axis double programmed **Cause of error** In a circle-center block or a pole block (CC, ISO: I,J,K) you programmed the same axis twice. **Error correction** Edit the NC program
1A0-0009	**Error message** Axis in CC block (ISO: I,J,K) double programmed **Cause of error** In a circle-center block or a pole block (CC, ISO: I,J,K) you programmed the same axis twice. **Error correction** Edit the NC program
1A0-000A	**Error message** No tool axis defined **Cause of error** No plane selection or tool axis direction programmed, or no default plane specified. **Error correction** Edit the NC program or specify the default working plane in the configuration.
1A0-000B	**Error message** No arc end point programmed **Cause of error** Arc end point data missing **Error correction** Program at least one coordinate of the arc end point.
1A0-000C	**Error message** Arc block: No direction of rotation programmed **Cause of error** You programmed a circle without a direction of rotation. **Error correction** Always program the direction of rotation (DR).
1A0-000D	**Error message** No arc radius programmed in CR block **Cause of error** Missing arc radius in CR block **Error correction** Program a radius in the CR block.

Error number	Description
1A0-000E	**Error message** System error in the geometry chain: %1 **Cause of error** System error in the geometry chain **Error correction** Inform your service agency.
1A0-000F	**Error message** Pole is missing **Cause of error** You tried to move with polar coordinates (LP/CP/CTP, DIN/ISO: G10/G11/G12/G13/G15/G16), without first programming a pole (CC) (ISO: I/J/K); or you did not first enter a circle center when programming a circle. **Error correction** Program the pole (CC) before the first block with polar coordinates (ISO: I, J; K), or first program a circle center (CC) when programming a circle.
1A0-0010	**Error message** System error in the geometry chain: %1 **Cause of error** System error in the geometry chain **Error correction** Inform your service agency.
1A0-0011	**Error message** Programmed axis not assigned to a physical axis **Cause of error** Axis value programming with programmable axis without assigned physical axis **Error correction** - Correct the NC program. - Inform your service agency.
1A0-0012	**Error message** System error in the geometry chain: Gap in the programmed path **Cause of error** System error in the geometry chain **Error correction** Inform your service agency.

Error number	Description
1A0-0013	**Error message** Tool radius too large **Cause of error** - Inside contour radius smaller than tool radius - Tool compensation results in contour damage (loop in the path of the tool center) - Contour offset too large **Error correction** - Edit the NC program. - Select a smaller tool. - Program a smaller contour offset.
1A0-0016	**Error message** Error in module configuration: %1 **Cause of error** Error in the module configuration (uninitialized list in configuration object) **Error correction** - Edit the configuration data. - Inform your service agency.
1A0-0017	**Error message** Error in module configuration: %1 **Cause of error** Error in module configuration (list size of an attribute in configuration object is too small) **Error correction** - Edit the configuration data. - Inform your service agency.
1A0-0019	**Error message** Switch the diameter programming off before eccentric grinding **Cause of error** Diameter programming not switched off before eccentric grinding **Error correction** Edit the cycle.

Error number	Description
1A0-001B	**Error message** Automatic pole capture not permitted **Cause of error** You programmed (automatic pole capture) a CC block (DIN/ ISO: I,J,K) without coordinates. This is not possible in the current context, since the TNC cannot clearly identify the plane for the pole. **Error correction** - In the block directly before the pole-capture block, program two linear axes of the working plane. - Specify the working plane via TOOL CALL
1A0-001D	**Error message** Incorrect pole axis for selected working plane **Cause of error** - Z component with XY plane - X component with YZ plane - Y component with ZX plane **Error correction** Edit the NC program.
1A0-001E	**Error message** Chamfer/rounding arc: Subsequent line lies in the wrong plane **Cause of error** After programming a transition element (RND/CHF), you programmed a linear element that does not lie in the plane of the transition element. **Error correction** Edit the NC program.
1A0-0021	**Error message** System error in the geometry chain: %1 System error in the geometry chain: %1 **Cause of error** System error in the geometry chain **Error correction** Inform your service agency.

Error number	Description
1A0-0024	**Error message** An axis must not be locked after a contour transition element **Cause of error** Rounding or chamfer programmed immediately before axis locking **Error correction** - Correct the NC program. - Eliminate contour transition element from program, or - Program target position after contour transition element.
1A0-0025	**Error message** Presetting not permitted after a contour transition element **Cause of error** Setting the base transformation immediately after contour transition element **Error correction** - Correct the NC program. - Eliminate contour transition element from program, or - Program target position after contour transition element.
1A0-0026	**Error message** Setting of axis values not permitted immediately after contour transition element. **Cause of error** Setting of axis values immediately after contour transition element **Error correction** - Edit the NC program. - Eliminate contour transition element from program or - Program target position after contour transition element.
1A0-0027	**Error message** Tool change not permitted right after contour transition element **Cause of error** Tool change immediately after contour transition element **Error correction** - Correct NC program. - Eliminate contour transition element from program, or - Program target position after contour transition element.

Error number	Description
1A0-0028	**Error message** Probe block not permitted right after contour transition element **Cause of error** Probing block immediately after contour transition element **Error correction** - Correct the NC program. - Eliminate contour transition element from program, or - Program target position after contour transition element.
1A0-002B	**Error message** Touch point inaccessible **Cause of error** In the TCH-PROBE 0 cycle (ISO: G55) or during use of the manual probing cycles, no touch point was reached within the traverse path defined in the touch probe table. **Error correction** - Preposition the touch probe closer to the workpiece. - Increase the value in the touch probe table.
1A0-002C	**Error message** Two successive APPR/DEP movements programmed **Cause of error** - Two approach/depart movements programmed in succession. - Elements with zero length were programmed between two approach/departure movements. **Error correction** Edit the NC program.
1A0-002D	**Error message** Compensation switching not permitted **Cause of error** Change of compensation without previous end of compensation **Error correction** - Edit the NC program. - Close the previous contour.
1A0-002F	**Error message** Tool definition is missing **Cause of error** The geometry chain has received no tool data before switching on the tool compensation. **Error correction** - Edit the NC program. - Inform your service agency.

Error number	Description
1A0-0030	**Error message** Path comp wrongly started **Cause of error** You tried to activate the tool radius compensation with RL or RR (ISO: G41 or G42) in an arc block. **Error correction** Activate the tool radius compensation only with a linear block (L, ISO: G0, G1, G10, G11).
1A0-0031	**Error message** Path comp wrongly ended **Cause of error** You tried to cancel the tool radius compensation with R0 (ISO: G40) in an arc block. **Error correction** Cancel the tool radius compensation only with a linear block (L, ISO: G0, G1, G10, G11).
1A0-0032	**Error message** Switching the working plane not permitted **Cause of error** - Change of working plane after RND, CHF, APPR **Error correction** - Edit the NC program.
1A0-0033	**Error message** Rounding cannot be calculated **Cause of error** - The rounding was programmed in the first positioning block of the NC program. - Before the rounding, a contour element was programmed that does not lie exclusively in the working plane. - Before the rounding, a contour element was programmed that has no geometric length. - An RND block (DIN/ISO: G25) was selected with GOTO after a program interruption. **Error correction** - At least two contour elements must be programmed before the rounding. - The contour element immediately before the rounding must be programmed exclusively in the working plane. - After a program interruption, restart at least two positioning blocks before the RND block.

Error number	Description
1A0-0034	**Error message** Chamfer cannot be calculated **Cause of error** - The chamfer was programmed in the first positioning block of the NC program. - Before the chamfer, a contour element was programmed that does not lie exclusively in the working plane. - Before the chamfer, a contour element was programmed that has no geometric length. - An CHF block (DIN/ISO: G24) was selected with GOTO after a program interruption. **Error correction** - At least two contour elements must be programmed before the chamfer. - The contour element immediately before the chamfer must be programmed exclusively in the working plane. - After a program interruption, restart at least two positioning blocks before the CHF block.
1A0-0035	**Error message** Two successive transitional elements not permitted **Cause of error** - Two transition elements were programmed in succesion - CHF after transition element - RND after transition element - APPRLT after transition element - APPRLN after transition element - APPRCT after transition element - APPRLCT after transition element - DEPLT after transition element - DEPLN after transition element - DEPCT after transition element - DEPLCT after transition element **Error correction** - Edit the NC program.
1A0-0036	**Error message** Contour transition not concluded **Cause of error** - Missing curve element after CHF/RND - E.g. program end after CHF/RND **Error correction** - Edit the NC program.

Error number	Description
1A0-0037	**Error message** General system error in the geometry chain Internal error in OCM contour milling cycle **Cause of error** - Contradictory data. **Error correction** - Inform your service agency.
1A0-0038	**Error message** Incorrect application of Cycle 19 **Cause of error** - Before Cycle 19 was called, tilted working plane was switched off (FN17 ID210 NR6). **Error correction** Edit the NC program.
1A0-0039	**Error message** Incorrect application of Cycle 19 **Cause of error** - Before Cycle 19 was called, Cycle 8 or Cycle 10 was called. **Error correction** Edit the NC program.
1A0-003A	**Error message** Incorrect axis index for FN18 **Cause of error** - In the Read System Data function (FN18, ISO: D18), you entered an incorrect axis index. **Error correction** - Check the index of the system datum.
1A0-003B	**Error message** System error in the geometry chain: Message in wrong state %1 %2 %3 **Cause of error** - System error in the geometry chain **Error correction** - Inform your service agency.

Error number	Description
1A0-003C	**Error message** Calculation of tool center path or contour-linking operations for present contour lists failed! **Cause of error** - Internal software error **Error correction** - Change the contour definitions - Inform your service agency
1A0-003D	**Error message** System error in the geometry chain: %1 **Cause of error** - System error in the geometry chain **Error correction** - Inform your service agency.
1A0-003E	**Error message** Tool compensation must not be switched on after G27 **Cause of error** An attempt was made to switch on the radius compensation after G27. **Error correction** Remove the radius compensation.
1A0-003F	**Error message** Linear movement not allowed **Cause of error** You tried to program a linear movement after G27 before deactivating the radius compensation. **Error correction** - First switch off the radius compensation
1A0-0040	**Error message** Approach movement by means of RND not allowed right after a contour transition element **Cause of error** An approach was programmed with RND after RND or CHF. **Error correction** - Edit the NC program.

Error number	Description
1A0-0041	**Error message** G26 programmed in wrong context **Cause of error** - Radius compensation was not switched on immediately after G26. **Error correction** - Switch on the radius compensation immediately before G26.
1A0-0042	**Error message** G26 not allowed after corner rounding or chamfer **Cause of error** You programmed a G26 after RND (ISO: G25) or CHF (ISO: G24). **Error correction** - Edit the NC program
1A0-0043	**Error message** G27 not allowed when tool compensation is off **Cause of error** A G27 was programmed, although tool compensation was switched off. **Error correction** - Edit the NC program.
1A0-0044	**Error message** Radius compensation must not be switched on in a block preceding the approach block **Cause of error** You tried to switch on the tool radius compensation before an approach block. **Error correction** - Switch on the tool radius compensation only in the approach block
1A0-0045	**Error message** System error in the geometry chain: %1 %2 **Cause of error** System error: Data in a message are contradictory. **Error correction** - Inform your service agency.

Error number	Description
1A0-0046	**Error message** Pole programming with only one coordinate not allowed **Cause of error** You defined a pole in only one axis. **Error correction** - Program two axes or no axes (automatic pole transfer)
1A0-0047	**Error message** Circular arc after G27 not allowed **Cause of error** A circular arc was programmed after G27. **Error correction** - Edit the NC program.
1A0-0048	**Error message** Helix after corner rounding or chamfer not allowed **Cause of error** A helix was programmed after a contour transition element. **Error correction** - Edit the NC program.
1A0-0049	**Error message** Height of helix must not lie a circle plane **Cause of error** You programmed an incorrect axis in the direction perpendicular to the circle plane. **Error correction** - Edit the NC program
1A0-004A	**Error message** Angle of a helical path must be programmed incrementally **Cause of error** You programmed a helix without incremental data on the angle. **Error correction** - Edit the NC program

Error number	Description
1A0-004B	**Error message** The sign and direction of a circle's angle are contradictory **Cause of error** In a circular movement, you programmed a negative angle increment to a positive direction of rotation (counterclockwise) or a positive angle increment to a negative direction of rotation (clockwise). **Error correction** - Correct the direction of the movement or the algebraic sign of the angle
1A0-004C	**Error message** Tangent at start point of element not defined **Cause of error** A geometrical element with tangential transition (e.g. CT) was programmed. However, the tangent at the start point is undefined, e.g. because of an immediately preceding verticaldeparture. or because it is the 1st block of the NC program. **Error correction** - Edit the NC program.
1A0-004D	**Error message** First geometric element after scaling is not a straight line **Cause of error** A scaling was programmed immediately before a geometric element that is not a linear element. **Error correction** - Edit the NC program.
1A0-004E	**Error message** Linear movement after tangential departure is not in circle plane **Cause of error** Immediately after a tangential departure, a linear element was programmed that contains a component perpendicular to the arc plane. **Error correction** Edit the NC program.
1A0-004F	**Error message** Tool compensation not switched off for 5-axis movement **Cause of error** You programmed a linear 5-axis movement although the tool radius compensation was active. **Error correction** - Switch off the tool radius compensation beforehand

Error number	Description
1A0-0050	**Error message** Linear 5-axis movement not allowed after transition element **Cause of error** A linear 5-axis movement was programmed after a contour transition element. **Error correction** - Edit the NC program.
1A0-0051	**Error message** Illegal axis programmed **Cause of error** You programmed an illegal axis. **Error correction** Edit the NC program: - Program another axis - Change the machining mode via FUNCTION MODE MILL/ TURN - Switch to another tool (with the appropriate tool type and tool orientation) - In the Programming mode, switch the AUTO DRAW soft key to ON and edit/check the (sub-) contour in a separate NC program - Edit/check the (sub-) contour in a separate NC program if the error with the AUTO DRAW soft key appears on ON
1A0-0052	**Error message** System error in the geometry chain: %1 **Cause of error** System error: Not all axis values were included in the message GmAxesValueSet. **Error correction** - Inform your service agency.
1A0-0053	**Error message** Programmed NC block not permitted right after a contour transition element **Cause of error** - Immediately after a transition element an attempt was made to program an NC block that is not allowed at that **Error correction** - Edit the NC program. - Inform your service agency.

Error number	Description
1A0-0054	**Error message** System error in the geometry chain: %1 **Cause of error** System error: The axis programmed in Cycle 19 is not a physical axis. **Error correction** - Inform your service agency.
1A0-0055	**Error message** System error in the geometry chain: %1 **Cause of error** System error: The axis programmed in Cycle 19 is a rotary axis. **Error correction** - Inform your service agency.
1A0-0056	**Error message** System error in the geometry chain: %1 **Cause of error** System error: The value in the message GmGeoRotWork-Plane is not absolute. **Error correction** - Inform your service agency.
1A0-0057	**Error message** Probe monitoring must not be switched on right after a contour transition element **Cause of error** The probe monitoring was switched on immediately after a contour element was programmed. **Error correction** - Complete the contour before switching on the touch probe.
1A0-0058	**Error message** TCPM must not be switched on or off right after a contour transition element **Cause of error** An attempt was made to switch the TCPM mode on or off immediately after a contour transition element. **Error correction** - Edit the NC program.

Error number	Description
1A0-0059	**Error message** %1 not allowed **Cause of error** A function was programmed that is not allowed in the current context. **Error correction** - Edit the NC program.
1A0-005A	**Error message** System error in the geometry chain: %1 **Cause of error** System error in the geometry chain. **Error correction** - Inform your service agency.
1A0-005B	**Error message** System error in the geometry chain: %1 **Cause of error** System error in the geometry chain. **Error correction** - Inform your service agency.
1A0-005C	**Error message** System error in the geometry chain: %1 %2 **Cause of error** System error in internal path calculation **Error correction** - Inform your service agency
1A0-005D	**Error message** Thread cycle not allowed right after a contour transition element **Cause of error** A thread cycle was programmed immediately after a contour transition element. **Error correction** - Edit the NC program.

Error number	Description
1A0-005E	**Error message** Tool not perpendicular to working plane **Cause of error** You tried to use a function that requires the tool to be perpendicular to the working plane (e.g. tapping) when it was not. **Error correction** - Edit the NC program - Rotate the tool to make it perpendicular to the working plane - If need be, tilt back the working plane
1A0-005F	**Error message** Thread cutting not allowed with tool compensation active **Cause of error** A tapping cycle was programmed with the tool compensation switched on. **Error correction** - First switch off the tool compensation.
1A0-0060	**Error message** Plunging depth in tapping cycle too small **Cause of error** Excessively small plunging depth was programmed in a tapping cycle. **Error correction** - Select a larger value for plunging depth.
1A0-0061	**Error message** Plunging depth in tapping cycle has wrong sign **Cause of error** In a tapping cyle the plunging depth was programmed with negative sign. **Error correction** - Edit the NC program.
1A0-0062	**Error message** Value for retraction has wrong sign **Cause of error** You programmed the retraction value with the incorrect algebraic sign. **Error correction** - Enter the algebraic sign

Error number	Description
1A0-0063	**Error message** System error in the geometry chain: %1 **Cause of error** - System error in the geometry chain. **Error correction** - Inform your service agency.
1A0-0064	**Error message** Tool change not allowed with tool compensation active **Cause of error** You programmed a tool change while the tool radius compensation was active. **Error correction** - Switch off the tool radius compensation before a tool change
1A0-0065	**Error message** Tool compensation must not be switched on before the approach block **Cause of error** You activated the tool radius compensation before the approach block. **Error correction** Switch on the tool radius compensation in the approach block
1A0-0066	**Error message** System error in the geometry chain: %1 **Cause of error** - System error in the geometry chain **Error correction** - Inform your service agency.
1A0-0067	**Error message** Departure movement not permitted immediately after activation of tool radius compensation **Cause of error** A departure was programmed immediately after switch-on of the tool compensation. **Error correction** Program a geometric element before departure.

Error number	Description
1A0-0068	**Error message** System error in the geometry chain: %1 **Cause of error** - System error in the geometry chain. **Error correction** - Inform your service agency.
1A0-006A	**Error message** System error in the geometry chain: %1 **Cause of error** - Sytem error in the geometry chain. **Error correction** - Inform your service agency.
1A0-006B	**Error message** System error in the geometry chain: %1 %2 **Cause of error** - System error in the geometry chain. **Error correction** - Inform your service agency.
1A0-006C	**Error message** System error in the geometry chain: %1 **Cause of error** - System error in the geometry chain. **Error correction** - Inform your service agency.
1A0-006D	**Error message** Approach movement not allowed before touch probe cycle **Cause of error** An approach was programmed before a probing cycle. **Error correction** - Edit the NC program.
1A0-006E	**Error message** System error in the geometry chain: %1 **Cause of error** System error in the geometry chain. **Error correction** - Inform your service agency.

Error number	Description
1A0-006F	**Error message** DEP movement not allowed right after a nonplanar movement **Cause of error** Illegal movement before a departure (DEP). **Error correction** Edit the NC program
1A0-0070	**Error message** Mid-program startup not possible **Cause of error** The target position of the mid-program startup is within a thread or measuring cycle. **Error correction** - Choose a different target position for mid-program startup
1A0-0071	**Error message** APPR/DEP CT or APPR/DEP LN not allowed with inactive tool radius compensation **Cause of error** You programmed APPR/DEP CT or APPR/DEP LN with inactive tool radius compensation. **Error correction** Edit the NC program
1A0-0072	**Error message** Approach movement cannot be calculated **Cause of error** The given geometric data do not result in a defined approach. **Error correction** Program another approach.
1A0-0073	**Error message** Departure movement cannot be calculated **Cause of error** The given geometric data do not result in a defined departure. **Error correction** Program another departure

Error number	Description
1A0-0074	**Error message** Circle tangent cannot be calculated **Cause of error** A circle was programmed with radius 0. **Error correction** Edit the NC program
1A0-0075	**Error message** After tangential departure only a line block is permitted **Cause of error** An illegal movement was programmed after a tangential departure. **Error correction** Program an L block after a tangential departure.
1A0-0076	**Error message** Rounding or chamfer cannot be calculated **Cause of error** Connecting geometrical element is too small or has the same tangent. **Error correction** Edit the NC program.
1A0-0077	**Error message** System error in the geometry chain: %1 **Cause of error** Cause is stated in the error text. **Error correction** Inform your service agency.
1A0-0078	**Error message** Illegal probe function **Cause of error** You tried to conduct a probe function during active mirroring or scaling. **Error correction** Edit the NC program

Error number	Description
1A0-0079	**Error message** No contour pockets present for fixed cycle **Cause of error** - No contour pocket geometery, or only islands defined **Error correction** - Program the missing Cycle 14 - If required, check the rotational direction and compensation direction of the individual contours
1A0-007A	**Error message** Invalid contour expression **Cause of error** Syntax error in contour expression: Missing parentheses, incorrect operands or operators, etc. **Error correction** - Check the contour expression
1A0-007B	**Error message** No technological data available for contour pocket machin-ing No technological data available for contour pocket machin-ing **Cause of error** A Cycle 20 must be programmed before every fixed cycle 21, 22, 23, or 24. **Error correction** Program a Cycle 20
1A0-007C	**Error message** Compensation spacing of tool paths too small **Cause of error** The compensation distance of the tool center path during contour cycle machining is less than 0.1 mm. **Error correction** – Use a larger tool radius, or - Increase the path overlap (Q2) (if relevant for the called cycle).
1A0-007E	**Error message** Polar programming not possible if M91/M92 is active **Cause of error** You tried to program polar coordinates during an active M91/M92. **Error correction** Program the positions with Cartesian coordinates

Error number	Description
1A0-007F	**Error message** Pole invalid **Cause of error** The pole was not programmed in the currently valid coordinate system. The error occurs when M91/M92 is used to define or apply the pole. **Error correction** Program a new pole
1A0-0080	**Error message** Arc definition in parallel coordinate axes **Cause of error** You programmed the arc end point in parallel coordinate axes (e.g. X and U coordinate). **Error correction** Program the arc end point in two coordinate axes that define a plane (e.g. X and V coordinate).
1A0-0081	**Error message** Invalid helix definition **Cause of error** You programmed a helical path with more than one coordinate outside the plane of the arc. **Error correction** Program a helix with one coordinate perpendicular to the plane of the arc.
1A0-0082	**Error message** Circle incorrectly programmed **Cause of error** Start point and end point are the same in a programmed arc. **Error correction** Program the start point and end point with different coordinates.
1A0-0083	**Error message** Circle incorrectly programmed **Cause of error** Radius for circular arc programming too small (radius of 0 or insufficient distance between start point and end point). **Error correction** - Increase the radius - Program the start point and end point with different coordinates.

Error number	Description
1A0-0084	**Error message** Circle incorrectly programmed **Cause of error** Center or end point of CC data is incorrect. The distances from the start point to the midpoint and from the end point to the midpoint differ by more than the tolerance value. **Error correction** The starting point, end point, and midpoint do not belong to a circular segment. - Recalculate the midpoint and/or end point. - If necessary, use another type of circular arc programming.
1A0-0085	**Error message** Circle incorrectly programmed **Cause of error** The end point of a CT block lies in the extension of the tangent of the previously programmed contour element. **Error correction** Edit the coordinates of the end point
1A0-0086	**Error message** Scaling factor invalid **Cause of error** - The programmed scaling factor is outside of the permitted range. **Error correction** - Enter a scaling factor in the range of 0.000 001 to 99.999 999.
1A0-0087	**Error message** Mid-program startup not allowed **Cause of error** Mid-program startup not allowed after an approach block that was programmed immediately before the program end. **Error correction** Set the mid-program startup to the block in which the approach movement is programmed.
1A0-0088	**Error message** Working plane cannot be changed **Cause of error** You called Cycle 10 (ISO: G73) before selecting the plane. **Error correction** Edit the NC program

Error number	Description
1A0-0089	**Error message** Illegal base transformation **Cause of error** The base information applies to a nonexistent axis. **Error correction** Change the datum.
1A0-008A	**Error message** Illegal coordinate transformation **Cause of error** The coordinate transformation applies to a nonexistent axis. **Error correction** Edit the NC program.
1A0-008B	**Error message** Incorrect axis index for FN18 **Cause of error** Coordinate transformations can be used only for the principal axes X,Y,Z. **Error correction** Edit the NC program.
1A0-008C	**Error message** Illegal coordinate transformation **Cause of error** Coordinate transformations can be used only for the principal axes X,Y,Z. **Error correction** Edit the NC program.
1A0-008D	**Error message** Not enough block memory **Cause of error** The system cannot resolve the NC program due to lack of block memory. Between two tool movements only a limited number of blocks can be processed that cause no movement (e.g.comments or variable assignments). **Error correction** Edit the NC program

Error number	Description
1A0-008E	**Error message** Safety clearance for synchronization of spindles is missing **Cause of error** No safety clearance was entered for synchronizing the spindle. **Error correction** Edit the NC program.
1A0-008F	**Error message** Tool radius too large **Cause of error** The radius of the cutter is too large to machine the programmed contour pockets or contour trains. **Error correction** Use a smaller tool radius or change the geometry of the contour pockets or contour trains.
1A0-0090	**Error message** Drill radius too large **Cause of error** - The pilot drill being used causes a collision with an edge contour. **Error correction** - Use a smaller drill or larger cutter. If the drill radius is equal to or less than the cutter radius, there can be no collisions.
1A0-0091	**Error message** R0 not allowed in contour subprogram. **Cause of error** Within a contour subprogram, RL/RR controls the type of contour (pocket/island). R0 is undefined and illegal. **Error correction** Remove R0 from the contour subprogram.
1A0-0092	**Error message** Rounding radius for inside corners too large **Cause of error** The circular arcs with the inside corner rounding radius programmed in Cycle 20 are too large to be inserted between two neighboring contour elements. **Error correction** Select a smaller rounding radius in Cycle 20.

Error number	Description
1A0-0093	**Error message** No space for approach movement **Cause of error** No suitable position was found for a collision-free approach in a contour pocket cycle (stroke of reciprocation during clearance, approach arc during finishing). **Error correction** Use a smaller tool diameter, change the pocket geometry, try drilling instead of a reciprocating plunge.
1A0-0094	**Error message** Cannot calculate tool radius compensation **Cause of error** Cannot calculate a tool radius compensation for the programmed contour in the working plane. **Error correction** Circles can be corrected only in the working plane.
1A0-0095	**Error message** Cannot calculate tool radius compensation **Cause of error** Cannot make a tool radius compensation for the programmed contour. **Error correction** Edit the contour or use another tool.
1A0-0096	**Error message** Contour subprogram: Illegal axis programmed **Cause of error** You programmed an illegal axis (e.g. a rotary axis) within a contour subprogram. **Error correction** Define in the contour subprogram only coordinates of the active working plane. Edit the NC program.

Error number	Description
1A0-0097	**Error message** Clearance height lies on machining side **Cause of error** The clearance height (Q7) programmed for the called cycle lies on the machining side of the workpiece surface (Q5) specified by the algebraic sign of the milling depth (Q1). That is not allowed. Also, the (absolute) clearance height (Q7) should not be equal to the (absolute) coordinate of the workpiece surface (Q5). **Error correction** - Change the cycle parameters clearance height (Q7), milling depth (Q1) and/or the coordinate of the workpiece surface (Q5).
1A0-0098	**Error message** Limit plane: Jump/jump not allowed **Cause of error** The "jump" method of machining cannot be set for both sides of a limit plane. **Error correction** Select another machining method for the limit plane.
1A0-0099	**Error message** Limit plane: jump move in wrong direction **Cause of error** A jump auxiliary movement must go toward the jump side of the limit plane. **Error correction** Change the direction of the jump auxiliary movement or adjust the clearance height
1A0-009A	**Error message** Limit plane: Incomplete definition of limit plane **Cause of error** Cannot acivate the plane because it has not been defined completely. A point or normal vector of the plane is missing, or maybe the direction for projection or for the jump auxiliary movements. **Error correction** Program the missing information before the plane is activat-ed.

Error number	Description
1A0-009B	**Error message** An active limit plane cannot be redefined or deleted **Cause of error** The definition of the limit plane cannot be changed or deleted as long as the limit plane is active. **Error correction** First deactivate the limit plane.
1A0-009C	**Error message** Cannot activate/deactivate limit plane now **Cause of error** The limit plane can be switched on or off only if the programmed position is on a curve side or a jump side beyond the 2nd safety clearance. **Error correction** Move to a safe position before switching the limit plane on or off.
1A0-009D	**Error message** Limit plane: Space between 2 limit planes must be set to "curve" **Cause of error** Between two limit planes (for non-parallel planes: in the work space) the curve machining method must be set. **Error correction** Adjust the machining method for one or both limit planes.
1A0-009E	**Error message** SL cycle call with active tool radius compensation **Cause of error** Before an SL cycle is called the tool radius compensation must be switched off. **Error correction** Program an R0 before the SL cycle or move the cycle call to another place.
1A0-009F	**Error message** An active zoning filter cannot be redefined or deleted **Cause of error** The definition of the zoning filter cannot be deleted or edited as long as the zoning filter is still active. **Error correction** First define the zoning filter.

Error number	Description
1A0-00A0	**Error message** Definition of the zoning filter incomplete **Cause of error** The zoning filter could not be activated because it was not fully defined. It still needs: at least one polygon (curve), a projection direction (of the length >0, if explicitly programmed), a setup clearance and a clearance height. **Error correction** Program the missing data before the zoning filter is activated.
1A0-00A1	**Error message** Definition of the zoning polygons (polygon curves) inconsistent **Cause of error** A closed zoning polygon must be defined by at least three points, an open polygon curve by at least two points. Each side of a polygon (curve) must have a component perpendicular to the direction of zoning projection. The individual polygon curves must not intersect with themselves or with the other polygon curves. An "illegal" zone must not enclose a "legal" zone. **Error correction** Check the definition of the zoning polygons (curves) and correct them.
1A0-00A2	**Error message** Incorrect sequence of vertices of a zoning polygon (polyg. curve) **Cause of error** The corner points of a polygon curve must be produced in the sequence: FirstPoint ->IntermediatePoint -> ... -> IntermediatePoint -> LastPoint(ForClose). The corresponding attributes must have the correct syntax. **Error correction** Note the correct sequence in the definition of zoning polygons.
1A0-00A3	**Error message** Invalid tool technology data **Cause of error** Technology data of the tool used, such as ANGLE or LCUTS, are not registered in the tool database or have invalid values. **Error correction** Make or correct the corresponding entries: ANGLE : Max. plunge angle in degrees, 1.0 <= ANGLE <= 90.0 LCUTS : Tooth length in mm, 0.1 <= LCUTS <= tool length

Error number	Description
1A0-00A4	**Error message** Tooth length of the tool used is too small **Cause of error** The tooth length of the tool used is smaller than the plunging depth programmed in the cycle. **Error correction** Program a smaller plunging depth or use a tool with a longer tooth.
1A0-00A5	**Error message** No contours are available under this label **Cause of error** Possible causes: - Contour labels that are be used as operands in expressions must have been assigned contours by means of DECLARE CONTOUR or by using previous expressions. - The contour can be empty, e.g. because antiparallel contour elements cancel each other. **Error correction** Check the contour declarations and expressions.
1A0-00A6	**Error message** Tool form compensation not allowed with active tool radius comp. **Cause of error** Tool form compensation (LN blocks with programmed workpiece normal) is not allowed during active tool radius compensation (RR/RL). **Error correction** Edit the NC program (e.g. R0 before first LN block).
1A0-00A7	**Error message** No machining side defined for peripheral milling **Cause of error** Before activation of the 3-D tool radius compensation (peripheral milling) no machining side was programmed with RR/RL. **Error correction** Change the NC program (e.g. RL or RR before the first LN or L block).
1A0-00A8	**Error message** Axis-specific scaling factor not allowed **Cause of error** During active tool radius compensation, axis-specific scaling factors are not allowed for circular and helical movements. **Error correction** Edit the NC program.

Error number	Description
1A0-00A9	**Error message** Operation not allowed with active radius compensation **Cause of error** A function was programmed (e.g. cycle, tool change) that is not allowed during active tool radius compensation. **Error correction** First switch off the tool radius compensation.
1A0-00AA	**Error message** Incorrect tool at start of block scan (current T%1, programmed T%2) **Cause of error** Mid-program startup with incorrect tool. **Error correction** Change to the correct tool and start again.
1A0-00AB	**Error message** Block scan cannot jump over probing functions **Cause of error** A probing function was found before the block being searched for with the block scan. **Error correction** Attempt the block scan on a different block
1A0-00AC	**Error message** Gap in non-cylindrical contour **Cause of error** The starting and end point of a non-cylindrical contour do not coincide. **Error correction** Edit the part program
1A0-00AD	**Error message** Contour intersects itself **Cause of error** The edge contour of a pocket cannot be programmed to intersect itself. **Error correction** Change the contour definition in the NC program.

Error number	Description
1A0-00AE	**Error message** Active tool larger than reference tool **Cause of error** To fully prevent collisions with the workpiece, the tool selected for machining with 3-D tool compensation must in every direction have a surface curvature that is not smaller than that of the reference tool. **Error correction** - Use a smaller tool. - Ensure that there are no collisions with the currently used tool, and use M107 to suppress this error.
1A0-00AF	**Error message** Axis-specific scaling not allowed **Cause of error** An axis-specific scaling factor is not allowed during the definition of a limit plane filter or zoning filter, or during active 3-D tool radius compensation or tool form compensation. **Error correction** Edit the NC program.
1A0-00B0	**Error message** Axis-value programming not allowed **Cause of error** Axis value programming in a linear block with 3-D tool radius compensation or tool form compensation is allowed only for rotary axes, not for translation axes. **Error correction** Use coordinate programming (remove M91)
1A0-00B1	**Error message** Rotary axes mixed with tool polar vectors **Cause of error** Rotary axis values and tool direction vectors must never be in the same NC block, and during active 3-D tool radius compensation they also must not appear alternately in successive blocks. **Error correction** - Program either only rotary axes or only one direction vector (TX, TY, TZ) to specify the tool axis direction per NC block. - During active 3-D tool radius compensation, program either only direction vectors or only rotary axes. If necessary, switch the tool radius compensation off and then on again within the program.

Error number	Description
1A0-00B2	**Error message** Programmed direction vector is zero vector **Cause of error** A programmed direction vector in an LN block must have at least one component not equal to zero. **Error correction** - Program NX, NY, NZ, TX, TY or TZ to be unequal to zero. - Remove NX, NY and NZ from the LN block (in which case there will be no tool form compensation!) or remove TX, TY and TZ (in which case the tool axis direction will not be changed).
1A0-00B3	**Error message** No spindle available for tapping **Cause of error** No spindle available for tapping **Error correction** Use a configuration with a spindle
1A0-00B4	**Error message** Missing start angle for incremental programming **Cause of error** If the end point of the last block lies on the pole, incremental angle programming is not allowed. **Error correction** Program the angle here with absolute values.
1A0-00B5	**Error message** Position logic not allowed in App/Dep movement **Cause of error** It is not allowed to switch on the "Positioning logic" during APPR/DEP movements. **Error correction** Switch off the "Positioning logic" before the APPR/DEP movement.
1A0-00B6	**Error message** Position logic not allowed in rounding/chamfer **Cause of error** It is not allowed to switch on the "Positioning logic" during rounding/chamfer movements **Error correction** Switch off the "Positioning logic" before the rounding/chamfer movement

Error number	Description
1A0-00B7	**Error message** Specified axis does not lie on "ToolSide"! **Cause of error** The specified axis does not lie on the "tool side" of the kinematic elements. **Error correction** The specified axis lies on the "tool side" of the kinematic elements.
1A0-00B8	**Error message** Specified axis does not lie on "WpSide"! **Cause of error** The specified axis does not lie on the "workpiece side" of the kinematic elements. **Error correction** Set the specified axis on the "workpiece side" of the kinematic elements.
1A0-00B9	**Error message** Specified axes inconsistent! **Cause of error** The specified axes are faulty **Error correction** Inform your service agency
1A0-00BA	**Error message** Programming of axes in the REF system is not allowed after RND/CHF or APPR/DEP **Cause of error** Programming of axes in the REF system is not allowed after RND/CHF or APPR/DEP movements **Error correction** Use RND/CHF or APPR/DEP movements without M91
1A0-00BB	**Error message** Programming together with M130 not allowed! **Cause of error** Programming together with M130 not allowed! **Error correction** This command cannot be used together with M130

Error number	Description
1A0-00BC	**Error message** Programming of axes in the REF system is not allowed **Cause of error** Polar programming is not allowed in the REF system! **Error correction** This command cannot be used together with M91
1A0-00BD	**Error message** Polar kinematics not possible! **Cause of error** Polar kinematics are not possible with the specified axes! **Error correction** The given axes cannot be used for polar kinematics
1A0-00BE	**Error message** General error in the calculation of a circle **Cause of error** No circle can be calculated from the given input data **Error correction**
1A0-00BF	**Error message** It is not possible to program a tangential connecting arc with axis-value programming. **Cause of error** - It is not possible to program a tangentially connecting arc during axis value programming **Error correction** - Program the arc with center and end point
1A0-00C0	**Error message** Pole and arc in various planes **Cause of error** The pole and end point of the arc are not programmed in the same plane **Error correction** Check the definitions of the pole and the arc
1A0-00C1	**Error message** Define the arc end point with two coordinates **Cause of error** Define the arc end point with two coordinates. **Error correction** Define the arc end point with both coordinates of the working plane.

Error number	Description
1A0-00C2	**Error message** Probe movement with length 0 **Cause of error** A probing movement must have a length not equal to zero **Error correction**
1A0-00C3	**Error message** Programming of rotary axes with circular movement is not allowed! **Cause of error** Programming of rotary axes with circular movement is not allowed! **Error correction**
1A0-00C4	**Error message** Departing movement not allowed! **Cause of error** Preceding movement is too complex **Error correction** Omit the departing movement or program the preceding movement differently
1A0-00C5	**Error message** System error in geometry chain: %1 **Cause of error** System error **Error correction** Inform your service agency
1A0-00C6	**Error message** Error in the geometry configuration. %1 **Cause of error** Indicated in English in the additional text **Error correction** Corresponding to the given cause
1A0-00C7	**Error message** Not allowed after approaching movement: %1 **Cause of error** Indicated in English in the additional text **Error correction** Corresponding to the given cause

Error number	Description
1A0-00C8	**Error message** Probing length must not be zero! **Cause of error** The probing length is zero. **Error correction** Correct the probing length (must be greater than 0)
1A0-00C9	**Error message** Nesting of pocket definitions is not allowed! **Cause of error** Nested pockets programmed **Error correction** Edit the program
1A0-00CA	**Error message** Deletion of the configuration object is not allowed! %1 **Cause of error** The type of deleted object is indicated in English in the additional text **Error correction** Use the configuration editor to reinsert the deleted object
1A0-00CB	**Error message** Contour train cannot be machined. **Cause of error** The contour description is ambiguous: The selected contour contains too many subcontours. **Error correction** Edit the NC program.
1A0-00CC	**Error message** Error in tool radius compensation **Cause of error** The tool radius compensation is missing or the entered tool radius compensation cannot be machined. **Error correction** Edit the NC program.
1A0-00CD	**Error message** Empty contour **Cause of error** An operand or intermediate result in the contour calculation is an empty contour. **Error correction** Edit the NC program.

Error number	Description
1A0-00CE	**Error message** A contour element of the slot in the cylinder surface too small **Cause of error** Possible causes: One distance is too short, or an angular length is too small. **Error correction** Edit the NC program.
1A0-00CF	**Error message** The data of the slot in the cylinder surface are faulty **Cause of error** Possible causes: A contour element of the slot is too small, the cylinder radius is too small, the slot too deep, or something similar. **Error correction** Edit the NC program.
1A0-00D0	**Error message** The position entered for the cylinder in the working plane is incorrect **Cause of error** Possible causes: Either the vectors do not have the length 1, they are not perpendicular, or there is some similar problem. **Error correction** Edit the NC program.
1A0-00D1	**Error message** Tool not perpendicular to the cylinder surface **Cause of error** The cylinder must be aligned parallel to the machine axes and be clamped at the center of the rotary table. The tool must be perpendicular to the cylinder surface. **Error correction** If needed, tilt the working plane in order to position the tool perpendicular to the cylinder surface, unless this has already been configured in the kinematics. - Program the position of the cylinder coordinate system correctly. - If required, configure the machining table system at the center over the rotary axis. The Z axis of the machine table system must point in the direction of rotary axis rotation.

Error number	Description
1A0-00D2	**Error message** No translation axis is parallel to the cylinder reference axis **Cause of error** Possible causes: The cylinder or the working plane is not in the right position. **Error correction** Edit the NC program.
1A0-00D3	**Error message** Approach not allowed **Cause of error** Possible causes: - APPR command in MDI mode - APPR command at the end of an NC program - APPR command before a coordinate transformation - Similar sequence of NC commands **Error correction** Edit the NC program.
1A0-00D4	**Error message** Reading the axis values is not allowed during block scan **Cause of error** During a block search you attempted to read the current axis values before finding the desired block. **Error correction** - Try a block scan to another block - Edit the program
1A0-00D5	**Error message** Contour subprogram for cylinder surface machining is faulty **Cause of error** Possible causes: - Programmed contour is not defined in X/Y cylinder surface coordinates. - Programmed contour contains incremental coordinates. - Programmed contour contains diameter coordinates. **Error correction** Edit the NC program.
1A0-00D6	**Error message** Contour subprogram for cylinder surface machining is faulty **Cause of error** Programmed contour is not defined in X/Y cylinder surface coordinates. **Error correction** Always program contours on a cylinder surface (regardless of the machine geometry) in X/Y cylinder surface coordinates.

Error number	Description
1A0-00D7	**Error message** No rotary axis found. **Cause of error** Possible causes: The first axis beneath the machine table must be a rollover rotary axis. **Error correction** - Change the kinematics configuration- Inform your service agency
1A0-00D8	**Error message** Cylinder axis is not parallel to rotary axis. **Cause of error** Possible causes: - The cylinder axis does not run parallel to the first axis under the machine table. The first axis under the machine table must be a rotary axis. - The cylinder is not clamped in the center. - One of the coordinate directions X, Y, or Z of the machine table system must point in the direction of the rotary axis. **Error correction** Change the kinematic configuration.
1A0-00D9	**Error message** Basic rotation not allowed **Cause of error** The rotary axis of the basic rotation during cylinder surface machining does not lie parallel to the cylinder axis. One of the coordinate directions X, Y, or Z of the machine table system must point in the direction of the rotary axis. **Error correction** - Change the basic rotation. - Change the kinematic configuration.
1A0-00DA	**Error message** Cylinder radius too small. **Cause of error** Cylinder radius too small. **Error correction** Edit the NC program.
1A0-00DB	**Error message** Cylinder slot too deep or excessive plunging depth. **Cause of error** Cylinder slot too deep or excessive plunging depth. **Error correction** Edit the NC program.

Error number	Description
1A0-00DC	**Error message** Cylinder slot too shallow or insufficient plunging depth. **Cause of error** Cylinder slot too shallow or insufficient plunging depth. **Error correction** Edit the NC program.
1A0-00DD	**Error message** Cylinder slot too narrow. **Cause of error** Cylinder slot too narrow. **Error correction** Edit the NC program.
1A0-00DE	**Error message** The programmed safety clearance is too small. **Cause of error** The clearance height must be be at least as large as the cutter radius. **Error correction** Edit the NC program.
1A0-00DF	**Error message** The precision for the slot walls is too small or too large. **Cause of error** The precision for the slot walls is too small or too large. **Error correction** Edit the NC program.
1A0-00E0	**Error message** Diameter of selected milling cutter is too small. **Cause of error** Diameter of selected milling cutter is too small. **Error correction** Insert a different tool.

Error number	Description
1A0-00E1	**Error message** Transformation not allowed **Cause of error** Possible causes: - Define datum shifts only in X/Y cylinder surface coordinates. - Contour definition with angle data: program a datum shift only within the contour definition. - Rotations and scaling are allowed only with length dimensions and only cylinder surface coordinates. - Define mirroring only in cylinder surface coordinates. - You must not change presets, basic rotations or the tilt condition during cylinder surface machining. **Error correction** Edit the NC program.
1A0-00E2	**Error message** This action is not allowed **Cause of error** Possible causes: This action is not yet implemented for cylinder surface machining. There may be a positioning block that is not programmed in the cylinder surface. Polar or axis-value programming, APPR or DEP blocks, probing blocks, thread cutting, tool change, certain cycles, 3-D tool compensation or similar things are also possible. **Error correction** Edit the NC program.
1A0-00E3	**Error message** The tool is in the wrong position **Cause of error** The tool is in an incorrect or unexpected position, e.g. too deep in the workpiece. This error also occurs during cylinder surface machining if the tool point is located too close to the cylinder axis. **Error correction** Edit the NC program, reposition the tool, or inform your service agency.
1A0-00E4	**Error message** Contour too complex **Cause of error** A pocket contour consists of more than 10000 blocks. **Error correction** Adapt the NC program: Program a simpler contour.

Error number	Description
1A0-00E5	**Error message** M103 not allowed **Cause of error** A reduction of the infeed velocity in the negative tool axis direction is not possible. Possible causes are programmed, e.g. rotary axes, 3-D radius compensation or kinematic compensation movements. **Error correction** Edit the NC program.
1A0-00E6	**Error message** Orientation not possible **Cause of error** You tried to orient the spindle through the NC, but no spindle is configured. **Error correction** Use a configuration with a spindle
1A0-00E7	**Error message** Closed contour train not allowed **Cause of error** The contour train is closed or nearly closed. **Error correction** Use pocket machining cycles for closed contour trains.
1A0-00E8	**Error message** Diameter of selected cutter is too large **Cause of error** The selected cutter does not fit in the cylinder slot. **Error correction** Insert a different tool.
1A0-00EA	**Error message** Rounding arc and chamfer not possible with active stretch filter **Cause of error** Transition elements (rounding arcs and chamfers) are not possible when the stretch filter is active. **Error correction** Switch off the stretch filter in the configuration (CfgStretch-Filter).

Error number	Description
1A0-00EB	**Error message** Programmed parallel axis not available **Cause of error** In the FUNCTION PARAXCOMP or FUNCTION PARAXMODE functions, you programmed parallel axes that are not available in this kinematic model. **Error correction** - Use other machine kinematics - Edit the NC program
1A0-00EC	**Error message** Position of a linear axis is overdetermined **Cause of error** You programmed two end values for the same machine axis in one NC program block. Possible causes: - You programmed the axis as coordinate and, over the syntax element POS, also as axis value - You did not switch with FUNCTION PARAXMODE to machining in minor axes or did not list the doubly defined axis in that function - With an active polar kinematic configuration you additionally assigned a target value to an axis in the three-axis kinematic configuration **Error correction** Edit the NC program.
1A0-00ED	**Error message** Syntax element POS not allowed in this block **Cause of error** You programmed the syntax element POS at an illegal place. **Error correction** Edit the NC program.
1A0-00EE	**Error message** Parallel axes not allowed in this block **Cause of error** You tried to program parallel axes - in approach or departure movements - in circle center or pole definitions - in circular or helical movements - in LN blocks. **Error correction** Edit the NC program.

Error number	Description
1A0-00EF	**Error message** Polar kinematics not allowed with parallel axis machining **Cause of error** You tried to use FUNCTION PARAXMODE although a polar kinematic configuration is active. **Error correction** Switch off the machining method before you switch another on.
1A0-00F0	**Error message** Kinematic switch-over is not allowed **Cause of error** You tried to use FUNCTION PARAXCOMP to program axis compensation values for parallel axes, although the default setting is not active. **Error correction** - Edit the NC program - Switch the kinematics only in the default condition. The default condition is configured in the config object CfgAxe-sPropKin in the parameter parAxComp
1A0-00F1	**Error message** Kinematic switch-over is not allowed **Cause of error** You have tried to perform a kinematics switch-over although FUNCTION PARAXMODE is active. **Error correction** Deactivate FUNCTION PARAXMODE before kinematic switch-over.
1A0-00F2	**Error message** Kinematic switch-over is not allowed **Cause of error** You tried to switch the kinematics although the tilted plane function or kinematic compensation movements (e.g. M128, M144) are active. **Error correction** Before switching the kinematics, deactivate all functions that depend on them.

Error number	Description
1A0-00F3	**Error message** Kinematic switch-over is not allowed **Cause of error** You tried to switch the kinematics although a kinematic compensation in a calling program (e.g. M128, M144, FUNCTION PARAXCOMP, FUNCTION PARAXMODE) is active. **Error correction** Before switching the kinematics, return to the default condition in all programs.
1A0-00F4	**Error message** No further axes allowed in pole plane **Cause of error** In a line block with polar coordinates you programmed further axes that lie in the working plane defined by the pole. The end position is therefore overdetermined. **Error correction** Delete additionally defined axes from the line block with polar coordinates.
1A0-00F5	**Error message** Tilting the working plane is not allowed **Cause of error** You tried to tilt the working plane although this function is not allowed with the active kinematic configuration. **Error correction** - Use another machine kinematic configuration - If required, edit the NC program - If necessary, inform your service agency
1A0-00F8	**Error message** Angle cannot be calculated **Cause of error** In the tilted-working-plane function you have the spatial-angle input mode active although this mode is not supported for your machine configuration. **Error correction** Select axis-angle input in the active kinematic table. If necessary, refer to your machine tool builder.

Error number	Description
1A0-00F9	**Error message** Coordinate transformation not allowed in the contour subprogram **Cause of error** You programmed an illegal coordinate transformation in a contour program, e.g. tilting the working plane, preset change, basic rotation or an axis offset. **Error correction** In the contour subprogram, use only the coordinate transformations rotation, datum shift, mirroring and scaling. Edit the NC program.
1A0-00FA	**Error message** Incremental tilting angle not allowed **Cause of error** You tried to tilt the working plane farther incrementally with axis angles, although you did not define the function with axis angles. **Error correction** Always define incremental tilting of the working plane with the same method as in the previous tilting. Change the type of incremental tilting or the previous absolute tilting.
1A0-00FB	**Error message** Incremental tilting angle not allowed **Cause of error** You tried to tilt the working plane farther incrementally with spatial angles, although you did not define the function with spatial angles. **Error correction** Always define incremental tilting of the working plane with the same method as in the previous tilting. Change the type of incremental tilting or the previous absolute tilting.
1A0-00FC	**Error message** No solution in limited range **Cause of error** You tried to limit the range for the master axis with SEQ+ or SEQ-. In this range the control cannot tilt the working plane. **Error correction** Cancel the limitation by SEQ+ / SEQ-.

Error number	Description
1A0-00FD	**Error message** Vectors are not perpendicular **Cause of error** You tried to define a working plane with PLANE VECTOR, entering vectors that are not perpendicular or do not intersect. **Error correction** Ensure that the vectors are perpendicular and intersect. Permit vectors that are not perpendicular to each other by changing the configuration: CfgRotWorkPlane-->autoCorrectVector to TRUE.
1A0-00FE	**Error message** Points on a plane too close to each other **Cause of error** You tried to define a working plane with PLANE POINTS, entering plane points that lie too close together. **Error correction** Define plane points that are farther apart from each other.
1A0-00FF	**Error message** Points on a plane lie on a line **Cause of error** You tried to define a working plane with PLANE POINTS, entering plane points that lie one a straight line. Therefore the control cannot calculate an unambiguous plane. **Error correction** Define plane points that form a triangle.
1A0-0100	**Error message** No rotary axes available **Cause of error** You attempted to tilt the working plane in a kinematic configuration without rotary axes. **Error correction** - Correct the NC program: Delete the functions for tilting the working plane. - Activate the kinematic configuration with rotary rotary axes.

Error number	Description
1A0-0101	**Error message** Vectors are too short **Cause of error** You tried to define a working plane with PLANE VECTOR, when at least one of the vectors is too short. **Error correction** - Enter longer vectors - Adapt machine parameters (must be done by machine manufacturer): Set machine parameter CfgRotWorkPlane/autoCorrectVector to the value TRUE in order to permit basic vectors with zero length.
1A0-0102	**Error message** Infeed depth too small **Cause of error** In one of the Cycles 21, 22, 24 or 25 (DIN/ISO: G121, G122, G124, G125) you defined the plunging depth Q10 smaller than 0.1 mm. **Error correction** Define the plunging depth Q10 with a value larger than 0.1 mm.
1A0-0103	**Error message** Too many rotary axes available **Cause of error** You attempted to tilt the working plane in a kinematic configuration with more than two rotary axes. This is only possible when programming with axis values. **Error correction** - Correct the NC program: use PLANE AXIAL - Activate the kinematic configuration with two rotary rotary axes - Use M138 to select the rotational axes
1A0-0104	**Error message** Combination of functions not permitted **Cause of error** You tried to tilt the working plane while a datum shift in rotational axes was active. This is only possible when programming with axis values. **Error correction** - Correct the NC program: use PLANE AXIAL - Use a reference point for this shift.

Error number	Description
1A0-0105	**Error message** Position after G43/G44 not perpendicular to the G41/G42 contour! **Cause of error** The G43/G44 approach is not perpendicular to the next G41/G42 movement. This causes a contour error that can damage the workpiece. The contour error depends on the distance between the end position and the perpendicular distance R of the G41/G42 starting position. The distance is greater than 0.1 * tool radius R. **Error correction** - Edit the NC program: the approach from G43/G44 must be perpendicular to the contour.
1A0-0106	**Error message** & operator not applicable to active 3-axis kinematics **Cause of error** You tried to use the X, Y or Z axis with the & operator, although this axis in included in the active 3-axis kinematic configuration. The & operator is permissible only if you have used the PARAXMODE FUNCTION to take the corresponding axis out of the active 3-axis kinematic configuration. **Error correction** Use the corresponding axis without the & operator.
1A0-0107	**Error message** M128 and M144 with CYCL CALL POS not allowed **Cause of error** During an active M128 or M144 you tried to use CYCL CALL POS to call a cycle. **Error correction** Deactivate M128 and M144 before the cycle call with CYCL CALL POS.
1A0-0108	**Error message** CYCL CALL POS: Incremental values without reference **Cause of error** You tried to call CYCL CALL POS with incremental coordinates, of which some are not based on coordinates that you had previously programmed with CYCL CALL POS. **Error correction** Ensure that every incrementally programmed coordinate in a cycle call with CYCL CALL POS is given with respect to coordinates in previously programmed CYCL CALL POS commands.

Error number	Description
1A0-0109	**Error message** Resumption with M120 not allowed **Cause of error** Re-entry with GOTO during active M120 not permitted. **Error correction** Re-entry possible only via mid-program startup.
1A0-010A	**Error message** TCPM: PATHCTRL VECTOR not possible **Cause of error** You tried to move the rotary axes with PATHCTRL VECTOR so that the direction of the tool axis is always in the same plane. PATHCTRL VECTOR is not possible with the programmed direction vectors. **Error correction** - Use the TCPM function with PATHCTRL AXIS. - If required, correct the directional vector.
1A0-010B	**Error message** Spatial circular arc not allowed **Cause of error** You tried to move on a spatial circular arc, but this function is not possible. A spatial circular arc results, for example, if you have programmed a circle in the X/Z plane, and then, for example, turn with Cycle 10 in the X/Y plane. **Error correction** Edit the NC program.
1A0-010C	**Error message** Movement is nonlinear **Cause of error** You programmed an NC block that causes a counter axis to make a nonlinear movement. **Error correction** - Edit the NC program
1A0-010D	**Error message** This contour is not possible in turning cycles. **Cause of error** You programmed an illegal NC block within a contour for a turning cycle. **Error correction** Edit the contour definition in the NC program.

Error number	Description
1A0-010E	**Error message** Run-in length incorrectly programmed **Cause of error** You programmed the overrun length for tapping to be zero or a negative number. **Error correction** Enter only positive numbers for the run-in length. Recommended run-in length: at least half the pitch.
1A0-010F	**Error message** Overrun length incorrectly programmed **Cause of error** You programmed the overrun length for tapping to be zero or a negative number. **Error correction** Enter only positive numbers for the overrun length. Recommended overrun length: at least half the pitch.
1A0-0110	**Error message** Error in turning cycle **Cause of error** Possible causes: - You tried to run a turning cycle, although the active tool is not a turning tool. - You tried to run a turning cycle, although the milling mode is active. **Error correction** - Insert a turning tool. - Use FUNCTION MODE TURN to switch to the turning mode.
1A0-0111	**Error message** Error in rounding arc **Cause of error** You tried to program a rounding arc in a contour with less than two elements. **Error correction** Edit the NC program.
1A0-0112	**Error message** Error in rounding arc **Cause of error** You tried to end a contour with a rounding arc. However, the contour not closed. **Error correction** Edit the NC program.

Error number	Description
1A0-0113	**Error message** Error in contour element of a turning cycle **Cause of error** You programmed an undercut or recess at the beginning of a turning contour. **Error correction** Edit the NC program.
1A0-0114	**Error message** Error in recess **Cause of error** Possible causes: - You have programmed neither the center point of the recess (CENTER) nor the recess position (PLACE). - You have programmed both the center point of the recess (CENTER) and the recess position (PLACE). **Error correction** Edit the NC program.
1A0-0115	**Error message** Turning operation: tool position is incorrect **Cause of error** The cutting insert of the turning tool is not in the permitted working plane. **Error correction** Rotary axes and cutting inserts must lie in a working plane. - Correct the position of the tool. - If desired, adopt the rotary axis coordinates with M128 or M144.
1A0-0116	**Error message** Recessing cycle: tool position is incorrect **Cause of error** You tried to use a recessing tool, although the machine is not in the default setting. **Error correction** Cancel the tool orientation: - Move the rotary axis to the home position. - If necessary, use M128 or M144 to load the rotary axis values.

Error number	Description
1A0-0117	**Error message** Turning cycle with button tool dimensioned at center **Cause of error** You tried to run a turning cycle with a button tool dimensioned at its center. **Error correction** Button tools that are dimensioned at the center must be measured in a corner, so they have to have tool orientation 1 to 8.
1A0-0118	**Error message** Program resumption not possible **Cause of error** It is not possible to resume the program at the point of interruption. **Error correction** - Jump to the program start using the GOTO key or reselect the program over PGM MGT. - The StretchFilter must be deactivated in order to be able to continue the program at the point of interruption.
1A0-0119	**Error message** Thread not possible with inclined tool **Cause of error** You tried to cut a thread with an inclined tool and at a feed rate of 0. **Error correction** - Cancel the tool position. To do so, return the rotary axes to their home position and, if required, take over the rotary axis values with M128 or M144. - Change the type of feed rate.
1A0-011A	**Error message** Coordinate transformation in turning operation **Cause of error** You tried to change to turning mode although a coordinate transformation (rotation, mirroring and/or scaling) is active. **Error correction** Deactivate coordinate transformations (rotation, mirroring and or scaling) before you switch to turning mode.

Error number	Description
1A0-011B	**Error message** Noncylindrical contour must not begin at an inside corner **Cause of error** You tried to begin a noncylindrical contour with radius compensation at an inside corner (concave position). These are some of the possible causes of this error message: - The starting point lies on a real inside corner - The starting point lies on the transition between two arcs that are tangential, but were programmed or generated with poor accuracy - A "round" inside noncylindrical contour was resolved into nothing but straight-line segments. The starting point then lies on a tangential transition between two arcs. However, the resolution into straight line segments again results in an inside corner. **Error correction** - Correct the starting point by choosing a correct point that does not lie on an inside corner - Create/generate the noncylindrical program (especially circular movements) with higher accuracy - Avoid resolving the noncylindrical contour into straight-line segments, or manually place the starting point in the middle of a generated line segment - Have the tool-compensated path of the noncylindrical contour calculated/generated externally instead of by the control.
1A0-011C	**Error message** Side finishing: Tool radius too large **Cause of error** With the defined contour data, the tool radius is too large for side finishing or fine roughing. **Error correction** For side finishing, the sum of the side-finishing allowance (side-finishing cycle) and the finishing-tool radius must be smaller than the sum of the side-finishing allowance (contour data cycle) and the roughing-tool radius. The above calculation also applies if you run the side-finishing cycle without first having cleared the area out with the roughing tool; the radius of the roughing tool then has the value “0.” During fine roughing, the radius of the fine roughing tool must be smaller than the radius of the coarse roughing tool.

Error number	Description
1A0-011D	**Error message** Normal vector too short **Cause of error** You tried to define a working plane with PLANE VECTOR, but the normal vector is too short. **Error correction** The TNC cannot correct the normal vector automatically, enter a longer normal vector.
1A0-011E	**Error message** Workpiece blank definition: contour is not closed **Cause of error** The start point and end point do not agree in the definition for the workpiece blank contour. **Error correction** Edit the NC program. The start position must be complete, which means that it has to contain values for both coordinates.
1A0-011F	**Error message** Invalid tooth length in recessing cycle **Cause of error** You tried to run a recess turning cycle with a tool whose tooth length was zero or is not defined. **Error correction** Check the cutting length for the recess turning tool in the tool table.
1A0-0120	**Error message** No recessing tool is active **Cause of error** You tried to run a recess turning cycle although the active tool is not a recess turning tool. **Error correction** Insert a recess turning tool.
1A0-0121	**Error message** Illegal syntax element in contour subprogram for turning cycles **Cause of error** In a contour subprogram you have not specified the radius compensation in the first line of the contour description. **Error correction** Correct the contour subprogram.

Error number	Description
1A0-0123	**Error message** Radius comp. undefined **Cause of error** You programmed a radius-compensated single-axis positioning block that, without the radius compensation, does not result in tool movement (e.g. IX+0 R+, ISO: G7). **Error correction** Edit the NC program.
1A0-0124	**Error message** Cannot calculate any intersection **Cause of error** The control cannot calculate an intersection: two straight lines are parallel. **Error correction** Check the contour description.
1A0-0125	**Error message** Cannot calculate any intersection **Cause of error** The control cannot calculate an intersection: two outside circles do not intersect. **Error correction** Check the contour description.
1A0-0126	**Error message** Cannot calculate any intersection **Cause of error** The control cannot calculate an intersection: two inside circles do not intersect. **Error correction** Check the contour description.
1A0-0127	**Error message** Cannot calculate any intersection **Cause of error** The control cannot calculate an intersection: two inside circles do not intersect. **Error correction** Check the contour description.

Error number	Description
1A0-0128	**Error message** Cannot calculate any intersection **Cause of error** The control cannot calculate an intersection: a straight line and a circle do not intersect. **Error correction** Check the contour description.
1A0-0129	**Error message** Contiguous circles with opposite direction of rotation **Cause of error** Two contiguous circles illegally have opposite directions of rotation. **Error correction** Check the contour description.
1A0-012A	**Error message** Contour element with length=0 programmed **Cause of error** The starting the ending points of a profile contour are identical. **Error correction** Check the contour description.
1A0-012B	**Error message** Cannot calculate any intersection **Cause of error** The control cannot calculate an intersection: a circle has a zero radius. **Error correction** Check the contour description.
1A0-012E	**Error message** Cannot calculate any intersection **Cause of error** The control cannot calculate an intersection: two straight lines are parallel and are not superimposed. **Error correction** Check the contour description.

Error number	Description
1A0-012F	**Error message** Faulty subdivision of the vertical profiles **Cause of error** The control cannot machine the defined profile. **Error correction** Check the profile description (SEL CONTOUR PROFILE), machining parameters and data of the tool used.
1A0-0130	**Error message** The plane profile is not closed or begins at a corner **Cause of error** The start point and end point of the plane profile either do not match or they are on a corner. **Error correction** Check the programmed plane profile.
1A0-0131	**Error message** Control cannot conclude machining operation **Cause of error** Error in internal calculations. **Error correction** Check the contour description (SEL CONTOUR SURFACE and SEL CONTOUR PROFILE), machining parameters and data of the tool used.
1A0-0132	**Error message** Machining operation requires too many cycles **Cause of error** The maximum permissible number of machining runs was exceeded. **Error correction** Check the machining parameters and data of the tool used.
1A0-0133	**Error message** Error management tables are inconsistent **Cause of error** SEL CONTOUR SURFACE uses a table index that lies outside of the permissible value range. **Error correction** Inform your service agency.

Error number	Description
1A0-0134	**Error message** Cycle not suited for contour definition with APPR/DEP block. **Cause of error** The cycle you selected cannot use any contour definition that contains APPR or DEP blocks. **Error correction** Remove APPR and DEP blocks from the contour definition. For Cycle 1025, use Cycle 270 to program APPR/DEP.
1A0-0135	**Error message** APPR block in contour definition not in first line **Cause of error** In a contour description you have programmed an APPR block that is not in the first line. **Error correction** Correct the contour description.
1A0-0136	**Error message** Too many APPR/DEP blocks in contour description **Cause of error** You programmed multiple APPR or DEP blocks in a contour description. **Error correction** Contour descriptions must contain only one APPR/DEP block. Correct the contour description.
1A0-0137	**Error message** Radius compensation in contour subprogram inconsistently defined **Cause of error** In a contour subprogram, you have defined multiple radius compensation values that contradict each other. **Error correction** Edit the contour subprogram.
1A0-0138	**Error message** DEP block in contour definition not programmed in the last line **Cause of error** In a contour subprogram you have programmed an DEP block that is not in the last line of the contour description. **Error correction** Correct the contour description.

Error number	Description
1A0-013A	**Error message** Erroneous plane profile programmed **Cause of error** The plane profile was programmed incorrectly. **Error correction** - Ensure that for each geometric element that describes the geometry of the plain profile (which therefore excludes blocks that describe an approaching or departing motion) an appropriate vertical profile is defined. - Ensure that in each case no more than one approaching or departing motion is programmed at the beginning or end of the plane profile definition. - Ensure that at first, after each reference to a vertical profile, at least one geometric element is programmed.
1A0-013B	**Error message** Illegal transformation during execution of a profile surface **Cause of error** Programming a profile surface (Cycles 281-283) is impermissible if a mirror image along a tool axis (Cycle 8) is active at the same time. **Error correction** Rewrite the program so that the mirroring is not active during the call of the profile surface cycles (281-283).
1A0-013C	**Error message** Cycles 281 and 283 only applicable to pockets **Cause of error** Cycles 281 for roughing and 283 for floor finishing must be used only for profile surfaces that form a pocket. **Error correction** Ensure that the programmed plane profile is closed. If the plane profile is defined with Cycle 14, ensure that the combination of machining direction, radius compensation and monotonicity of the vertical profile results in a pocket.
1A0-013D	**Error message** Missing radius compensation in the plane profile definition **Cause of error** If the plane profile of a profile surface (Cycles 280 to 283) is programmed using Cycle 14, a radius compensation (RL or RR) must be entered within the definition of the plane profile. **Error correction** Enter the radius compensation within the definition of the plane profile.

Error number	Description
1A0-013E	**Error message** Invalid vertical profile defined **Cause of error** The programmed vertical profile of a profile surface(Cycles 280 – 283) is invalid. **Error correction** Ensure that the definition of the vertical profile contains at least two geometric blocks. Ensure that no radius compensation is programmed within the definition of the vertical profile. Ensure that the vertical profile increases with respect to the abscissa (usually the x coordinate) (i.e. increases monotonically). Ensure that the vertical profile either increases or decreases with respect to the ordinate (usually the y coordinate) (i.e. monotonically increases or monotonically decreases).
1A0-013F	**Error message** Radius compensation defined within plane profile **Cause of error** If the plane profile of a profile surface (Cycles 280 to 283) is specified using the syntax element CONTOUR DEF, there must be no radius compensation entered within the definition of the plane profile. **Error correction** Remove the radius compensation from the definition of the plane profile.
1A0-0140	**Error message** Profile surface cycle with active tool radius compensation **Cause of error** You tried to call a profile surface cycle (Cycles 281 – 283) with active tool radius compensation. **Error correction** Before the profile surface cycle, use R0 to cancel the tool radius compensation or program the cycle call at another location.
1A0-0141	**Error message** Programmed plane profile is not closed. **Cause of error** You tried to use CONTOUR DEF to program a plane profile as a pocket. However, the plane profile does not result in a closed contour. **Error correction** Program a closed plane profile. Use Cycle 14 to define an open plane profile.

Error number	Description
1A0-0142	**Error message** Programmable axis %1 missing in "CfgChannelAxes/progAxis" **Cause of error** The machine configuration is faulty. The affected axis is not configured as a programmable axis. **Error correction** - Inform your machine tool builder - Correct the machine configuration: Enter the axis as a programmable axis in 'CfgChannelAxes/progAxis'
1A0-0143	**Error message** Roughing cycle: Start position too close to rotary axis **Cause of error** The starting position of a roughing cycle is located too close to the rotary axis. **Error correction** Edit the NC program.
1A0-0144	**Error message** Workpiece blank definition: Contour intersects itself **Cause of error** A contour that describes the surface line of a workpiece blank (NC block BLK FORM ROTATION) intersects itself. **Error correction** Correct the NC program: Adapt the workpiece blank contour so that it no longer intersects itself.
1A0-0145	**Error message** Workpiece blank definition: Illegal axis in subprogram **Cause of error** You programmed an illegal axis in a subprogram that defines the surface line of a workpiece blank (NC block: BLK FORM ROTATION). **Error correction** - Correct the NC program: Program the coordinates in the subprogram that result from the selection of the rotation axis for the workpiece blank.
1A0-0146	**Error message** Turning tool with contradictory data **Cause of error** A turning tool was inserted whose data are contradictory for the following reasons: The tool orientation does not fit the tool angle and point angle. **Error correction** Correct the data in the turning tool table

Error number	Description
1A0-0147	**Error message** Workpiece blank definition for active coordinate transformation **Cause of error** During an active coordinate transformation (datum shift, tilting), you tried to define a workpiece blank using a surface line (NC block: BLK FORM ROTATION). **Error correction** Reset all active coordinate transformations before you define the workpiece blank.
1A0-0148	**Error message** Function not permitted **Cause of error** You tried to calculate a spindle rotation between input coordinate system and tool coordinate system (e.g. with ID210 NR8), at the same time as a transformation for scaling or mirroring was active. **Error correction** Edit the NC program
1A0-014B	**Error message** Illegal movement if FUNCTION TCPM and mirroring are active. **Cause of error** You tried to program a rotary axis motion defined with spatial angles during a circular movement (CP..., CPT...) with active TCPM FUNCTION (with AXIS SPAT) and active mirroring. **Error correction** Deactivate mirroring before the motion is processed while TCPM FUNCTION is active.
1A0-014C	**Error message** Erroneous tool-carrier kinematics in the file %1 **Cause of error** - Tool-carrier kinematic model in the given file is faulty **Error correction** - For more detailed information on this error message, press the INTERNAL INFO soft key - Check the tool kinematic model in the given file and correct it if necessary - Inform your service agency

Error number	Description
1A0-014D	**Error message** Data of the tool carrier kinematics is faulty **Cause of error** The tool-carrier kinematic data for the current tool are faulty. Note: Do not run any NC programs in this condition and be careful if you move the axes manually! **Error correction** - Ensure under “KINEMATICS” that a valid file for the tool-carrier kinematics is entered for the desired tool in the tool table. - Acknowledge the error message - Run a TOOL CALL for a tool that has no tool-carrier kinematics assigned or one that has a valid tool-carrier kinematic model. - Inform your service agency.
1A0-0151	**Error message** Illegal number of lines (%1) in the compensation value table **Cause of error** Too few (or too many) measured values were entered in the compensation value table for 3D-ToolComp. At least two values must be entered. **Error correction** - Check the compensation value table and correct it if necessary - Perform the calibration cycle again
1A0-0152	**Error message** Inconsistent (multiple) angular values in the compensation table. **Cause of error** The compensation value table contains ambiguous (multiple) angular values (ANGLE). **Error correction** Check the table and perform the calibration cycle again if necessary.
1A0-0153	**Error message** Angle value (%1) is outside of the valid range. **Cause of error** An evaluation was attempted outside the boundaries of the angular range that was measured. **Error correction** Expand the compensation table in order to include the necessary angles.

Error number	Description
1A0-0154	**Error message** Tool carrier kinematics is ignored in "%1" **Cause of error** The given kinematic model has no insertion point for tool-carrier kinematics. **Error correction** - Adjust the machine configuration for tool-carrier kinematics. To do so, please contact your machine tool builder. Please note: If you use the entered kinematic model, the machining operation will be executed without the desired tool carrier.
1A0-0161	**Error message** Programmed rotary axis on circle not allowed (TCPM TIP-CENTER) **Cause of error** An attempt was made to program a circle with a rotary axis setting without tool radius compensation with an active TCPM REFPNT TIP CENTER. Simultaneous rotary axis adjustment on circles is permissible only with tool radius compensation. **Error correction** Activate tool radius compensation
1A0-0162	**Error message** Tool radius compensation incorrectly ended (TCPM TIP-CENTER) **Cause of error** An attempt was made to stop tool radius compensation with TCPM REFPNT TIP-CENTER in an impermissible manner. With this TCPM preset, tool radius compensation can be stopped only by means of a linear block with R0 in which both working plane coordinates are programmed. **Error correction** Stop tool radius compensation with a linear block containing both working plane coordinates.
1A0-0164	**Error message** Cannot find direction of rotation for the defined contour **Cause of error** The programmed workpiece blank contour is not closed or is without curves. It is therefore impossible to find the rotational direction or display in 3-D. **Error correction** - Change the NC program - Program a workpiece blank contour consisting of more than one point. The contour must be closed and must not lie on a single straight line.

Error number	Description
1A0-0165	**Error message** Recesses in the BLK FORM are not supported **Cause of error** A recess was programmed in the contour for the BLK FORM. **Error correction** - Edit the NC program. Remove the recess from the contour for the BLK FORM.
1A0-0166	**Error message** Undercuts in the BLK FORM are not supported **Cause of error** An undercut was programmed in the contour for the BLK FORM. **Error correction** Remove the undercut from the contour
1A0-0167	**Error message** SL cycle not allowed (TCPM REFPNT CENTER) **Cause of error** An attempt has been made to program an SL cycle while TCPM REFPNT TIP-CENTER or REFPNT CENTER-CENTER is active. No SL cycles are possible with these TCPM settings. **Error correction** Edit the NC program
1A0-0169	**Error message** M130 not allowed **Cause of error** No M130 can be programmed during active turning-tool compensation in the tilted plane's system (FUNCTION TURNDATA CORR-WPL, or columns WPL-DZL and WPL-DX-DIAM from the turning-tool table). **Error correction** - Check the NC program and adapt it if necessary.
1A0-016C	**Error message** Facing slide: Only ZK contour allowed **Cause of error** A contour was programmed that is not in the ZX plane. **Error correction** Check the NC program and adapt it if necessary.

Error number	Description
1A0-016D	**Error message** Facing slide: Transformation not allowed **Cause of error** Certain transformations are not allowed with an active facing slide: - Tilting the working plane - Scaling - Datum shift **Error correction** Check the NC program and adapt it if necessary.
1A0-016E	**Error message** Tilted working plane no allowed **Cause of error** With FUNCTION MODE TURN, tilting the working plane is allowed only with facing slide kinematics. **Error correction** Check the NC program and adapt it if necessary.
1A0-016F	**Error message** Helix with active facing slide not allowed **Cause of error** No helix is allowed with an active facing slide. **Error correction** Check the NC program and adapt it if necessary.
1A0-0170	**Error message** Facing slide: Combination with M91 not allowed **Cause of error** The combination of active facing slide and M91 are not allowed. **Error correction** Check the NC program and adapt it if necessary.
1A0-0171	**Error message** Facing slide: TCPM not allowed **Cause of error** No TCPM (M128) is allowed with an active facing slide. **Error correction** Check the NC program and adapt it if necessary.

Error number	Description
1A0-0172	**Error message** Facing slide: 3-D radius compensation not allowed **Cause of error** 3-D radius compensation is not allowed with an active facing slide. **Error correction** Check the NC program and adapt it if necessary.
1A0-0173	**Error message** Special kinematics are not allowed for facing slide machining **Cause of error** You tried to combine FUNCTION PARAXMODE with a special kinematic model: - Polar kinematics - Facing slide kinematics **Error correction** Deactivate the machining method before another is to be activated.
1A0-0174	**Error message** Facing slide: Only in turning mode **Cause of error** A facing slide can be activated only in turning mode. **Error correction** Use FUNCTION MODE TURN to switch to the turning mode.
1A0-0175	**Error message** Facing slide: Impermissible circle programmed **Cause of error** The programmed circle has a radius or arc that is too small for the facing slide **Error correction** Check the NC program and adapt it if necessary
1A0-0176	**Error message** Facing slide: Probing block not allowed **Cause of error** Probing block not allowed with an active facing slide **Error correction** Run the probing block before the facing slide is activated

Error number	Description
1A0-0177	**Error message** Facing slide: Spindle is not aligned **Cause of error** The Z axis of the input system and the spindle direction are not parallel **Error correction** Align the spindle direction before the facing slide is activated
1A0-0178	**Error message** Facing slide not possible when stretch filter is active **Cause of error** Facing slide cannot be activated when the “stretch filter” is active **Error correction** - Check the entry under CfgStrechFilter and change it if required - Inform your service agency
1A0-0179	**Error message** Facing slide: M140 not allowed **Cause of error** Tool retraction (M140) not allowed with an active facing slide **Error correction** Edit the NC program
1A0-017A	**Error message** Facing slide: PARAXCOMP not allowed **Cause of error** FUNCTION PARAXCOMP not allowed with an active facing slide **Error correction** Check the NC program and adapt it if necessary
1A0-017B	**Error message** Turning cycle is allowed only with an active facing slide **Cause of error** With facing slide kinematics, you tried to execute a turning cycle without activating the facing slide **Error correction** - Program FACING HEAD POS

Error number	Description
1A0-017C	**Error message** Tool contour missing for simultaneous turning cycle **Cause of error** The tool contour for simultaneous turning could not be read. **Error correction** The 2-D tool contour for the cycle is calculated from the corresponding 3-D tool carrier kinematics: - Ensure that a valid tool carrier kinematic model is entered in the "KINEMATIC" tool table column. - For the simultaneous rotation cycle, make particularly sure that the geometry defined in it matches the data of the tool in the tool table.
1A0-017D	**Error message** Faulty tool data for simultaneous turning cycle **Cause of error** The tool data of the tool table is not compatible with the simultaneous turning cycle. The tool data (ZL, XL, RS, TO, P-ANGLE, T-ANGLE, CUTWIDTH, CUTLENGTH and KINEMATIC) must describe a realistic tool. In particular, the following conditions must be met: - Neither the radius (RS) nor the cutting edge length (CUTLENGTH and CUTWIDTH) are zero. - Only button tools, roughing tools, and finishing tools are allowed. - TO, ZL, and XL must agree with the tool holder geometry in KINEMATIC. **Error correction** Check and correct the entries in the tool table
1A0-017E	**Error message** GS rotation with working plane not in XY **Cause of error** An attempt has been made to combine a rotation from the global program settings with a working plane in ZX or YZ. This is not allowed. Such a working plane is available in the turning mode as well as when using TOOL CALL X or TOOL CALL Y. **Error correction** Edit the NC program or, in the corresponding program section, activate no rotation via global program settings.

Error number	Description
1A0-017F	**Error message** Negative cutting edge radius **Cause of error** An attempt was made to start a turning cycle with a turning tool with negative cutting edge radius. That is not allowed. The effective cutting edge radius is the sum of the following three elements: - Value in the RS column from the turning-tool table - Value in the DRS column from the turning-tool table - through FUNCTION TURNDATA CORR-TCS: Z/X DRS programmed oversize **Error correction** The sum of the three values must be positive: adjust the NC program or tool table
1A0-0180	**Error message** Simultaneous turning: No fitting tilting axis found. **Cause of error** No appropriate tilting axis was found for the simultaneous turning cycle. **Error correction** - If the machine physically has a suitable axis: - Adapt the precession angle via Cycle 800 - Check the kinematics configuration and change it if necessary - Inform your service agency
1A0-0182	**Error message** Tilting working plane does not fit to rotary transformations **Cause of error** - An attempt has been made to activate the tilting of the machining plane while one of the rotational transformations mentioned below is active. - An attempt has been made to activate one of the rotational transformations named below while the machining plane is tilted. **Error correction** - Deactivate tilting of the machining plane or Cycle 800. If the transformation named in item 2 is active outside the turning operation, please contact the machine manufacturer. The following are affected: 1. Transformation activated by Cycle 800 2. Special transformation in turning operation, which the input system usually adapts to kinematics with the A or B table. The POS tab of the status display shows whether the transformer is active.

Error number	Description
1A0-0183	**Error message** Data for turning tool invalid **Cause of error** The data of the active turning tool are invalid. Invalid value combination: TYPE and TO do not match. The value 9 can be defined in TO only for roughing and finishing tools. **Error correction** Edit the tool data.
1A0-0184	**Error message** Simultaneous turning: Programmed tool compensations not allowed **Cause of error** Programmed tool compensations (FUNCTION TURNDATA CORR-TCS ...) are not permitted for the simultaneous turning cycle. Such compensations change the position of the indexable insert relative to the tool carrier, which can lead to collisions. **Error correction** Remove all tool compensations programmed before the cycle.
1A0-0185	**Error message** Selected TCPM mode cannot be combined with simultaneous turning **Cause of error** The simultaneous turning cycle does not support the programmed TCPM mode **Error correction** The following TCPM parameters must be set: - AXIS POS (coordinates = nominal position), - PATHCTRL AXIS (interpolation = nominal position) - REFPNT CENTER-CENTER or REFPNT TIP-CENTER (tool preset)
1A0-0188	**Error message** Function not permitted **Cause of error** - FUNCTION FACINGHEAD is programmed with active tool compensation regarding the workpiece coordinate system. - FUNCTION FACINGHEAD is not allowed in combination with FUNCTION TURNDATA CORR-WCS. **Error correction** Deactivate tool compensation with regard to the workpiece coordinate system.

Error number	Description
1A0-0189	**Error message** Impermissible interpolation of rotary axes **Cause of error** - A rotary axis was programmed that was deselected with M138 or in the machine parameter CfgAxisPropKin/MP_rotAxisForKinCalc = FALSE but, according to the machine parameter CfgAxisPropKin/MP_paraxComp = Display, must be considered. - This movement cannot be interpreted with TCPM movements. **Error correction** - Check the NC program and edit it if necessary - Inform your service agency
1A0-018A	**Error message** No physical axis available for handwheel superimpositioning **Cause of error** Handwheel superimpositioning in an axis that is not in the current kinematics **Error correction** - Deactivate the handwheel superimpositioning - Check the machine configuration - Inform your service agency
1A0-018B	**Error message** Contour preparation not possible **Cause of error** An internal error occurred while preparing the contour for the loaded noncircular program, which can therefore not be executed. **Error correction** Inform your service agency
1A0-018C	**Error message** Contour preparation cannot process a noncircular program **Cause of error** The noncircular program cannot be processed by the contour preparation. Possible causes: - The program contains contour elements whose length is extremely short (length < 1pm) - The parameter "F effective as C feed rate" is set in the program and the C axis reverses direction during the program or its speed (briefly) drops to zero **Error correction** - Edit the NC program - Inform your service agency

Error number	Description
1A0-018E	**Error message** Simultaneous turning: Pre-positioning **Cause of error** The current inclination of the tool is outside the programmed angle range. **Error correction** Adjust the inclination angle of the tool accordingly before calling the cycle.
1A0-018F	**Error message** Inclination angles could not be reached **Cause of error** The desired inclination angles are outside the valid inclination range. **Error correction** Adjust the inclination angle range or the desired inclination angle at the beginning or end of the contour.
1A0-0190	**Error message** Axis of a branched kinematics path used **Cause of error** An axis was used that is in a kinematics path that is currently branched. The following uses are not possible for such an axis: - Positioning with the PLANE function - Selecting the axis with M138 - Positioning within an LN block - Positioning within a CP block **Error correction** Edit the NC program
1A0-0191	**Error message** Impermissible axis was programmed **Cause of error** You have programmed an axis that is configured as a spindle in the selected kinematics model. **Error correction** Edit the NC program
1A0-0192	**Error message** Faulty turning tool data **Cause of error** The lathe tool is incorrectly defined. It does not have a permissible type. **Error correction** Correct the type of the turning tool

Error number	Description
1A0-0194	**Error message** The limit switches of a modulo axis are invalid **Cause of error** Please note that the following conditions apply for the limit switches/protection zones of modulo axes: - The lower limit must be greater than -360° and less than +360° - The upper limit must not be negative and must be less than +360° - The lower limit must not be greater than the upper limit - The lower limit and upper limit must be less than 360° apart Please also ensure that the set limit switches and protection zone result in a clearly defined traverse range. A missing or doubled overlap of the two ranges is not permitted. **Error correction** Correct an incorrectly set protection zone or incorrectly configured limit switches.
1A0-0195	**Error message** Faulty tool data for simultaneous turning cycle **Cause of error** The tool contour consisting of cutter and holder could not be determined. **Error correction** - TO, ZL, XL and ORI must agree with the tool holder geometry in KINEMATIC. - The faulty contours were stored in TNC:\system\Toolkinematics\
1A0-0196	**Error message** TCPM: PATHCTRL VECTOR not possible **Cause of error** You programmed TCPM with PATHCTRL VECTOR so that the tool orientation lies in the same plane during the complete movement from the start point to the end point. The current rotary axes in conjunction with the programmed start orientation and end orientation do not permit smooth motion. **Error correction** - Prefer PATHCHTRL AXIS. PATHCHTRL VECTOR is only useful during peripheral milling or if large changes of angle are programmed. - Program an additional NC data point in the symmetry position (pole) - Edit the NC program

Error number	Description
1A0-0198	**Error message** TCPM: PATHCTRL VECTOR not possible **Cause of error** You programmed TCPM with PATHCTRL VECTOR so that the tool orientation lies in the same plane during the complete movement from the start point to the end point. This is not possible because positions that cannot be approached are located along the path between the start orientation and the end orientation (e.g., limit switches or kinematic limitations). **Error correction** - If the fault is not due to a limit switch, prefer PATHCHTRL AXIS. PATHCHTRL VECTOR is only useful during peripheral milling or if large changes of angle are programmed. - Edit the NC program
1A0-0199	**Error message** TCPM: PATHCTRL VECTOR not possible **Cause of error** You programmed TCPM with PATHCTRL VECTOR so that the tool orientation lies in the same plane during the complete movement from the start point to the end point. This is not possible because a rotary axis that was not selected with M138 or a linear secondary axis was programmed. **Error correction** Edit the NC program.
1A0-019A	**Error message** Coordinate transformation not allowed in dressing mode **Cause of error** You attempted to switch to dressing mode even though a coordinate transformation (datum shift, rotation, mirroring, and/or scaling) is active. **Error correction** Deactivate the coordinate transformation (datum shift, rotation, mirroring, and/or scaling) before switching to dressing mode.
1A0-019B	**Error message** Tool-carrier kinematics not allowed **Cause of error** Grinding wheels with tool-carrier kinematics cannot be dressed. **Error correction** - For the grinding wheel to be dressed, delete the entry under "KINEMATIC" in the tool table - Inform your service agency

Error number	Description
1A0-019C	**Error message** Plunging not possible at position (%1, %2) **Cause of error** A pocket cannot be machined since plunging is not possible with this tool radius. **Error correction** - Use a smaller tool - Rework with a smaller tool
1A0-019D	**Error message** Limitation cannot be defined with Cycle 14 **Cause of error** The first defined contour cannot be interpreted as a border if Cycle 14 was used to define it. **Error correction** - Define contours with CONTOUR DEF or - Use the first contour as a pocket and set parameter Q569 to 0 in Cycle 271
1A0-019F	**Error message** Pocket not supported after an "open frame" **Cause of error** In the definition of the contours, a pocket (P2) is defined after a "bounding box". A "bounding box" must be followed by an island (I2). **Error correction** - Do not define a "bounding box" in Cycle 271 if a closed pocket is to be machined. - Use CONTOUR DEF to define an island after the "bounding box" if an open pocket is to be machined. - Refer to the User's Manual for more documentation.
1A0-01A0	**Error message** Plunging depth too small **Cause of error** You programmed too low a depth in Cycle 271. **Error correction** NC-Programm anpassen
1A0-01A1	**Error message** No technology data record available for contour machining **Cause of error** A Cycle 271 must be programmed before every fixed cycle 272, 273, or 274. **Error correction** - Adapt the NC program - Program Cycle 271

Error number	Description
1A0-01A3	**Error message** Plunging depth too small **Cause of error** You defined the plunging depth Q238 to be less than 0.1 mm in Cycle 274. **Error correction** - Adapt the NC program - Define the plunging depth Q238 to be greater than 0.1 mm
1A0-01A4	**Error message** Tool radius too small **Cause of error** The tool radius of the current tool is too small. **Error correction** Select a larger tool
1A0-01A5	**Error message** Roughing tool not defined **Cause of error** A roughing tool must be defined for each fixed cycle 273 and 274. **Error correction** - Adapt the NC program - Call Cycle 272 - Reference a roughing tool in parameter Q438
1A0-01A6	**Error message** Parameter 'Feed per revolution Q436' incorrectly defined **Cause of error** You entered the value 0 for the infeed per revolution parameter Q436. **Error correction** Check and correct the value in Q436
1A0-01A7	**Error message** Impermissible NC block in contour **Cause of error** This NC block is not permitted in a contour (e.g. APPR or DEP blocks, LN blocks,...) **Error correction** Edit the contour

Error number	Description
1A0-01A8	**Error message** Erroneous description of fixture in file %1 **Cause of error** The description of the fixture in the given file is faulty or the file does not exist. **Error correction** - Check the description of the fixture in the given file and correct it if necessary - Reset the fixture with FIXTURE RESET ALL - Load a valid fixture with FIXTURE SELECT - Inform your service agency
1A0-01A9	**Error message** SW limit switch for modulo axes faulty **Cause of error** Movements of modulo axes with software limit switches are not permitted in this version of the control software. **Error correction** - Edit the NC program - Do not configure limit switches for a modulo axis - Do not configure the axis as a modulo axis - Install a newer version of the NC software
1A0-01AA	**Error message** Traverse limits for modulo axes faulty **Cause of error** Movements of modulo axes with traverse limits are not permitted in this version of the control software. **Error correction** - Edit the NC program - Do not configure traverse limits for a modulo axis - Do not configure the axis as a modulo axis - Install a newer version of the NC software
1A0-01AB	**Error message** Fixture not permitted **Cause of error** Fixtures are not permitted in dressing mode. **Error correction** - Remove the entry CfgKinFixSocket from the active kinematics configuration - Inform your service agency

Error number	Description
1A0-01AC	**Error message** Configuration not suited for cylinder surface machining **Cause of error** The first machine axis under the table must be a modulo rotary axis. **Error correction** - Check the axis configuration - Inform your machine tool builder
1A0-01AD	**Error message** Fixtures ignored in "%1" **Cause of error** The indicated kinematic model has no insertion point for fixtures. **Error correction** - Adjust the machine configuration to include fixtures. To do so, please contact your machine tool builder. Please note: If you use the indicated kinematic model, the machining operation will be executed without the desired fixture.
1A0-01AE	**Error message** Island not permitted directly after a bounding block **Cause of error** In the definition of the contours, an island (I2) is defined after a "bounding block". A "bounding block" must be followed by a pocket (P2). **Error correction** - Do not define a "bounding block" in Cycle 271 if a closed pocket or stud is to be machined - Use CONTOUR DEF to define a pocket after the "bounding block" if an open pocket is to be machined. - Refer to the User's Manual for more documentation
1A0-01AF	**Error message** Invalid tool technology data **Cause of error** The tool radius is the sum of the values R and DR from the tool table; in some cases a programmed oversize has been added. If the width of the indexable insert (RCUTS) equals this tool radius, then the plunge angle (ANGLE) must be 90. **Error correction** Check the tool data and correct them if required.

Error number	Description
1A0-01B1	**Error message** Width of the indexable insert is too large **Cause of error** The tool radius results from the sum of the values R and DR from the tool table; in some cases a programmed oversize has been added. The width of the indexable insert (RCUTS) must not exceed 95% of the tool radius. **Error correction** Check the tool data and correct them if required.
1A0-01B2	**Error message** Usable length of the tool used is too small **Cause of error** The useful length of the tool being used (column LU in the tool table) is less than the machining depth programmed in the cycle. **Error correction** - Use a tool with a greater useful length
1A0-01B3	**Error message** Polar kinematics cannot be activated **Cause of error** The polar kinematics could not be activated with the programmed axes and selected solution. **Error correction** Check the selected axes and the solution: - The axes must span the three-dimensional space - The rotary axis must be built onto the table side and configured as a modulo axis (CfgAxis/isModulo = TRUE) - Exactly one rotary axis must be selected - It must be possible to reach the selected solution from the current position (MODE_POS: machine is at a positive value of the radial axis, MODE_NEG: machine is at a negative value of the radial axis)
1A0-01B4	**Error message** Polar kinematics: TCPM not allowed **Cause of error** TCPM (M128) is not allowed with active polar kinematics. **Error correction** Check the NC program and adapt it if necessary

Error number	Description
1A0-01B5	**Error message** Polar kinematics: transformation not allowed **Cause of error** Certain transformations are not permitted with active polar kinematics: - Tilt the working plane **Error correction** Check the NC program and adapt it if necessary
1A0-01B6	**Error message** Polar kinematics not possible when stretch filter is active **Cause of error** Polar kinematics cannot be activated if a "Stretch Filter" is active. **Error correction** - Check the entry under CfgStrechFilter and change it if required - Inform your service agency
1A0-01B7	**Error message** Five-axis machining is not allowed with active polar kinematics **Cause of error** Programming of linear- and rotary-axis movements in one NC block is not not permitted with active polar kinematics. **Error correction** Edit the NC program.
1A0-01B8	**Error message** Handwheel superimp. not allowed with active polar kinematics **Cause of error** Handwheel superimpositioning is not permitted with active polar kinematics **Error correction** - Deactivate handwheel superimpositioning - Deactivate polar kinematics
1A0-01B9	**Error message** Polar kinematics: combination with M91 not allowed **Cause of error** The combination of active polar kinematics and M91 is not permitted. **Error correction** Check the NC program and adapt it if necessary

Error number	Description
1A0-01BA	**Error message** Alternating machining not permitted for a closed contour **Cause of error** A value of 0 for Q15 (alternating machining direction) is not supported for a closed contour. **Error correction** Change the value for Q15 to +1 (climb) or -1 (up-cut).
1A0-F302	**Error message** APPRLT not permitted for a closed contour **Cause of error** Approaching with APPRLT is not supported for a closed contour. **Error correction** In Cycle 270 set the input parameter Q390 to 1 (APPRCT) or 3 (APPRLN).
1A0-F303	**Error message** No contours to be machined **Cause of error** After internal resolution of the contours, no (sub)contours that can be machined with OCM remain. Please note: - Pockets that are narrower than 2*R*(1+Q578) cannot be machined, due to the rounding arcs of inside corners. - Depending on R and RCUTS, no plunging is possible in narrow pockets. **Error correction** Ensure that the programmed contours are sufficiently wide, particularly concerning the dimensions stated above.
1A0-F304	**Error message** The depth will not be finished without an allowance **Cause of error** The depth will not be finished as long as no allowance is programmed for the depth (Q369). **Error correction** When defining the contour data, program an allowance for the depth in Q369.
1A1-000C	**Error message** Selected kinematics not defined **Cause of error** - Attempt to use nonexisting kinematics **Error correction** - Expand the kinematics configuration. - Change the cycle. - Inform your service agency.

Error number	Description
1A1-000D	**Error message** Kinematics configuration faulty %1 **Cause of error** - System error **Error correction** - Inform your service agency.
1A1-000E	**Error message** Kinematics configuration faulty %1 **Cause of error** - System error **Error correction** - Inform your service agency.
1A1-000F	**Error message** Kinematics configuration faulty %1 **Cause of error** - System error **Error correction** - Inform your service agency.
1A1-0010	**Error message** Limit switch %1%2 CC limit switch %2 + **Cause of error** The calculated tool path exceeds the machine's positive traverse limits. The current machine setting was presumably not used and the workpiece is therefore in the wrong position in the working space. The positive software limit switch is defined with the configuration datum CfgPositionLimits->swLimitSwitchPos. **Error correction** - Check the programmed coordinates. If required, edit the program. - Check the reference point. If required, set a new reference point.

Error number	Description
1A1-0011	**Error message** Limit switch %1%2 CC limit switch %2 - **Cause of error** The calculated tool path exceeds the machine's negative traverse limits. The current machine setting was presumably not used and the workpiece is therefore in the wrong position in the working space. The negative software limit switch is defined with the configuration datum CfgPositionLimits->swLimitSwitchNeg. **Error correction** - Check the programmed coordinates. If required, edit the program. - Check the reference point. If required, set a new reference point.
1A1-0012	**Error message** Kinematics configuration faulty %1 **Cause of error** - System error **Error correction** - Inform your service agency.
1A1-0013	**Error message** Kinematics configuration faulty %1 **Cause of error** Fewer than 3 translation axes are configured in the machine kinematics. **Error correction** - Edit the configuration of the machine kinematics - Check the number of axes in the kinematic model that is defined in the config object CfgProgAxis as MainLinCoord type - When using the FUNCTION PARAXMODE: Check the number and type of axes that you have programmed in this function - Inform your service agency

Error number	Description
1A1-0014	**Error message** Kinematics configuration faulty %1 **Cause of error** More than 3 translation axes are configured in the machine kinematics. **Error correction** - Edit the configuration of the machine kinematics - Check the number of axes in the kinematic model that is defined in the config object CfgProgAxis as MainLinCoord type - When using the FUNCTION PARAXMODE: Check the number and type of axes that you have programmed in this function - Inform your service agency
1A1-0015	**Error message** Kinematics configuration faulty %1 **Cause of error** - System error **Error correction** - Inform your service agency.
1A1-0016	**Error message** Program position not accessible **Cause of error** The machine cannot reach all points in the space. The three linear axes with which the control moves to programmed positions all lie in one plane. Possible causes: - With FUNCTION PARAXMODE you selected three axes that lie in one plane - A linear axis is mounted on a rotary axes; the rotary axis has tilted the linear axis into the plane of the two other linear axes **Error correction** Edit the NC program
1A1-0017	**Error message** Kinematics configuration faulty %1 **Cause of error** - System error **Error correction** - Inform your service agency. - Edit the cycles.

Error number	Description
1A1-0018	**Error message** Kinematics configuration faulty %1 **Cause of error** - System error **Error correction** - Inform your service agency.
1A1-0019	**Error message** Kinematics configuration faulty %1 **Cause of error** - System error **Error correction** - Inform your service agency.
1A1-001A	**Error message** Kinematics configuration faulty %1 **Cause of error** - System error **Error correction** - Inform your service agency.
1A1-001B	**Error message** No accuracy specified for calculating the kinematic compen-sating movement. **Cause of error** - Accuracy data missing for calculation of the kinematic compensation movement **Error correction** - Edit the cycle.
1A1-001C	**Error message** Rotary axis undefined **Cause of error** - Machine kinematics incorrectly configured - Wrong kinematics selected **Error correction** - Edit the configuration of the machine kinematics. - Edit the cycle. - Inform you service agency.

Error number	Description
1A1-001D	**Error message** Kinematics configuration faulty %1 **Cause of error** - Machine kinematics incorrectly configured **Error correction** - Edit the configuration of the machine kinematics. - Inform your service agency.
1A1-001E	**Error message** Kinematics configuration faulty %1 **Cause of error** - System error **Error correction** - Inform your service agency.
1A1-0022	**Error message** Kinematics configuration faulty %1 **Cause of error** - System error **Error correction** - Choose a kinematic configuration with orthagonally arranged axes - Inform your service agency
1A1-0023	**Error message** Kinematics configuration faulty %1 **Cause of error** - System error **Error correction** - Inform your service agency.
1A1-0024	**Error message** Kinematics configuration faulty %1 **Cause of error** - System error **Error correction** - Inform your service agency.

Error number	Description
1A1-0025	**Error message** Kinematics configuration faulty %1 **Cause of error** - System error **Error correction** - Inform your service agency.
1A1-0026	**Error message** Function not yet implemented: %1 **Cause of error** - You tried to use a non-implemented function. **Error correction** - Edit the NC program
1A1-0027	**Error message** Type of grinding wheel compensation not defined **Cause of error** You have not specified the grinding wheel edge to be compensated. **Error correction** - Edit the cycle
1A1-0028	**Error message** Axis cannot be moved! %1 **Cause of error** You tried to move an axis that cannot be moved by the NC, such as a display axis, which is only displayed. **Error correction** - Check the NC program - Select suitable machine kinematics (polar)
1A1-0029	**Error message** Kinematics configuration faulty %1 **Cause of error** - System error **Error correction** - Inform your service agency.

Error number	Description
1A1-002A	**Error message** Kinematics configuration faulty %1 **Cause of error** - System error **Error correction** - Inform your service agency.
1A1-002B	**Error message** Kinematics configuration faulty %1 **Cause of error** - System error - Incorrect kinematics **Error correction** - Edit the configuration of the machine kinematics. - Inform your service agency.
1A1-003B	**Error message** Grinding wheel geometry incorrect Negative value %1 in the grinding wheel parameters **Cause of error** - Incorrect parameter settings of grinding wheel geometry **Error correction** - Correct the parameters of the grinding wheel geometry.
1A1-003C	**Error message** Grinding wheel geometry incorrect Negative value for %1 in the grinding wheel parameters **Cause of error** - Incorrect parameter settings of grinding wheel geometry **Error correction** - Correct the parameters of the grinding wheel geometry.
1A1-003D	**Error message** Grinding wheel geometry incorrect Angle %1 in the grinding wheel parameters too small **Cause of error** - Incorrect parameter settings of grinding wheel geometry **Error correction** - Correct the parameters of the grinding wheel geometry.

Error number	Description
1A1-003E	**Error message** Grinding wheel geometry incorrect Negative edge length in the grinding wheel geometry **Cause of error** - Incorrect parameter settings of grinding wheel geometry **Error correction** - Correct the parameters of the grinding wheel geometry.
1A1-003F	**Error message** Grinding wheel geometry incorrect Missing parameter %1 in grinding wheel parameters **Cause of error** - Incorrect parameter settings of grinding wheel geometry **Error correction** - Correct the parameters of the grinding wheel geometry.
1A1-0040	**Error message** System error in the geometry chain: %1 **Cause of error** - System error **Error correction** - Inform your service agency.
1A1-0042	**Error message** Kinematics configuration faulty %1 **Cause of error** Invalid attribute or list element in a view message, caused by incorrect key entries in configuration messages. Because of this, the configuration server overlooks entities, which is why elements of the output lists in the view message are set to invalid. **Error correction** - Correct the kinematic configuration. - Inform your service agency.
1A1-0043	**Error message** Kinematics configuration faulty %1 **Cause of error** Cause of error is explicitly described in the error text. **Error correction** Inform your service agency.

Error number	Description
1A1-0044	**Error message** Setting of software limits for roll-over axis not permitted **Cause of error** You tried to set values for software limit switches on a roll-over axis. **Error correction** - Change the configuration - Edit the cycle
1A1-0045	**Error message** Vertical axis direction not possible **Cause of error** It is not possible to orient the tool axis orthogonally to the working plane that you defined. **Error correction** - Edit the NC program - If possible, clamp the tool differently - Where applicable, change the limit switch setting of the rotary axes
1A1-0046	**Error message** Control cannot calculate the circle tangent **Cause of error** You defined a cirle with the radius 0. **Error correction** Edit the NC program
1A1-0047	**Error message** The control cannot change the tool orientation because no rotary axes are defined **Cause of error** Rotary axes are not defined to allow changing the tool orientation. **Error correction** - Edit the NC program - Rebuild the machine - Configure the kinematics with rotary axes
1A1-0048	**Error message** Error in the kinematic configuration: %1 **Cause of error** Indicated in English in the additional text **Error correction** - Edit the kinematic configuration - Inform your service agency

Error number	Description
1A1-0049	**Error message** No axis found for tool length compensation. **Cause of error** Possible causes: there is no axis or no clearly definable axis that can compensate the tool length. **Error correction** - Change the contour configuration - Inform your service agency
1A1-004A	**Error message** Too many axes to be interpolated **Cause of error** The maximum allowed number of simultaneously moving axes was exceeded. (In the export version the maximum is 4 axes.) **Error correction** Check the NC program
1A1-004B	**Error message** Kinematics configuration faulty **Cause of error** More than 3 translation axes are configured in the machine kinematics. **Error correction** - Edit the configuration of the machine kinematics - Check the number of axes in the kinematic model that are defined in the config object CfgAxis in the Parameter specCoordSys as additional linear axes. Together with the axes in the kinematic model, which are defined in the config object CfgProgAxis as the MainLinCoord type, exactly 3 axes must be available for the machine kinematics. - When using the FUNCTION PARAXMODE: Check the number and type of axes that you have programmed in this function - Inform your service agency
1A1-004C	**Error message** Thread cutting: Direction reversal not allowed! **Cause of error** A direction reversal of the thread reference axis is not allowed. **Error correction** - You must not change the direction of the thread reference axis. - Edit the NC program.

Error number	Description
1A1-004D	**Error message** Non-interpolating axis is exceeding the traverse range! **Cause of error** A non-interpolating axis is exceeding the traverse range limits. **Error correction** Reduce the programmed path of the non-interpolating axis.
1A1-004E	**Error message** Distance is too short to accelerate non-interpolating axis! **Cause of error** A non-interpolating axis is exceeding the maximum acceleration! **Error correction** Extend the programmed path of the non-interpolating axis.
1A1-004F	**Error message** This area cannot be machined! **Cause of error** No traverse permitted with polar kinematics in the programmed range. **Error correction** Check the height difference of the point or the position of the fixed axis. Check whether the machining operation is permitted at the pole.
1A1-0050	**Error message** Limit switch with handwheel superimpositioning %1%2 **Cause of error** The calculated tool path exceeds the machine's positive traverse limits. The current machine setting was presumably not adopted and the workpiece is therefore in the wrong position in the working space. M118 limit switch **Error correction** Reduce the handwheel traverse range (M118)
1A1-0051	**Error message** Wrong kinematic model for FACING HEAD POS **Cause of error** The active kinematic model had not facing slide. FACING HEAD POS is allowed only with facing-slide kinematics. **Error correction** Insert the facing slide and switch the kinematics

Error number	Description
1A1-0052	**Error message** Tool inclination cannot be calculated **Cause of error** There are too many or too few rotary axes present in order to calculate the tool angle of inclination **Error correction** - Use M138 to select or deselect the rotary axes - Check the configuration of the tool spindle, particularly CfgAxisPropKin/rotAxisForKinCalc - Contact your machine tool builder
1A1-0053	**Error message** Tool inclination cannot be calculated **Cause of error** The orientation of the indexable insert of the turning tool is not permissible. **Error correction** The plane of the indexable insert must be parallel or perpendicular to the tool spindle: - Check the tool data - Check the kinematics configuration, particularly the transformations (CfgKinSimpleTrans) between the tool spindle and tool - Contact your machine tool builder
1A1-0054	**Error message** Tool inclination cannot be calculated **Cause of error** Incorrect orientation of the selected rotary axes. Possible causes: - The turning spindle is parallel to the selected tilting axis - The tool direction is parallel to the selected tilting axis - The programmed inclination is not possible with the present device **Error correction** - Check the programmed inclination - Use M138 to select a different tilting axis - Check the kinematics configuration - Check the configuration of the tool spindle, particularly CfgAxisPropKin/rotAxisForKinCalc - Contact your machine tool builder
1A2-000A	**Error message** System error in the calculation of transformation: %1 **Cause of error** Ist im Fehlertext direkt angegeben **Error correction** - Kundendienst benachrichtigen

Error number	Description
1A2-000B	**Error message** Axis programmed more than once in PRESET command **Cause of error** Sie haben im PRESET-Befehl mehrfach dieselbe Achse programmiert. **Error correction** - NC-Programm bzw. Zyklus ändern
1C7-01F6	**Error message** Data record for the FS configuration of the SPLC program **Cause of error** Data record for the configuration of functional safety for the SPLC program **Error correction**
1C7-0205	**Error message** Max. time until the test of the motor holding-brakes **Cause of error** Axis-specific time monitoring for the execution of the brake test. - 0: No time monitoring through the SKERN **Error correction**
1C7-0206	**Error message** Maximum path with SS2 reaction **Cause of error** Maximum permissible path or spindle revolutions for SS2 reaction in SOM2 operating mode **Error correction**
1C7-0207	**Error message** Maximum path with SS2 reaction **Cause of error** Maximum permissible path or revolutions of the spindle with SS2 reaction in SOM3 operating mode **Error correction**
1C7-0208	**Error message** Maximum path with SS2 reaction **Cause of error** Maximum permissible path or spindle revolutions for SS2 reaction in SOM4 operating mode **Error correction**

Error number	Description
1C7-021B	**Error message** MC drives cannot be switched on: NN_GenSafe = 0 **Cause of error** - SPLC interface signal NN_GenSafe = 0. It is therefore impossible to switch on the drives. - SPLC program does not set the interface signal. - The machine parameter MP_skipEmStopTest has been set. **Error correction** - Check the SPLC program. - Check the entry in MP_skipEmStopTest. - Inform your service agency.
1C7-0255	**Error message** Following error monitoring for RTC coupled axes **Cause of error** Position monitoring for coupled axes. If the axis cannot follow the RTC specification and the position difference exceeds this value, an EMERGENCY STOP reaction is triggered. You can find information on braking the drives during an EMERGENCY STOP in the Technical Manual for your control. The settings in posTolerance apply only during active RTC and are independent of the settings in CfgPosControl. **Error correction**
1C7-025F	**Error message** Default HSCI data rate **Cause of error** Enter the desired HSCI data rate. With the “automatic” option, the control automatically selects the highest possible data rate. If there are devices or cables in the HSCI system that are suited for only limited data rates, a manual preselection might be necessary. **Error correction**
1C7-0268	**Error message** Permit handwh. superimposition of rotary axes only with TCPM **Cause of error** **Error correction**

Error number	Description
1C7-0350	**Error message** Mode of nominal/actual value monitoring (optional) **Cause of error** The parameter specifies the type of nominal-actual-value monitoring: - speedAndPosCompDefault: With FS spindles, the nominal-actual-value comparison is always performed for rotational speeds; with position-controlled feed axes when the guard doors are open for positions, and when the guard doors are closed for speeds. - speedAndPosCompReduced: With FS spindles, the nominal-actual-value comparison is always performed for rotational speeds; with position-controlled axes when the guard doors are open for positions and otherwise for speeds - noComp: The nominal-actual-value comparison is inactive, so neither speeds nor positions are checked - speedComp: With FS spindles, the nominal-actual-value comparison is performed for rotational speeds, and with feed axes for positions. **Error correction**
1C9-006B	**Error message** Description of a tool carrier **Cause of error** Describe here a tool carrier. **Error correction**
200-0001	**Error message** Calculator **Cause of error** **Error correction**
200-0017	**Error message** Configuration of '%1' incorrect **Cause of error** The configuration data are incomplete or contain invalid values. **Error correction** Check the configuration data.

Error number	Description
200-0018	**Error message** Configuration for axis %1 invalid **Cause of error** The configuration data for the specified axis are incomplete or contain invalid values. **Error correction** Check the configuration datum "CfgProgAxis" for this axis.
200-0019	**Error message** Configured name for axis %1 invalid **Cause of error** The configured name for an axis with the configured properties is not permissible or is already assigned to another axis. **Error correction** Change the configuration datum "CfgProgAxis/axName"
200-001A	**Error message** Configured index for axis %1 invalid **Cause of error** The configured index for an axis with the configured properties is not permissible or is already assigned to another axis. **Error correction** Change the configuration datum "CfgProgAxis/index"
200-001B	**Error message** Configured direction for axis %1 invalid **Cause of error** None of the directions XAxis, YAxis or ZAxis is configured for the axis. **Error correction** Change the configuration datum "CfgProgAxis/dir"
200-001C	**Error message** Cycle %1 already defined **Cause of error** In CycleDesign, the same number or G number was assigned more than once for a cycle or query cycle. **Error correction** In CycleDesign, change the number of one of the cycles or its G number.

Error number	Description
200-001D	**Error message** Unable to open configuration server queue **Cause of error** Error in system-inherent communication **Error correction** Inform your service agency
200-001E	**Error message** Unable to read configuration data '%1' **Cause of error** Error in system-inherent communication **Error correction** Inform your service agency.
200-001F	**Error message** No programmable axes defined for the editor **Cause of error** The configuration is faulty: CfgEditorSettings/useProgAxes is set so that the programmable axes defined through CfgChannelAxes/progAxis are to be used for the editor. CfgChannelAxes/progAxis is empty, however. **Error correction** Correct the configuration: CfgEditorSettings/useProgAxes
200-0020	**Error message** NC program is incomplete **Cause of error** No valid program end found: - File was not transmitted to the control completely - File corrupted during editing with a text editor - Error in the file system **Error correction** - Retransmit the file or restore it from an archive - Manually correct the file in the NC editor Note: The NC editor automatically appends a program end for visual purposes. Use 'Save as' to write this program end into the file.
201-0800	**Error message** Key non-functional Key non-functional Key non-functional Key non-functional Key non-functional Key non-functional **Cause of error** In this context the key has no function.

Error number	Description
201-0801	**Error message** Program memory exceeded **Cause of error** The NC program memory no longer suffices for part programs. **Error correction** Delete the programs that you no longer need.
201-0802	**Error message** Search address missing **Cause of error** In the NC program the original search address no longer exists. **Error correction** Abort search.
201-0803	**Error message** Entry value incorrect Entry value incorrect Entry value incorrect **Cause of error** - The value you entered is out-of-range. - Cycle 209 (ISO: 209): You entered the value 0 as infeed depth for chip breaking (Q257). **Error correction** - Enter the correct value. - Enter a value other than 0 in Q257.
201-0804	**Error message** Program not found **Cause of error** You attempted to call a program that is not stored in TNC memory. **Error correction** Edit the part program.
201-0805	**Error message** Protected File! Protected File! **Cause of error** You cannot edit or erase this program until the protection has been removed. **Error correction** Cancel the program protection.

Error number	Description
201-0806	**Error message** Block format incorrect **Cause of error** Incorrect block format in the highlighted block. **Error correction** Edit the part program.
201-0807	**Error message** Address letter already assigned **Cause of error** You used an address letter incorrectly in an ISO block. **Error correction** Edit the highlighted block.
201-0808	**Error message** Block too long DATUM SHIFT **Cause of error** **Error correction**
201-092E	**Error message** Traverse direction not defined Traverse direction not defined Traverse direction not defined **Cause of error** In a probing cycle you entered 0 for the traverse direction Q267. **Error correction** For Q267, enter either +1 (for positive traverse direction) or -1 (for negative traverse direction).
201-092F	**Error message** No datum table active No datum table active **Cause of error** Probing cycle for datum setting: You want the TNC to write the measured point into a datum table, but you have not activated a datum table in a program run mode (status M). **Error correction** In the single block or full sequence program run mode, activate the datum table into which you want the measured point to be entered.

Error number	Description
201-0930	**Error message** Position error: center in axis 1 Position error: center in axis 1 Position error: center in axis 1 **Cause of error** Probing cycle for workpiece measurement: Center of 1st axis outside of position tolerance. **Error correction** Check the workpiece and the measuring log.
201-0931	**Error message** Position error: center in axis 2 Position error: center in axis 2 Position error: center in axis 2 **Cause of error** Probing cycle for workpiece measurement: Center of 2st axis outside of position tolerance. **Error correction** Check the workpiece and the measuring log.
201-0932	**Error message** Hole diameter too small Hole diameter too small Hole diameter too small **Cause of error** Probing cycle for workpiece measurement: Hole diameter too small for tolerance. **Error correction** Check the workpiece and the measuring log.
201-0933	**Error message** Hole diameter too large Hole diameter too large Hole diameter too large **Cause of error** - Probing cycle for workpiece measurement: Hole diameter tolerance exceeded. - Cycle 208: The programmed hole diameter (Q335) cannot be machined with the active tool. **Error correction** - Check the workpiece and, if necessary, the measuring log. - Cycle 208: Use a larger tool. Hole diameter must not be larger than twice the tool diameter.

Error number	Description
201-0934	**Error message** Stud diameter too small Stud diameter too small Stud diameter too small **Cause of error** Probing cycle for workpiece measurement: Stud diameter too small for tolerance. **Error correction** Check the workpiece and the measuring log.
201-0935	**Error message** Stud diameter too large Stud diameter too large Stud diameter too large **Cause of error** Probing cycle for workpiece measurement: Stud diameter too large for tolerance. **Error correction** Check the workpiece and the measuring log.
201-0936	**Error message** Pocket too small: rework axis 1 Pocket too small: rework axis 1 Pocket too small: rework axis 1 **Cause of error** Probing cycle for workpiece measurement: Pocket length in 1st axis too small for tolerance. **Error correction** Check the workpiece and the measuring log.
201-0937	**Error message** Pocket too small: rework axis 2 Pocket too small: rework axis 2 Pocket too small: rework axis 2 **Cause of error** Probing cycle for workpiece measurement: Pocket width in 2nd axis too small for tolerance. **Error correction** Check the workpiece and the measuring log.

Error number	Description
201-0938	**Error message** Pocket too large: scrap axis 1 Pocket too large: scrap axis 1 Pocket too large: scrap axis 1 **Cause of error** Probing cycle for workpiece measurement: Pocket length in 1st axis too large for tolerance. **Error correction** Check the workpiece and the measuring log.
201-0939	**Error message** Pocket too large: scrap axis 2 Pocket too large: scrap axis 2 Pocket too large: scrap axis 2 **Cause of error** Probing cycle for workpiece measurement: Pocket width in 2nd axis too large for tolerance. **Error correction** Check the workpiece and the measuring log.
201-093A	**Error message** Stud too small: scrap axis 1 Stud too small: scrap axis 1 Stud too small: scrap axis 1 **Cause of error** Probing cycle for workpiece measurement: Stud length in 1st axis too small for tolerance. **Error correction** Check the workpiece and the measuring log.
201-093B	**Error message** Stud too small: scrap axis 2 Stud too small: scrap axis 2 Stud too small: scrap axis 2 **Cause of error** Probing cycle for workpiece measurement: Stud width in 2nd too small for tolerance. **Error correction** Check the workpiece and the measuring log.

Error number	Description
201-093C	**Error message** Stud too large: rework axis 1 Stud too large: rework axis 1 Stud too large: rework axis 1 **Cause of error** Probing cycle for workpiece measurement: Stud length in 1st axis too large for tolerance. **Error correction** Check the workpiece and the measuring log.
201-093D	**Error message** Stud too large: rework axis 2 Stud too large: rework axis 2 Stud too large: rework axis 2 **Cause of error** Probing cycle for workpiece measurement: Stud width in 2nd axis too large for tolerance. **Error correction** Check the workpiece and the measuring log.
201-093E	**Error message** Meas. cycle: length exceeds max Meas. cycle: length exceeds max Meas. cycle: length exceeds max **Cause of error** Probing cycle 425 or 427: The measured length exceeds the maximum permissible value. **Error correction** Check the workpiece and the measuring log.
201-093F	**Error message** Meas. cycle: length below min Meas. cycle: length below min Meas. cycle: length below min **Cause of error** Probing cycle 425 or 427: The measured length is below the minimum permissible value. **Error correction** Check the workpiece and the measuring log.

Error number	Description
201-0940	**Error message** TCHPROBE 426: length exceeds max TCHPROBE 426: length exceeds max TCHPROBE 426: length exceeds max **Cause of error** Probing cycle 426: The measured length exceeds the maximum permissible value. **Error correction** Check the workpiece and the measuring log.
201-0941	**Error message** TCHPROBE 426: length below min TCHPROBE 426: length below min TCHPROBE 426: length below min **Cause of error** Probing cycle 426: The measured length is below the minimum permissible value. **Error correction** Check the workpiece and the measuring log.
201-0942	**Error message** TCHPROBE 430: diameter too large TCHPROBE 430: diameter too large TCHPROBE 430: diameter too large **Cause of error** Probing cycle 430: The measured bolt-hole-circle diameter exceeds the maximum permissible value. **Error correction** Check the workpiece and the measuring log.
201-0943	**Error message** TCHPROBE 430: diameter too small TCHPROBE 430: diameter too small TCHPROBE 430: diameter too small **Cause of error** Probing cycle 430: The measured bolt-hole-circle diameter is below the minimum permissible value. **Error correction** Check the workpiece and the measuring log.
201-094F	**Error message** Incomplete cycle was deleted **Cause of error** Informational message that the TNC has erased an incomplete cycle. **Error correction**

Error number	Description
201-0950	**Error message** Intermediate memory empty **Cause of error** You attempted to insert a block from an empty intermediate memory. **Error correction** before trying to insert a block from intermediate memory, put the block into memory by: - using the DEL key to delete the block to be copied, or - placing the editing cursor into the block to be copied
201-0951	**Error message** No permission to write **Cause of error** You have selected a write-protected file for editing. **Error correction** Before editing, enter the code number 86357 to cancel the write protection.
201-0952	**Error message** To delete entire context: NO ENT **Cause of error** During editing you attempted to delete a word that is a required element of a function. **Error correction** Press NO ENT to delete the entire function, or press END to cancel.
201-0953	**Error message** Impermissible change of context **Cause of error** You attempted to open another context within a context dialog sequence. **Error correction** Continue the dialog, or completely erase the block and enter a new context.
201-0954	**Error message** No polar coordinates possible No polar coordinates possible **Cause of error** You pressed the P key to enter polar coordinates. Polar coordinates are not programmable for the active function. **Error correction** Enter Cartesian coordinates to program the active function, or use a function that permits polar coordinate input.

Error number	Description
201-0955	**Error message** To change context: press ENT **Cause of error** You attempted to change a context initiator to which other elements in the current block belong. **Error correction** First delete the elements, then change the context initiator.
201-0956	**Error message** Input as context not permitted **Cause of error** You entered a function that cannot initiate a context. **Error correction** Enter only permissible functions.
201-0957	**Error message** Check parentheses for pairs **Cause of error** You attempted to end a Q-parameter block containing an odd number of parentheses. Parentheses can be programmed only in pairs. **Error correction** Enter the missing parentheses.
201-099D	**Error message** Too many decimal places **Cause of error** **Error correction**
201-099E	**Error message** File name not equal program name **Cause of error** **Error correction**
201-099F	**Error message** Context code name unknown **Cause of error** **Error correction**
201-09A0	**Error message** Numerical value out of range **Cause of error** **Error correction**

Error number	Description
201-09A1	**Error message** Syntax error **Cause of error** Syntax error **Error correction**
201-09A2	**Error message** NC language unknown **Cause of error** **Error correction**
201-09A3	**Error message** File access not possible **Cause of error** **Error correction**
201-09A5	**Error message** Required value missing **Cause of error** You attempted to save an NC block although you have not entered all values required for the elements programmed in the block. **Error correction** Enter the NC block with all required data. Refer to the User's Manual if required.
201-09A8	**Error message** Table data unknown **Cause of error** Table data unknown **Error correction**
201-09A9	**Error message** Syntax error in binary record **Cause of error** Syntax error in binary record **Error correction**
201-0A1F	**Error message** Entry character not allowed **Cause of error** You attempted to enter a character that is not allowed in the entry box. **Error correction** Edit the NC program.

Error number	Description
201-0A20	**Error message** Lowercase letter not allowed **Cause of error** You attempted to enter a lowercase letter. **Error correction** Edit the NC program. Use only uppercase letters in the entry box.
201-0A21	**Error message** Letter not allowed **Cause of error** You attempted to enter a letter. **Error correction** Edit the NC program. Use only numerals in the entry box.
201-0A22	**Error message** Numeral not allowed **Cause of error** You attempted to enter a numeral. **Error correction** Edit the NC program. Use only letters in the entry box.
201-0A51	**Error message** Reference to block %.6s:no DEL **Cause of error** FK programming: You have attempted to delete a part program block to which another block refers. **Error correction** First edit the referring block, then delete the reference
201-0A52	**Error message** FK reference to current block **Cause of error** You attempted in an FK program to delete a block to which another part of the program makes a reference. **Error correction** Change the FK reference.

Error number	Description
201-0A55	**Error message** No axes selected **Cause of error** In the MOD settings of the machining modes, no axes were selected for L-block generation. **Error correction** In the MOD settings, enter the axes whose positions are to be put into an L block when the "actual-position-capture key" is pressed.
201-0A6F	**Error message** Too many characters **Cause of error** You exceeded the maximum permissible number of charac-ters for the active input box. **Error correction** Enter fewer characters.
201-0A70	**Error message** Value out of input range **Cause of error** You attempted to enter a numerical value that lies outside the permissible range. **Error correction** Comply with the permissible input range.
201-0A71	**Error message** Too many decimal places **Cause of error** You attempted to enter a value that exceeds the permissible number of decimal places. **Error correction** Comply with the permissible input range.
201-0A72	**Error message** Algebraic sign not allowed **Cause of error** You tried to enter an algebraic sign using the -/+ key. **Error correction** - The -/+ key is non-functional. - It is not necessary/possible to enter the algebraic sign.

Error number	Description
201-0A73	**Error message** Only integers permitted **Cause of error** You tried to enter a number with decimal places. **Error correction** - The , key is non-functional. - It is not necessary/possible to enter a decimal place.
201-0A74	**Error message** Q not allowed: enter a number **Cause of error** You attempted to use a Q parameter in the active input box. **Error correction** Enter a numerical value.
201-0A75	**Error message** Incremental input not allowed Incremental input not allowed **Cause of error** You attempted to enter an incremental value by pressing the I key. **Error correction** Enter an absolute value.
201-0A76	**Error message** Too many M functions **Cause of error** Too many M functions for one NC block. **Error correction** Use no more than two M functions per NC block.
201-0A77	**Error message** Too many axes programmed **Cause of error** - An NC block has more than the allowed number of simultaneously movable axes. - You tried to use an NC program to make a reverse program in which more than 5 axes are programmed. **Error correction** - Standard version: Program no more than 5 axes per NC block. - Export version: Program no more than 4 axes per NC block. - The source program must not include more than a total of 5 different axes.

Error number	Description
201-0A78	**Error message** Axis double programmed **Cause of error** You programmed the same axis more than once within one NC block. **Error correction** Program only different axes within one block.
201-0A79	**Error message** Element double / not allowed **Cause of error** - You used the same syntax element more than once within one NC block.- The current sequence of syntax elements in an NC block do not comply with requirements. **Error correction** - Do not program syntax elements more than once within one NC block.- Put the syntax elements into the required sequence.
201-0A7A	**Error message** Incomplete data input **Cause of error** Not all required data have been entered in an NC block. **Error correction** Add the missing information.
201-0A7B	**Error message** ISO: Block number N missing **Cause of error** An NC block in an ISO program begins without a block number N. **Error correction** Insert the block number.
201-0A7C	**Error message** Required element missing Required element missing **Cause of error** Not all required data have been entered in an NC block. **Error correction** Add the missing information.

Error number	Description
201-0A7D	**Error message** Syntax incorrect **Cause of error** An NC block contains a syntax element that requires other syntax elements. **Error correction** Correct the NC block.
201-0A9F	**Error message** Keyword unknown **Cause of error** In an NC block, you attempted to enter a word that the TNC cannot interpret. **Error correction** Enter only valid words.
201-0AA0	**Error message** Syntax element not editable **Cause of error** You attempted to edit a syntax element in an NC block. **Error correction** Enter a new NC block with a different syntax element.
201-0AA1	**Error message** PGM header not editable **Cause of error** In a program, you attempted to edit one of the blocks BEGIN PGM (ISO: %... G71), or END PGM (ISO: N99999999%...). **Error correction** The program beginning and program end must not be edited. To change the program name, use the RENAME function in the file management.
201-0AA2	**Error message** No reference system change! **Cause of error** You attempted to change the coordinate data in the present block from Cartesian to polar or vice versa. **Error correction** Move the cursor to the block initation element and press the P key to change to polar or Cartesian coordinate input.

Error number	Description
201-0AA3	**Error message** Rotary axis not permitted here **Cause of error** You programmed a rotary axis as tool axis. **Error correction** Program only linear axes in the TOOL CALL block (ISO: T..).
201-0AA4	**Error message** Incorrect block syntax **Cause of error** A part program block contains a syntax error. **Error correction** Edit the part program.
201-0AA5	**Error message** Really delete NC block? DEL! **Cause of error** Warning before deleting an NC block. **Error correction** For complete deletion of the NC block, press DEL. To abort the delete sequence, press any other key.
201-0AA6	**Error message** Axis letter not permitted **Cause of error** An attempt was made to program an axis that is not allowed for the currently active function. **Error correction** Only program permitted axes.
201-0AA7	**Error message** Cannot cancel Block Skip **Cause of error** You attempted to cancel the Block Skip funktion with the Backspace key. **Error correction** Function is only permitted if the NC block begins with / .
201-0AA8	**Error message** String incomplete **Cause of error** You attempted to enter an NC block in which a syntax element was not concluded with the required apostrophe. **Error correction** Ensure that apostrophes are entered in the correct locations. Refer to the User's Manual if required.

Error number	Description
201-0AB4	**Error message** Cannot go past edge of screen **Cause of error** You moved the display position of the current block to the edge of the screen. **Error correction** Select the display position of the current block so that it lies within the screen limits.
201-0ADF	**Error message** Actual pos. capture not possible **Cause of error** You attempted to load the actual position into the program while the tilted working plane function was active. **Error correction** The actual position can be loaded only if the tilted working plane function is not active.
201-0AFE	**Error message** Context change only on initiat.! **Cause of error** You tried to make a major change to the format of an NC block. **Error correction** Changing the NC block format is possible only if you place the cursor on the block initiator.
201-0B31	**Error message** CANCELLATION in block %u (%u %%) **Cause of error** You have aborted the search process. **Error correction** If required, restart the search function and let it terminate the search process.
201-0B67	**Error message** Line %u label name already assigned **Cause of error** You tried to assign the same label name in more than one NC block containing LBL SET. **Error correction** Use different label names.

Error number	Description
201-0B88	**Error message** No editing while PGM is running **Cause of error** - You tried to edit a program that is now being run. - You tried to edit a table that is accessed from within the program that is now being run. **Error correction** - Make changes only in the stopped condition. - Stop the program (internal stop) and reselect it with the PGM MGT key. Then edit the AFC settings.
201-0C02	**Error message** File system I/O error **Cause of error** Error during access to a file system device. **Error correction** - For TNC drives, switch the control off and on to test the drives. Contact HEIDENHAIN if the problem recurs. - For network drives, check the network connection and the computer providing the directory. - To download a table, ensure correct table contents (for redundant lines, for example).
210-0001	**Error message** End of a system file, no identifier found **Cause of error** An identifier was expected in a message file, but the file end was reached. **Error correction** Inform your service agency.
210-0002	**Error message** Identifier in system file expected **Cause of error** An identifier was expected in a message file, but a nonal-phanumeric character was read. **Error correction** Inform your service agency.
210-0003	**Error message** End of a system file, no string found **Cause of error** A string was expected in a message file, but the file end was reached. **Error correction** Inform your service agency.

Error number	Description
210-0004	**Error message** String in system file expected **Cause of error** A string beginning with " was expected in a message file, but another character was read. **Error correction** Inform your service agency.
210-0005	**Error message** Incompatible data types in system file **Cause of error** In a message file data were read that do not fit the data object to be read. **Error correction** Inform your service agency.
210-0006	**Error message** Unknown entity name in system file Message library incompatible or no entity instance implemented **Cause of error** An undefined message was read in a message file. **Error correction** Inform your service agency.
210-0007	**Error message** Identifier already assigned in system file **Cause of error** **Error correction**
210-0008	**Error message** Integral value expected in system file **Cause of error** An integer was expected in a message file. **Error correction** Inform your service agency.
210-0009	**Error message** Floating point number expected in system file **Cause of error** A floating-point number was expected in a message file. **Error correction** Inform your service agency.

Error number	Description
210-000A	**Error message** Invalid logical value in system file **Cause of error** A message file should contain a logical value (TRUE or FALSE, or a Q parameter with numerical value 0 or 1). **Error correction** Inform your service agency
210-000B	**Error message** Invalid list number in system file **Cause of error** A whole number was expected in a message file, but an undefined string or a Q parameter with invalid numerical value was read. **Error correction** Inform your service agency.
210-000C	**Error message** "(" expected in system file **Cause of error** A opening parenthesis "(" was expected in a message file. **Error correction** Inform your service agency.
210-000D	**Error message** Unexpected end of system file **Cause of error** More characters were expected in a message file, but the file end was reached. **Error correction** Inform your service agency.
210-000E	**Error message** Unknown attribute name in system file **Cause of error** In a message file an unknown message attribute was read. **Error correction** Inform your service agency.
210-000F	**Error message** Attribute already assigned in system file **Cause of error** In a message file a message attribute was read more than once. **Error correction** Inform your service agency.

Error number	Description
210-0010	**Error message** ":=" expected in system file **Cause of error** A colon and equal sign ":=" were expected in a message file. **Error correction** Inform your service agency.
210-0011	**Error message** ")" or "," expected in system file **Cause of error** A closing parenthesis ")" or a comma "," was expected in a message file. **Error correction** Inform your service agency.
210-0012	**Error message** "[" expected in system file **Cause of error** An opening square bracket "[" was expected in a message file. **Error correction** Inform your service agency.
210-0013	**Error message** End of a system file while reading a list **Cause of error** **Error correction**
210-0014	**Error message** End of a system file while reading an array **Cause of error** In a message file the file end was reached while an array was being read. **Error correction** Inform your service agency.
210-0015	**Error message** "]" or "," expected in system file **Cause of error** A closing square bracket "]" or comma "," was expected in a message file. **Error correction** Inform your service agency.

Error number	Description
210-0016	**Error message** List in system file too long **Cause of error** A message contains a list with more elements than allowed. **Error correction** Inform your service agency.
210-0017	**Error message** List in system file too short **Cause of error** A message contains a list with fewer elements than allowed. **Error correction** Inform your service agency.
210-0018	**Error message** Incorrect binary data in system file (string) **Cause of error** Error during binary transmission of a string in a message **Error correction** Inform your service agency.
210-0019	**Error message** Incorrect binary data in system file **Cause of error** An error occurred during the binary transfer of a binary number in a message. **Error correction** Inform your service agency
210-001A	**Error message** Incorrect binary data in system file (list) **Cause of error** Error during binary transmission of a list in a message. **Error correction** Inform your service agency.
210-001B	**Error message** Incorrect binary data in system file (array) **Cause of error** Error during binary transmission of an array in a message. **Error correction** Inform your service agency.

Error number	Description
210-001C	**Error message** Incorrect binary data in system file (entity) **Cause of error** Error during binary transmission of a message. **Error correction** Inform your service agency.
210-001D	**Error message** Error in system file **Cause of error** An error occurred during access to an internal list element. **Error correction** Inform your service agency
210-001E	**Error message** Invalid array index in system file **Cause of error** Access with an illegal index to an array. **Error correction** Inform your service agency.
210-001F	**Error message** Invalid Q parameter index in system file **Cause of error** An excessively large Q-parameter index is being used in a message file. **Error correction** Inform your service agency.
210-0020	**Error message** Invalid binary data in system file **Cause of error** In a message, a binary number was supposed to be read (% followed by a combination of 0 and 1). **Error correction** Inform your service agency
210-0021	**Error message** Invalid attribute name in system file **Cause of error** An undefined attribute name was sought in a message. **Error correction** Inform your service agency.

Error number	Description
210-0022	**Error message** No base type defined in system file **Cause of error** Nonavailable information about base types was requested in a message. **Error correction** Inform your service agency.
210-0023	**Error message** Error during access to system file **Cause of error** Basic reading error while reading a message file. **Error correction** Inform your service agency.
210-0024	**Error message** Insufficient memory **Cause of error** The message memory manager has no more memory. **Error correction** Inform your service agency.
210-0025	**Error message** System error: Insufficient memory **Cause of error** The message memory management is not receiving required resources from the system. **Error correction** Inform your service agency.
210-0026	**Error message** System error: File mapping **Cause of error** The message memory management could not create global buffers. **Error correction** Inform your service agency.
210-0027	**Error message** Requested memory block too large **Cause of error** An excessively large globel message buffer was requested. **Error correction** Inform your service agency.

Error number	Description
210-0028	**Error message** Invalid memory block returned **Cause of error** An invalid buffer was returned to the message memory management. **Error correction** Inform your service agency.
210-0029	**Error message** Memory block already returned **Cause of error** A buffer was returned repeatedly to the message memory management. **Error correction** Inform your service agency.
210-002A	**Error message** Missing type information in system file **Cause of error** The given message type is unknown. **Error correction** Inform your service agency.
210-002B	**Error message** Invalid attribute index in system file **Cause of error** Information was requested on a nonexistent message attribute. **Error correction** Inform your service agency.
210-002C	**Error message** Invalid supertype index in system file **Cause of error** Information was requested on a nonexistent message super-type. **Error correction** Inform your service agency.
210-002D	**Error message** Invalid function call in system file **Cause of error** A function was called that is not allowed for Q messages. **Error correction** Inform your service agency.

Error number	Description
210-002E	**Error message** Invalid Q message data in system file **Cause of error** Error in a message file while reading a Q message. **Error correction** Inform your service agency.
210-002F	**Error message** Invalid Q string **Cause of error** An excessively long string was assigned to a Q-String. **Error correction** Inform your service agency.
220-0002	**Error message** Internal software error **Cause of error** System error. The given message contains an attribute with illegal value. **Error correction** Inform your service agency.
220-0003	**Error message** Internal software error **Cause of error** Attempt to read the same measuring position more than once with the same identifier. **Error correction** Inform your service agency.
220-0004	**Error message** Internal software error Internal software error Internal software error Internal software error **Cause of error** System error **Error correction** Inform your service agency.

Error number	Description
220-000A	**Error message** Start was not executed **Cause of error** Start of an application that cannot be run together with another. There are unacknowledged errors in the error window. **Error correction** First end the application. Delete the error message.
220-000C	**Error message** Message will not be handled in its present state **Cause of error** Message will not be handled in its present state. **Error correction** None
220-000E	**Error message** Error in module configuration **Cause of error** The object requested by the configuration server could not be found. **Error correction** Edit the configuration data. Inform your service agency.
220-000F	**Error message** Error in TOOL DEF or TOOL CALL cycle **Cause of error** The TOOL DEF message was followed by an incorrect TOOL CALL message. **Error correction** Inform your service agency.
220-0010	**Error message** Internal software error **Cause of error** Internal software error **Error correction** Inform your service agency.

Error number	Description
220-0011	**Error message** Error occured in startup cycle **Cause of error** Startup cycle interrupted with error. **Error correction** Remove the cause of error and delete the error message. The cycle is restarted.
220-0013	**Error message** Configuration error occured **Cause of error** Channel name must be unambiguous **Error correction** Edit the configuration data.
220-0014	**Error message** Invalid message %1 **Cause of error** The entered message contains an attribute with invalid value. **Error correction** No further action required
220-0015	**Error message** File access not possible **Cause of error** 1.) Access to the file was denied. 2.) Another application is already writing to the file. 3.) Error in path name. 4.) Data medium full. **Error correction** 1.) Check the access rights to the file and remove any existing write protection. 2.) Close the file in the application that has locked access to the file. 3.) Correct the entered path name. 4.) Delete any unneeded files on the data medium.
220-0016	**Error message** Disk full **Cause of error** Data medium full. **Error correction** Delete any unneeded files on the data medium.

Error number	Description
220-0017	**Error message** File close failed **Cause of error** Error while closing the file. **Error correction** Ensure that the file is not being used by another application.
220-0018	**Error message** General internal communication error **Cause of error** An error has occurred in the system-inherent communication. **Error correction** Inform your service agency.
220-0019	**Error message** ClientQueue (%1) could not be opened **Cause of error** Error in system-inherent communication. No access possible to the specified queue. **Error correction** Inform your service agency.
220-001A	**Error message** Cannot write to queue '%1' **Cause of error** Error in the system-inherent communication. An error occurred while writing data to the specified queue. **Error correction** Inform your service agency.
220-001B	**Error message** Cannot close queue '%1' **Cause of error** Error in the system-inherent communication. The specified queue cannot be closed. **Error correction** Inform your service agency.

Error number	Description
220-001C	**Error message** Unknown error Unknown error **Cause of error** An unknown error occurred during the execution of a program. **Error correction** - Inform your service agency.
220-001D	**Error message** Value too small in %1-%2 **Cause of error** - The entered value is below the minimum limit value. **Error correction** - Change the value. - Check the minimum limit value.
220-001E	**Error message** Value too large in %1-%2 **Cause of error** - The entered value is above the maximum limit value. **Error correction** - Change the value. - Check the maximum limit value.
220-001F	**Error message** Value in %1 out of range **Cause of error** - The entered value is outside of the permitted value range. **Error correction** - Change the value. - Check the limit values.
220-0020	**Error message** System error in the channel object **Cause of error** System error in the channel object **Error correction** - Inform your service agency.

Error number	Description
220-0021	**Error message** Invalid FN14 function **Cause of error** - Stop error not allowed within an internal cycle - Stop error not alllowed after start via soft key **Error correction** Edit the cycle or inform your service agency or machine tool builder.
220-0022	**Error message** System error in program run: Control might be inconsistent **Cause of error** An error occurred in an internal cycle. The internal data of the control might therefore be inconsistent. **Error correction** - Shut down the control as soon as possible and restart it. Until then procede with increased caution. - Inform your service agency.
220-0023	**Error message** Format file defective **Cause of error** The outputs with FN16: F-PRINT (ISO: D16) have reached the maximum size. **Error correction** Change the format file. If necessary, output each text individually, concluding with M_CLOSE.
220-0024	**Error message** Function not available **Cause of error** During a block scan on a control without a history, an attempt was made to implement a PLC strobe with a macro. The function cannot be run on this control. **Error correction** - Change the machine configuration - Inform your service agency
220-0025	**Error message** Contradictory data during PLC strobe implementation **Cause of error** The data in a message are contradictory (implementation of a PLC strobe with a macro). **Error correction** - Inform your service agency

Error number	Description
220-0026	**Error message** Mid-program startup: Simulated TOOL CALL missing **Cause of error** - You executed a block scan that makes a TOOL CALL. However, in the config object CfgSimPosition, the required axis positions after the tool change were not specified. **Error correction** - Adapt the machine configuration. Assign appropriate values to the config object CfgSimPosition. - Inform your machine tool builder.
220-0027	**Error message** Contradictory data in calculation of the position to be attained **Cause of error** When returning to the contour (mid-program startup), the control found contradictory data when calculating the position to be moved to. **Error correction** - Inform your service agency.
220-0028	**Error message** OK **Cause of error** **Error correction**
220-0029	**Error message** NC program **Cause of error** **Error correction**
220-002A	**Error message** NC program changed! **Cause of error** **Error correction**
220-002B	**Error message** External tool **Cause of error** **Error correction**
220-002C	**Error message** Remaining tool life too short **Cause of error** **Error correction**

Error number	Description
220-002D	**Error message** Tool life exceeded **Cause of error** **Error correction**
220-002E	**Error message** Radius difference exists **Cause of error** **Error correction**
220-002F	**Error message** Radius R2 greater than radius R **Cause of error** **Error correction**
220-0030	**Error message** Tool not defined **Cause of error** **Error correction**
220-0031	**Error message** No fitting tool available **Cause of error** **Error correction**
220-0032	**Error message** Tool locked **Cause of error** **Error correction**
220-0033	**Error message** Warning: Tool usage file was not generated with %s! **Cause of error** **Error correction**

Error number	Description
220-0034	**Error message** The current kinematic configuration uses a deactivated axis! **Cause of error** In the current kinematic configuration, an axis is used that is deactivated at present. When an NC program is started or after a PLC strobe is executed, the control checks whether all axes of the active kinematic configuration are also active. Axis movements are no longer allowed. **Error correction** - Activate the deactivated axis, check the machine configuration and correct it if required. - Activate another machine kinematic configuration through the NC program. - Edit the machine configuration or activate another machine kinematic configuration.
220-0035	**Error message** Not all axes in necessary nominal position **Cause of error** You tried to resume the program after returning to the contour, after an NC stop, or after a mid-program startup although not all axes are on the nominal position. The nominal position after an NC stop is the stop position. The nominal position after a mid-program startup is the calculated restore position. **Error correction** - Check the configuration, CfgChannelAxes/restoreAxis - Inform your machine tool builder.
220-0036	**Error message** Incorrect operating mode for internal cycle **Cause of error** An internal cycle is running in another operating mode than intended. Therefore the internal data of the control are possibly inconsistent. **Error correction** - Shut down the control and restart. - Inform your service agency.
220-0037	**Error message** Cancel during switch between turning op. and milling operation **Cause of error** A cancelation occurred during switchover between turning and milling operation. **Error correction** Run FUNCTION MODE MILL or FUNCTION MODE TURN again for consistency.

Error number	Description
220-0038	**Error message** Machine not initialized **Cause of error** - After the machine traversed the reference points, you tried to select a program run mode although the machine was not yet completely initialized. - You canceled the initialization process. **Error correction** - Close all open protective doors. - Unlock all emergency stop buttons. Then press the INIT MACHINE soft key (2nd soft-key row).
220-0039	**Error message** Data reset due to reconfiguration of the kinematics **Cause of error** Data were set during a reconfiguration of the kinematics that are independent from the kinematics. Press the "INTERNAL INFO" soft key for more information. **Error correction** - Delete the error and do an NC start if the reset is OK. - Cancel if difficulties are expected in program continuation due to the reset.
220-003A	**Error message** Data record already locked **Cause of error** An attempt was made to update the tool life in an locked tool data record. **Error correction** Cancel the lock on the data record (e.g. exit the input with the "EDIT OFF/ON" soft key), otherwise it can result in data loss at program end when the tool life updated.
220-003B	**Error message** Cannot end the cancel system cycle %1 **Cause of error** Could not complete the cancel system cycle, perhaps because a PLC strobe was not acknowledged. **Error correction** - Shut down and restart the control (shutdown via error window, MORE FUNCTIONS soft key) - Inform your machine tool builder. He should take the following measures: - Correct the error in the cancel cycle or in the OEM cancel macro - Correct the error in the PLC program

Error number	Description
220-003C	**Error message** Faulty configuration **Cause of error** Entry appears twice in the list **Error correction** Check the configuration data and edit them if necessary
220-003D	**Error message** Tool usage time could not be calculated **Cause of error** - An error occurred in finding the application times of the tools. - Tool usage file is not available or not up to date. **Error correction** - Ensure that the tool usage test has been activated by the configuration. - Usage file for NC program: simulate the program in the Test Run operating mode. The TNC then automatically creates the tool usage file. - Usage file for pallet file: simulate the marked program in the Test Run operating mode. The TNC then automatically creates the tool usage file for each simulated program.
220-003F	**Error message** Program cannot be continued. Selection with GOTO necessary. **Cause of error** You have called for the program simulation to continue within an NC block. Changed conditions must be applied in order to continue. These can be, for example, a new position for a stop, a changed Q parameter, or a changed condition for the activation of skipped blocks. **Error correction** Starting with RESET+START is possible, as is START after GOTO. As an alternative, perform the stated changes only at a stop at the beginning of an NC block.
220-0040	**Error message** File path %1 missing in CfgConfigDataFiles or in CfgJhConfigDataFiles %2 has no effect **Cause of error** A file path is missing in the configuration data. See the error text for more information. **Error correction** Enter the missing path in CfgConfigDataFiles or in CfgJhConfigDataFiles

Error number	Description
220-0041	**Error message** Programmed variable cannot be applied **Cause of error** You tried to edit a variable (e.g. a Q parameter) even though this is not possible in the current state. For example, variables of an NC program cannot be edited while the program is running (not stopped). **Error correction** Try again under appropriate conditions.
220-0042	**Error message** Warnings are being suppressed **Cause of error** The current program run is generating many warnings. The number of warnings of the same type is limited. Further warnings of this type will be suppressed. **Error correction** Correct the NC program
221-0004	**Error message** Error in the kinematic configuration: %1 **Cause of error** List attribute not initialized **Error correction** - Change the kinematic configuration. - Inform your service agency.
221-0005	**Error message** Error in module configuration **Cause of error** The object requested by the configuration server could not be found. **Error correction** - Edit the configuration data - Inform your service agency
221-0007	**Error message** Configuration error occured **Cause of error** General error message that shows that at least one configuration error has occurred. **Error correction** - Correct the displayed configuration error - If no more configuration errors occur, the message is automatically deleted.

Error number	Description
221-0008	**Error message** Error in module configuration: %1 **Cause of error** - The individual object received by the configuration server is incorrect. **Error correction** - Change the kinematic configuration. - Inform your service agency.
221-0009	**Error message** Error in module configuration: %1 **Cause of error** - The view object received by the configuration server is incorrect. **Error correction** - Change the kinematic configuration. - Inform your service agency.
221-000A	**Error message** Error in module configuration: %1 **Cause of error** Inconsistent configuration data **Error correction** - Edit the configuration data. - Inform your service agency.
221-000B	**Error message** General system error in the geometry chain **Cause of error** Contradictory data **Error correction** Inform your service agency.
221-000C	**Error message** Incorrect condition in switch statement **Cause of error** System error during reconfiguration **Error correction** - Edit the kinematic configuration. - Inform your service agency.

Error number	Description
221-000D	**Error message** Error in module configuration: %1 **Cause of error** Uninitialized list in configuration object **Error correction** - Change the kinematic configuration. - Inform your service agency.
221-000E	**Error message** Error in module configuration: %1 **Cause of error** List size of an attributre in configuration object is too small. **Error correction** - Change the kinematic configuration. - Inform your service agency.
221-000F	**Error message** Kinematics configuration faulty %1 **Cause of error** Incorrect axis key in key list **Error correction** - Change the kinematic configuration. - Inform your service agency.
221-0010	**Error message** Kinematics configuration faulty **Cause of error** Error in the kinematic configuration **Error correction** - Change the kinematic configuration. - Inform your service agency.
221-0011	**Error message** Kinematics configuration faulty **Cause of error** Error in the kinematic configuration **Error correction** - Change the kinematic configuration. - Inform your service agency.

Error number	Description
221-0012	**Error message** Kinematics configuration faulty **Cause of error** Error in the kinematic configuration **Error correction** - Edit the kinematic configuration. - Inform your service agency.
221-0013	**Error message** Kinematics configuration faulty **Cause of error** Error in the kinematic configuration **Error correction** - Change the kinematic configuration. - Inform your service agency.
221-0014	**Error message** Kinematics configuration faulty %1 **Cause of error** Missing attribute **Error correction** - Change the kinematic configuration. - Inform your service agency.
221-0015	**Error message** Kinematics configuration faulty %1 **Cause of error** Attribute with incorrect value **Error correction** - Change the kinematic configuration. - Inform your service agency.
221-0016	**Error message** Kinematics configuration faulty %1 **Cause of error** Inconsistency in number of axes **Error correction** - Change the kinematic configuration. - Inform your service agency.

Error number	Description
221-0017	**Error message** Kinematics configuration faulty %1 **Cause of error** Inconsistent key lists in the kinematic model **Error correction** - Change the kinematic configuration. - Inform your service agency.
221-0018	**Error message** Kinematics configuration faulty %1 **Cause of error** Keys in key list already defined **Error correction** - Change the kinematic configuration. - Inform your service agency.
221-0019	**Error message** Kinematics configuration faulty %1 **Cause of error** Same key in the key lists for coordinate transformation through directions and coordinate transformation through angle. **Error correction** - Change the kinematic configuration. - Inform your service agency.
221-001A	**Error message** Kinematics configuration faulty %1 **Cause of error** Incorrect index for key list **Error correction** - Change the kinematic configuration. - Inform you service agency.
221-001B	**Error message** Kinematics configuration faulty %1 **Cause of error** Incorrect number of coordinate transformations **Error correction** - Change the kinematic configuration. - Inform your service agency.

Error number	Description
221-001C	**Error message** Kinematics configuration faulty %1 **Cause of error** Missing coordinate transformation matrix **Error correction** - Change the kinematic configuration. - Inform your service agency.
221-001D	**Error message** Kinematics configuration faulty %1 **Cause of error** Key missing in two key lists, although it should be in one of them **Error correction** - Change the kinematic configuration. - Inform your service agency.
221-001E	**Error message** Error in the kinematic configuration Function not yet implemented: %1 **Cause of error** Attempt to use a nonimplemented function **Error correction** - Edit the NC program.
221-001F	**Error message** Kinematics configuration faulty %1 **Cause of error** Coordinate system defined in two different ways **Error correction** - Change the kinematic configuration. - Inform your service agency.
221-0020	**Error message** Kinematics configuration faulty %1 **Cause of error** - Missing coordinate system definition by angle - Usually caused by an incorrect key in a coordinate transformation defined by directions **Error correction** - Change the kinematic configuration. - Inform your service agency.

Error number	Description
221-0021	**Error message** Kinematics configuration faulty %1 **Cause of error** Incorrect key in key list **Error correction** - Change the kinematic configuration. - Inform your service agency.
221-0022	**Error message** System error during reconfiguration of geometry chain: %1 **Cause of error** System error during reconfiguration **Error correction** - Inform your service agency.
221-0023	**Error message** Incorrect path parameters for look-ahead: %1 **Cause of error** Incorrect path parameter for look-ahead **Error correction** - Edit the configuration.
221-0024	**Error message** No acceleration was defined **Cause of error** No axis acceleration set **Error correction** Edit the configuration.
221-0025	**Error message** Invalid max. feed override **Cause of error** Invalid maximum feed rate override **Error correction** Edit the configuration

Error number	Description
221-0026	**Error message** Error in the general parameter configuration: %1 **Cause of error** Error in the general parameter configuration. **Error correction** - Edit/complete the parameter configuration. - Inform your service agency.
221-0027	**Error message** Kinematics configuration faulty %1 **Cause of error** A programmable axis with special properties was configured. This programmable axis was not assigned to any physical. **Error correction** – Check the axis configuration and edit/add to it if required. - Inform your service agency
221-0028	**Error message** Bad attribute info of %1 **Cause of error** Attribute information invalid or illegible **Error correction** Inform your service agency.
221-0029	**Error message** Value too small in %1-%2 **Cause of error** Programmed or configured value too small. **Error correction** - Edit the configuration. - Edit the program.
221-002A	**Error message** Value too large in %1-%2 **Cause of error** Programmed or configured value too large. **Error correction** - Edit the configuration. - Edit the program.

Error number	Description
221-002B	**Error message** No SQL column description for column %1 in table %2 **Cause of error** The SQL server does not provide a column description for the given SQL table column. It could be that the corresponding table does not exist, is incorrect in syntax, or for some other reason cannot be opened from the SQL server. Or the table has no column with the given name. **Error correction** Ensure that the corresponding table exists and that it has the matching column. Then restart the control. The interpreter needs column descriptions - For all table columns for which you have configured bonds (over CfgSqlProperties, CfgTableBinding and CfgColumn-Binding). - For all columns of some fundamental SQL tables, that are indispensable for the correct function of the system (e.g. tool table).
221-002C	**Error message** SQL column description for column %1 in table %2 inconsistent with bond **Cause of error** The column description for the specified SQL table column provided by the SQL server does not have the correct format for the bond that you have configured for this column, or the table column has a format the interpreter does not recog-nize. **Error correction** Ensure that the column description is correct.
221-002D	**Error message** CfgTableBinding with key %1 inconsistent **Cause of error** In a CfgTableBinding you listed a key for a CfgColumnBind-ing that does not exist. **Error correction** Add the missing CfgColumnBinding or delete the entry from CfgTableBinding.

Error number	Description
221-002E	**Error message** Faulty SQL column bond for column %1 **Cause of error** A faulty bond is configured for the specified column (CfgColumnBinding). **Error correction** Correct CfgColumnBinding: You can configure bonds on Q parameters (ID=0, NR0 bis 999) and bonds on the system data managed in the interpreter.
221-002F	**Error message** Inconsistent configuration for implicit SQL access in the interpreter **Cause of error** The configuration data that determine how the interpreter implicitly accesses SQL tables are inconsistent. (These configuration data are accessible only to the control manufacturer) **Error correction** Correct the configuration data: - The tables (id50Table etc.) given in CfgChannelSysData for the corresponding channel must exist. - An entity CfgSysDataTable with the corresponding key must exist for the columns (id50Columns etc.). - For every entry in the Attribute column of the entity CfgSysDataTable, an entity CfgSysDataColumn with the corresponding key must exist.
221-0031	**Error message** Machine base not specified **Cause of error** The kinematics contain a plane (CfgCMOPlane) and rotary axes. The position of the machine base must be entered in this kinematic configuration. **Error correction** Specify the position of the machine base (in CfgKinAnchor). Use only planes between the machine base and the first rotary axis at the tool. Use only planes between the machine base and the first rotary axis at the machine table.
221-0032	**Error message** Kinematics configuration faulty **Cause of error** Physical axis cannot be assigned to any programmable axis **Error correction** - Change the configuration (CfgProgAxis, CfgAxis) - Inform your service agency

Error number	Description
221-0033	**Error message** Model not loaded "%1": CMOMesh3D "%2" **Cause of error** The M3D-file %1 could not be opened. **Error correction** Check the path to the file in the machine configuration and correct it if necessary.
221-0034	**Error message** Model not loaded "%1": CMOMesh3D "%2" **Cause of error** Error during read-in of the M3D file. The file is corrupted or not a valid M3D file. **Error correction** - Check the file path and correct it if required. - Re-install the file
221-0035	**Error message** STL model does not fulfill the quality requirements **Cause of error** STL model %1 does not fulfill the quality requirements. **Error correction** Use an STL model that fulfills the quality requirements. The following requirements are placed on STL models: - All size values in mm - No gaps between triangles ("waterproof") - No overlapping - No degenerated triangles Refer to the additional information in the Technical Manual.
221-0036	**Error message** Kinematic temperature compensation incorrectly configured **Cause of error** Parameters in the machine configuration were entered incorrectly: Within the config object CfgKinSimpleTrans, both machine parameters realtimeComp and temperatureComp are set. This is not allowed. Only one of the two parameters can be set. **Error correction** Correct the machine configuration: Delete either the parameter realtimeComp or temperatureComp.

Error number	Description
221-0037	**Error message** Model not loaded "%1": CMOMesh3D "%2" **Cause of error** Error while loading the M3D file. The file contains too many triangles. **Error correction** Model the collision objects with fewer triangles. Refer to the additional information in the Technical Manual.
221-006F	**Error message** Faulty kinematics configuration Active kinematics %1 contains an invalid insertion point. **Cause of error** The given kinematic model contains at least one invalid insertion point for a tool-carrier kinematic model (entry under CfgKinToolSocket) **Error correction** Ensure that the kinematic model contains no more than one object of the CfgKinToolSocket type. Ensure that no objects of the CfgKinSimpleAxis or CfgKinAnchor types are located between the tool (i.e. the upper end of the kinematic chain) and the insertion point for the tool carrier.
221-0071	**Error message** No facing slide axis available in the kinematic model **Cause of error** The kinematics do not include a facing slide axis. **Error correction** - Change the kinematic configuration - Inform your service agency
221-0072	**Error message** Spindle or facing slide in faulty in the kinematic model **Cause of error** The spindle is not correctly configured in the kinematics: - In the kinematics configuration, the spindle is not located directly next to the facing slide - The kinematics do not include spindle **Error correction** - Inform your service agency - Adapt the kinematic configuration

Error number	Description
221-0073	**Error message** Datum of facing slide axis is incorrect **Cause of error** The datum of the facing slide is not on the spindle axis. **Error correction** - Check the kinematic configuration and adapt it if necessary. - Inform your service agency.
221-0074	**Error message** Faulty kinematics configuration **Cause of error** Active kinematics contains an invalid insertion point for a fixture (entry under CfgKinFixSocket). The invalid entry is shown in the additional information of the error message. **Error correction** Ensure that the kinematic model contains no more than one object of the CfgKinFixSocket type. Ensure that no objects of the type CfgKinSimpleAxis or CfgKinAnchor are located between the machine table (i.e. the bottom end of the kinematics chain) and the insertion point for the fixture.
221-0075	**Error message** Faulty kinematics configuration **Cause of error** Active kinematics contains an invalid insertion point for a tool-carrier kinematic model (entry under CfgKinToolSocket). The invalid entry is shown in the additional information of the error message. **Error correction** Ensure that the kinematic model contains no more than one object of the CfgKinToolSocket type. Ensure that no objects of the type CfgKinSimpleAxis or CfgKinAnchor are located between the tool (i.e. the top end of the kinematics chain) and the insertion point for the tool carrier.
230-0001	**Error message** Parameter set %2 of axis %3 does not exist **Cause of error** An undefined axis parameter block was selected. **Error correction** In the configuration data, create an additional parameter block for this axis, or select another parameter block for this axis.

Error number	Description
230-0002	**Error message** Logical axis number %2 too large **Cause of error** The control supports a certain maximum number of axes. Here more axes were configured that permitted. **Error correction** Configure fewer axes.
230-0003	**Error message** Too many analog axes configured (more than 2) **Cause of error** The control supports a certain maximum number of analog axes. Here more axes were configured than allowed. **Error correction** Configure fewer analog axes.
230-0004	**Error message** More axes are activated than are enabled in the SIK **Cause of error** The axis options in the SIK specify how many axes can be active at the same time. You have activated more axes over the machine configuration or the PLC program than are allowed as axis options in the SIK. You can delete this error message. If the configured axis number is still too large after the drives are switched on again, the error message will reappear. **Error correction** - Check the machine configuration and PLC program. - If you need more axes, you can get a code number from HEIDENHAIN to enable them.
230-0005	**Error message** External EMERGENCY STOP External EMERGENCY STOP **Cause of error** - The PLC input for the control-is-ready signal is inactive - The EMERGENCY STOP circuit was interrupted manually or by the control. **Error correction** - Enable the EMERGENCY STOP button, switch on the control voltage, and acknowledge the error message. - Check the EMERGENCY-STOP circuit. (EMERGENCY STOP button, axis limit switches, wiring, etc.)

Error number	Description
230-0006	**Error message** Check the parameter for the direction of spindle rotation (2)! **Cause of error** A change in the evaluation of the parameter signCorrNominalVal automatically changed the value of the parameter signCorrActualVal. **Error correction** Please check whether the spindle turns with M3 and M19 in the correct direction. If required, use parameter CfgAxisHardware > signCorrNominalVal or CfgAxisHardware > signCorrActualVal to define the direction of rotation correctly according to the data in the Technical Manual.
230-0007	**Error message** Channel number %2 too large **Cause of error** The control supports a certain maximum number of channels. Here more channels were configured than allowed. **Error correction** Configure fewer channels.
230-0008	**Error message** No reaction from CC **Cause of error** The speed and current controller was switched off due to an error. **Error correction** Check the axis cabling.
230-0009	**Error message** IPO exceeds cycle time **Cause of error** The control loop exceeds the maximum permissible cycle time. **Error correction** Increase the maximum permissible cycle time in the System->MachineHardware->ipoCycle parameter.
230-000A	**Error message** Axis %2 is switched inactive **Cause of error** Command to an axis configured as inactive. **Error correction** In the parameter "Axes->PhysicalAxes->????->axisMode," switch the axis to "active." "????" designates the current axis name.

Error number	Description
230-000B	**Error message** This is not the export version of the software **Cause of error** This is not the export version of the software. **Error correction** Inform your service agency.
230-000C	**Error message** Parameter %2 is not loaded until the control has been restarted **Cause of error** A parameter cannot be loaded for this axis without a RESET of the control. **Error correction** Restart the control.
230-000D	**Error message** Ipo-Trace started **Cause of error** IPO trace started (info) **Error correction**
230-000E	**Error message** Ipo-Trace stopped **Cause of error** IPO trace stopped (info) **Error correction**
230-000F	**Error message** Drive switched off illegally %2 **Cause of error** The drive was switched off without a command from the PLC. **Error correction**
230-0010	**Error message** IPO is running in simulation mode **Cause of error** IPO is running in simulation mode (info) **Error correction**

Error number	Description
230-0011	**Error message** This software version has not been enabled **Cause of error** Wrong software installed **Error correction** Inform your service agency
230-0012	**Error message** Only %1 KB of free memory remaining in SYS partition **Cause of error** The memory capacity of the SYS partition is almost depleted. **Error correction** Inform your service agency
230-0013	**Error message** Only %1 KB of free memory remaining in SYS partition **Cause of error** The memory capacity of the SYS partition is almost depleted. Service information recording was stopped. **Error correction** Inform your service agency
230-0014	**Error message** Parameter selection for axis %2 not allowed in this state **Cause of error** A parameter block switchover was requested in an illegal condition of the NC. **Error correction** Check the PLC program
230-0015	**Error message** Initialization of counter components (G50) failed **Cause of error** The required configuration data for the counter component (G50) could not be read from the file %SYS%\config\CfgG50Init.cfg. **Error correction** Inform your service agency

Error number	Description
230-0016	**Error message** Wrong hardware configuration **Cause of error** There are two SPI modules with various versions. **Error correction** Inform your service agency
230-0017	**Error message** Access to internal periphery failed **Cause of error** A timeout was caused during access to the internal periphery **Error correction** Inform your service agency
230-0018	**Error message** Position or speed control of axis %2 still active **Cause of error** The position, speed and current controllers of axes must be switched off before they can be activated or deactivated. **Error correction** - Check the PLC program
230-0019	**Error message** Changing a parameter requires an NC STOP **Cause of error** During reconfiguration or a parameter set switchover a parameter was changed that requires a previous NC STOP. **Error correction** - Check the PLC program
230-001A	**Error message** A parameter change requires the drive to be switched off (axis %2) **Cause of error** During reconfiguration or a parameter set switchover a parameter was changed that requires that the drive be switched off beforehand. **Error correction** - Check the PLC program

Error number	Description
230-001B	**Error message** For a parameter change the drive has to be deactivated (axis %2) **Cause of error** During reconfiguration or a parameter set switchover a parameter was changed that requires that the drive be deactivated beforehand. Note: The changed parameter or parameter set was not accepted. **Error correction** - Check the PLC program
230-001C	**Error message** Interrupt cycle greater than 3 ms **Cause of error** The cycle time of the controller interrupt exceeds the maximum permissible tolerance of 3 ms. The cause could be a hardware defect of the computer unit MC. **Error correction** - Inform your service agency
230-001D	**Error message** Control loop of axis %2 was opened **Cause of error** The position control loop was opened in order to optimize the axis (e.g. with TNCopt). **Error correction**
230-001E	**Error message** Timeout in the initial servicing of axis %2 **Cause of error** Possible cause: There is no connection to the PC initial-servicing software TNCopt. **Error correction** - Check the connection to TNCopt. (Is the network cable plugged in? Are the interface settings correct?) - Restart TNCopt
230-001F	**Error message** Max. traverse range limits of axis %2 exceeded **Cause of error** When the control loop was open the traverse range limits given by TNCopt were exceeded. **Error correction** Inform your service agency

Error number	Description
230-0020	**Error message** Failed to send internal message **Cause of error** Error in the internal system communication **Error correction** Inform your service agency
230-0021	**Error message** Axis %2 cannot be activated **Cause of error** The value configured under CfgAxis-axisHw prohibits this activation command. **Error correction** Check the configuration
230-0022	**Error message** One or more axes of the channel (%2) are deactivated **Cause of error** You have selected a machine kinematic configuration that contains deactivated axes. During NC start the control checks whether all axes of the selected kinematic configuration are also active. **Error correction** - Check the machine configuration and PLC program. - Activate deactivated axes. - Select a machine kinematic configuration that has no deactivated axes.
230-0023	**Error message** Change of the activation status of axis %2 not allowed **Cause of error** A change was requested of the activation status of an axis (activate/deactivate) in an illegal status of the NC. **Error correction** - Check the PLC program and correct if necessary.
230-0024	**Error message** SPI analog module on CC%2 not recognized **Cause of error** An analog axis was configured on a CC, but no SPI analog module was detected there. **Error correction** Check the configuration. If necessary, inform your service agency.

Error number	Description
230-0025	**Error message** Position of axis %2 stored **Cause of error** The position of this axis is to be saved (frozen) while the control loop is closed or the control loop of this axis was to be closed while the position was saved. **Error correction** Check the PLC program. If necessary, inform your service agency.
230-0026	**Error message** An HSCI participant has triggered the SS2/STOP2 stop reaction **Cause of error** - The self-test of the control could not be completed - A device reports a temperature problem - The fan of a device is defective **Error correction** - Note further messages - Use the bus diagnostics (or TNCdiag, if available) to find out which device reports the error (bit REQ.SS2 in the local S status)
230-0027	**Error message** More spindles than permitted are configured **Cause of error** You configured more spindles than allowed for the control. **Error correction** - Check the machine configuration and correct it if required Parameter: System / CfgAxes / spindleIndices
230-0029	**Error message** IPO cycle time exceeded permissible threshold (%2 us) **Cause of error** The cycle time of the controller interrupt exceeds the default threshold in the internal parameter maxIpoTime. **Error correction** Inform your service agency.

Error number	Description
230-002A	**Error message** Difference between ACTL and NOML spindle speed (%2) too high **Cause of error** The difference between the actual and nominal speed exceeds the tolerance. **Error correction** - Check the parameters CfgSpindle/absSpeedTolerance and CfgSpindle/relSpeedTolerance - Check whether the actual and nominal speeds have the same algebraic sign
230-002B	**Error message** Formula entered in distPerMotorTurnF is invalid **Cause of error** In the machine parameter "distPerMotorTurnF" you entered a formula that contains invalid characters. **Error correction** - Check the input value in machine parameter "distPerMotor-TurnF " and correct it
230-002C	**Error message** PLC:/ccfiles file must be deleted **Cause of error** The file PLC:/ccfiles is available, but it is needed as a directory by the NC software for CC files. **Error correction** Delete the PLC:/ccfiles file and then restart the control
230-002D	**Error message** Deactivation of an active touch probe (TS or TT) not allowed **Cause of error** The PLC program tried to deactivate a touch probe activated by the NC, or the NC tried to deactivate a touch probe activated by the PLC. **Error correction** Check the NC program and/or the PLC program
230-002E	**Error message** Initialization of counter components (G127) failed **Cause of error** Hardware is defective **Error correction** Inform your service agency.

Error number	Description
230-002F	**Error message** The control is still in its factory default setting **Cause of error** The parameter CfgMachineSimul/simMode is still set to the value "Delivery". The drives cannot be switched on in this mode. **Error correction** - Set parameter CfgMachineSimul/simMode to the value "FullOperation". First the parameters of the axes must be assigned with realistic values.
230-0030	**Error message** Encoder error in axis %2 **Cause of error** The encoder for this axis reports an error. Possible errors (encoder status): Bit 2 = 1: Position could not be ascertained Bit 3 = 1: CRC error during EnDat 2.2 transmission Bit 4 = 1: No position measurement with EnDat 2.2 Bit 5 = 1: Alarm 1 with EnDat 2.2 Bit 6 = 1: Alarm 2 with EnDat 2.2 Bit 7 = 1: Timeout during EnDat 2.2 transmission **Error correction** Check the connected encoder
230-0031	**Error message** RTC: Axis %2 exceeds the max. permissible velocity **Cause of error** The maximum permissible value was exceeded during the real-time coupling (RTC). **Error correction** Allow a greater share of CfgFeedLimits/maxFeed in CfgRtCoupling/maxFeed, or change the function in CfgRtCoupling/function
230-0032	**Error message** RTC: Axis %2 exceeds the max. permissible acceleration **Cause of error** The real-time coupling function (RTC) causes a violation of the maximum permissible acceleration. **Error correction** Allow a greater share of CfgFeedLimits/maxAcceleration in CfgRtCoupling/maxAcc, or change the function in CfgRtCoupling/function

Error number	Description
230-0033	**Error message** RTC: Axis %2 exceeds the max. permissible end positions **Cause of error** The real-time coupling function (RTC) causes a violation of the maximum permissible working space. **Error correction** Adjust the setting in CfgRtCoupling/function
230-0034	**Error message** RTC: Axis %2 causes a run-time error **Cause of error** The configured function for Real-Time Coupling (RTC) causes a run-time error (e.g. root(-1)). **Error correction** - Check the function in the machine parameter CfgRTCou-pling/function and adapt it if required - Inform your service agency
230-0034	**Error message** The formula in limitAccSpeedCtrlF is faulty **Cause of error** In the machine parameter "distPerMotorTurnF", you entered a formula that contains invalid characters. **Error correction** Check the input value in the parameter "distPerMotorTurnF" and correct it
230-0035	**Error message** The formula in limitDecSpeedCtrlF is faulty **Cause of error** In the machine parameter "limitDecSpeedCtrlF", you entered a formula that contains invalid characters. **Error correction** Check the input value in the parameter "limitDecSpeedCtrlF" and correct it

Error number	Description
230-0036	**Error message** Voltage drop on controller unit **Cause of error** The power supplies on a device in the HSCI line are outside of the specified range. The HSCI bus diagnosis indicates which HSCI component triggered the error. Possible devices: - MC main computer - PL inputs/outputs - MB machine operating panel - Other CC in the HSCI line Possible causes: - Insufficient power supply to the devices - Short circuit in the power supply - Short circuit in PL inputs and outputs **Error correction** - Check the supply voltage in the connected devices Check the wiring for possible short circuits (e.g. PLC inputs or outputs). - If required, exchange the defective hardware - Inform your service agency
230-0037	**Error message** Impermissibly large position nominal value in axis %2 **Cause of error** - Internal software error - Faulty nominal value jump detected **Error correction** - Save the service files - Inform your service agency
230-003A	**Error message** Measuring cycle started without a touch probe **Cause of error** - Touch probe cycle started for measurement without inserted touch probe **Error correction** - Check the NC program - Insert the touch probe - Inform your service agency

Error number	Description
230-003B	**Error message** Parameter checking: %2 warnings issued **Cause of error** - Current configuration of the machine has discrepancies **Error correction** - Check the inspection results in PLC:\service\Param-Check.txt - Correct any discrepancies - Inform your service agency
230-003D	**Error message** Two-fold positioning was requested for axis %2 **Cause of error** - Double positioning started for an axis - The axis is to be moved both by the PLC as well as the NC **Error correction** - Check the PLC program and correct it if necessary - Inform your service agency
230-003F	**Error message** Position encoder input reserved by FS (axis %2) **Cause of error** In systems with functional safety, the speed and position encoder inputs are always permanently assigned to a single axis. This means in a single-encoder system (speed encoder only) it is not possible for example to use the vacant position encoder input for another drive or a display axis. **Error correction** - Check the configuration and change it if necessary - Inform your service agency.
230-0040	**Error message** Position encoder input reserved **Cause of error** In systems with functional safety, the speed and position encoder inputs are always permanently assigned to a single axis. This means in a single-encoder system it is not possible for example to use the vacant position encoder input for another drive or a handwheel. **Error correction** - Check the configuration and change it if necessary - Inform your service agency.

Error number	Description
230-0041	**Error message** IPO cycle time has exceeded the permissible threshold (%2 µs) **Cause of error** - Internal error: Cycle time of the controller interrupt is too large. **Error correction** - Make a service file - Inform your service agency
230-0042	**Error message** The touch probe monitor is deactivated for %2 seconds **Cause of error** The probe monitoring has been deactivated by the operator for a certain time **Error correction** Retract the touch probe and/or remove it from the working space
230-0043	**Error message** Error in reference point acquisition in axis %2 **Cause of error** An error occurred during determination of the EnDat switch-on position **Error correction** Inform your service agency
230-0044	**Error message** Error in axis simulation **Cause of error** Incorrect call of the controller unit during the simulation. **Error correction** Inform your service agency.
230-0045	**Error message** Error in CfgAnalogSync (key = %2) **Cause of error** No function was configured in an element. **Error correction** - Check the configuration and correct it if necessary - Inform your service agency.

Error number	Description
230-0046	**Error message** Error in CfgAnalogSync **Cause of error** No free list element was found. **Error correction** - Check the configuration and correct it if necessary - Inform your service agency.
230-0048	**Error message** The axis (%2) cannot be traversed additionally **Cause of error** Due to the active kinematics model, this axis cannot be traversed additionally. Possible causes: - Basic rotation activated - TCPM activated - Machine with oblique axis **Error correction** Deactivate basic rotation Deactivate TCPM
230-0049	**Error message** Timeout during job acknowledgment **Cause of error** The module that assigned commands to the CC (UVR commands) can't be reached. **Error correction** Inform your service agency
230-004A	**Error message** Could not send message to PLC **Cause of error** An acknowledgment message could not be sent to the PLC. The incoming queue of the PLC is full. **Error correction** Inform your service agency
230-0064	**Error message** Axis %2 in channel %3 not yet configured **Cause of error** An axis unknown to the system is to be moved **Error correction** Check the NC program, and if required, configure the axes.

Error number	Description
230-0065	**Error message** Grinding function not available **Cause of error** Grinding function was not enabled. **Error correction** Check the NC program. If necesary, configure the grinding axes.
230-0066	**Error message** Internal error in grinding functions **Cause of error** Internal error in the grinding generators for swinging and infeed **Error correction** Inform your service agency
230-0067	**Error message** Grinding command not allowed in this state **Cause of error** Command not permitted in current state of the grinding generators **Error correction** - Check sequence of grinding commands. - Inform your service agency if necessary.
230-006C	**Error message** Stylus deflected in %2 outside of the probing process **Cause of error** The touch probe was triggered although the measuring procedure had not yet begun. **Error correction** Check the NC program or working space.
230-006D	**Error message** In %2 no axis polynomial available during movement **Cause of error** Timing problem in the coordination of interpolator and LookAhead. **Error correction** Inform your service agency.

Error number	Description
230-006E	**Error message** %2 Parameter CfgLiftOff off **Cause of error** In the parameter NcChannel->????->CfgLiftOff->on, the lift-off is switched off with NC stop although it should be activated in the NC program. "????" stands for the current channel name. **Error correction** Check the NC program or activate CfgLiftOff
230-006F	**Error message** %2 Distance CfgLiftOff != Parameter **Cause of error** The lift-off height in the NC program is greater than that entered in the parameter NcChannel->????->CfgLiftOff->distance. "????" stands for the current channel name. **Error correction** Change the lift-off distance in the NC program.
230-0070	**Error message** Too many axes to be interpolated **Cause of error** The maximum allowed number of simultaneously moving axes was exceeded. (In the export version the maximum is 4 axes.) **Error correction** Check the NC program
230-0071	**Error message** Spindle is not yet referenced **Cause of error** An spindle without reference is supposed to be positioned. **Error correction** - Check the NC program - Home the spindle
230-0072	**Error message** Too many labels in channel %2 during channel synchronization **Cause of error** Too many labels assigned during channel synchronization. **Error correction** - Check the NC program

Error number	Description
230-0073	**Error message** Error in synchronization on coordinates in channel %2 **Cause of error** A channel that is supposed to be waited for before starting channel synchronization has already traversed the next synchronization mark; i.e. the synchronization is faulty. **Error correction** - Check the NC program
230-0074	**Error message** Thread with incorrect spindle **Cause of error** You tried to drill/cut threads with a spindle that does not at present belong to this channel. **Error correction** - Check the NC program
230-0075	**Error message** This function is permitted only for modulo axes (axis %2) **Cause of error** An axis was being placed in modulo limits although it was not defined as a modulo axis in the machine configuration. Only a modulo axis can be placed in modulo limits. **Error correction** - Check the NC program - Check the machine parameter CfgAxis->isModulo and correct it if required.
230-0076	**Error message** No axes-movement allowed in channel %2 **Cause of error** The NC program was not started with the the NC Start key, so no axis movements are allowed. Or, one or more unreferenced axes are to be moved in one cycle. **Error correction** - Check the NC program - Move the axes over the reference marks
230-0077	**Error message** Illegal jump in the path profiles of an axis **Cause of error** The actual position of an axis does not agree with the nominal value calculated from the geometry. **Error correction** - Inform your service agency

Error number	Description
230-0078	**Error message** Spindle synchronization is not possible! **Cause of error** The programmed starting length for synchronizing the spindle is insufficient. **Error correction** - Increase the starting length or reduce the spindle speed.
230-0079	**Error message** Spindle not synchronized at beginning/end of the thread! **Cause of error** The programmed starting length/overtravel length for synchronizing and desynchronizing the spindle is insufficient. As a result, the thread at the start/end does not have the programmed pitch! **Error correction** - Increase the starting length/overtravel length, or reduce the spindle speed.
230-007A	**Error message** One or more axes do not reach the control window in channel %2 **Cause of error** At program start and during an exact stop, all axes must be in the control window.One or more axes of this channel has not fulfilled this condition. **Error correction** Check the configuration data CfgControllerTol->posTolerance and CfgControllerTol->timePosOK. Adapt the configuration data to the conditions of the machine.
230-007B	**Error message** One or more axes in channel %2 will be assigned by the PLC **Cause of error** For NC stop, the PLC must cancel all PLC positioning of this channel's axes. It has up to 10 seconds for this task. This time was exceeded. **Error correction** Check the PLC program
230-007C	**Error message** IPO internal Breakpoint reached **Cause of error** **Error correction**

Error number	Description
230-007D	**Error message** Thread cutting canceled with NC stop **Cause of error** The NC stop button was pressed in channel %2 during thread cutting **Error correction** Restart NC program
230-007E	**Error message** Axis %2 in channel %3 has no reference **Cause of error** One axis of the active kinematic configuration has no reference. **Error correction** Reference the axis and restart the NC program.
230-007F	**Error message** Retraction from thread completed **Cause of error** The retraction from the thread has been concluded. **Error correction** NC program cannot be continued. If required, restart the program.
230-0080	**Error message** Auxiliary axes are not permitted in an NC channel **Cause of error** Free auxiliary axes (e.g. from a UMC 11x), are supposed be adopted in the kinematics of an NC channel. This is not allowed. **Error correction** Check the machine configuration and correct it if required.
230-0081	**Error message** Finding the field angle **Cause of error** **Error correction**
230-0082	**Error message** Touch probe cannot be switched off **Cause of error** The control tried to switch off the touch probe but it did not react within a specified time. **Error correction** - Check the signal. – Check the transmitter/receiver and cleaned it if necessary.

Error number	Description
230-0083	**Error message** “MoveAfterRef” is not possible with active protection zone **Cause of error** - A protection zone was defined for a modulo axis. - A configured movement is not possible after the reference run. **Error correction** - Check the axis position - After the reference run, delete the movement in the configuration - Inform your service agency
230-0084	**Error message** Dual-head evaluation not permitted in the export software (%2) **Cause of error** - The dual-head evaluation function requires an export license. - The parameter MP_posEncoderTwoHead may not be set in the export software. **Error correction** - Check and correct the configuration. - Inform your service agency.
230-00C7	**Error message** Coupling for inactive axes not possible (axis %2) **Cause of error** A coupling for a deactivated axis was supposed to be closed. This is not possible. **Error correction** Check the PLC program or configuration. Inform your service agency.
230-00C8	**Error message** No configuration available for axis %2 **Cause of error** There is no configuration available for the desired axis coupling. **Error correction** A desired coupling (position coupling or torque coupling) for the respective slave axis must be entered under CfgAxisCoupling.

Error number	Description
230-00C9	**Error message** Axis %2 is already a master axis **Cause of error** For the desired axis coupling, the slave axis is already a master axis. **Error correction** Couplings can be commanded only for axes that are not the master or slave axis of an already existing coupling.
230-00CA	**Error message** Axis %2 is already a slave axis **Cause of error** For the desired axis coupling, the slave axis is already a slave axis. **Error correction** Couplings can be commanded only for axes that are not the master or slave axis of an already existing coupling.
230-00CB	**Error message** No coupling active (axis %2) **Cause of error** An attempt was made to open an axis coupling that is already active. **Error correction** Only active couplings can be opened.
230-00CC	**Error message** Coupling is modulo / non-modulo axes not allowed (axis %2) **Cause of error** Differently configured axes were supposed to be coupled. **Error correction** For axis coupling, either both or neither of the axes (master and slave) have to be modulo axes.
230-00CD	**Error message** Opening an axis coupling only allowed for slave axis (axis %2) **Cause of error** An axis coupling was supposed to be opened. The command for opening must be sent to the slave axis. **Error correction** Check the PLC or NC program

Error number	Description
230-00CE	**Error message** Maximum position difference exceeded (axis %2) **Cause of error** The position difference configured in parameter CfgAxisCoupling->maxPosDiff was exceeded. **Error correction** Check the machine or parameters.
230-00CF	**Error message** Maximum position difference exceeded (axis %2) **Cause of error** The position difference configured in parameter CfgAxisCoupling->ultimatePosDiff was exceeded. This error is not deletable because it is a mechanical defect. **Error correction** Check the mechanical configuration or parameters.
230-00D0	**Error message** Slave does not reach coupling position. (axis %2) **Cause of error** During coupling the slave axis crossed over its own software limit switch. **Error correction** Check the position of the axes (master and slave) and the parameters.
230-00D1	**Error message** Option for gantry axes not enabled **Cause of error** A gantry axis (synchronized axes with position coupling) was configured and activated, but the required software option was not yet enabled. **Error correction** - Check the parameter object CfgAxisCoupling - Enable the software option
230-00D2	**Error message** Coupling factor not equal to +1 or -1 is not allowed **Cause of error** For modulo axes, only coupling factors of +1 or -1 are allowed for a gantry coupling. **Error correction** Check the parameter object CfgAxisCoupling or the PLC program

Error number	Description
230-00D3	**Error message** Option for spindle synchronism not enabled **Cause of error** A spindle synchronization was commanded, but the required software option was not enabled. **Error correction** Enable the software option
230-00D4	**Error message** During active synchronism, a spindle cannot be used as an axis **Cause of error** During active synchronism, a spindle is to be used as an interpolating axis **Error correction** - Check the NC or PLC program and adapt it if necessary - Inform your service agency
230-00D5	**Error message** Kinematics axis not possible as slave axis. (axis %2) **Cause of error** An axis that is in the kinematics cannot be used as a slave axis of a gantry system. **Error correction** - Check the axis configuration. - Check the kinematics configuration. - Inform your service agency.
230-00FA	**Error message** Limit switch %2 + Limit switch %1 + **Cause of error** The calculated tool path exceeds the machine's positive traverse limits. **Error correction** - Check the programmed coordinates. If required, edit the program. - Check the reference point. If required, set a new reference point.

Error number	Description
230-00FB	**Error message** Limit switch %2 - Limit switch %1 - **Cause of error** The calculated tool path exceeds the machine's traverse limits. **Error correction** - Check the programmed coordinates. If required, edit the program. - Check the reference point. If required, set a new reference point.
230-00FE	**Error message** Pos. SW limit switch is smaller than neg. SW limit switch (%1) **Cause of error** The value of the positive SW limit switch is smaller than the value of the negative SW limit switch **Error correction** Check the parameter Axes->ParameterSets->????->CfgPositionLimits->... "????" stands for the current parameter block name
230-00FF	**Error message** The PLC variable %1 has reached the maximum value of %2 mm **Cause of error** The variable concerned goes into the calculation of the kinematic compensation and has exceeded the maximum permissible value. The variable will be set to the maximum value. The warning will be deleted as soon as the variable has fallen below the maximum value by 0.1 mm. **Error correction** - Check the calculation for the variable's value - Inform your machine tool builder
230-0100	**Error message** %1 axis has reached the max. axis-error compensation of %2 mm **Cause of error** The calculated axis-error compensation has exceeded the max. permissible value for the axis. The compensation is set to the maximum value. The warning is deleted as soon as the axis compensation has fallen below the maximum value by 0.1 mm. **Error correction** - Check the parameters for axis error compensation. - Check the values in the axis-error compensation table.

Error number	Description
230-0104	**Error message** In %2, the load limit 1 of %3 was exceeded **Cause of error** During load monitoring the warning threshold for power was exceeded. **Error correction** - Reduce feed rate of machining - If necessary, run a reference search to reestablish the power limits
230-0105	**Error message** In %2, the load limit 2 was exceeded by %3 **Cause of error** During load monitoring (power) the threshold for program cancelation was exceeded. **Error correction** - Reduce feed rate of machining - If necessary, run a reference search to reestablish the power limits
230-0106	**Error message** In %2 the total load limit of %3 was exceeded **Cause of error** During load monitoring the warning threshold for the total load was exceeded. **Error correction** - Reduce feed rate of machining - If necessary, run a reference search to reestablish the power limits
230-0109	**Error message** Error in the real-time coupling function (RTC) of axis %2 **Cause of error** Real-time coupling function (RTC) is supposed to be opened, but no coupling function is active. **Error correction** - Check the NC program and correct if necessary - Inform your machine tool builder
230-010A	**Error message** Error in the real-time coupling function (RTC) of axis %2 **Cause of error** Real-time coupling (RTC) is supposed to be closed, but coupling function is already active. **Error correction** - Check the NC program and correct if necessary - Inform your machine tool builder

Error number	Description
230-010B	**Error message** Error in the real-time coupling function (RTC) of axis %2 **Cause of error** No valid command for closing or opening the coupling was given for the real-time coupling function. **Error correction** - Check the NC program and correct if necessary - Inform your machine tool builder
230-010C	**Error message** Error in the real-time coupling function (RTC) of axis %2 **Cause of error** The PLC program tried to open a coupling function activated by the NC, or die NC tried to open a coupling function activated by the PLC. **Error correction** - Check the NC program and correct if necessary - Inform your machine tool builder
230-010D	**Error message** Error in the real-time coupling function (RTC) of axis %2 **Cause of error** An error occurred during compilation of the function (see INTERNAL INFO soft key). **Error correction** - Check the real-time coupling function (RTC) to be activated - Inform your service agency
230-010E	**Error message** Error in the real-time coupling function (RTC) of axis %2 **Cause of error** No function was entered in the configuration for closing a real-time coupling function (RTC). **Error correction** - Check the function under CfgRtCoupling/function and adjust if necessary - Inform your machine tool builder
230-010F	**Error message** Error in the real-time coupling function (RTC) of axis %2 **Cause of error** The active real-time coupling function (RTC) has caused a run-time error. (E.g. sqrt(-1)) **Error correction** - Check the active function in the machine configuration (CfgRtCoupling/function) - Inform your machine tool builder

Error number	Description
230-0110	**Error message** Option for coupling functions not enabled **Cause of error** A coupling was commanded, but the required software option was not enabled. **Error correction** - Enable option #135 (synchronizing functions)
230-0111	**Error message** Error in the real-time coupling function (RTC) of axis %2 **Cause of error** The function entered for closing a real-time coupling function (RTC) was too long. **Error correction** - Check the function under CfgRtCoupling/function and adjust if necessary - If the formula was presented by the PLC, check the PLC program - Inform your machine tool builder
230-0112	**Error message** RTC coupling programmed with active DCM. Deactivate DCM? **Cause of error** During active DCM collision monitoring you started a real-time coupling function (RTC). Caution: DCM must be deactivated! **Error correction** Press NC start to confirm deactivation of DCM and continue editing the program
230-0113	**Error message** RTC coupling programmed with active DCM **Cause of error** During active DCM collision monitoring you started a real-time coupling function (RTC). The NC program run was aborted. **Error correction** Adapt the NC program: Deactivate DCM if the real-time coupling function (RTC) is switched on by a cycle.

Error number	Description
230-0115	**Error message** Formula is erroneous **Cause of error** Faulty formula in the entity RTCanalog. **Error correction** - Check the configuration and change it if necessary - Inform your service agency
230-0116	**Error message** Extended limit switch monitoring %2 + **Cause of error** A compensation movement traverses the extended positive limit switch **Error correction** - Check compensations - Inform your service agency
230-0117	**Error message** Extended limit switch monitoring %2 - **Cause of error** A compensation movement traverses the extended negative limit switch **Error correction** - Check compensations - Inform your service agency
230-011A	**Error message** Run-time error in the formula calculation of offsetForM19 **Cause of error** The active formula for offsetForM19 caused a run-time error, such as sqrt(-1). **Error correction** Check the active function in the machine configuration (CfgSpindle/offsetForM19)
230-011B	**Error message** Formula in offsetForM19 invalid **Cause of error** In the machine parameter "offsetForM19", you entered a formula that contains invalid characters. **Error correction** Check the input value in the parameter "offsetForM19" and correct it

Error number	Description
230-015E	**Error message** Error in initialization of touch probe **Cause of error** 3-D touch probe: Actual position capture was refused by the CC with an error message. **Error correction** - Inform your service agency
230-0190	**Error message** Excessive servo lag in %2 **Cause of error** The following error of a moving axis is greater than the value specified in the configuration datum Axes > ParameterSets > ???? > CfgPosControl > servoLagMin1 / servoLagMax1. "????" designates the name of the affected parameter set. **Error correction** - Reduce the contouring feed rate, increase the rotational speed. - Remove any possible sources of vibration. - Inform your service agency if the error occurs frequently.
230-0192	**Error message** Excessive following error in %2 **Cause of error** The following error of a moving axis is greater than the value specified in the configuration datum Axes > ParameterSets > ???? > CfgPosControl > servoLagMin2 / servoLagMax2. "????" designates the name of the affected parameter set. **Error correction** - Reduce the contouring feed rate, increase the rotational speed. - Remove any possible sources of vibration. - Inform your service agency if the error occurs frequently.
230-0193	**Error message** Position encoder %2: Amplitude too small **Cause of error** The amplitude of the position encoder signal is too low or the signal for contamination is active. **Error correction** Check the amplitude of the position encoder signal.

Error number	Description
230-0194	**Error message** Position encoder %2: Frequency too high **Cause of error** The maximum input frequency was exceeded at a position encoder input. **Error correction** Check the input frequency of the position encoder signal.
230-0195	**Error message** Error in zero pulse distance of encoder %2 **Cause of error** Encoder defective **Error correction** Exchange the encoder.
230-0196	**Error message** Position encoder %2 defective **Cause of error** Contradiction apparent from comparison of the absolute and incremental positions. **Error correction** Inform your service agency.
230-0197	**Error message** Error in zero pulse distance of encoder %2 **Cause of error** Contradiction in comparison of the absolute and incremental position. **Error correction** Inform your service agency.
230-0198	**Error message** Nominal speed value too high %2 **Cause of error** An excessively high nominal speed value was calculated. Analog axes: Maximum nominal value +-10 V Analog spindle: Maximum nominal value +-10 V Digital axes and spindle: Maximum nominal value = maximum motor speed - The machine does not reach the set acceleration and braking ramps - Hardware error in the control loop **Error correction** - Analog axes: Check the servo - Inform your service agency

Error number	Description
230-0199	**Error message** Movement monitoring error in %2 **Cause of error** Movement monitoring: Nominal rpm=0, actual rpm=0, feed value>0 ==> Axis physically blocked or position comparison of motor encoder does not equal external position encoder. **Error correction** Check the parameter Axes->ParameterSets->????->CfgEncoderMonitor->movementThreshold. "????" designates the present parameter set name. - Inform your service agency
230-019A	**Error message** Standstill monitoring err. in %2 **Cause of error** The position error at standstill is greater than the parameter Axes->ParameterSets->????->CfgControllerAuxil->checkPosStandstill defined in the configuration datum. "????" designates the present configuration set name. **Error correction** Inform your service agency.
230-019B	**Error message** %2 does not attain the control window **Cause of error** The configuration datum Axes->ParameterSets->????->CfgControllerTol->posTolerance is defined too low. "????" designates the current parameter set name **Error correction** Increase the value
230-019C	**Error message** Following error in switched-off axis (%2) is too large **Cause of error** Disconnected axis was moved. **Error correction** When an axis is switched off, it must be locked. Or Switch off the parameter Axes->ParameterSets->????->CfgControllerAuxil->driveOffLagMonitor. "????" stands for the current parameter block name.

Error number	Description
230-019D	**Error message** Probe system not ready **Cause of error** - Touch probe is not connected. - Battery in touch probe is dead. - No connection between infrared probe system and receiver unit. **Error correction** - Connect the touch probe. - Exchange the battery. - Clean the receiver unit. To be able to exchange the defective touch probe: 1. In the Manual operating mode, press the "touch probe monitoring" soft key. 2. Delete the error message. 3. Call another tool. Note: The touch probe monitoring is inactive until the next tool call or measuring operation. This means that the NC will not detect a collision with the touch probe!
230-019E	**Error message** Exchange touch probe battery **Cause of error** The battery in the touch probe is dead. **Error correction** Use a fresh battery.
230-019F	**Error message** CC index for %1 too large **Cause of error** In the hardware equipment of this control, there are fewer speed controller processors than were configured for this axis. **Error correction** Check the parameters in the Axes->ParameterSets->????->CfgAxisHardware entity. "????" stands for the current parameter block name.
230-01A0	**Error message** Axis index on CC too large **Cause of error** The axis index on the CC is specified by the parameter selEncoderIn, but the CC has fewer axes than were configured. **Error correction** Distribute the axes into two or more CCs (if available).

Error number	Description
230-01A1	**Error message** Input for position encoder (%1) not found **Cause of error** The input of the position encoder in the indicated axis is configured incorrectly. **Error correction** Check the configuration of the axis: - CfgAxisHardware/posEncoderInput
230-01A2	**Error message** EnDat encoder (%2) reports error **Cause of error** Connected EnDat encoder or encoder cable is defective **Error correction** Check the EnDat encoder or encoder cable
230-01A3	**Error message** Absolute actual position of the axis (%2) not confirmed **Cause of error** Current EnDat position will not be transferred (user input) **Error correction** Check the EnDat encoder or encoder cable, exchange encoder if necessary
230-01A4	**Error message** EnDat encoder (%2) reports different resolution **Cause of error** The resolution reported by the connected EnDat encoder does not match the resolution defined in the configuration data **Error correction** Check the configuration data of the encoder
230-01A5	**Error message** EnDat encoder (%2) reports wrong position **Cause of error** Connected EnDat encoder or encoder cable is defective **Error correction** Check the EnDat encoder or the encoder cable

Error number	Description
230-01A6	**Error message** %2 does not attain the programmed speed **Cause of error** The configuration datum Axes->ParameterSets->????->CfgControllerTol->speedTolerance is defined too low. "????" designates the current name of the configuration set. **Error correction** Increase the value
230-01AB	**Error message** Drive to be moved (%2) is not switched on. **Cause of error** A drive that is supposed to be moved from an NC program or by PLC positioning is not switched on. **Error correction** Check the PLC program
230-01AC	**Error message** Drive to be moved (%2) is not in the position loop **Cause of error** Nominal position values are being generated from an NC program or by a PLC positioning command for a drive that is not in the position loop. **Error correction** Check the PLC program.
230-01AD	**Error message** Deviation in the switch-on position of axis %2 too large **Cause of error** The switch-on position of this axis deviates more than allowed from the position last saved (CfgReferencing->endatDiff). **Error correction** Check the current position. If required, increase the parameter values.
230-01AE	**Error message** Hardware description for axis %2 has changed Position might not be valid **Cause of error** Hardware description parameters of this axis have been changed. Saved positions are invalid. **Error correction** Check the current position.

Error number	Description
230-01AF	**Error message** Error in encoder configuration of axis %1 **Cause of error** Incorrect encoder configuration of the axis. **Error correction** The encoder configuration does not fit the hardware. Refer to the Technical Manual.
230-01B0	**Error message** Error in spindle positioning (%2) **Cause of error** A spindle positioning movement could not be ended properly. **Error correction** The configuration datum Axes/ParameterSets/[key of the axis]/CfgFeedLimits/m19MaxSpeed is defined too low.
230-01B1	**Error message** MC software does not match CC software **Cause of error** Incorrect combination of CC and MC software. **Error correction** Inform your service agency
230-01B2	**Error message** Configuration of digital axes not possible without CC **Cause of error** Without CC only analog axes can be configured. **Error correction** Inform your service agency or change the configuration.
230-01B3	**Error message** S-RAM contents of axis %2 are invalid. **Cause of error** The axis position values saved in S-RAM are invalid. **Error correction** Check the current position
230-01B4	**Error message** Maximum traverse range of EnDat axis was exceeded. **Cause of error** The axis must be readjusted. **Error correction** Redetermine the parameter CfgReferencing->refPosition

Error number	Description
230-01B5	**Error message** The maximum traverse range of the EnDat axis was exceeded while it was switched off **Cause of error** Check the position of the axis. **Error correction** If necessary, reenter the parameter CfgReferencing->refPosition
230-01B6	**Error message** %2 synchronous window not reached **Cause of error** The configuration datum Axes->ParameterSets->????->CfgControllerTol->syncTolerance is defined too low. "????" designates the current name of the configuration set. **Error correction** Increase the value
230-01B7	**Error message** The encoder of an axis in the position control loop must not be switched (%2). **Cause of error** Before a position encoder can be switched, the drive concerned must be switched off by the PLC. **Error correction** Check the NC program, check the PLC program.
230-01B8	**Error message** Two encoders with EnDat interface cannot be used for one axis (%2). **Cause of error** If an EnDat encoder is configured for an axis, the encoder must be entered in parameter block index 0. No more than one EnDat encoder is allowed per axis. **Error correction** - Change the configuration (sequence of parameter blocks). - Change the hardware configuration (encoders).
230-01B9	**Error message** Input X%2 for axis %3 is already assigned to another axis. **Cause of error** The CfgAxes->ParamSet->..->posEncoderInput parameter refers to an input that is already occupied by another axis. **Error correction** - Check the encoder inputs. - If an axis does not have a position encoder, enter the value "none."

Error number	Description
230-01BA	**Error message** Input X%2 for axis %3 is already assigned to another axis. **Cause of error** The CfgAxes->ParamSet->..->speedEncoderInput parameter refers to an input that is already occupied by another axis. **Error correction** - Check the encoder inputs. - If an axis does not have a speed encoder, enter the value "none."
230-01BB	**Error message** Input X%2 for axis %3 is already assigned to another axis. **Cause of error** The CfgAxes->ParamSet->..->pwmSignalOutput parameter refers to an output that is already occupied by another axis. **Error correction** - Check the wiring. - If an axis does not have a PWM output, enter the value "none."
230-01BC	**Error message** Error during control of an SPI module **Cause of error** An error occurred during transfer of rotary encoder data to or from an SPI module (module %2) **Error correction** - Check the wiring - Inform your service agency
230-01BD	**Error message** Spindle (%2) has no position encoder **Cause of error** A selected function (spindle positioning, synchronism, thread, etc.) requires a position encoder of the spindle concerned, but no such encoder has been configured. **Error correction** Check the NC program

Error number	Description
230-01BE	**Error message** AxisMode and AxisHw for axis (%2) do not match **Cause of error** An illegal combination of Axes->PhysicalAxes->CfgAxis->axisMode and Axes->PhysicalAxes->CfgAxis->axisHw has been configured. Permissible combinations include: - AxisMode = NotActive => axisHw = everything allowed - AxisMode = Active => axisHw = InOutCC axisHw = AnalogMC axisHw = AnalogCC axisHw = DisplayMC axisHw = DisplayCC axisHw = ManualMC axisHw = ManualCC - AxisMode = Virtual => axisHw = None **Error correction** Check the configuration.

Error number	Description
230-01BF	**Error message** Encoder type not permitted for axis (%2) **Cause of error** An impermissible combination of Axes->PhysicalAxes->CfgAxis->axisHw and Axes->ParameterSets->CfgAxisHardware->posEncoderType is configured. Permissible combinations are: axisHw = InOutCC CC422 - Motor encoder and all position encoders connected to MC CC424 - Motor encoder and all position encoders connected to CC CC520 - Motor encoder and all position encoders connected to CC axisHw = AnalogMC All position encoders connected to MC axisHw = AnalogCC All position encoders connected to CC axisHw = DisplayMC All position encoders connected to MC axisHw = DisplayCC All position encoders connected to CC axisHw = ManualMC All position encoders connected to MC axisHw = ManualCC All position encoders connected to CC axisHw = ProfiNet Motor encoder and all position encoders connected to ProfiNet **Error correction** Check the configuration
230-01C0	**Error message** Analog output of axis %2 was assigned twice **Cause of error** More than one axis is trying to write to an analog output at one time. **Error correction** Check the PLC program. If more than one axis uses the same analog output, only one at a time can be switched on.
230-01C1	**Error message** Unknown touch probe model designation **Cause of error** An unknown touch probe model designation was selected in the touch probe table. **Error correction** Check the touch probe table.

Error number	Description
230-01C2	**Error message** Spindle (%2) has not yet been homed **Cause of error** A command has been given for a synchronous spindle run. However, not all spindles have been homed. The synchronous spindle run can be switched off only if all involved spindles have been referenced. **Error correction** — Home the spindle - Check the NC or PLC program
230-01C3	**Error message** EMERGENCY STOP defective (%2) **Cause of error** The internal or external EMERGENCY STOP circuit is defective. - Excessively long switching times of the involved relays in the chain between the control-is-ready output signal (MC.RDY, STO.A.G) and the control-is-ready acknowledgment (I3, ES.A, ES.B) during the EMERGENCY STOP or switch-on routine - Control-is-ready acknowledgement (I3, ES.A, ES.B) has a short circuit to +24 V **Error correction** Check the emergency-stop circuit: - Check / replace the applicable relays in the electrical cabinet - Check / restore the contacts / wiring - Inform your service agency
230-01C4	**Error message** Relay ext. dc voltage missing **Cause of error** Error message after power interruption. **Error correction** - Switch on the control voltage separately - Check the wiring in the electrical cabinet - Check the 'Machine control voltage ON' button
230-01C5	**Error message** After SW download, CC no longer responds **Cause of error** After a download of the controller software, an existing CC no longer answers. **Error correction** CC defective. Exchange the hardware.

Error number	Description
230-01C6	**Error message** The option for double-speed control loops has not been enabled **Cause of error** A double-speed control loop was configured, but the option was not enabled. Single-speed controller performance was activated for the control loop. **Error correction** Check the parameter CfgAxisHardware->ctrlPerformance.
230-01C7	**Error message** Communication between MC and CC is faulty **Cause of error** An error occurred in the HSCI communication between the MC computer unit and the CC controller unit. **Error correction** Inform your service agency
230-01C8	**Error message** Timeout during command processing by the CC **Cause of error** A CC was given commands and has not acknowledged them. **Error correction** - Note further messages - Correct the configuration error - If this error occurs without configuration errors: The CC controller unit might be defective. Replace the hardware.
230-01C9	**Error message** Option for master-slave torque control not enabled **Cause of error** You have configured a master-slave torque control, but you have not enabled the required software option. **Error correction** - Check the parameter CfgAxisCoupling - Enable the software option
230-01CA	**Error message** Switch off after NC stop due to error %2 **Cause of error** The machine was switched off after NC stop. Reason: CC error **Error correction** Note the information on remedies while the CC error is displayed.

Error number	Description
230-01CB	**Error message** Output of axis %2 was assigned twice **Cause of error** More than one axis is trying to write to an output at one time. **Error correction** - Check the PLC program If more than one axis uses the same output, only one at a time can be switched on.
230-01CC	**Error message** Input of axis %2 was assigned twice **Cause of error** Two or more axes are trying to read one input at the same time. **Error correction** - Check the PLC program If more than one axis uses the same input, only one at a time can be switched on.
230-01CD	**Error message** Incorrect connector assignment of the axis %2 **Cause of error** On the CC 424 or CC 61xx there is a fixed assignment of speed encoder input to PWM output. The parameters speedEncoderInput and pwmSignalOutput have an illegal connector assignment. Permissible connector assignments: X15 - X51 X16 - X52 X17 - X53 X18 - X54 X19 - X55 X20 - X56 X80 - X57 X81 - X58 X82 - X59 X83 - X60 **Error correction** Check the axis configuration and edit it if required.
230-01CE	**Error message** Machine parameters were changed through TNCOPT **Cause of error** **Error correction**

Error number	Description
230-01CF	**Error message** Switch off after NC stop due to error %2 **Cause of error** The machine was switched off after an NC stop. Reason: PLC error **Error correction** Note the further information on remedies available when the PLC error is displayed.
230-01F5	**Error message** Probe cycle started with stylus already deflected **Cause of error** You tried to start a probing cycle although the stylus is still deflected. **Error correction** Increase the retraction path
230-01F6	**Error message** LookAhead: Time out **Cause of error** Run-time error in LookAhead. **Error correction** Inform your service agency
230-01F7	**Error message** High-speed inputs were incorrectly configured **Cause of error** Only inputs I0 to I31 and I128 to I152 can be used. **Error correction** Check the configuration
230-0226	**Error message** Client with this thread ID is already logged on with CfgServer. **Cause of error** **Error correction** Inform your service agency.
230-0227	**Error message** Configuration server not ready **Cause of error** **Error correction** Inform your service agency.

Error number	Description
230-0228	**Error message** Missing entity (%2) in configuration data **Cause of error** A required parameter is missing in the configuration. **Error correction** Check the configuration.
230-0229	**Error message** Missing entity (%2) in configuration data for axis %3 **Cause of error** A required parameter is missing in the configuration. **Error correction** Check the configuration. If more than one parameter block is assigned to this axis, no other block than block 0 must be complete. However, the extended parameter block key must be entered in configuration date CfgKeySynonym->key and the corresponding basis block key in configuration date CfgKeySynonym->relatedTo.
230-022A	**Error message** Power module %2 not found in table **Cause of error** The specified power module is not listed in the power module table. **Error correction** - Inform your service agency - Check the name of the motor and the power module in the table
230-022B	**Error message** Power module table cannot be read **Cause of error** Cannot read or find the power module table. **Error correction** - The SQL server was given a table file with a syntactically incorrect file name. The file name of the table must begin with a letter, as in M123.D. Change the table's file name. - Check the directory of the power module table - Check the power module table.

Error number	Description
230-022C	**Error message** Motor (%2) not found in motor table **Cause of error** The entered motor is not in the motor table. **Error correction** - Check the motor assignment of the axes - Check the entries in the motor table, especially whether the MODE column has the right value - Inform your service agency
230-022D	**Error message** Motor table (%2) cannot be read **Cause of error** The specified motor table could not be found or read. The file name specified for the motor table is syntactically incorrect. For the control's SQL server to read the file, the file name of the table must contain at least one letter at the beginning. Example: MOTOR123.MOT Observe other displayed messages on the cause of the error. **Error correction** - Correct the file name of the motor table - Check the directory of the motor table - Check the motor table - Check whether the motor table has all required columns - Inform your service agency
230-022E	**Error message** No connection to the SQL server **Cause of error** No connection to the SQL server **Error correction** Inform your service agency.
230-022F	**Error message** Axis (%2) not found in compensation table **Cause of error** Data of the specified axis could not be found in the compensation table. **Error correction** - Check the compensation table. The specified axis must be available as a column in the compensation table. - Inform your service agency.

Error number	Description
230-0230	**Error message** Syntax error in compensation table (%2) **Cause of error** The data in the specified compensation table could not be read. **Error correction** - Check the configuration table (*.cma) - Check the compensation table (*.com) The table can contain up to 1024 compensation points (lines). The AXISPOS column of the first and last line must show the beginning and end of the compensation range with respect to the machine datum. The compensation points between them are calculated internally by the control and do not need to be specified. If you enter optional position values in the AXISPOS column they must have equal spacing. If required, in the BACKLASH column enter compensation values that are measured in negative traverse direction. In the column of the associated axis, enter the values belonging to the compensation points. - Inform your service agency
230-0231	**Error message** Compensation table (%2) cannot be read **Cause of error** Could not find or read the given compensation table. **Error correction** - Check the name and directory of the configuration table saved in the configuration editor through the keyword "TABCMA". - Check the directory of the compensation table saved in the configuration editor through the keyword "oemTable". - The tables assigned to the axes in the configuration table must be in the directory of the compensation tables. - The SQL server was given a table file with a syntactically incorrect file name. The file name of the table must begin with a letter, as in M123.D. Change the table's file name. - Check the configuration table (*.cma) - Check the compensation table (*.com) - Inform your service agency
230-0232	**Error message** Parameter block name (%2) for axis (%3) is already assigned **Cause of error** Two or more axes are defined with reference to the same parameter block. **Error correction** Each axis needs its own parameter block name.

Error number	Description
230-0233	**Error message** Too many parameter blocks for axis %2 **Cause of error** More parameter blocks were requested for an axis than allowed. **Error correction** Make fewer parameter blocks for this axis.
230-0234	**Error message** Shut down the control and restart after you delete an entity **Cause of error** An axis parameter entity was deleted. **Error correction** Restart the control.
230-0235	**Error message** Positioning of axis %2 was stopped due to reconfiguration. **Cause of error** An attempt was made to change a parameter for a moving axis. **Error correction** Axis was stopped.
230-0236	**Error message** Timeout while stopping axis %2 **Cause of error** An attempt was made to change a parameter for a moving axis. **Error correction** Axis was stopped.
230-0237	**Error message** A spindle must be configured as a modulo axis (axis %2) **Cause of error** An axis was defined as spindle that was not configured as a modulo axis. A spindle must always be configured as a modulo axis. **Error correction** Check and, if necessary, correct the parameter CfgAxis->isModulo

Error number	Description
230-0238	**Error message** Fatal configuration error: Cycle machining has been stopped **Cause of error** A fatal error in the configuration has prevented normal operation of the control. **Error correction** Check the configuration
230-0239	**Error message** Name (%2) for axis (%3) is invalid **Cause of error** Two or more axes refer to the same axis key, or an invalid key was installed in System->CfgAxes->axisList. **Error correction** The names must be unambiguous and valid for each axis.
230-023A	**Error message** Invalid configuration for axis %2 **Cause of error** This error can have several causes: 1. In CfgAxis->axisMode, NotAllowed is configured 2. In CfgAxis->axisMode, Active is configured, but this axis has no parameter block 3. In CfgAxis->axisMode, Virtual is configured, but something other than None is in CfgAxis->axisHw **Error correction** Check the combination of parameters
230-023B	**Error message** Fatal error in interpolator: Cyclic machining has been stopped **Cause of error** A fatal error in the interpolator has prevented normal operation of the control. **Error correction** Inform your service agency.
230-023C	**Error message** Supply module %2 not found in table **Cause of error** The specified supply module is not listed in the supply module table. **Error correction** - Inform your service agency. - Check the name of the supply module in the table

Error number	Description
230-023D	**Error message** Supply-module table cannot be read **Cause of error** Cannot read or find the supply module table. The control cannot read or find the supply module table. The file name must begin with a letter. **Error correction** - Check the path of the supply module table under CfgTablePath (SUPPLY or SUPPLY_OEM keys) - Check the directory of the supply module table - Check the supply module table and correct the file name if required.
230-02BC	**Error message** No oriented spindle stop of homed spindle **Cause of error** Oriented spindle stop should be performed with a spindle that has not yet been homed. **Error correction** - Check the NC program - Home the spindle - The parameter Axis->ParamSets->(Spindle)->CfgReferencing->refType must be set to "without Switch and on the fly" so that the spindle automatically homes.
230-02BD	**Error message** Stylus already in contact **Cause of error** The stylus is already deflected at the start of a probing movement. **Error correction** - Get the touch probe clear and repeat the probe. - If the error frequently recurs, inspect the probe for damage. - If necessary, contact your service agency.
230-02BF	**Error message** Handwheel? **Cause of error** - The electronic handwheel is not connected. - An incorrect handwheel is configured in machine parameter System/CfgHandwheel/type. - The transmission line is defective was incorrectly chosen. **Error correction** - Connect the handwheel via cable adapter. - Check the machine parameter System/CfgHandwheel/type. - Inspect the transmission line for damage

Error number	Description
230-02C0	**Error message** Velocity programmed for axis %2 too low **Cause of error** The velocity programmed for this axis for PLC positioning is too slow. **Error correction** Program a faster velocity or check the configuration datum Axes->ParameterSets->????->CfgFeedLimits->minFeed. "????" designates the current name of the configuration set.
230-02C1	**Error message** Rotational speed programmed for spindle ("%2") too low **Cause of error** The shaft speed programmed for this axis for PLC positioning is too slow. **Error correction** Program a faster shaft speed or check the configuration datum Axes->ParameterSets->????->CfgFeedLimits->minFeed. "????" designates the current name of the configuration set.
230-02C2	**Error message** Return to contour in thread cycle not allowed. **Cause of error** In a thread cycle, you tried to return in the tilted working plane. **Error correction** In thread cycles, always return only in the tool axis direction.
230-02EE	**Error message** The option for HSC filter has not been enabled **Cause of error** An HSC filter was configured, but the option was not enabled. Now the triangle filter was activated for this axis. **Error correction** Configure another file type

Error number	Description
230-02EF	**Error message** Software option 151 Load Monitoring not enabled **Cause of error** A load monitor (G995, G996) was programmed in the NC program, but the required software option 151 Load Monitoring is not enabled. **Error correction** - Check the NC program and adapt it if necessary - If required, enable the software option 151 Load Monitoring - Contact the machine tool builder - Inform your service agency
230-02F0	**Error message** Option for digital control loops not enabled **Cause of error** A digital control loop was configured without enabling the necessary option in the control's SIK. **Error correction** - Check the configuration and correct if necessary - Enable the option - Inform your machine tool builder
230-0327	**Error message** Plug & Play (%2) Motor detected: %3 **Cause of error** The "Plug & Play" function for automatic recognition of drive components through the electronic ID label is active for this axis. A motor was recognized that differs from the current configuration. **Error correction** - Confirm the "Plug & Play" dialog, if the detected motor belongs to this combination of axis and parameter set - Deactivate "Plug & Play", if the motor was not correctly recognized - Contact your machine tool builder

Error number	Description
230-0328	**Error message** Plug & Play (%2) Inverter detected: %3 **Cause of error** The "Plug & Play" function for automatic recognition of drive components through the electronic ID label is active for this axis. An inverter was recognized that differs from the current configuration. **Error correction** - Confirm the "Plug & Play" dialog, if the detected inverter belongs to this combination of axis and parameter set - Deactivate "Plug & Play", if the inverter was not correctly recognized - Contact your machine tool builder
230-0329	**Error message** Plug & Play (%2) Supply Module detected: %3 **Cause of error** The "Plug & Play" function for automatic recognition of drive components through the electronic ID label is active. An supply module was recognized that differs from the current configuration. **Error correction** - Confirm the "Plug & Play" dialog prompt if the supply module was correctly recognized - Deactivate "Plug & Play", if the supply module was not correctly recognized and check the configuration - Contact your machine tool builder
230-032A	**Error message** Axis %1 (%2): Motor %3 detected and registered **Cause of error** The named motor was detected through plug-and-play and entered in the axis configuration under CfgServoMotor->motName. **Error correction**
230-032B	**Error message** Axis %1 (%2): Inverter %3 detected and registered **Cause of error** The named inverter was detected through plug-and-play and entered in the axis configuration under CfgPowerStage->ampName. **Error correction**

Error number	Description
230-032C	**Error message** Axis %1 (%2): Supply module %3 detected and registered **Cause of error** The named supply module was detected through plug-and-play and entered in the axis configuration under CfgSupply-Module->name. **Error correction**
230-032D	**Error message** Axis %1 (%2): Plug & play has been deactivated for the motor **Cause of error** Plug-and-play was deactivated in the named axis for the motor. **Error correction** - Check the configuration and the motor being used - Plug-and-play can be reactivated through CfgServoMo-tor->plugAndPlay
230-032E	**Error message** Axis %1 (%2): Plug & play has been deactivated for the invert-er **Cause of error** Plug-and-play was deactivated in the named axis for the inverter. **Error correction** - Check the configuration and the inverter being used - Plug-and-play can be reactivated through CfgPowerS-tage->plugAndPlay
230-032F	**Error message** Axis %1 (%2): Plug & play has been deactivated for supply module **Cause of error** Plug-and-play was deactivated in the named axis for the supply module. **Error correction** - Check the configuration and the supply module being used - Plug-and-play can be reactivated through CfgSupplyMod-ule->plugAndPlay
230-041A	**Error message** Position error (axis %2) too large **Cause of error** The difference between position measurements by the position encoder and speed encoder is too large. **Error correction** Check the position and speed encoders.

Error number	Description
230-041B	**Error message** Axis %2 cannot be switched on **Cause of error** This axis is to be switched on by the PLC, although it was switched off by DriveOffGroup. **Error correction** Check the PLC program.
230-041C	**Error message** Error bit in safety status (S status) of the HSCI transmission **Cause of error** An error was signaled over the HSCI S status. **Error correction** - Inform your service agency. - You can find more diagnostic information in the diagnostics menu.
230-041D	**Error message** TRC: Wrong control; axis %1 **Cause of error** The compensation file was generated for another control than the one now in use. Copying the compensation file from another control is not allowed. **Error correction** - Recalculate the compensation parameter with TNCopt under Optimization/Torque Ripple Compensation. - Deactivation of the compensation: Entry in configuration datum Go to "Axes/ParameterSets/[Keyname of parameter block]/CfgControllerComp/" and delete "compTorqueRipple." - Inform your service agency
230-041E	**Error message** TRC: Compensation file (%1) illegible **Cause of error** Could not find or read the given compensation file. **Error correction** - Check the directory of the compensation file saved in the configuration editor through the keyword "oemTable". - Check the compensation file. - Deactivation of the compensation: Entry in configuration datum Go to "Axes/ParameterSets/[Keyname of parameter block]/CfgControllerComp/" and delete "compTorqueRipple." - Inform your service agency

Error number	Description
230-041F	**Error message** Error in parameter posEncoderIncr or posEncoderDist (axis %2) **Cause of error** The two machine parameters posEncoderIncr and posEncoderDist in the configuration object CfgAxisHardware are configured incorrectly. Even if you operate the axes solely with motor encoders (without linear encoders), the two parameters must contain realistic values. **Error correction** - Enter in the machine parameters CfgAxisHardware->posEncoderIncr and CfgAxisHardware->posEncoderDist realistic values for the position or motor encoder.
230-0420	**Error message** No field angle for drive %1 **Cause of error** The field angle of a motor with an unaligned encoder has not yet been ascertained. Absolute encoder with EnDat interface: - The encoder serial number saved does not fit the encoder Incremental encoders: - The SIK serial number saved does not fit the SIK of the control **Error correction** - If required, find the field angle in the "current controller adjustment" mode (press the "FIELD ORIENT." soft key) - Check the “type of encoder” entry in the motor table and correct it if necessary - Check the machine parameter motEncType and correct it if required - Check the machine parameters motPhiRef and motEncSerialNumber. If you want to force a new field angle acquisition, enter the value 0. - Inform your service agency
230-0421	**Error message** MCU/CCU watchdog mismatch **Cause of error** MCU and CCU have different watchdog values. **Error correction** Inform your service agency.

Error number	Description
230-0422	**Error message** Axis motion not allowed while the filter is being changed **Cause of error** All axes must remain stationary while the filter is being edited. **Error correction** Inform your service agency.
230-0423	**Error message** Error in configuration of axis %2 **Cause of error** Connections were configured that are not available on this CC. **Error correction** Check the configuration of the axis: - CfgAxisHardware->posEncoderInput - CfgAxisHardware->speedEncoderInput - CfgAxisHardware->inverterInterface For analog axes via CMA-H expansion module: - Check whether the expansion module is functioning correctly
230-0424	**Error message** DCM: %1 **Cause of error** Dynamic collision monitoring (DCM) stopped all axis movements in order to avoid a collision. **Error correction**
230-0425	**Error message** Unbalance monitoring: measurement not possible **Cause of error** The measurement of the unbalance failed. The spindle could not be accelerated correctly. The programmed nominal speed was not attained. **Error correction** - Inspect the spindle for damage. - Inform your service agency.
230-0426	**Error message** Unbalance monitoring (user): unbalance too large Unbalance monitoring (system): unbalance too large **Cause of error** The value found by the unbalance monitor was too large. **Error correction** - Balance the signal

Error number	Description
230-0427	**Error message** Unbalance monitoring (user): sum of unbalance too large Unbalance monitoring (system): sum of unbalance too large **Cause of error** The unbalance sum calculate by the unbalance monitor was too large. **Error correction** - Balance the signal
230-042A	**Error message** Unbalance monitoring: configuration missing **Cause of error** The machine parameters for configuring the unbalance monitoring are not available. **Error correction** - Check the config object CfgUnbalance and correct it if required.
230-042B	**Error message** Unbalance monitoring: invalid spindle defined **Cause of error** No value spindle index was given in the machine parameters for unbalance monitoring. **Error correction** - Check the machine parameters in the config object CfgUnbalance and correct it if required.
230-042C	**Error message** Unbalance monitoring: invalid meas. axis defined **Cause of error** An invalid measuring axis was given in the machine parameters for unbalance monitoring. **Error correction** - Check the machine parameter axisOfMeasure in the config object CfgUnbalance and correct it if required.
230-042D	**Error message** Unbalance monitoring: system monitor is not active **Cause of error** The system monitor of the unbalance monitoring is not active. **Error correction** - Activate the system monitor through the turning cycle - Check the machine parameters maxUnbalanceOem and limitUnbalanceOem and correct it if required.

Error number	Description
230-042E	**Error message** Unbalance monitoring: spindle is not configured **Cause of error** The machine parameters for configuring the spindle are missing for the unbalance monitor. **Error correction** - Check the configuration of the spindle in the config object CfgUnbalance and correct it if required.
230-042F	**Error message** Unbalance monitoring: spindle parameter or index is faulty **Cause of error** The spindle configuration or configuration of the unbalance monitor is faulty. An incorrect spindle index was given or the spindle configuration in the config object CfgUnbalance is incorrect. **Error correction** - Check the spindle index in the CfgAxes config object and correct it if required. - Check the machine parameters in the config object CfgUnbalance and correct it if required.
230-0430	**Error message** Unbalance monitoring: limit speed has been reached **Cause of error** The maximum permissible shaft speed calculated by the control for measuring the unbalance was attained. **Error correction** - Reduce the speed of the spindle and restart the measurement.
230-0431	**Error message** Unbalance trace: internal error **Cause of error** Internal error in unbalance trace: incorrect status in the IPO in unbalance monitoring **Error correction** - Inform your service agency.
230-0432	**Error message** Unbalance trace: trigger timeout **Cause of error** In the unbalance trace, the trigger conditions defined in the machine configuration were not fulfilled. **Error correction** - Check the machine parameters triggerMin and triggerMax, and correct it if required.

Error number	Description
230-0433	**Error message** Unbalance trace: internal error **Cause of error** An incorrect trace channel is active for the unbalance trace. **Error correction** - Inform your service agency.
230-0434	**Error message** Unbalance trace: spindle index refers to an incorrect axis **Cause of error** An incorrect spindle index was given for the unbalance trace. The index refers to an incorrect address. **Error correction** - Check the machine parameters in the config object CfgUn-balance and correct it if required.
230-0435	**Error message** Unbalance trace: machine parameters not defined **Cause of error** The machine parameter for configuring the unbalance traces are not available. **Error correction** - Enter machine parameters in the config object CfgUnbal-ance.
230-0436	**Error message** Unbalance trace: internal error **Cause of error** The OEM cycle for the unbalance trace is faulty. The shaft speed or the number of revolutions to be measured was not defined. The parameter count or speed must not have the value 0. **Error correction** - Correct the OEM cycle for the unbalance trace. The values for count or speed must not be 0.
230-0437	**Error message** Unbalance trace: incorrect spindle index **Cause of error** An invalid spindle index was given for the unbalance trace. **Error correction** - Check the machine parameter for the spindle and correct if required.

Error number	Description
230-0438	**Error message** Unbalance trace: axis for measurement not defined **Cause of error** No measuring axis was defined for the unbalance trace. **Error correction** - Check the machine parameter axisOfMeasure and correct if required.
230-0439	**Error message** Unbalance trace: spindle is not configured **Cause of error** The spindle defined for the unbalance trace was not found in the machine configuration. **Error correction** - Check the machine parameter for the spindle and correct if required.
230-043A	**Error message** Unbalance trace: specified trigger axis does not exist **Cause of error** The trigger axis defined for the unbalance trace does not exist. **Error correction** - Check the machine parameter for the spindle and correct if required.
230-043B	**Error message** Unbalance trace: trigger conditions are not fulfilled **Cause of error** The trigger conditions set for the unbalance trace are no longer fulfilled. **Error correction** - Check the machine parameters triggerMin and triggerMax, and correct it if required.
230-043C	**Error message** Unbalance monitoring: permissible unbalance not defined **Cause of error** A user parameter required for the unbalance monitoring (the maximum permissible unbalance) was not defined. **Error correction** - Enter the user parameter maxUnbalanceUsr.

Error number	Description
230-043D	**Error message** Unbalance monitoring: permissible unbalance sum not defined **Cause of error** A user parameter required for the unbalance monitoring (the maximum permissible unbalance sum) was not defined. **Error correction** - Enter the user parameter limitUnbalanceUsr.
230-043E	**Error message** Unbalance monitoring: permissible unbalance not defined **Cause of error** A machine parameter required for the unbalance monitoring, the maximum permissible unbalance (system-wide), was not defined. **Error correction** - Enter the machine parameter maxUnbalanceOem.
230-043F	**Error message** Unbalance monitoring: permissible unbalance sum not defined **Cause of error** A machine parameter required for the unbalance monitoring, the maximum permissible unbalance sum (system-wide), was not defined. **Error correction** - Enter the machine parameter limitUnbalanceOem.
230-0441	**Error message** Internal error in transmission of oscilloscope measured data **Cause of error** The display of measured value in the oscilloscope is incomplete because of an error in the internal data transmission between the interpolator real-time buffer and the oscilloscope. **Error correction** - Repeat the measurement - Inform your service agency if the error continues to occur

Error number	Description
230-0442	**Error message** Progmmd. limit switch/protection zone incorrect for axis %2 **Cause of error** The following constraints apply to limit switches and protection zones for modulo axes: - The lower limit must be between –360° and +360°. - The upper limit must be between 0° and +360°. - The lower limit must be less than the upper limit. - The difference between the upper and lower limit must be less than 360°. - If the machine parameter "moveAfterRef" is configured, the axis is not moved further. A warning is output. - Both protection zones = 0 means: Monitoring is inactive **Error correction** Adjust the value for the protection zone.
230-0443	**Error message** Handwheel superimposition not allowed (M118) **Cause of error** You tried to activate the M118 function during active collision monitoring. The handwheel superimpositioning function with M118 is not allowed in combination with collision monitoring. **Error correction** Remove M118 from the NC program or deactivate the collision monitoring.
230-0444	**Error message** Collision monitoring not possible in turning mode **Cause of error** The collision monitoring cannot monitor turning tools and collision objects that rotate with the lathe spindle. **Error correction** - If necessary, remove the collision objects (CMOs) from the turning kinematics (notify the machine manufacturer). - Do not insert any turning tools during milling.
230-0445	**Error message** Velocity error (axis %2) too great **Cause of error** The velocity deviation between position the position encoder and the speed encoder is too large. **Error correction** Check the coupling between the position encoder and speed encoder

Error number	Description
230-0446	**Error message** Internal error while processing the oscilloscope measuring data **Cause of error** Internal software error: The synchronization of the oscilloscope channels is faulty. **Error correction** - Repeat the measurement - Inform your service agency if the error continues to occur
230-0447	**Error message** Internal error while processing the oscilloscope measuring data **Cause of error** Internal software error: The synchronization of the oscilloscope channels in combination with the trigger condition is faulty. **Error correction** - Repeat the measurement - Inform your service agency if the error continues to occur
230-0448	**Error message** Internal error while processing the oscilloscope measuring data **Cause of error** Internal software error: The sequence of the data to be transmitted to the oscilloscope is faulty. **Error correction** - Repeat the measurement - Inform your service agency if the error continues to occur
230-0449	**Error message** Handwheel: wrong handwheel connected Handwheel %3: Wrong handwheel connected **Cause of error** - The electronic handwheel is not connected. - An incorrect handwheel is configured in machine parameter System/CfgHandwheel/type. **Error correction** - Connect the handwheel via cable adapter. - Check the machine parameter System/CfgHandwheel/type.

Error number	Description
230-044A	**Error message** Handwheel: Contaminated or damaged Handwheel %3: Contaminated or damaged **Cause of error** The handwheel reports a problem in signal transmission: - Rotary encoder in the handwheel is contaminated - Handwheel is defective **Error correction** - Check the emergency stop and permissive buttons for proper function - Exchange handwheel if necessary
230-044B	**Error message** Handwheel: Transmission disturbance Handwheel %3: Transmission disturbance **Cause of error** - An incorrect handwheel was configured in machine parameter System/CfgHandwheel/type. - Data transfer between the handwheel and control was disturbed. **Error correction** - Check the machine parameter System/CfgHandwheel/type. - For wireless handwheel: Reduce distance to receiver - Switch off possible sources of interference - Check the connecting cable
230-044C	**Error message** Handwheel: Transmission error Handwheel %3: Transmission error **Cause of error** The transmission line is defective or faulty. **Error correction** Inspect the data transfer line for damage.
230-044D	**Error message** Handwheel: Wrong parameter Handwheel %3: Wrong parameter **Cause of error** The initialization values for the connected handwheel are invalid. **Error correction** Check the configuration datum System/CfgHandwheel/initValues.

Error number	Description
230-044E	**Error message** Handwheel: Timeout Handwheel %3: Timeout **Cause of error** A time limit was exceeded during communication with the handwheel. **Error correction** - Check the access point of the handwheel - Check the radio settings
230-044F	**Error message** Handwheel: No connection possible Handwheel %3: No connection possible **Cause of error** Cannot connect with the handwheel. The handwheel might not be in the access point (handwheel holder). **Error correction** Place the handwheel in the access point (handwheel holder).
230-0450	**Error message** Axis %2: Enter CfgReferencing/doubleRefOffset: %3 **Cause of error** The reference run was performed twice. **Error correction** Enter the indicated value in the machine configuration (parameter: CfgReferencing/dblRefOffset).
230-0451	**Error message** PLC movement for axis %2 not allowed **Cause of error** The presently active NC program blocks manual axis movements by the manual direction keys or movements by the PLC program. **Error correction** Edit the PLC Program
230-0452	**Error message** DCM: No manual movement allowed during a program run **Cause of error** You tried to make a movement with axis direction keys, a handwheel or PLC command while a program run was active **Error correction** Wait until the program run has ended or change to Single Block mode

Error number	Description
230-0453	**Error message** DCM: Program start or continuation not possible **Cause of error** You tried to start a program during an axis movement, e.g. by the axis direction key, handwheel or PLC command. **Error correction** Wait until the motion by axis direction key, handwheel or PLC command has finished
230-0454	**Error message** DCM: No TCPM allowed during active DCM **Cause of error** You tried to move in Manual mode with TCPM during active DCM **Error correction** Deactivate TCPM Deactivate DCM and move without monitoring
230-0455	**Error message** DCM: Motion of the floating tap holder is not monitored **Cause of error** When DCM is active, you use the "tapping with floating tap holder" cycle. Please note that movements of the floating tap holder are not monitored by DCM. Collision monitoring observes the floating tap holder at its resting position. **Error correction**
230-0456	**Error message** DCM not possible in following error mode or semifeedforward mode **Cause of error** You tried to use DCM with a non-feedforward axes. **Error correction** Change the configuration
230-0457	**Error message** Reference mark not found **Cause of error** The reference mark was not found after covering the distance necessary for distance-coded referencing. **Error correction** - Inform your machine tool builder - Check the mounted encoder - Check the machine configuration (parameter "posEncoderRefDist")

Error number	Description
230-0458	**Error message** DCM: Check the skipReferencing parameter **Cause of error** You have set the machine parameter "System/CfgMachineSimul/skipReferencing" to the value TRUE. The Dynamic Collision Monitoring (DCM) is not possible with this setting. **Error correction** Set the parameter "skipReferencing" to the value FALSE or activate the programming-station mode (simMode = CcAndExt)
230-0459	**Error message** S-RAM contents of axis %2 are inconsistent **Cause of error** The EnDat axis position values saved in S-RAM are invalid. The values saved in a file will be used. **Error correction** Check the current position of the axis
230-045B	**Error message** DCM: Activation during a movement **Cause of error** You activated the dynamic collision monitoring (DCM) during a program run or an axis movement. **Error correction** Activate DCM when the machine is at standstill.
230-045C	**Error message** S-RAM contents of axis %2 overwritten with values from file **Cause of error** The EnDat axis position values saved in S-RAM were overwritten by the values saved in a file. **Error correction** Check the current position of the axis
230-045D	**Error message** Axis %2: CfgReferencing/doubleRefOffset: %3 was entered **Cause of error** The reference run was performed twice. **Error correction** The given value was entered in the configuration.

Error number	Description
230-045E	**Error message** Oscilloscope active during start of reference machining **Cause of error** The oscilloscope is active and a reference operation was started at the same time. The oscilloscope cannot be used during the reference operation. **Error correction** Close the oscilloscope and repeat the reference operation
230-045F	**Error message** Programmed movement not allowed **Cause of error** No programmed movement of axes is allowed in the "Retract" operating mode. **Error correction** Do not start an NC program as long as the "Retract" operating mode is active.
230-0460	**Error message** Error in configuration of axis %2 **Cause of error** The axis has been configured incorrectly. **Error correction** Check the axis configuration at the following places and correct if required: - CfgSupplyModule->name - CfgPowerStage->ampPowerSupplyType - CfgPowerStage->ampBusVoltage - CfgServoMotor->motSupply
230-0461	**Error message** Configuration of kinematic compensation is faulty **Cause of error** The configuration of the temperature compensation or the kinematic compensation is faulty. The controls traverses without compensation as long as the error is not corrected. The more exact cause is described in the additional text. **Error correction** - Acknowledge the error in order to continue without compensation - Correct the configuration

Error number	Description
230-0462	**Error message** Temperature compensation is faulty **Cause of error** An error occurred in the calculation of the temperature compensation. The temperature compensation might no longer be working. **Error correction** Check the configuration of the temperature compensation.
230-0463	**Error message** Kinematic compensation is faulty **Cause of error** An error occurred in the calculation of the kinematic compensation. The kinematic compensations might no longer be working. **Error correction** Check the kinematic compensations and and correct them if required.
230-0464	**Error message** EnDat multiturn counter of the %2 axis was corrected **Cause of error** The value for the EnDat multiturn counter saved in the configuration is not plausible. The value was automatically corrected by the control. **Error correction** Check the current position of the axis
230-0465	**Error message** EnDat multiturn counter of the %2 axis was changed **Cause of error** The value for the EnDat multiturn counter saved in the configuration was exceeded. The change does not become effective until the control is restarted. **Error correction** Restart the control.
230-0467	**Error message** The KinematicsComp option has not been enabled **Cause of error** An kinematic compensation was configured, but the KinematicsComp option was not enabled. The kinematic compensation is not in effect. **Error correction** - Correct the configuration or enable the software option.

Error number	Description
230-0468	**Error message** Max. compensation value %2 reached in CfgKinSimpleTrans %1 **Cause of error** The value for the kinematic temperature compensation at the transformation has exceeded the maximum permissible value. The compensation is set to the maximum value. The warning is deleted as soon as the maximum value is no longer exceeded. **Error correction** - Check the calculation of the compensation, and correct it if required - Check the incoming PLC variables
230-0469	**Error message** Max. compensation value %2 reached in axis %1 component %3 **Cause of error** The value for the kinematic compensation at the axis has exceeded the maximum permissible value. The compensation is set to the maximum value. The warning is deleted as soon as the maximum value is no longer exceeded. **Error correction** - Contact your machine tool builder - Check the value and correct it if required - Check the incoming PLC variables and tables and correct them if required
230-046A	**Error message** More than %2 fast PLC inputs defined **Cause of error** In the IOC file, more fast PLC inputs are defined than allowed. **Error correction** - Check the IO configuration. - Inform your service agency

Error number	Description
230-046B	**Error message** Fast PLC input on impermissible bus system **Cause of error** - In the IOC file, a fast PLC input was defined on an illegal bus system. - Fast PLC inputs can be defined only on an HSCI-PL or the internal PL. The affected PLC input is shown in the additional information. **Error correction** - Check the IO configuration - Inform your service agency
230-046C	**Error message** Fast PLC inputs with more than one definition **Cause of error** Fast PLC inputs are defined both in the IOC file as well as in the configuration data (machine parameters). Note that the entry in the configuration data has priority. **Error correction** - Check the IO configuration - Delete the CfgPlcFastInput configuration parameter (parameter number 103700) from the configuration data, if required - Inform your service agency
230-046D	**Error message** Input for axis group enabling has incorrect parameters **Cause of error** The PLC input for the axis-group release was not in the IO configuration (IOC file) or it was faulty. **Error correction** - Check the IO configuration. - Inform your service agency
230-046E	**Error message** Multiple inputs defined for axis group enabling %2 **Cause of error** - Per axis group, only one PLC input for the axis-group release was defined. - In the IOC file, multiple PLC inputs for the axis-group release were defined for one axis group. **Error correction** - Check the IO configuration. - Inform your service agency

Error number	Description
230-046F	**Error message** Input for axis group enabling %s on impermissible bus system **Cause of error** The input for the axis-group release was defined on an illegal bus system in the IO configuration (IOC file). The input can be defined only on an HSCI-PL or an internal PL. **Error correction** - Check the IO configuration. - Inform your service agency
230-0470	**Error message** Fast input for spindle has incorrect parameters **Cause of error** The fast input for the spindle was not in the IO configuration (IOC file) or it has incorrect parameters. **Error correction** - Check the IO configuration. - Inform your service agency
230-0471	**Error message** Several fast inputs defined for spindle %2 **Cause of error** More than one fast input was defined for a spindle in the IO configuration (IOC file). Only one input is allowed. **Error correction** - Check the IO configuration. - Inform your service agency
230-0472	**Error message** Fast input for spindle %1 on impermissible bus system **Cause of error** - The fast input for the spindle was defined on an illegal bus system. - The input can be defined only on an HSCI-PL or an internal PL. **Error correction** - Check the IO configuration. - Inform your service agency

Error number	Description
230-0473	**Error message** Fast input cannot be activated **Cause of error** A fast input cannot be activated because the IO configuration does not match the actual hardware configuration. The affected input is shown in the additional information. - The control is operated in the simulation mode. - The IOC file does not match the hardware configuration. - The options in the configuration are incorrectly set. **Error correction** - Check the hardware configuration - Check the IO configuration - Check the options - Inform your service agency
230-0474	**Error message** Inputs for axis group enabling have multiple definitions **Cause of error** Inputs for axis-group release are defined both in the IOC file as well as in the configuration data (machine parameters). Note that the entry in the configuration data has priority. **Error correction** - Check the IO configuration - Delete the configuration parameter driveOffGroupInput (parameter number 100106) if necessary - Inform your service agency
230-0475	**Error message** Fast input for spindle %2 already defined **Cause of error** Fast inputs are defined for the spindle both in the IOC file as well as in the configuration data (machine parameters). Note that the entry in the configuration data has priority. **Error correction** - Check the IO configuration. - If required, delete the configuration datum CfgSpindle->fastInput (parameter number 401502)
230-0479	**Error message** TRC: The identification was adapted; axis %1; file %2 **Cause of error** The compensation file for the TRC was adapted. The values were transferred to the CC controller unit and activated. **Error correction** Note further messages.

Error number	Description
230-047A	**Error message** No fast input for spindle %2 (%3) **Cause of error** No fast input was designed for homing or stopping. **Error correction** - Check the IO configuration (IOC file)
230-047B	**Error message** Programmed position error too large. Limit to %1 mm. **Cause of error** - The configured position error is too large for KinematicsComp. - The configured value is limited. **Error correction** - Correct the corresponding value(s) in the kinematic configuration (machine parameters locErrX, locErrY, locErrZ, locErrA, locErrB, locErrC). - Inform your service agency
230-047E	**Error message** Axis %2: Double reference name is active **Cause of error** A scanning cycle was started with active double reference run although the position encoder's reference mark had not yet been scanned. **Error correction** Traverse the reference mark - Check the entry for double reference run in machine parameter MP_doubleRef - Inform your service agency
230-047F	**Error message** Current actual position of the axis (%2) cannot be used **Cause of error** - The machine tool builder's configuration does not allow transfer of the current EnDat position **Error correction** - Inform your service agency

Error number	Description
230-0480	**Error message** Max. compensation value %2 reached in axis %1 **Cause of error** The value for the kinematic compensation at the axis has exceeded the maximum permissible value. The compensation is set to the maximum value. The warning is deleted as soon as the value falls 0.1 mm below the maximum value. Both the kinematic temperature compensation and the compensation via KinematicsComp (software option) go into the kinematic compensation. **Error correction** - Check calculation of compensation values, and correct if required - Check and the PLC variables and tables going into the compensation and correct them if necessary - Inform your service agency
230-0488	**Error message** No assignment between handwheels and connections **Cause of error** - Two or more handwheels were configured (CfgHandwheel) but no connections assigned - The automatic assignment to a connection is possible only with a single handwheel **Error correction** - Reduce the number of configured handwheels to one handwheel - Assign individual handwheels to one connection each (CfgHandwheelList) - Inform your service agency
230-0489	**Error message** Only one HR 550FS wireless handwheel possible **Cause of error** - More than one active HR 550FS wireless handwheel is configured **Error correction** - Check and adjust the range of action. Only one wireless handwheel can be active: Deactivate wireless handwheels (CfgHandwheel->type) or remove the assignment (CfgHand-wheelList) - Inform your service agency

Error number	Description
230-048C	**Error message** Error in acknowledging the SampleRate of the CC **Cause of error** The acknowledged SampleRate of the CC controller unit does not agree with the SampleRate of the set parameters **Error correction** - Check parameter MP_ampPwmFrq for the SampleRate - Inform your service agency
230-048D	**Error message** Handwheel superimpositioning is ignored **Cause of error** The handwheel superimpositioning cannot be changed during M140 and measuring movements. **Error correction** The handwheel superimpositioning can be changed again when no M140 or measuring movement is active.
230-048E	**Error message** Internal software error during Program Run, Single Block **Cause of error** An internal error occurred that can disturb the block display in Single Block mode. **Error correction** - Delete the error and continue as normal. In very rare cases in Single Block mode the block display might not agree with the operation. The movements are nevertheless made individually. - If the error should reoccur, please generate a service file and inform your service agency.
230-048F	**Error message** Handwheel %3: Communication error **Cause of error** - Internal communication error with the handwheel **Error correction** - Save service files - Inform your service agency
230-0490	**Error message** PLC movement for axis %2 was canceled **Cause of error** - An axis movement through the manual direction keys or the PLC program was stopped by a reconfiguration or a system cycle. **Error correction** - Restart the axis movement, if required.

Error number	Description
230-0491	**Error message** Retraction from thread completed **Cause of error** The retraction from the thread has been concluded. **Error correction** - NC program is to be continued: acknowledge message and continue NC program with NC start. - NC program is not to be continued: acknowledge message and terminate NC program with INTERNAL STOP.
230-0492	**Error message** NC software does not match UVR firmware **Cause of error** Faulty combination of NC software and UVR firmware. **Error correction** Inform your service agency
230-0493	**Error message** MCU/UVR watchdog mismatch **Cause of error** The watchdogs on the MC main computer and UVR supply unit have different values. **Error correction** Generate the service files and inform your service agency.
230-0494	**Error message** Message from UVR %2 **Cause of error** The UVR supply unit reports an error **Error correction** Inform your service agency
230-0495	**Error message** Incorrect axis index in axis %1 **Cause of error** - Machine parameter CfgAxisHardware/MP_ccAxisIndex contains an invalid value. **Error correction** - Check and, if necessary, change the configuration in MP_c-cAxisIndex: Valid values are 0 to N-1, where N is the number of control loops on the controller unit concerned. Example: For a CC xx06, the valid values are 0 to 5. - Inform your service agency

Error number	Description
230-0496	**Error message** Input for speed encoder (%1) not valid **Cause of error** Faulty configuration of the speed encoder input for the axis **Error correction** Check the configuration of the axis: - CfgAxisHardware/MP_speedEncoderInput
230-0497	**Error message** Incorrect inverter or motor connection (%1, inv. %2, motor %3) **Cause of error** - The configured connection for the inverter to the controller unit is not available (CfgAxisHardware/MP_inverterInterface) - or no inverter is connected to the configured socket (CfgAxisHardware/MP_inverterInterface) - or the configured connection for the motor on the inverter is not available (CfgAxisHardware/MP_motorConnector). **Error correction** Check the following machine parameters: - CfgAxisHardware/MP_inverterInterface - CfgAxisHardware/MP_motorConnector
230-0498	**Error message** Faulty synchronization during a movement **Cause of error** A system error led to an incorrect synchronization **Error correction** Inform your service agency
230-0499	**Error message** CfgLaAxis/MP_axManualJerk (%2) missing for interpol. PLC movement **Cause of error** - Machine parameter CfgLaAxis/MP_axManualJerk must be configured for interpolating PLC movements. **Error correction** - For the PLC axes to be moved in interpolation, check the configuration in the machine parameter CfgLaAxis/MP_axManualJerk. - Inform your service agency

Error number	Description
230-049A	**Error message** Spindle speed? **Cause of error** The NC program cannot be simulated because the spindle speed for the feed per revolution is missing. A simulation is possible only with the simulation speed FMAX. **Error correction** - Check the NC program and change it if necessary - Change the simulation speed to FMAX.
230-049C	**Error message** Timeout during command processing by the UVR %2 **Cause of error** A UVR was given a command and has not acknowledged it **Error correction** Possible causes: - HSCI connection interrupted (see other error messages) - UVR defective
230-049D	**Error message** A parameter change requires switching off the drive **Cause of error** Before changing the directional bit in the parameters, the drive must be switched off. **Error correction**
230-049E	**Error message** Real time coupling function (RTC) together with handwheel active **Cause of error** - Real time coupling function (RTC) is to be closed while the handwheel is active, or - the handwheel is to be activated while the real time coupling function is active. **Error correction** - Check the NC program and correct it if necessary - Activate the handwheel at a later time - Inform your service agency
230-04A0	**Error message** Test of brake %1 for axis %2 was unsuccessful **Cause of error** - Note further messages. **Error correction** - Inform your service agency

Error number	Description
230-04A2	**Error message** Touch probe %1 is not supported by the transmitter/receiver unit **Cause of error** The transmitter/receiver unit does not support the touch probe. **Error correction** Select another touch probe Inform your service agency
230-04A3	**Error message** Collision of the touch probe **Cause of error** The touch probe collision protection has responded. **Error correction** Manually retract the touch probe.
230-04A4	**Error message** Configuration of handwheel on axis %2 is faulty **Cause of error** Connections were configured that are not available on this CC. **Error correction** Check the configuration of the axis: - CfgAxisHandwheel->hsciCcIndex - CfgAxisHandwheel->input
230-04A5	**Error message** Handwheel %3: Handwheel is not supported **Cause of error** - The electronic handwheel is not supported with this NC software version **Error correction** - Check the software version - Inform your service agency - If required, use an older-model handwheel - If required, install the service pack of the NC software that supports this handwheel model

Error number	Description
230-04A6	**Error message** Multiple handwheels on the same radio channel **Cause of error** There might be several radio handwheels operating in the environment with the same radio channel. **Error correction** - Check the channels selected for the radio handwheels - Use the configuration dialog to check the frequency spectrum - Change radio channel if required
230-04A7	**Error message** Other radio devices are disturbing radio handwheel operation **Cause of error** Other devices are disturbing radio handwheel operation **Error correction** - Use the configuration dialog to check the frequency spectrum - Change radio channel if required
230-04A8	**Error message** Could not activate or deactivate axis %2 **Cause of error** In a traverse range switchover, the position, speed and current controller of the axes to be deactivated must be switched off first. **Error correction** - Check the PLC program and adapt it if necessary. - Inform your service agency.
230-04A9	**Error message** Do not set the switch-off group, parameter set %2 **Cause of error** Setting the parameter CfgAxisHardware/MP_driveOffGroup is not permitted in controls with integrated functional safety (FS) from HEIDENHAIN. **Error correction** - Check the parameters. - The function must be implemented by the machine manufacturer via the SPLC program. - Inform your service agency.

Error number	Description
230-04AA	**Error message** The switch-off group must be set, parameter set %2 **Cause of error** The parameter CfgAxisHardware/MP_driveOffGroup must be set for controls without integrated functional safety (FS) from HEIDENHAIN. Refer to the Technical Manual for your control for the function and constraints of this parameter. **Error correction** - Check the parameters. - Inform your service agency.
230-04AB	**Error message** Parameter %2 not set for parameter set %3 **Cause of error** The parameter must be set for this parameter set. **Error correction** - Check the parameters. - Inform your service agency.
230-04AC	**Error message** Inputs for axis-group enabling are ignored **Cause of error** Inputs for axis-group enabling were found where the setting CfgHardware/MP_driveOffGroupInputs was defined. This machine ignores them. The safety functions STO, SBC, and SS1 can only be used via a PAE-H switch-off module. **Error correction** - Delete the setting CfgHardware/MP_driveOffGroupInputs. - Put the safety functions on terminals of a PAE module and configure them in accordance with the risk analysis of the machine. - Inform your service agency.
230-04AD	**Error message** PL inputs are not allowed as axis-group enabling **Cause of error** PL inputs for axis-group enabling were defined in the IOCP file. This machine ignores them. The safety functions STO, SBC, and SS1 can only be used via a PAE-H switch-off module. **Error correction** - Delete the axis-group enabling machine function from all PL input terminals. - Put the safety functions on terminals of a PAE module and configure them in accordance with the risk analysis of the machine. - Inform your service agency.

Error number	Description
230-04AE	**Error message** PAE module not configured in IOCP file **Cause of error** No machine functions for axis-group enabling were found in the IOCP file. The safety functions STO, SBC, and SS1 must be configured via a PAE-H switch-off module. The PAE module is presumably not configured. **Error correction** - Configure the PAE module correctly in the IOCP file. - Put the safety functions on terminals of a PAE module and configure them in accordance with the risk analysis of the machine. - Inform your service agency.
230-04AF	**Error message** Axis-group enabling machine function configured on PL module **Cause of error** The axis-group enabling machine function was defined on at least one terminal in the IOCP file even though the module is not a PAE module. The safety functions STO, SBC, and SS1 can only be used via a PAE-H switch-off module. **Error correction** - Put the safety functions on terminals of a PAE module and configure them in accordance with the risk analysis of the machine. - Inform your service agency.
230-04B0	**Error message** Invalid PWM frequency configured for axis %2 **Cause of error** An incorrect or invalid PWM frequency was configured. Frequencies up to 10 kHz are possible for CC 61xx and UEC 1xx. For Gen3 devices, depending on the UM device only frequencies up to 10 kHz are possible, or even only specific individual frequencies. **Error correction** Check and correct the configuration under CfgPowerStage->ampPwmFreq.

Error number	Description
230-04B3	**Error message** More safe axes are activated than are enabled in the SIK **Cause of error** The axis options in the SIK specify how many safe axes can be active at the same time. You have activated more safe axes over the machine configuration than are enabled as axis options in the SIK. **Error correction** - Check the machine configuration and correct it if necessary - If you need more safe axes, you can get a code number from HEIDENHAIN to enable them..
230-04B4	**Error message** SMC: Missing acknowledgment **Cause of error** SMC run-time error: - The safety-oriented software did not respond within the expected time period. - Generally high system load **Error correction** Check the system load
230-04B7	**Error message** Error in configuration of axis %2 **Cause of error** The axis is not configured correctly. **Error correction** Check the axis configuration in the following machine parameters and correct if required: - CfgSupplyModule/name - CfgPowerStage/ampPowerSupplyType - CfgPowerStage/ampBusVoltage - CfgPowerStage/supplyModule - CfgSupplyModule3xx/hsciUvIndex - CfgPowerStage/pwmPhaseShift - Inform your service agency
230-04B9	**Error message** The signal cannot be recorded **Cause of error** The necessary access right to record PLC signals is missing. **Error correction**

Error number	Description
230-04BA	**Error message** UVR%2 change of parameters requires restart. Shut down the control and restart it. **Cause of error** The UVR cannot apply the changed machine parameters without restarting. **Error correction** Restart the control
230-04BC	**Error message** Warning from EnDat speed encoder on motor in %1 axis ID: %2 SN: %3 Warning from EnDat position encoder in %1 axis ID: %2 SN: %3 **Cause of error** - Lower internal functional limit of the encoder has been exceeded. **Error correction** - Check the mounting of the encoder and correct it if necessary - Clean the encoder, if possible - Check whether any of the encoder specifications were not complied with, e.g. the supply voltage or ambient temperature. Ensure that the encoder is operated within the specifications. - Inform your service agency
230-04BD	**Error message** Advance warning from EnDat position encoder in %1 axis ID: %2 SN: %3 **Cause of error** - Internal functional limit of the encoder has been reached. The encoder can still be operated, but it is recommended that the encoder be checked. **Error correction** - Check the mounting of the encoder and correct it if necessary - Clean the encoder, if possible - Check whether any of the encoder specifications were not complied with, e.g. the supply voltage or ambient temperature. Ensure that the encoder is operated within the specifications. - Inform your service agency

Error number	Description
230-04BF	**Error message** Fatal error on inverter %2 Emergency stop by inverter %2 NC stop by inverter %2 **Cause of error** - Internal error in the inverter **Error correction** - Note any further messages - Inform your service agency
230-04C2	**Error message** Brake outputs can't be read by IOCP file **Cause of error** The IOCP file was not configured or cannot be read **Error correction** Inform your service agency
230-04C3	**Error message** Brake outputs are ignored **Cause of error** "Outputs for brake control" were defined in the IOCP file. These are not supported by the present machine configuration and will therefore be ignored. **Error correction** - Remove configured outputs for brake control from the IOCP file - Configure outputs for brake control through CfgBrake/MP_connection - Inform your service agency
230-04C4	**Error message** Two brake outputs refer to the same brake %1 **Cause of error** In the IOCP file, two "outputs for brake control" were configured with the same reference to one brake (CfgBrake). **Error correction** - Check the brake control configuration in the IOCP file and correct it - Inform your service agency

Error number	Description
230-04C5	**Error message** Control of brake %2 on axis %3 incorrectly configured **Cause of error** The configured output for brake control in the IOCP file refers to a hardware terminal other than the one currently being used by the axis. **Error correction** - Configure the output for brake control in the IOCP file to the correct terminal - Inform your service agency
230-04C6	**Error message** Brake %2: MP_connection must not be configured **Cause of error** The machine parameter CfgBrake/connection is not supported by the present machine configuration. **Error correction** Use IOconfig to configure "Output for controlling the brake" through the IOCP file
230-04C7	**Error message** Connection of brake %2 not configured **Cause of error** The output necessary for brake control is missing from the IOCP file **Error correction** - Configure the output for brake control for this brake in the IOCP file - Inform your service agency
230-04C8	**Error message** Braking connection for brake %2 not configured **Cause of error** Configuration of the brake connection is missing in CfgBrake/MP_connection **Error correction** - Configure the machine parameter CfgBrake/MP_connection - Inform your service agency

Error number	Description
230-04C9	**Error message** Acceptance testing of safety-relevant parameters %1 required **Cause of error** - The hardware configuration was significantly changed, e.g. different model of inverter - The configuration of the safety-related parameters was changed - The saved configuration was changed by the hardware defects **Error correction** - Check the safety-relevant configuration for the drive (parameter set) - Have suitable persons accept the configuration again, if necessary - Inform your service agency
230-04CA	**Error message** Braking connection for brake %2 incorrectly configured **Cause of error** An incorrect value was configured for the brake connection CfgBrake/MP_connection **Error correction** - Check the entry in the machine parameter CfgBrake/MP_connection and correct it as necessary - Inform your service agency
230-04CD	**Error message** Error during conversion of motor %1 **Cause of error** Converting the motor data from the old table 'PLC:\table\motor_oem.mot' to the table MOTOR_OEM failed. **Error correction** - Inform your service agency
230-04CE	**Error message** Communication with CC controller unit faulty **Cause of error** An error occurred during the internal communication with the CC controller unit. Internal information: error in acknowledging the SampleRate. The requested "blockSize" is not available. **Error correction**

Error number	Description
230-04CF	**Error message** A client with this ID is already logged on **Cause of error** The data interface to the configuration server is occupied. **Error correction** Inform your service agency.
230-04D0	**Error message** Configuration server is not ready **Cause of error** No readiness for communication through the data interface with the configuration server. **Error correction** Inform your service agency.
230-04D1	**Error message** The requested parameter is not available **Cause of error** A parameter that is not available was entered. **Error correction** - Check/Correct the entered parameter - If the error recurs, inform your service agency
230-04D2	**Error message** Faulty axis configuration (%2) **Cause of error** Axes that are not configured on the same CC controller unit are to be operated as torque-master-slaves. **Error correction** Check and correct the configuration
230-04D3	**Error message** Faulty monitoring of the software limit switches **Cause of error** Monitoring of the software limit switch was probably deactivated by the machine manufacturer via a macro. This is currently no longer permitted. **Error correction** - Contact the machine manufacturer - Information for machine manufacturers: check handling of the software limit switch in the OEM macro and correct as needed

Error number	Description
230-04D4	**Error message** Emergency stop by CC, %2 NC stop by CC, %2 **Cause of error** - Internal error in the controller unit **Error correction** - Note any further messages - Inform your service agency
230-04D6	**Error message** Temp. of the CC too high %2 **Cause of error** Temperature sensor detects an excessively high or low temperature within the housing of the controller unit. - Insufficient heat dissipation for the controller unit - Contaminated filter pads - Defective climate control unit in the electrical cabinet - Defective fan - Defective temperature sensor - Unfavorable mounting of components **Error correction** - Clean the filter pads - Check the climate control unit, and repair it if necessary - Replace the fan - Inform your service agency
230-04D7	**Error message** Error in acknowledging the sample rate of the UVR **Cause of error** The acknowledged sample rate of the UVR drive unit does not agree with the expected sample rate **Error correction** If the error recurs, inform your service agency.
230-04D8	**Error message** Error in acknowledging the sample rate of the UVR **Cause of error** The requested "blockSize" of the UVR drive unit is not available. **Error correction**

Error number	Description
230-04DD	**Error message** Input for SBC.GLOBAL configured incorrectly **Cause of error** For the use of the SBC.GLOBAL input terminal of the PAE module, the corresponding machine function was either not configured in the IO configuration (IOC file) or it was configured incorrectly. - No PAE module was configured. - A PAE module with an outdated version of the HDD file was configured. - More than one PAE module was configured. - SBC.GLOBAL was configured on the wrong module. **Error correction** - Check the IO configuration - Inform your service agency
230-04DE	**Error message** Input for SBC.GLOBAL must not be configured **Cause of error** Do not configure the machine function SBC.GLOBAL in the IO configuration (IOC file) of systems with integrated functional safety. **Error correction** - Check the IO configuration - Inform your service agency
230-04E0	**Error message** Progmmd. limit switch/protection zone incorrect for axis %2 **Cause of error** Protection zones for modulo axes should not be used with this version of the control software. **Error correction** - Remove protection zone for modulo axis - Do not configure the axis as a modulo axis
230-04E2	**Error message** Start position of axis (%2) not permissible for block scan **Cause of error** The starting position of the axis is outside of the permissible range. **Error correction** - Check the configuration of the software limit switches - Check the starting points of the axes in the NC program

Error number	Description
230-04E3	**Error message** No complete circle was recorded **Cause of error** During evaluation of the measured data, it was found that no complete circle was recorded. **Error correction** - Check whether the configured feed rate was achieved - Check the configured trigger speed
230-04E5	**Error message** Incorrect UVR/UEC configuration: %2, index invalid: %3 **Cause of error** No valid value entered for the machine parameter CfgSupplyModule3xx > hsciUvIndex. **Error correction** Check and correct the parameter: CfgSupplyModule3xx > hsciUvIndex
230-04E6	**Error message** Incorrect UVR/UEC configuration: config. duplicated: %1 - %2 **Cause of error** The parameter CfgSupplyModule3xx > hsciUvIndex is identical in the two stated instances of CfgSupplyModule3xx. That is not allowed. **Error correction** Check the parameter in all instances and correct as necessary: CfgSupplyModule3xx > hsciUvIndex
230-04E7	**Error message** Axis movement not permitted while switching the CLP filter **Cause of error** No axis may move while the CLP filter is being switched on or off. The movement may also result from superimpositioning (e.g., swing-frame grinding). Possible causes of the filter switching: - Switch-on or -off of TCPM (also M128 / M129) - Tilting the working plane **Error correction** Edit the NC program.

Error number	Description
230-04E8	**Error message** Underlying velocity is too low **Cause of error** There were changes to the algebraic sign over the course of the actual velocity. This reduces the quality of the determined characteristic values. **Error correction** - Increase the underlying velocity - The excitation amplitude might need to be reduced
230-04E9	**Error message** Not enough RAM to evaluate the measured data **Cause of error** Not enough RAM is available to evaluate the "Measure machine status" cycle. **Error correction** - Close any unnecessary applications - Restart the control
230-04EA	**Error message** MEASURE MACHINE STATUS: memory management faulty **Cause of error** Cannot delete an internal system file for temporary processing. **Error correction** Inform your service agency
230-04EC	**Error message** Axis-group enabling disabled while in motion **Cause of error** Axis-group enabling was disabled for safety reasons. **Error correction** If no reason can be identified, inform your machine tool builder

Error number	Description
230-04ED	**Error message** Parameters of current controller are not correct %2 **Cause of error** - The current controller (CfgCurrentControl) is not parameterized correctly Mixed parameterization is not permitted: Please use only (iCtrlPropGain and iCtrlIntGain) or (iCtrlPropGainD, iCtrlIntGainD, iCtrlPropGainQ, and iCtrlIntGainQ) **Error correction** - Correct the parameterization of the current controller Set (iCtrlPropGain = 0 and iCtrlIntGain = 0) or (iCtrlPropGainD = 0, iCtrlIntGainD = 0, iCtrlPropGainQ = 0, and iCtrlIntGainQ = 0)
230-04EE	**Error message** Parameters of current controller are not correct %2 **Cause of error** - The current controller (CfgCurrentControl) is not parameterized correctly iCtrlPropGain = 0, even though iCtrlIntGain > 0 **Error correction** - Correct the parameterization of the current controller: Set iCtrlPropGain > 0 or iCtrlIntGain = 0
230-04EF	**Error message** Parameters of current controller are not correct %2 **Cause of error** - The current controller (CfgCurrentControl) is not parameterized correctly iCtrlPropGainD = 0, even though iCtrlIntGainD > 0 **Error correction** - Correct the parameterization of the current controller: Set iCtrlPropGainD > 0 or iCtrlIntGainD = 0
230-04F0	**Error message** Parameters of current controller are not correct %2 **Cause of error** - The current controller (CfgCurrentControl) is not parameterized correctly iCtrlPropGainQ = 0, even though iCtrlIntGainQ > 0 **Error correction** - Correct the parameterization of the current controller: Set iCtrlPropGainQ > 0 or iCtrlIntGainQ = 0

Error number	Description
230-04F1	**Error message** Configuration error in Monitoring **Cause of error** Die Konfiguration des Monitorings (Komponenten- und Prozessüberwachung) ist mit dem beschriebenen Fehler fehlgeschlagen. **Error correction** Konfigurationsfehler durch Maschinenhersteller beheben lassen.
230-04F2	**Error message** Run-time error during calculation **Cause of error** Laufzeitfehler bei Berechnung des Monitorings **Error correction** Kundendienst benachrichtigen
230-04F3	**Error message** Error with external modules **Cause of error** In Bezug auf eine Monitoring-Funktion ist ein schwerwiegender Fehler mit externen Komponenten auf der Steuerung aufgetreten. **Error correction** Kundendienst benachrichtigen
230-04F4	**Error message** Internal (implementation) error **Cause of error** Schwerwiegender interner (Implementierungs-)Fehler bei Monitoring-Funktion. **Error correction** Kundendienst benachrichtigen
230-04F5	**Error message** Missing rights **Cause of error** Rechte für die auszuführende Aktion fehlen **Error correction** Kundendienst benachrichtigen

Error number	Description
230-04F6	**Error message** Monitoring task results in a warning **Cause of error** Auszuführende Aktion im Montioring löst eine Warnung aus **Error correction** Kundendienst benachrichtigen
230-04F7	**Error message** Error while setting up Process Monitoring **Cause of error** Beim Einrichten der Prozessüberwachung ist ein Fehler aufgetreten: "Monitoring Meta Data"-Datei fehlerhaft **Error correction** Kundendienst benachrichtigen
230-04F8	**Error message** Faulty configuration of Multicast data **Cause of error** Die Konfiguration der Beauftragung der Multicast-Daten ist mit dem beschriebenen Fehler fehlgeschlagen. **Error correction** Konfigurationsfehler durch Maschinenhersteller beheben lassen.
230-04F9	**Error message** Internal error in the Multicast data interface **Cause of error** Schwerwiegender interner (Implementierungs-)Fehler in der Multicast-Datenschnittstelle. **Error correction** Kundendienst benachrichtigen
230-04FA	**Error message** Realtime Container error in the Multicast data interface **Cause of error** Realtime Container Fehler in der Multicast-Datenschnittstelle aufgetreten. **Error correction** Kundendienst benachrichtigen.

Error number	Description
230-04FB	**Error message** Realtime Container error in monitoring tasks **Cause of error** Realtime Container Fehler im Monitoring aufgetreten. **Error correction** Kundendienst benachrichtigen.
230-04FC	**Error message** Error while calculating the indicators **Cause of error** Fehler im Zusammenhang mit den Indikatoren im Monitoring aufgetreten. **Error correction** Kundendienst benachrichtigen.
230-04FD	**Error message** Internal error in the NC reactions for monitoring tasks **Cause of error** Fehler bei den Reaktionen im Monitoring aufgetreten. **Error correction** Kundendienst benachrichtigen.
230-04FE	**Error message** Internal error in monitoring tasks **Cause of error** Schwerwiegender interner (Implementierungs-)Fehler im Monitoring. **Error correction** Kundendienst benachrichtigen.
230-04FF	**Error message** Error in the table server of monitoring tasks **Cause of error** Es sind Fehler aufgetreten, die Tabellen im Monitoring betreffen. **Error correction** Kundendienst benachrichtigen.
230-0500	**Error message** Error in the formulas used for monitoring tasks **Cause of error** Es sind Fehler in Bezug auf die im Monitoring verwendeten Formeln aufgetreten. **Error correction** Kundendienst benachrichtigen.

Error number	Description
230-0501	**Error message** Faulty configuration of the monitoring tasks **Cause of error** An error occurred while configuring a monitor. **Error correction** Inform your service agency.
230-0502	**Error message** Software option for component monitoring is not enabled **Cause of error** Die Komponentenüberwachung kann nicht verwendet werden. Die notwendige Software-Option ist nicht freigeschaltet. **Error correction** - Software-Option für die Komponentenüberwachung im SIK freischalten - Kundendienst benachrichtigen
230-0503	**Error message** Process Monitoring software option is missing **Cause of error** The software option for process monitoring is not enabled. Process monitoring cannot be used. **Error correction** Inform your service agency
230-0504	**Error message** Cancel program after NC stop because of error %2 **Cause of error** Program execution was canceled after an NC stop. Reason: The CC controller triggered an error. **Error correction** Note the information on remedies while the CC error is displayed.
230-0505	**Error message** Frequency too high for eval. slot %s in envelope curve spectrum **Cause of error** The frequency to be evaluated is beyond the Nyquist frequency. **Error correction** - Select an adequate frequency below the Nyquist frequency

Error number	Description
230-0506	**Error message** No monitoring due to an upstream error **Cause of error** Due to an upstream error, Component Monitoring and Process Monitoring were deactivated. **Error correction** Inform your service agency.
231-4003	**Error message** 4003 EMERGENCY STOP is active (emergency stop test) **Cause of error** **Error correction**
231-4004	**Error message** 4004 EMERGENCY STOP is inactive (emergency stop test) **Cause of error** **Error correction**
231-4005	**Error message** 4005 Stack overflow warning **Cause of error** **Error correction**
231-4007	**Error message** 4007 No interrupt from the gate array **Cause of error** **Error correction**
231-4008	**Error message** 4008 Answer to a host command was too late **Cause of error** **Error correction**
231-4009	**Error message** 4009 False interrupt (AC failure, emergence stop) **Cause of error** **Error correction**
231-400B	**Error message** 400B Host is prompted to synchronize **Cause of error** **Error correction**

Error number	Description
231-4011	**Error message** 4011 Axis %1: measurement interrupted by NC Stop **Cause of error** The cycle was interrupted by an NC Stop while measuring. The measurement was canceled and the data discarded. **Error correction** - Continue the cycle with NC Start - Repeat the measurement
231-4110	**Error message** 4110 Encoder contamination in axis %1 **Cause of error** **Error correction**
231-4120	**Error message** 4120 Excessive frequency in encoder for axis %1 **Cause of error** **Error correction**
231-4130	**Error message** 4130 Contamination of Z1 track in encoder for axis %1 **Cause of error** **Error correction**
231-4140	**Error message** 4140 Power module warning: Heat sink temperature in axis %1 **Cause of error** **Error correction**
231-4150	**Error message** 4150 Power module warnung for axis %1 **Cause of error** **Error correction**
231-4160	**Error message** 4160 Gate array status reg. = not nicht stored (axis %1) **Cause of error** **Error correction**

Error number	Description
231-4170	**Error message** 4170 Error in temperature measurement for axis %1 **Cause of error** **Error correction**
231-4200	**Error message** 4200 PLC: Drive is ready for operation in axis %1 **Cause of error** **Error correction**
231-4210	**Error message** 4210 PLC: Drive is not ready for operation in axis %1 **Cause of error** **Error correction**
231-4220	**Error message** 4220 Standstill recognition (V=0 with IQ_max): (axis %1) **Cause of error** **Error correction**
231-4230	**Error message** 4230 End of standstill recognition in axis %1 **Cause of error** **Error correction**
231-4240	**Error message** 4240 Warning for I^2*t monitoring in axis %1 **Cause of error** **Error correction**
231-4250	**Error message** 4250 End of warning for I^2*t monitoring in axis %1 **Cause of error** **Error correction**
231-4260	**Error message** 4260 Limit through I^2*t monitoring **Cause of error** **Error correction**

Error number	Description
231-4270	**Error message** 4270 End of limit through I^2*t monitoring in axis %1 **Cause of error** **Error correction**
231-4280	**Error message** 4280 Error during REF scan in axis %1 **Cause of error** **Error correction**
231-4290	**Error message** 4290 Drive switch-off (inactive RDY signal) in axis %1 **Cause of error** **Error correction**
231-4300	**Error message** 4300 Drive enable in axis %1 **Cause of error** **Error correction**
231-4310	**Error message** 4310 Drive disabled, e.g. through emergency stop in axis %1 **Cause of error** **Error correction**
231-4400	**Error message** 4400 Excessive following error (axis: %1) **Cause of error** - The following error of an axis exceeds one of the following error limits. - The acceleration entered is too large. - The motor does not move in spite of “Drive on.” **Error correction** - Reduce the contouring feed rate, increase the rotational speed. Remove any possible sources of vibration. Inform your service agency if the error occurs frequently. - Check the acceleration (CfgFeedLimits/maxAcceleration) - Check the following error limits (CfgPosControl/servoLag-Min[1/2] or servoLagMax[1/2]) - The motor current must not be under limitation during acceleration

Error number	Description
231-5100	**Error message** 5100 Endless loop: Time monitoring (value: %1) **Cause of error** **Error correction**
231-5200	**Error message** 5200 Compensated angle error alignment (value: %1) **Cause of error** **Error correction**
231-5300	**Error message** 5300 Timeout of shaft speed interrupt (value: %1) **Cause of error** **Error correction**
231-5500	**Error message** 5500 Emergency stop failure **Cause of error** **Error correction**
231-6002	**Error message** 6002 Status of machine-on input = 1 after "hcSgMaschineEin" **Cause of error** **Error correction**
231-6003	**Error message** 6003 Status of machine-on input = 0 after "hcSgMaschineEin" **Cause of error** **Error correction**
231-6005	**Error message** 6005 STOP1 release due to error in T2 test **Cause of error** **Error correction**
231-6006	**Error message** 6006 Tool changer: "SHS2"-output change to open chuck **Cause of error** **Error correction**

Error number	Description
231-6016	**Error message** 6016 STOP2 release: Incorrect power supply **Cause of error** **Error correction**
231-6017	**Error message** 6017 STOP2 release: Out of temperature range **Cause of error** **Error correction**
231-6018	**Error message** 6018 Request for test of pulse deletion **Cause of error** **Error correction**
231-6100	**Error message** 6100 Cut-out channel test: Status change -STO.A.x %1 = 0->1 **Cause of error** **Error correction**
231-6140	**Error message** 6140 Negative position monitoring with stop 1 **Cause of error** **Error correction**
231-8000	**Error message** 8000 CC%2 Warning: Temperature of controller card is high **Cause of error** - The temperature of the controller card has exceeded a warning threshold - Ambient temperature is too high **Error correction** - Check the air conditioning of the electrical cabinet - Check whether the fan is working - Inform your service agency
231-8001	**Error message** 8001 CC%2 Warning: Temperature of controller card is low **Cause of error** - The temperature of the controller card has fallen below a warning threshold - Ambient temperature is too low **Error correction** - Check the air conditioning of the electrical cabinet - Inform your service agency

Error number	Description
231-8002	**Error message** 8002 CC%2 warning: Fan speed is low **Cause of error** - The rotational speed of the fan in the CC controller unit has exceeded a warning threshold **Error correction** - Check the fan - Inform your service agency
231-8003	**Error message** 8003 CC%2 early warning: dc-link current too high **Cause of error** - The DC-link voltage of the temperature of the supply module has exceeded a warning threshold **Error correction** - Reduce the DC-link voltage by: - Adjust the acceleration/braking ramps of the axes/spindles - Check the "motPbrMax" and "motPMa" machine parameters - Inform your service agency
231-8004	**Error message** 8004 CC test software loaded **Cause of error** - In the control there is a non-released CC test program without valid CRC program checksum - No valid CRC checksum value was entered in the binary file of the CC software - The MC software version does not support the CRC checksum comparison **Error correction** - The software can be used after the error acknowledgment for initial servicing or error diagnostics - Check the software version - Read out the log - Inform your service agency

Error number	Description
231-8005	**Error message** 8005 Oscilloscope signal not supported **Cause of error** - At least one of the selected signals of the internal oscilloscope is not supported with this controller unit (CC422) - The following signals are not supported by the controller unit: P mech., P elec., DSP debug, DC-link P, CC DIAG, I actual, actl. Id, Iq max, U noml, int. diag., motor A and motor B **Error correction** - Please do not select the following signals: - P mech. - P elec. - DSP debug - DC-link P - CC DIAG - I actual - Actl. Id - U nominal - int. Diag. - Motor A - Motor B - Max. Iq
231-8010	**Error message** 8010 LSV2 transmission error **Cause of error** - Error in data transfer by LSV2 protocol **Error correction** - Press the CE key to acknowledge the error. - Error does not impair the control functions. - Inform your service agency.
231-8040	**Error message** 8040 Heat sink temp. in UV 1xx **Cause of error** - Heat-sink temperature of UV 1xx power supply unit too high - Temperature in the electrical cabinet too high - Contaminated filter pads - Defective climate control unit in the electrical cabinet - Defective fan in the UV - Defective temperature sensor - If the heat-sink temperature continues to increase, the unit will be switched off **Error correction** - Stop the machine and let it cool down - Continue working with lower power (reduce the feed rate) - Clean the filter pads - Check the climate control unit in the electrical cabinet - Inform your service agency

Error number	Description
231-8041	**Error message** 8041 Excessive Iz in UV 1xx **Cause of error** - DC-link current of UV 1xx power supply unit too high - Overload of the machine while machining a workpiece **Error correction** - Continue working with lower power (reduce feed rate, replace worn tool, etc.)
231-8060	**Error message** 8060 Leakage current in UV 1xx **Cause of error** - Insulation problem (e.g. defective motor, contamination of the inverter, humidity) - Check the motor connection for a ground fault **Error correction** - Isolate the cause by deselecting specific axes - Replace the motor of the affected axis or check for a ground fault - Replace the power cable of the affected axis or check for a ground fault - Replace the inverter of the affected axis or check for a ground fault - Check the motors of all selected axes - Inform your service agency
231-8061	**Error message** 8061 Power module not ready **Cause of error** - Readiness signal of the power supply module is inactive after the servo control starts. - Master contactor has opened - Error in PLC program - Power supply module, inverter defective **Error correction** - Try restarting the inverter. If the error recurs: - Inform your service agency - Check the wiring (main contactor) - Check the PLC program - Exchange the power supply module

Error number	Description
231-8062	**Error message** 8062 Limit: Uz too small **Cause of error** - The dc-link voltage from the supply unit fell below the defined limit. **Error correction** - Inform your service agency - Failure of the power supply at the supply module - Excessive power consumption by the axes->activate the power limitation of the spindle
231-8063	**Error message** 8063 CC%2 timeout in S status test **Cause of error** - The MC activates the S status evaluation too late after a test. - The maximum test switch-off time was exceeded. **Error correction** - Inform your service agency
231-8064	**Error message** 8064 AC powerfail AC powerfail **Cause of error** An error occurred during the AC Fail process. The line voltage was intermittently interrupted. Possible causes: - Power failure - Dropout in line power - Defective protection of the line power supply - Check the wiring of the line power supply **Error correction** - Check the line power circuit breakers - Check the power supply wiring - Check the quality of the line voltage (possible dropouts) - Inform your service agency

Error number	Description
231-8065	**Error message** 8065 DC powerfail DC powerfail 806C DC powerfail **Cause of error** An error occurred during the DC Fail process. The dc-link voltage is below the specified limit. **Error correction** - Check the dc-link voltage - Check the DC-link charging contactor for interruptions - Check the line power supply - Check the line power circuit breakers - Check the wiring of the line power - Check the quality of the line voltage (possible dropouts) - Inform your service agency
231-8066	**Error message** 8066 CC%2 maximum temperature of controller card exceeded 8042 CC%2 maximum temperature of controller card exceeded **Cause of error** - The maximum temperature of the controller card (CC) was exceeded - Ambient temperature is too high **Error correction** - Check the air conditioning of the electrical cabinet - Check whether the fan is working - Inform your service agency
231-8067	**Error message** 8067 CC%2 temperature of controller card below minimum 8043 CC%2 temperature of controller card below minimum **Cause of error** - The temperature of the controller card (CC) is below the minimum - Ambient temperature is too low **Error correction** - Check the air conditioning of the electrical cabinet - Inform your service agency

Error number	Description
231-8068	**Error message** 8068 CC%2 Fan speed too low 8044 CC%2 Fan speed too low **Cause of error** - The rotational speed of the fan in the CC controller unit has exceeded a monitoring threshold **Error correction** - Check the fan - Exchange the controller unit - Inform your service agency
231-8069	**Error message** 8069 IGBT error in the supply module **Cause of error** - The supply module switched off with an IGBT error (overload). **Error correction** - Check the power consumption of axes and spindle - Exchange the power supply module - Inform your service agency
231-806A	**Error message** 806A Unknown SPI expansion module **Cause of error** - The SPI plug-in module (for CC or MC) is unknown or provides an unknown code. - The SPI plug-in module is defective. **Error correction** - Remove the defective SPI plug-in module. - Exchange the defective SPI plug-in module. - Inform your service agency.
231-806B	**Error message** 806B Powerfail AC drive cntrller **Cause of error** An "AC fail" occurred during operation. This means that the line power supply was temporarily interrupted. Possible causes: - Power failure - Dropout in line power - Defective protection of the line power supply - Defective wiring of the line power supply **Error correction**

Error number	Description
231-8080	**Error message** 8080 Uz UV 1xx exceeds max. **Cause of error** - DC-link voltage of the power supply unit too high - Defective braking resistor - Defective power supply unit (infeed/regenerative feedback module) - Interruption in the primary supply (fuses, wires, etc.) - Energy recovery not possible **Error correction** - Inform your service agency - Check the configuration datum (braking of the spindle) - Check the braking resistor - Replace the power supply unit - Check the fuses and wiring of the primary supply
231-8081	**Error message** 8081 Uz is too small **Cause of error** - DC-link voltage of the supply unit is too low **Error correction** - Inform your service agency - Failure of the power supply at the supply module - Excessive power consumption by the axes->activate the power limitation of the spindle - Check MP2192
231-8082	**Error message** 8082 MC shut-off signal "-STO.A.MC.WD" is active **Cause of error** - The shut-off signal "-STO.A.MC.WD" of the MC is active - Check the entry in machine parameter CfgCycleTime -> watchdogTime - Hardware defective - The drive was switched off due to an internal error of the MC **Error correction** - Inform your service agency
231-8086	**Error message** 8086 Probing already active **Cause of error** Internal software error **Error correction** - Inform your service agency - Check the software version

Error number	Description
231-8092	**Error message** 8092 Pos. contr. cyc. time error **Cause of error** - MC is providing erroneous cycle time for CC position controller - Hardware error **Error correction** - Inform your service agency - Check the configuration datum ipoCycle - Exchange the drive control board
231-8093	**Error message** 8093 CC%2 HSCI communication code=%4 address=%5 **Cause of error** - The HSCI communication monitor reports a transmission error - Hardware of an HSCI participant is defective **Error correction** - Check the HSCI cabling - Exchange the defective hardware - Inform your service agency

Error number	Description
231-8093	**Error message** 8093 CC%2 HSCI data package not received Code=%4 Address=%5 8093 CC%2 HSCI data package not received Code=%4 Address=%5 8093 CC%2 HSCI data package not received Code=%4 Address=%5 8093 CC%2 HSCI data packet not received Code=%4 Address=%5 **Cause of error** There was an error in HSCI communication. An expected data packet with the above described HSCI address could not be received. Code 2101: Missing cyclic data 2102: Missing asynchronous data 2103: Missing asynchronous data 2 2104: Missing cyclic data of low priority - Sporadic interruption of the HSCI communication through contact problems (connector) or external EMC disturbance - Grounding problems in the HSCI system - Disturbance in the power supply of an HSCI participant - Power supply fluctuations are too low or too high Power supply of an HSCI participant - Defect of an HSCI participant **Error correction** - Check the cabling (HSCI connection) - Check the ground and power supply of the HSCI participant - Check the software version. - Inform your service agency.

Error number	Description
231-8093	**Error message** 8093 CC%2 HSCI: Wrong ID data from HSCI device Code=%4 Address=%5 8093 CC%2 HSCI: Wrong ID data from HSCI device Code=%4 Address=%5 8093 CC%2 HSCI: Wrong ID data from HSCI device Code=%4 Address=%5 8093 CC%2 HSCI: Wrong ID data from HSCI device Code=%4 Address=%5 8093 CC%2 HSCI: Wrong ID data from HSCI device Code=%4 Address=%5 8093 CC%2 HSCI: Wrong ID data from HSCI device Code=%4 Address=%5 **Cause of error** There was an error in HSCI communication. an HSCI device with functional safety FS sent an incorrect identifica-tion data to the HSCI device with the above described HSCI address. Code 2201: Missing cyclic telegram 2202: Data telegram contains incorrect CRC checksum 2203: Data telegram contains incorrect watchdog counter 2204: Data telegram indicates incorrect channel 2205: Data telegram contains incorrect HSCI address 2206: Data telegram contains incorrect number of inputs - Incorrect HSCI configuration (IOC file) or wiring error - Defect of an HSCI participant
231-8093	**Error message** 8093 CC%2 Error in HSCI telegram between MC-CC Code=%4 Address=%5 8093 CC%2 Error in HSCI telegram between MC-CC Code=%4 Address=%5 8093 CC%2 Error in HSCI telegram between MC-CC Code=%4 Address=%5 **Cause of error** There was an error in HSCI communication. An expected data packet with the above described HSCI address could not be received. Code 2301: Missing telegram from MC to controller unit 2302: Data telegram contains incorrect CRC checksum 2303: Data telegram contains incorrect watchdog counter - Sporadic problems of the HSCI connection or external disturbance - Defect of an HSCI participant **Error correction** - Check the cabling (HSCI connection) - Check the software version. - Inform your service agency.

Error number	Description
231-8093	**Error message** 8093 CC%2 Error in HSCI telegram between CCs Code=%4 Address=%5 8093 CC%2 Error in HSCI telegram between CCs Code=%4 Address=%5 8093 CC%2 Error in HSCI telegram between CCs Code=%4 Address=%5 8093 CC%2 Error in HSCI telegram between CCs Code=%4 Address=%5 **Cause of error** An error occurred in the HSCI communication between two or more CC 61xx or UEC 1xx controller units. Code 2401: Missing transmission telegram between the controller units 2402: Data telegram contains incorrect CRC checksum 2403: Data telegram contains incorrect watchdog counter 2404: Incorrect index of a controller unit - Sporadic interruption of the HSCI communication through contact problems (connector) or external disturbance - Defect of an HSCI participant **Error correction** - Check the cabling (HSCI connection) - Check the software version. - Inform your service agency.
231-8093	**Error message** 8093 CC%2 Configuration error of an HSCI device with FS Code=%4 Address=%5 8093 CC%2 Configuration error of an HSCI device with FS Code=%4 Address=%5 8093 CC%2 Configuration error of an HSCI device with FS Code=%4 Address=%5 8093 CC%2 Configuration error of an HSCI device with FS Code=%4 Address=%5 8093 CC%2 Configuration error of an HSCI device with FS Code=%4 Address=%5 8093 CC%2 Configuration error of an HSCI device with FS Code=%4 Address=%5 8093 CC%2 Configuration error of an HSCI device with FS Code=%4 Address=%5 **Cause of error**

Error number	Description
231-8093	**Error message** 8093 CC%2 Alarm message from HSCI device Code=%4 Address=%5 8093 CC%2 Alarm message from HSCI device Code=%4 Address=%5 8093 CC%2 Alarm message from HSCI device Code=%4 Address=%5 8093 CC%2 Alarm message from HSCI device Code=%4 Address=%5 8093 CC%2 Alarm message from HSCI device Code=%4 Address=%5 8093 CC%2 Alarm message from HSCI device Code=%4 Address=%5 8093 CC%2 Alarm message from HSCI device Code=%4 Address=%5 8093 CC%2 Alarm message from HSCI device Code=%4 Address=%5 8093 CC%2 Alarm message from HSCI device Code=%4 Address=%5
231-8094	**Error message** 8094 CC%2 HSCI sampling interval not transferred **Cause of error** - Internal software error **Error correction** - Inform your service agency
231-8130	**Error message** 8130 Motor brake defective %1 **Cause of error** - Motor brake defective **Error correction** - Inform your service agency - Check the motor brake control - Exchange the motor
231-8150	**Error message** 8150 Field orient. successful %1 8690 Field orientation successful %1 **Cause of error** - Field orientation successful **Error correction** - Press CE to acknowledge the message

Error number	Description
231-8160	**Error message** 8160 Actual current value too high %1 8630 Actual current value too high %1 **Cause of error** - The maximum permissible current of the power stage was exceeded **Error correction** - Check the current controller adjustment - Inform your service agency - Check the motor table, power stage table and configuration data - Check the system for short circuits
231-8190	**Error message** 8190 Error in TNCopt measurement %1 **Cause of error** - The TNCopt measurement was cancelled **Error correction** - Check the TNCopt version - Check whether the control is active - Inform your service agency
231-81A0	**Error message** 81A0 Invalid diagnostics channel %1 **Cause of error** - Invalid CC-diag channel is selected in the oscilloscope. **Error correction** - Select another channel
231-81A1	**Error message** 81A1 CC %2 axis %1: Invalid DSP debug channel %4 **Cause of error** - Invalid DSP debug signal selected in the oscilloscope **Error correction** - Select another signal
231-81A2	**Error message** 81A2 Axis %1: Quantity of channels per inverter exceeded 81A3 Axis %1: Quantity of channels per encoder exceeded **Cause of error** The maximum permissible number of oscilloscope channels per device was exceeded. **Error correction** Reduce the number of oscilloscope channels for the device.

Error number	Description
231-81A4	**Error message** 81A4 Axis %1: result of weighing was deleted **Cause of error** The result of the weighing run was deleted. Cycle 239 was not deactivated. **Error correction** Deactivate Cycle 239 before switching to another setting.
231-81B0	**Error message** 81B0 DQ com error of inverter %1 Po=%4 Dev=%5 Error=%6 **Cause of error** - DRIVE-CLiQ communication to the inverter of the named axis is disturbed - DRIVE-CLiQ communication at the named output (Po=Port) has been interrupted - Error code (error) of the DSA link (third additional info): - Output in decimal, to be interpreted in binary, consisting of 8 bits: Bit(s) Meaning 7 Interrupt triggered 6..5 Error group: "00" Telegram reception error "01" Other reception error "10" Transmission error "11" Other errors 4 Telegram too early 3..0 More detailed information: 0x1: CRC error 0x2: Telegram too short 0x3: Telegram too long 0x4: Length byte incorrect 0x5: Wrong telegram type 0x6: Incorrect address 0x7: No SYNC telegram 0x8: Unexpected SYNC telegram 0x9: ALARM bit received 0xA: Life sign is missing 0xB: Synchronization error of the alternative cyclic data traffic **Error correction** - Inspect the DRIVE-CLiQ cabling - Exchange the inverter - Exchange the CC controller unit. - Inform your service agency.

Error number	Description
231-81C0	**Error message** 81C0 DQ com error motor encdr %1 Po=%4 Dev=%5 Error= %6 **Cause of error** - DRIVE-CLiQ communication to the speed encoder (motor encoder) of the named axis is disturbed. - DRIVE-CLiQ communication at the named output (Po=Port) has been interrupted. - Error code (error) of the DSA link (third additional info): - Output in decimal, to be interpreted in binary, consisting of 8 bits: Bit(s) Meaning 7 Interrupt triggered 6..5 Error group: "00" Telegram reception error "01" Other reception error "10" Transmission error "11" Other errors 4 Telegram too early 3..0 More detailed information: 0x1: CRC error 0x2: Telegram to short 0x3: Telegram to long 0x4: Length byte incorrect 0x5: Wrong telegram type 0x6: Incorrect address 0x7: No SYNC telegram 0x8: Unexpected SYNC telegram 0x9: ALARM bit received 0xA: Life sign is missing 0xB: Synchronization error of the alternative cyclic data traffic **Error correction** - Inspect the DRIVE-CLiQ cabling - Check the encoder connection - Exchange the speed encoder - Exchange the CC controller unit. - Inform your service agency.

Error number	Description
231-8300	**Error message** 8300 Motor brake defective %1 **Cause of error** - Motor brake defective **Error correction** Warning: Hanging axes cannot be supported under certain circumstances. The axis can fall down. Do not enter the area of danger under the axis! - Move the axis to a safe position before power-off - Inform your service agency - Check controls for motor brakes - Exchange the motor
231-8310	**Error message** 8310 No current in brake test %1 **Cause of error** - Motor is not properly connected - Inverter is incorrectly connected - Inverter is defective - Motor is defective **Error correction** - Inform your service agency - Check the wiring of the motor and inverter - Check the inverter - Check the motor
231-8320	**Error message** 8320 PIC: Actual value does not equal the nominal value %1 **Cause of error** - Check the entered power stage in the machine parameter file (MP_ampName) - Check the nominal value of the PICS (value in column S for the selected power stage of the file inverter.inv) - If necessary, change the PWM frequency (to >= 5 kHz) - If necessary, replace the power module **Error correction** - Nominal value (value in column S for the selected power stage of the file inverter.inv) = 1, but: - There is no PIC - PIC cannot be switched - PIC access has been deactivated (MP_motEncCheckOff, Bit16=1) - Nominal value (value in column S of the selected power stage of the file inverter.inv) = 0 however: - PIC access has been deactivated (MP_motEncCheckOff, bit 16=1) and PIC was already switched to 1

Error number	Description
231-8330	**Error message** 8330 Brake test was canceled %1 **Cause of error** The brake test was canceled by - PLC through Module 9161 = 0 - Missing enabling signal (emergency stop, X150, ...) - Other error message **Error correction** - Check the PLC program - Check the enabling signals - Inform your service agency
231-8420	**Error message** 8420 Excessive temperature of power module %2.s **Cause of error** - Axis is being loaded too heavily (overload, temperature) - Insufficient cooling in the electrical cabinet **Error correction** - Reduce the load – Check the climate control in the electrical cabinet. - Inform your service agency
231-8430	**Error message** 8430 Error during axis change %1 **Cause of error** - An axis was removed from the machine configuration while still in the closed control loop **Error correction** - Check the PLC program and edit if necessary - Check the configuration datum axisMode - Inform your service agency
231-8440	**Error message** 8440 Field orient. successful %1 **Cause of error** - Field orientation successfully completed. **Error correction** - Acknowledge the message with CE.
231-8600	**Error message** 8600 No drive-on command for %1 **Cause of error** - Speed controller is waiting for the "drive on" command; the PLC program has sent no "drive on" command. **Error correction** - Check the PLC program. - Inform your service agency. - Check the software version.

Error number	Description
231-8610	**Error message** 8610 I2T value is too high %1 **Cause of error** - The load of the drive is too high for the duration **Error correction** - Reduce the load or the duration - Inform your service agency - Check the motor table, power stage table and configuration data - Check whether the motor and power module are designed for the load
231-8620	**Error message** 8620 Load is too high %1 **Cause of error** - Drive has maximum current and cannot accelerate - Excessive load (torque, power) on the drive **Error correction** - Reduce the load on the drive - Inform your service agency - Check the motor table, power stage table and configuration data - Check whether the motor and power module are designed for the load
231-8640	**Error message** 8640 I2T value of motor is too high %1 **Cause of error** - The load of the motor is too high over the duration **Error correction** - Reduce the load or the duration - Check the motor table and configuration datum - Check whether the motor is designed for the load - Inform your service agency
231-8650	**Error message** 8650 I2T value of power module is too high %1 **Cause of error** - The load of the power module is too high over the duration **Error correction** - Reduce the load or the duration - Check the power module and configuration datum - Check whether the power module is designed for the load - Inform your service agency

Error number	Description
231-8680	**Error message** 8680 DQ inverter %1: Maximum current limiting **Cause of error** - The maximum current read from the inverter is smaller than the maximum current in the inverter table. - At a PWM frequency > 4 kHz: The output current has been derated too far. - The permissible load application of the inverter was exceeded. **Error correction** - Reduce the PWM frequency - Reduce the application load of the inverter - Inform your service agency
231-8800	**Error message** 8800 Signal LT-RDY inactive %1 8810 Signal LT-RDY inactive %1 **Cause of error** - Undesirable inverter switch-off during control of a vertical axis (caused by vertical axis). **Error correction** - Inform your service agency. - Check the PLC program. - Check the wiring of the inverter.
231-8820	**Error message** 8820 Field angle unknown %1 **Cause of error** - The field angle of the motor on the encoder reference point has not yet been ascertained. **Error correction** - Inform your service agency - Check the entry in the configuration datum motFieldAdjust-Move - If required, find field angle in the "current controller adjust-ment" mode (press the "FIELD ORIENT." soft key) Caution: The motor must be freely rotatable (no clamping, no hanging axis, no mechanical constraints). - Check the "type of encoder" entry in the motor table

Error number	Description
231-8830	**Error message** 8830 EnDat: no field angle %1 **Cause of error** - The field angle of a motor with unaligned EnDat encoder has not yet been ascertained- The transferred EnDat serial number does match the one saved **Error correction** - Inform your service agency - If required, find field angle in the "current controller adjustment" mode (press the "FIELD ORIENT." soft key) - "Type of encoder" entry in the motor table - Check the configuration datum motEncType
231-8840	**Error message** 8840 Axis not available %1 **Cause of error** - Starting command for unavailable axis. **Error correction** - Inform your service agency. - Check the software version.
231-8850	**Error message** 8850 Drive still active %1 **Cause of error** - Position measurement (Z1 track) was started although the drive is still active. **Error correction** - Inform your service agency. - Check the software version.
231-8860	**Error message** 8860 Input frequency of speed encoder %1 **Cause of error** - Noise on speed encoder signals - Signal connector: Poor contact or penetration of humidity - Humidity has entered the motor **Error correction** - Inform your service agency - Check the encoder signals - Check the shielding

Error number	Description
231-8870	**Error message** 8870 Input frequency of position encoder %1 **Cause of error** - Noise on position encoder signals - Penetration of humidity **Error correction** - Inform your service agency - Check the encoder signals - Check the shielding
231-8880	**Error message** 8880 No enabling while field angle %1 is being found **Cause of error** - Enabling is canceled while the field angle is being determined (e.g. PLC program, emergency stop, X150/X151, monitoring function). **Error correction** - Inform your service agency - Check the PLC program (most frequent cause)
231-8890	**Error message** 8890 TRC: Wrong type of motor %1 **Cause of error** - The axis for which the torque ripple compensation was activated through MP2260.x is not driven by a synchronous or linear motor. **Error correction** - Inform your service agency - To deactivate the compensation, delete the entry in MP2260.x
231-88A0	**Error message** 88A0 TRC: Wrong control %1 **Cause of error** - The compensation file was generated for a different control from this. Using a compensation file copied from another control is not allowed. **Error correction** - Inform your service agency - Find again the compensation parameters with TNCopt under Optimization/Torque Ripple Compensation - To deactivate the compensation, delete the entry in MP2260.x

Error number	Description
231-88B0	**Error message** 88B0 TRC: Wrong file – motor %1 **Cause of error** - The compensation file was generated for a motor with a different speed encoder with EnDat interface from this one. Using a compensation file copied from another control is not allowed. **Error correction** - Inform your service agency - Find again the compensation parameters with TNCopt under Optimization/Torque Ripple Compensation - To deactivate the compensation, delete the entry in MP2260.x
231-88C0	**Error message** 88C0 Max. nominal motor speed %1 exceeded **Cause of error** - Axis: Maximum feed rate is greater than the maximum motor speed (N-MAX) multiplied by the configuration datum distPerMotorTurn - Spindle: Maximum spindle speed is greater than the maximum motor speed (N-MAX) multiplied by the gear transmission ratio - The relationship between the line count of the position encoder and that of the motor encoder is faulty - The N-MAX entry in the motor table is faulty - Incorrect entry in the configuration datum motName - EcoDyn: The selected feed rate exceeds the max. permissible voltage **Error correction** - Inform your service agency - Check the N-MAX entry in the motor table - Check the configuration data maxFeed, manualFeed and distPerMotorTurn - Check the configuration data for spindle speed - Check the STR column in the motor table and line count in the spindle parameter block (configuration datum "posEncoderIncr") - Check all configuration data under CfgServoMotor

Error number	Description
231-88D0	**Error message** 88D0 Kinematic compensation %1 not possible **Cause of error** Kinematic compensation via compensation file is possible only for - Double-speed axes - PWM frequencies less than or equal to 5 kHz **Error correction** - Check the machine parameter: - Check the entry in SelAxType. - Check the entry in AmpPwmFreq. - Check the compensation file. - Inform your service agency.
231-88E0	**Error message** 88E0 Brake test %1 not possible **Cause of error** - A brake test is not possible because the axis is not in a control loop. **Error correction** - Inform your service agency - Software error
231-88F0	**Error message** 88F0 Inverter and supply module readiness is missing %s **Cause of error** - While the drive was still under servo control, both the Ready signal of the inverter and the Ready signal of the supply module were switched to inactive. - Possible causes: - UV was switched off over X70 - Fault clearance of the UV: - Dropout in power supply - DC-link voltage is too high - DC-link voltage is too low - DC-link current is too high - PLC or external wiring switched UV off - Noise signals on wiring CC -> UV, CC -> UM - CC controller unit is defective. **Error correction** - Check the diagnostic LEDs on the UV in the event of an error - Check the power supply of the UV - Check the enabling signal on X70 - Check whether the braking resistor is connected for a non-regenerative power supply. - Check the cable ground and shield - Exchange the supply module and the power module - Exchange the CC controller unit. - Inform your service agency.

Error number	Description
231-8900	**Error message** 8900 Noml. speed > %5 1/min: Field weakening inactive %1 **Cause of error** - The field weakening is not activated (machine parameter ampVoltProtection = 0) - The nominal speed was higher than the rotational speed possible without field weakening **Error correction** - Activate the field weakening (set machine parameter ampVoltProtection to be unequal to 0)
231-8910	**Error message** 8910 Velocity too high for rotor position measurement %1 **Cause of error** - An excessively high velocity was detected during the rotor position measurement - Cause 1: The rotor position is measured at a vertical axis without counterweight - Cause 2: The motor is in a poor switch-on position. The axis controls a certain position. **Error correction** - Regarding cause 1: Measure the rotor position with another method. Only methods that measure the rotor position at standstill are allowed. - Regarding cause 2: Restart the rotor position measurement - Inform your service agency
231-89F0	**Error message** 89F0 PLC input inactive %s **Cause of error** - A high-speed input is defined in MP4130.0 that stays inactive when the motor is switched on. - The high-speed input is not enabled over W522. **Error correction** - Inform your service agency - Check the PLC program - Check the high-speed PLC input (MP4130.5)

Error number	Description
231-8A00	**Error message** 8A00 No inverter enabling %1 **Cause of error** - Power-on of the drive not possible due to missing enabling of the inverter via –SH1 - Charging contactor and main contactor on the supply unit is not on (e.g. connector X70 on UV) - Safety relay not on (e.g. connectors X71 and X72 of the UV, X73 of the HEIDENHAIN expansion board for Simodrive) - PWM bus cable interrupted - Interruption in the electrical cabinet (unit bus, PWM ribbon cable) - Defective inverter, (supply unit and/or power modules, compact inverter) - Defective PWM interface on the control **Error correction** - Inform your service agency - Check the wiring
231-8A10	**Error message** 8A10 AC fail %1 **Cause of error** - Power-on of the drive not possible, because an AC-fail signal (power supply) is active. - At least one phase is missing at the primary connection of the supply module **Error correction** - Inform your service agency - Check the wiring of the power supply - Test the power supply
231-8A20	**Error message** 8A20 Powerfail %1 **Cause of error** - Power-on of the drive not possible, because a powerfail signal (power supply) is active **Error correction** - Inform your service agency - Check the wiring of the power supply - Test the power supply - DC-link voltage

Error number	Description
231-8A30	**Error message** 8A30 Drive enabling (I32) %1 **Cause of error** - Power-on of the drive not possible due to missing drive enabling via I32 **Error correction** - Inform your service agency - Check the wiring of the emergency-stop loop - Check the wiring for the drive enabling conditions (e.g. door contact, permissive button) - Measure 24 V- at connector X42/pin 33
231-8A40	**Error message** 8A40 Enabling of axis group %1 **Cause of error** - Because of missing drive enabling for axis groups (X150/X151), the drive cannot be switched on. **Error correction** - Inform your service agency - Check the connector on X150/X151 for correct fit - Check the wiring of X150/X151 - Check the optional configuration datum driveOffGroup.
231-8A50	**Error message** 8A50 Inverter not ready %1 **Cause of error** - Power-on of the drive not possible, because an inverter is not ready (RDY signal). - No pulse release, 24 V is missing on the terminal X71 or X72 - On interface PCBs for Siemens inverters, the second axis is not enabled - Compact inverter, inverter supply unit or power module is defective - Interruption at inverter bus cable (supply bus, unit bus, PWM bus) - Defective PWM interface on the control **Error correction** - Correct the defect in the pulse inhibitor on power supply module UV, X71/72 - Replace the defective compact inverter, supply unit or power module - Replace the defective cable - Inform your service agency

Error number	Description
231-8A60	**Error message** 8A60 Field angle incorrect %1 **Cause of error** The drive cannot be switched on because of missing field angle information. **Error correction** - Inform your service agency - Check the entries of the motor table (measuring device) - If necessary, ascertain the field angle
231-8A70	**Error message** 8A70 Drive change active %1 **Cause of error** The drive cannot be switched on because of a head exchange or a wye/delta switchover. **Error correction** - Inform your service agency - Check the PLC program
231-8A80	**Error message** 8A80 Error ack. missing %1 **Cause of error** The drive cannot be switched on because of a missing error acknowledgment. **Error correction** - Press the emergency stop and switch on again - Switch on the control voltage - Inform your service agency - Check the wiring of the emergency stop

Error number	Description
231-8A90	**Error message** 8A90 Safety module %1 **Cause of error** - Not a safety-oriented control: - The drive cannot be switched on because the safety module is locked - Switch-off of the drive through removal of the external drive enabling at the input of the safety module - Safety module is defective (exchange) - Safety-oriented control: - Drive cannot be switched on because of the operating status of the machine - Drive was switched off because of a change to an illegal operating status of the machine **Error correction** - Inform your service agency - Safety module is connected only to CC: - Switch the external drive enabling over the corresponding input at the safety module (apply 24 V) - Safety modules are connected at MC and CC: - All drives: - Check the function of the protective door contact - Cancel the emergency stop - Only spindle drive: - Check the tool holder (closing) - Check the permissive key - Check the position of the detachable-key switch - Exchange the safety module(s)
231-8AA0	**Error message** 8AA0 Illegal reference run %1 **Cause of error** - A reference value was requested during an active touch probe cycle - Internal software error **Error correction** - Inform your service agency. - Check the software version.
231-8AB0	**Error message** 8AB0 Illegal probing %1 **Cause of error** - A touch probe cycle was started during an active reference run - Internal software error **Error correction** - Inform your service agency. - Check the software version.

Error number	Description
231-8AD0	**Error message** 8AD0 Drive enabling gone (Signal: "-STO.A.MC.WD" active) **Cause of error** - It is not possible to switch the drives on because there is no drive release - The MC does not trigger the switch-off signal '-STO.A.M-C.WD' - Hardware defective - Internal software error **Error correction** - Inform your service agency
231-8AE0	**Error message** 8AE0 Drive enabling missing in axis %1 (signal: %4) **Cause of error** - The switch-on procedure was canceled due to an existing error condition: 1 = Signal -ES.A (emergency stop MC) is active during switch-on (emergency stop might have been pressed during switch-on) 2 = Signal -ES.A.HW (emergency stop MC, handwheel) is active during switch-on (emergency stop might have been pressed during switch-on) 3 = Signal -ES.B (emergency stop CC) is active during switch-on (emergency stop might have been pressed during switch-on) 4 = Signal -ES.B.HW (emergency stop CC, handwheel) is active during switch-on (emergency stop might have been pressed during switch-on) 5 = Switch-on procedure not allowed because of a unacknowledged error 6 = Internal software error: addressed axis module/gate array does not exist 7 = Internal error signal -STO.B.CC.WD active during switch-on 8 = Internal error signal -N0 active during switch-on 9 = Internal error signal PWM error active during switch-on **Error correction** - Check the emergency-stop wiring - Inform your service agency

Error number	Description
231-8AF0	**Error message** 8AF0 Encoder %1 defective **Cause of error** - Scale or scale tape contaminated or defective - Scanning head contaminated or defective - Signal cable defective - Encoder input defective on the control - Penetration of humidity - The position encoder is contaminated - Motor encoder cable defective - Motor control board defective **Error correction** - Inform your service agency - Exchange the position encoder - Check the encoder cable - Exchange the motor control board (or better, the control)
231-8B10	**Error message** 8B10 Wrong traverse direction %1 **Cause of error** - DIR entry in motor table is incorrect. - Incorrect power connection of the motor. **Error correction** - Inform your service agency. - Check the DIR entry in the motor table. - Check the power connection of the motor.
231-8B20	**Error message** 8B20 Error %1 field orientation **Cause of error** - Field orientation impossible for mechanical reasons - Incorrect relation between electrical field and mechanical motor movement - Incorrect motor encoder signal - Error in motor connection - Mechanical brake not released **Error correction** - Inform your service agency - Check the configuration data for number of signal periods and distance for the number of signal periods. - Check the configuration datum for the linear distance of one motor revolution - For linear motors: check column STR of the motor table - Check the speed encoder connection - Check the motor connection - Release brakes during orientation

Error number	Description
231-8B30	**Error message** 8B30 Motor temp. %1 too high **Cause of error** - Measured motor temperature is too high - No temperature sensor - Motor encoder cable is defective (wire broken) - Entry in motor table is incorrect - Incorrect or defective temperature sensor was installed - Signal connector: Poor contact **Error correction** - Let the motor cool down - Inform your service agency - Check the motor encoder cable - Check the entry in the motor table - Measure the temperature sensor
231-8B40	**Error message** 8B40 No drive release %1 **Cause of error** - Inverter not ready - No pulse release for the power module - Uz too high - Power-fail signal active - With M controls: I32 input inactive - With P controls: Drive enabling at X50 inactive In addition, for 246 261-xx (digital current controller): - For the given axis an illegal motor model (e.g. linear motor) was selected. - The CC receives a "Drive on" command for a nonexistent axis. - The power module is not ready when the field orientation starts. Readiness of the power module is detected through the Ready signal on the PWM cable. - The power module is not ready when the current controller adjustment begins. **Error correction** - Inform your service agency - Check the activation and wiring of the pulse release - Check Uz - Check the emergency stop circuit - For a non-regenerative system: Is the braking resistor connected? - For a regenerative system: Is the energy recovery activated? - Check the cable ground and shield - Exchange the power module - For SIEMENS power converter (inverter): Exchange the interface card - Exchange the drive control board

Error number	Description
231-8B50	**Error message** 8B50 Axis module %1 not ready **Cause of error** - Safety relay not on (e.g. connectors X71 and X72 of the UV, X73 of the HEIDENHAIN expansion board for Simodrive) - PWM bus cable interrupted - PWM interface on the control defective - Defective axis module - No pulse release for the power module **Error correction** - Inform your service agency - Exchange the power module - Exchange the HEIDENHAIN expansion board for Simodrive - Exchange the PWM bus cable
231-8B60	**Error message** 8B60 Overcurrent cutoff %1 **Cause of error** - Undervoltage, temperature or short-circuit monitor of an IGBT in the inverter has responded. **Error correction** - Let the inverter cool down - Inform your service agency - Check the current controller - Check the motor connection for a short circuit - Check the motor for a short circuit in the windings - Exchange the power module
231-8B70	**Error message** 8B70 External drive lock %1 **Cause of error** - Drive switch-on is blocked by one or more external signals. **Error correction** - Inform your service agency. - Check the external enabling signal (EMERGENCY STOP, PFAIL, N0). - Check the PLC program. - Check the external wiring.
231-8B80	**Error message** 8B80 External drive stop %1 **Cause of error** - The drive is switched off by an external signal. **Error correction** - Inform your service agency. - Check the external enabling signal (EMERGENCY STOP, PFAIL, N0). - Check the PLC program. - Check the external wiring.

Error number	Description
231-8B90	**Error message** 8B90 Current controller not ready %1 **Cause of error** - Error code: %x - The power module or current controller is not ready after switch-on. - The drive is not at a standstill when switched on. **Error correction** - Inform your service agency - Check the pulse inhibitor - Check the rotational speed input
231-8BA0	**Error message** 8BA0 Incorrect reference signal or line count %1 **Cause of error** - Incorrect entry for the line count under STR in the motor table - Faulty reference signal - Noise signals - Motor encoder cable defective (break or short circuit) - Scale or scale tape contaminated or defective - Scanning head contaminated or defective - Signal cable defective - Encoder input defective on the control - Penetration of humidity **Error correction** - Inform your service agency - Check the entry in the motor table - Check the signals of the speed encoder (PWM 8) - Check the encoder cable for breaks or short circuits under mechanical load (folding, stretching, etc.) - Check the shield and its connection in the encoder cable - Exchange the encoder cable - Exchange the motor
231-8BB0	**Error message** 8BB0 Motor temperature too low %1 **Cause of error** - Measured motor temperature too low - Temperatur sensor incorrectly wired (short circuit) - Temperature sensor is defective - Incorrect temperature sensor (KTY84 required) - Hardware error on encoder input board **Error correction** - Inform your service agency - Check the wiring - Test the temperature sensor - Deselect the monitoring for low temperature limit CfgServo-Motor->MotEncCheckOff bit 5 - Exchange the encoder input board

Error number	Description
231-8BC0	**Error message** 8BC0 Motor current %1 too high **Cause of error** - Incorrect motor or power module selected. - Volts-per-hertz spindle: Ramp gradient too high - Power module defective - Motor cable defective (short circuit) - Motor defective (short circuit, ground fault) - Humidity has entered the motor **Error correction** - Inform your service agency - Are the correct motor and power module selected? - Volts-per-hertz spindle: Readjust the ramp gradient (OEM) - Check the motor and motor cable for a ground circuit or short circuit - Exchange the power module
231-8BD0	**Error message** 8BD0 Excessive servo lag in %1 **Cause of error** - The following error of a moving axis is greater than the value specified in the configuration datum CfgPosControl->servoLagMax1. - Overloaded drive - Insufficient lubrication - Mechanical stiffness - Machine vibration - Hardware error in the control loop - For analog axes, servo defective **Error correction** - Reduce the contouring feed rate, increase the rotational speed - Check the lubrication - Remove mechanical stiffness - Remove any possible sources of vibration - Check the parameter CfgFeedLimits->maxAcceleration - Analog axes: Check the servo - Inform your service agency if the error occurs frequently
231-8BE0	**Error message** 8BE0 Encoder defective %1 **Cause of error** - Incorrect nominal increment between two reference marks **Error correction** - Inform your service agency. - Check the entry in the motor table or CfgAxisHardware->posEncoderRefDist. - Check whether the reference signal is disturbed.

Error number	Description
231-8BF0	**Error message** 8BF0 Velocity of the spindle is too low %1 **Cause of error** - Traversing speed of the spindle is to slow because of overload - If the milling power is too high (high power consumption), it lowers the rotational speed of the spindle **Error correction** - Reduce the plunging depth or traversing speed - Inform your service agency
231-8C00	**Error message** 8C00 Encoder on speed input %1 is defective **Cause of error** - There is no motor encoder signal - There is a break in the motor encoder cable - The signal amplitude of the motor encoder is missing or too small - The motor encoder is contaminated - Incorrect parameters of posEncoderResistor during use of an external Y cable **Error correction** - Check the motor encoder connection - Check the motor encoder for proper function - Check the amplitude of the motor encoder signal - Check configuration in machine parameter PosEncoderResistor. If an external Y cable is used, a 1 has to be entered in this machine parameter. - Inform your service agency
231-8C10	**Error message** 8C10 Encoder on speed input %1 is defective (EnDat) **Cause of error** - Position value of the motor encoder is invalid - Interruption in motor encoder cable - Motor encoder defective **Error correction** - Check the motor encoder connection - Check the motor encoder - Inform your service agency

Error number	Description
231-8C20	**Error message** 8C20 Position encoder %1 defective **Cause of error** - There is no position encoder signal - Interruption of the position encoder cable - The signal amplitude of the position encoder is missing or too small - The position encoder is contaminated - Incorrect values of the machine parameter posEncoderResistor during use of an external Y cable - Incorrect values of the machine parameter posEncoderFreq at feed rates greater than 50 kHz (counting frequency results from the encoder resolution) **Error correction** - Check the position encoder connection - Check the function of the position encoder - Check the amplitude of the position encoder. - Check settings in machine parameter PosEncoderResistor. If an external Y cable is used, a 1 has to be entered in this machine parameter. - Check the setting of the machine parameter posEncoderFreq and max. feed velocity. At feed rates greater than 50 kHz (corresponding counting frequency at the position input results from the resolution of the encoder), a 1 must be entered in posEncoderFreq. - Inform your service agency
231-8C30	**Error message** 8C30 Position encoder %1 defective (EnDat) **Cause of error** - Position value of the position encoder is invalid - Interruption in position encoder cable - Position encoder is defective **Error correction** - Check the position encoder connection - Check the position encoder - Inform your service agency
231-8C40	**Error message** 8C40 Speed input %1 measured value not saved (EnDat) **Cause of error** - Position value of the motor encoder was not latched - Interruption in motor encoder cable - Motor encoder defective **Error correction** - Check the motor encoder connection - Check the motor encoder - Inform your service agency

Error number	Description
231-8C50	**Error message** 8C50 Position input %1 measured value not saved (EnDat) **Cause of error** - Position value of the motor encoder was not stored - Interruption in position encoder cable - Position encoder is defective **Error correction** - Check the position encoder connection - Check the position encoder - Inform your service agency
231-8C60	**Error message** 8C60 Signal frequency at encoder of speed input %1 **Cause of error** - Noise on speed encoder signals **Error correction** - Check the encoder signals - Check the shielding - Inform your service agency
231-8C70	**Error message** 8C70 Signal frequency at position encoder %1 **Cause of error** - Noise on position encoder signals **Error correction** - Check the encoder signals - Check the shielding - Inform your service agency
231-8C80	**Error message** 8C80 Amplitude too high at encoder on speed input %1 **Cause of error** - The amplitude of the encoder signal is too high or the signal for contamination is active. - Noise on motor encoder signal - Short circuit in the motor encoder cable - Signal amplitude of motor too high **Error correction** - Check the motor encoder connection (ground connection) - Check the motor encoder - Inform your service agency

Error number	Description
231-8C90	**Error message** 8C90 Amplitude too high at position encoder %1 **Cause of error** - The amplitude of the position encoder signal is too high or the signal for contamination is active - Noise on the encoder signal - Short circuit in the encoder cable - Encoder signal amplitude too high - Incorrect values in the machine parameter posEncoderResistor **Error correction** - Check the encoder connection (ground connection) - Check the encoder - Check configuration in machine parameter posEncoderResistor. If a position encoder is used (no external Y cable), a 0 has to be entered in this machine parameter. - Inform your service agency
231-8CA0	**Error message** 8CA0 Incorrect reference signal or line count %1 **Cause of error** - Incorrect entry for the line count under STR in the motor table - Faulty reference signal - Noise signals - Motor encoder cable defective (break or short circuit) **Error correction** - Check the entry in the motor table - Check the signals of the speed encoder (PWM 8) - Check the encoder cable for breaks or short circuits under mechanical load (folding, stretching, etc.) - Check the shield and its connection in the encoder cable - Exchange the encoder cable - Exchange the motor - Inform your service agency
231-8CB0	**Error message** 8CB0 Commutation angle %1 missing **Cause of error** The commutation angle necessary for operating the motor is missing. **Error correction** - Determine the commutation angle again - In the machine parameters, change the procedure for determining the commutation angle - Inform your service agency

Error number	Description
231-9200	**Error message** 9200 Parameter compIpcJerkFact is faulty **Cause of error** - On the CC, the input range for the "compIpcJerkFact" parameter is 0.0 to 0.8 **Error correction** - Check the input value in machine parameter "compIpcJerk-Fact" - Inform your service agency
231-9210	**Error message** 9210 Parameter vCtrlDiffGain %1 is too large **Cause of error** - Differential factor is too large (max. value 0.5 [As^2/rev]) **Error correction** - Enter a value less than 0.5 in machine parameter "vCtrlDiff-Gain" - Inform your service agency
231-9220	**Error message** 9220 Incorrect speed encoder input **Cause of error** - Incorrect entry in the "speedEncoderInput" machine parameter - The assignment of the speed encoder input to the PWM output is incorrect **Error correction** - Check the "speedEncoderInput" machine parameter - Inform your service agency
231-9230	**Error message** 9230 Unknown motor type **Cause of error** - Incorrect motor type in the motor table - Unsupported motor type in the motor table - Incorrect motor data in the motor table **Error correction** - Inform your service agency

Error number	Description
231-9240	**Error message** 9240 Incorrect encoder type %1 **Cause of error** - Selected encoder does not match the connected one Examples: EnDat is selected, but an incremental encoder is connected EnDat 2.1 is selected, but EnDat 2.2 is connected - The selected encoder is not supported by this CC **Error correction** - Check the machine parameter "motEncType" (or SYS in the motor table) - Inform your service agency
231-9250	**Error message** 9250 Motor encoder: EnDat 2.2 not possible %1 **Cause of error** - EnDat communication error - An encoder with EnDat 2.2 interface is selected in the motor table, although no EnDat 2.2 encoder is connected - The EnDat 2.2 protocol cannot be read **Error correction** - Check whether the encoder supports EnDat 2.2 - Check the motor table (SYS column) - Check the machine parameter "motEncType" - Check the cable ground and shield - Exchange the motor control board - Check the cable (compare the cable ID number with the documentation) - Check the speed encoder cable (defective or too long) - Check the speed encoder - Inform your service agency
231-9260	**Error message** 9260 Motor parameters changed **Cause of error** - The motor type was changed without switching off the drive **Error correction** - Inform your service agency

Error number	Description
231-9261	**Error message** 9261 CC%2: algebraic signs not consistent in parameters %1 **Cause of error** The entry DIR in the motor table or machine parameter signCorrActualVal is set incorrectly **Error correction** Correct the entry DIR in the motor table or machine parameter signCorrActualVal. The following rule applies: DIR and signCorrActualVal must be set to the same value. Refer to the additional information in the Technical Manual, in the chapter "Defining the traverse direction".
231-9270	**Error message** 9270 Rated speed of motor unknown **Cause of error** - The entry in the motor table is zero **Error correction** - Inform your service agency
231-9280	**Error message** 9280 Parameter filter 1 invalid %1 **Cause of error** - Incorrect entry in machine parameter "vCtrlFiltDamping1," "vCtrlFiltFreq1," "vCtrlFiltType1" or "vCtrlFiltBandWith1" - Internal software error **Error correction** - Check the entry in machine parameter "vCtrlFiltDamping1," "vCtrlFiltFreq1," "vCtrlFiltType1" or "vCtrlFiltBandWith1" - Check the software version - Inform your service agency
231-9290	**Error message** 9290 Parameter filter 2 invalid %1 **Cause of error** - Incorrect entry in machine parameter "vCtrlFiltDamping2," "vCtrlFiltFreq2," "vCtrlFiltType2" or "vCtrlFiltBandWith2" - Internal software error **Error correction** - Check the entry in machine parameter "vCtrlFiltDamping2," "vCtrlFiltFreq2," "vCtrlFiltType2" or "vCtrlFiltBandWith2" - Check the software version - Inform your service agency

Error number	Description
231-92A0	**Error message** 92A0 Parameter filter 3 invalid %1 **Cause of error** - Incorrect entry in machine parameter "vCtrlFiltDamping3," "vCtrlFiltFreq3," "vCtrlFiltType3" or "vCtrlFiltBandWith3" - Internal software error **Error correction** - Check the entry in machine parameter "vCtrlFiltDamping3," "vCtrlFiltFreq3," "vCtrlFiltType3" or "vCtrlFiltBandWith3" - Check the software version - Inform your service agency
231-92B0	**Error message** 92B0 Parameter filter 4 invalid %1 **Cause of error** - Incorrect entry in machine parameter "vCtrlFiltDamping4," "vCtrlFiltFreq4," "vCtrlFiltType4" or "vCtrlFiltBandWith4" - Internal software error **Error correction** - Check the entry in machine parameter "vCtrlFiltDamping4," "vCtrlFiltFreq4," "vCtrlFiltType4" or "vCtrlFiltBandWith4" - Check the software version - Inform your service agency
231-92C0	**Error message** 92C0 Parameter filter 5 invalid %1 **Cause of error** - Incorrect entry in machine parameter "vCtrlFiltDamping5," "vCtrlFiltFreq5," "vCtrlFiltType5" or "vCtrlFiltBandWith5" - Internal software error **Error correction** - Check the entry in machine parameter "vCtrlFiltDamping5," "vCtrlFiltFreq5," "vCtrlFiltType5" or "vCtrlFiltBandWith5" - Check the software version - Inform your service agency
231-92D0	**Error message** 92D0 Line count of motor has changed **Cause of error** - Line count of the motor has changed, although it was not switched off. **Error correction** - Inform your service agency

Error number	Description
231-92E0	**Error message** 92E0 Line count for motor encoder incorrect %1 **Cause of error** - Encoder line count in the parameter is not equal to the EnDat line count found - The entry in machine parameter "cfgServoMotor --> motStr" is incorrect - Incorrect entry under STR in motor table - EnDat 2.2 motor encoder without line count information must be defined as STR = 1 or "cfgServoMotor --> motStr=1" **Error correction** - Edit the machine parameter "cfgServoMotor --> motStr" - Change STR in motor table - Inform your service agency

Error number	Description
231-92F0	**Error message** 92F0 Incorrect axis assignment **Cause of error** - Incorrect axis assignment with moment master-slave operation - Master and Slave are not assigned to the same controller motherboard - Axes in master-slave torque control are permitted only at the following pairs of encoder inputs: 6-axis CC424 X15 and X17 X16 and X18 6-axis CC 6106 X15 to X20 8-axis CC424: X15 and X17 X16 and X18 X19 and X80 X20 and X81 8-axis CC 6108 X15A to X18A X15B to X18B 10 axis CC424: X15 and X17 X16 and X18 10-axis CC 6110 X15A to X18A X15B to X20B 12-axis CC424: X15 and X17 X16 and X18 X82 and X84 X83 and X85 14-axis CC424: X15 and X17 X16 and X18 X19 and X80 X20 and X81 X82 and X84 X83 and X85 16-axis CC424: X15 and X17 X16 and X18 X19 and X80 X20 and X81 X82 and X84 X83 and X85 X86 and X88 X87 and X89 **Error correction** - Change the axis assignment - Inform your service agency

Error number	Description
231-9300	**Error message** 9300 Field angle determination %1 not allowed **Cause of error** - Field angle determination is not allowed in this mode - The method selected for determining the field angle is invalid or not possible with this encoder **Error correction** - Check the entry in machine parameters "motTypeOfFieldAdjust" and "motFieldAdjustMove" and/or the entry in the SYS column of the motor table - Inform your service agency
231-9310	**Error message** 9310 Wrong input for position encoder **Cause of error** - An incorrect input was selected for the position encoder (machine parameter "posEncoderInput") - Possible configuration CC61xx: PWM output <-> position encoder X51 <-> X201 X52 <-> X202 X53 <-> X203 X54 <-> X204 X55 <-> X205 X56 <-> X206 **Error correction** - Check the machine parameter "posEncoderInput" - Inform your service agency
231-9320	**Error message** 9320 Position encoder: EnDat 2.2 not possible %1 **Cause of error** - EnDat communication is defective - An encoder with EnDat 2.2 interface is selected in machine parameter posEncoderType or motEncTyp, although no EnDat 2.2 encoder is connected. - The EnDat 2.2 protocol cannot be read **Error correction** - Check whether the position encoder supports EnDat 2.2 - Check the machine parameter posEncoderType or motEncTyp - Check the cable ground and shield - Exchange the motor control board - Check the cable (compare the cable ID number with the documentation) - Check the position encoder cable (defective or too long) - Check the position encoder - Inform your service agency

Error number	Description
231-9330	**Error message** 9330 Incorrect position encoder input configured %1 **Cause of error** - The configured position encoder input does not exist **Error correction** - Check the configuration of the position encoder inputs - Inform your service agency
231-9340	**Error message** 9340 PWM frequency error %1 **Cause of error** - Entered PWM frequency in parameter "ampPwmFreq" lies outside the permissible input range - PWM frequencies that may not be combined with each other were selected **Error correction** - Check the parameter "ampPwmFreq" - Inform your service agency
231-9350	**Error message** 9350 PWM frequency too high %1 **Cause of error** - PWM frequency selected over 5000 kHz for PWM output X51 or X52, although PWM output X53 or X54 is active **Error correction** - Check machine parameter ampPwmFreq for PWM output X51 or X52 - Deactivate PWM output X53 and/or X54 - Inform your service agency
231-9360	**Error message** 9360 Double speed not possible %1 **Cause of error** - Control loop on X51 or X52 is defined as 'double speed', although the control loop on X53 or X54 is active - Control loop on X55 or X56 is defined as 'double speed', although the control loop on X57 or X58 is active (only CC 4xx with 8 control loops) **Error correction** - Define the control loop on X51 or X52 as 'single speed', or deactivate the PWM output X53 or X54 - Define the control loop on X55 or X56 is defined as 'single speed', or deactivate the PWM output X57 or X58 (only CC 4xx with 8 control loops) - Inform your service agency

Error number	Description
231-9370	**Error message** 9370 "Inverter.inv" is not supported %1 **Cause of error** - The 'Inverter.inv' file is not supported by this software **Error correction** - Replace the 'Inverter.inv' file with 'Motor.amp' - Inform your service agency
231-9380	**Error message** 9380 Voltage protection module parameter %1 **Cause of error** - Incorrect entry in machine parameter "ampVoltProtection" - Internal software error **Error correction** - Check the entry in machine parameter "ampVoltProtection" - Check the software version - Inform your service agency
231-9390	**Error message** 9390 Increased current controller factors: Wrong motor type %1 **Cause of error** - In machine parameter iCtrlAddInfo, the compensation in the current control loop is activated for a motor type other than a synchronous motor (linear motor, asynchronous motor). **Error correction** - Deactivate the compensation for increased current control factors by entering the value "0" in iCtrlAddInfo.
231-93A0	**Error message** 93A0 PDT1 feedforward current contrlr: Wrong motor type **Cause of error** - In machine parameter "iCtrlDiffFreqFF," PDT1 feedforward control was activated for the current control circuit of a drive with e.g. a linear or asynchronous motor. - PDT1 feedforward control is only possible for the current control circuit of a drive with synchronous motor. **Error correction** - Deactivate the PDT1 feedforward by entering the value 0 in machine parameter "iCtrlDiffFreqFF." - Inform your service agency.

Error number	Description
231-93B0	**Error message** 93B0 PDT1 feedforward current contrlr.: Invalid cutoff freq. **Cause of error** - Illegal maximum cutoff frequency in machine parameter "iCtrlDiffFreqFF." - The following are the maximum permissible cutoff frequencies for the respective PWM frequencies: PWM frequency Maximum cutoff frequency 3333 Hz 800 Hz 4000 Hz 960 Hz 5000 Hz 1200 Hz 6666 Hz 1600 Hz 8000 Hz 1920 Hz 10000 Hz 2400 Hz **Error correction** - Enter the permissible cutoff frequency in machine parameter "iCtrlDiffFreqFF." - Inform your service agency.
231-93C0	**Error message** 93C0 INVERTER.INV is faulty %1 **Cause of error** - Incorrect entry in the power module table: INVERTER.INV - Incorrect entry for I-MAX, U-IMAX or R sensor - R sensor not identical to U-IMAX/I-MAX **Error correction** - Check the entries for I-MAX, U-IMAX and R sensor - Inform your service agency
231-93D0	**Error message** 93D0 Transmission ratio is incorrect %1 **Cause of error** The transmission ratio has incorrect parameters: - Faulty entry for distPerMotorTurn, i.e. distance per motor revolution - Incorrect entry in posEncoderIncr, i.e. signal periods of position encoder - Faulty entry for distance traversed after posEncoderDist, i.e. parameterized signal periods of the position encoder **Error correction** - Inspection of the parameters distPerMotorTurn, posEncoderIncr and posEncoderDist - Inform your service agency

Error number	Description
231-93E0	**Error message** 93E0 PWM frequency greater than 5 kHz requires double speed %1 **Cause of error** - If the PWM frequency selected in the "ampPwmFreq" machine parameter is greater than 5000 Hz, the machine parameter "ctrlPerformance" must be set to Double Speed **Error correction** - Either reduce the PWM frequency in "ampPwmFreq," - or set the "ctrlPerformance" machine parameter to Double Speed - Inform your service agency
231-93F0	**Error message** 93F0 Maximum computer power exceeded **Cause of error** - CC61xx: The desired computing power in the "ctrlPerformance" machine parameter is not possible. The following configurations per controller unit are allowed: Single | Double 6 | 0 4 | 1 2 | 2 0 | 3 "ctrlPerformance" machine parameter = 0 Single Speed "ctrlPerformance" machine parameter = 1 Double Speed **Error correction** - Reduce the number of axes per controller unit - Change the double-speed axes to single-speed axes ("ctrlPerformance" machine parameter from 1 to 0) - Inform your service agency
231-9400	**Error message** 9400 Encoders with 11 µA are not supported **Cause of error** - "posEncoderSignal" machine parameter is set to 11 µA **Error correction** - "posEncoderSignal" machine parameter is set to 11 Vpp - Inform your service agency

Error number	Description
231-9410	**Error message** 9410 Relation of posEncoderDist to posEncoderIncr is faulty %1 **Cause of error** - The relation of CfgAxisHardware->posEncoderDist to CfgAxisHardware->posEncoderIncr does not agree with the values from the EnDat encoder - With EnDat 2.2: See the Technical Manual of the control **Error correction** - Check the entries CfgAxisHardware->posEncoderDist or CfgAxisHardware->posEncoderInc - Inform your service agency
231-9420	**Error message** 9420 Configuration of X150 not possible %1 **Cause of error** - The entry in GenDriveOffGroup (axis group switch-off with X150) is invalid **Error correction** - Correct the entry in GenDriveOffGroup - Inform your service agency
231-9430	**Error message** 9430 Configuration of I32 not possible %1 **Cause of error** - The entry in GenEmergencyStopFunction for drive enabling through I32 input is invalid **Error correction** - Correct the entry in GenEmergencyStopFunction - Inform your service agency
231-9440	**Error message** 9440 Configuration of powerfail is not possible %1 **Cause of error** - The entry in AmpAcFailSelection for AC fail or power fail is invalid **Error correction** - Correct the entry in AmpAcFailSelection - Inform your service agency
231-9450	**Error message** 9450 Configuration of PWM pattern not possible %1 **Cause of error** - The entry in ICtrlPwmInfo (configuration of the PWM pattern) is invalid **Error correction** - Correct the entry in ICtrlPwmInfo - Inform your service agency

Error number	Description
231-9460	**Error message** 9460 Configuration of LIFTOFF is not possible %1 **Cause of error** - The entry in PowSupplyLimitOfDcVoltage is invalid - The entry in PowSupplyDcLinkVoltageForSpindleStop is invalid **Error correction** - Correct the entry in PowSupplyLimitOfDcVoltage - Correct the entry in PowSupplyDcLinkVoltageForSpindleS-top - Inform your service agency
231-9470	**Error message** 9470 Configuration of brake output is not possible %1 **Cause of error** - The entry in MotBrakeNotExist is invalid **Error correction** - Correct the entry in MotBrakeNotExist - Inform your service agency
231-9480	**Error message** 9480 Configuration of jerk feedforward is not possible %1 **Cause of error** - The jerk feedforward over ComplpcJerkFact is not possible **Error correction** - Correct the entry in ComplpcJerkFact - Recommendation: As an alternative, the torsion feedfor-ward can be used through CompTorsionFact. - Inform your service agency
231-9490	**Error message** 9490 Configuration of active damping is not possible %1 **Cause of error** - The active damping through CompActiveDampFactor and CompActiveDampTimeConst is not possible **Error correction** - Correct the entry in CompActiveDampFactor and CompActiveDampTimeConst - Inform your service agency

Error number	Description
231-94A0	**Error message** 94A0 Configuration of SyncAxisTorqueDistrFact impossible %1 **Cause of error** - The variable torque distribution through SyncAxis-TorqueDistrFact is not possible **Error correction** - Correct the entry in SyncAxisTorqueDistrFact - Inform your service agency
231-94B0	**Error message** 94B0 Configuration of speed compensation impossible %1 **Cause of error** - The variable shaft speed compensation through SyncAx-isSpeedCorrectRatio is not possible **Error correction** - Correct the entry in SyncAxisSpeedCorrectRatio - Inform your service agency
231-94C0	**Error message** 94C0 DQ PWM freq. > 4 kHz requires double speed %1 **Cause of error** - If the PWM frequency selected in the "ampPwmFreq" machine parameter is greater than 4000 Hz, the machine parameter "ctrlPerformance" must be set to Double Speed **Error correction** - Either reduce the PWM frequency in "ampPwmFreq," - or set the "ctrlPerformance" machine parameter to Double Speed (software option) - Inform your service agency
231-94D0	**Error message** 94D0 DQ-ALM: Check the parameters %1 **Cause of error** - Incorrect supply module selected in CfgPowSupply. - The supply module is not entered in the supply module table Supply.Spy. **Error correction** - Select the correct supply module in CfgPowSupply. - Inform your service agency

Error number	Description
231-94E0	**Error message** 94E0 Switching EnDat 2.2 to 1 Vpp requires reinitialization %1 **Cause of error** - The encoder was changed from EnDat 2.2 to 1 Vpp or vice versa. A reinitialization of the drive is required. **Error correction** - Reinitialize the system - Deselect the axis with the machine parameter axisMode (bit x = 0) - Exit the MP editor - Reactivate the axis in machine parameter axisMode (bit x = 1) and set posEncoderType to the desired value - Re-exit the MP editor - or restart the system
231-94F0	**Error message** 94F0 Impermissible torsion compensation %1 **Cause of error** - Torsion compensation is configured, but the system is a single-encoder system. - Torsion compensation is configured, but stick-slip friction compensation is not configured. **Error correction** - Deactivate torsion compensation with machine parameter compTorsionFact. - Define the assignment between the position encoder inputs and the axes in posEncoderInput (if position encoder is present), and enter the friction compensation in machine parameter compFrictionT2. - Inform your service agency
231-9500	**Error message** 9500 DQ: Inverter not found %1 **Cause of error** - Not able to establish communication with the inverter of the displayed axis. - The DRIVE-CLiQ line is not connected, or incorrectly connected. - The supply voltage of the inverter has been interrupted. - The inverter is defective. - Machine parameter pwmSignalOutput is incorrect. **Error correction** - Check the cabling. - Check the supply voltage of the inverter. - Check the entry in machine parameter pwmSignalOutput. - Inform your service agency

Error number	Description
231-9510	**Error message** 9510 PWM frequency change during active servo control %1 **Cause of error** - The PWM frequency in machine parameter ampPwmFreq must not be changed while the drive or a corresponding drive is still in a control loop. Corresponding axis: X51 - X52 X53 - X54 X55 - X56 X57 - X58 X80 - X81 X82 - X83 X84 - X85 **Error correction** - Deactivate the drive controller before changing machine parameter ampPwmFreq - Inform your service agency
231-9520	**Error message** 9520 Erroneous input in vCtrlTimeSwitchOff %1 **Cause of error** - In machine parameter vCtrlTimeSwitchOff a time of zero was configured. The time entered must permit a safe braking process. - In order to prevent an unbraked runout of axes/spindles without mechanical braking, the time in machine parameter vCtrlTimeSwitchOff must be greater than the maximum possible braking time of the axes that can occur through electrical braking. **Error correction** - Enter an appropriate value in machine parameter vCtrlTimeSwitchOff - Inform your service agency
231-9530	**Error message** 9530 DRIVE-CLiQ axis %1 is still active **Cause of error** When an axis is deactivated in a DRIVE-CLiQ system, the associated axis must likewise be deactivated at the same port (e.g. 301). **Error correction** - Deactivate the second axis that is connected to the same connector (e.g. X301). - The axis must be deactivated through machine parameter axisMode or CfgPlcSStrobe. - Inform your service agency.

Error number	Description
231-9550	**Error message** 9550 EnDat2.2 - FS single-encoder system incorrectly configured %1 **Cause of error** It was configured so that both only the EnDat 2.2 position encoder and only the EnDat 2.2 shaft speed encoder are to be used for functional safety. This is not possible. **Error correction** - Check the entry in Machine Parameter CfgAxisSafety-encoderForSafety: It must either be "speedAndPosEncoder", "speedEncoder" or "posEncoder". - Special settings for single-encoder systems with EnDat 2.2 FS encoders: Set "posEncoder" if only the position encoder is to be used for functional safety or set "speedEncoder" if only the shaft speed encoder is to be used for functional safety - Standard setting: Set "speedAndPosEncoder" if you want to configure a normal dual-encoder system or if the affected axis is run in functional safety with only one encoder (single-encoder safety).
231-9560	**Error message** 9560 MP entry erroneous: counting pulse per path %1 **Cause of error** - Value in machine parameter posEncoderIncr lies outside the permissible range **Error correction** - Check the value in MP_posEncoderIncr and correct it if necessary - Inform your service agency
231-9570	**Error message** 9570 Incorrect parameter entry: path per motor revolution %1 **Cause of error** - Value in machine parameter distPerMotorTurn lies outside the permissible range **Error correction** - Check the value in MP_distPerMotorTurn and correct it if necessary - Inform your service agency

Error number	Description
231-9580	**Error message** 9580 Parameter filter 6 invalid %1 **Cause of error** - Incorrect entry in machine parameter "vCtrlFiltDamping6", "vCtrlFiltFreq6", "vCtrlFiltType6" or "vCtrlBandWidth6" **Error correction** - Check the entry in machine parameter "vCtrlFiltDamping6", "vCtrlFiltFreq6", "vCtrlFiltType6" or "vCtrlBandWidth6" - Inform your service agency
231-9590	**Error message** 9590 Maximum computing power exceeded **Cause of error** -CC61xx: There is not enough computing power for the activated expanded controller functions. **Error correction** - Deactivate the expanded controller functions - Reduce the number of axes per controller unit - Change double-speed axes to single-speed axes (change the machine parameter ctrlPerformance from 1 to 0) - Inform your service agency
231-9591	**Error message** 9591 TRC is not active **Cause of error** TRC is not active because not all parameters have been entered **Error correction** The following parameters are necessary in order to activate TRC: - Mass moment of inertia of the motor (from the motor table) or acceleration feedforward control CfgController-Comp.compAcc - Proportional component of the speed controller CfgSpeed-Control.vCtrlPropGain - Transformation ratio CfgAxisHardware.distPerMotorTurn
231-9800	**Error message** 9800 CC%2 MC command unknown %1 **Cause of error** - MC command is not allowed for this hardware - MC command is not allowed at this time - 0 = error in command code > 255 1...255 = incorrect or invalid command code - Internal software error **Error correction** - Inform your service agency. - Check the software version.

Error number	Description
231-9900	**Error message** 9900 CC%2 CC command unknown %1 **Cause of error** - CC command is not allowed for this hardware - Internal software error **Error correction** - Inform your service agency - Check the software version
231-A001	**Error message** A001 Cancelation of brake-test call monitoring **Cause of error** - Protective door(s) were opened during the brake test - No drive-ready signal during the brake-test call monitoring **Error correction** - Leave the protective door(s) closed during the brake test - Ensure the drive readiness during the brake test
231-A002	**Error message** A002 Cancelation of brake-line-test call monitoring A021 Cancelation of brake line test. Guard door open **Cause of error** - Guard door(s) were open during the brake control test or brake line test **Error correction** - Leave the guard door(s) closed during the brake control test or brake line test
231-A003	**Error message** A003 SPLC commissioning mode active **Cause of error** - CRC check of the SPLC program is deactivated (machine parameter CfgSafety --> commissioning is set) **Error correction** - The commissioning mode must be deactivated before a machine is delivered (reset commissioning in the machine parameter CfgSafety) - Inform your service agency

Error number	Description
231-A004	**Error message** A004 Short circuit on 24 V of the T.BRK.B signal A020 Short circuit on 24 V of the T.BRK.B signal **Cause of error** - Error during braking control test - Signal level = +24 V at input: -T.BRK.B of the SPL module although 0 V is expected due to the control. **Error correction** - Check the external wiring of the brakes and the T.BRK signal. - Check the relay for the brake control. - Inform your service agency.
231-A005	**Error message** A005 CC%2 Warning: Controller unit not suited for FS **Cause of error** When checking the safety kernel software SKERN-CC, the control unit detected, that this hardware (CC, UEC, UMC) is not suitable for control systems with functional safety (FS). This controller unit fulfills the safety requirements according to EN 13849 and is not approved for functional safety. **Error correction** - Exchange the affected controller unit (CC, UEC, UMC) - Inform your service agency.
231-A006	**Error message** A006 SPLC-CC%2: Cross comparison failed, output %4 **Cause of error** - Error in the cross comparison of the SPLC-CC outputs. - SPLC program of the CC[x] defines the output as 0 (LOW). However, the value of the output read from the terminal is 1 (HIGH). **Error correction** - Check the wiring of the output. - Check the SPLC program: signals for setting and resetting the SPLC outputs should always stay stable for at least 2 SPLC cycles. - Inform your service agency.

Error number	Description
231-A040	**Error message** A040 CC%2 operating mode not possible **Cause of error** The status of the operating mode switches and the protective doors is not allowed. **Error correction** - Inform your service agency - Check the setting of the operating mode switches - Check the status of the switch for the safety doors - Check the wiring
231-A041	**Error message** A041 CC%2 SOM 4 not possible **Cause of error** - Keylock switch 1 not in automatic mode (BA1) – Keylock switch 1 defective - Wiring error **Error correction** - Set keylock switch 1 to automatic mode (BA1) - Inform your service agency
231-A042	**Error message** A042 CC%2 SOM 4 not released **Cause of error** The BA4 operating mode is selected by key switch but has not been released. **Error correction** - Inform your service agency.
231-A043	**Error message** A043 CC%2 SOM 2 only one axis allowed **Cause of error** The simultaneous movement of more than one axes is not allowed in operating mode BA2 with open safety doors. **Error correction** Wait until all axes are at standstill, and then start only one axis.

Error number	Description
231-A080	**Error message** A080 CC%2 operating state not equal MC **Cause of error** - The automatic, SRG, SBH, and SH operating conditions are compared cyclically between the MC and CC. If the values remain unequal for longer than 500 ms, a Stop 1 is released. **Error correction** - Acknowledge the error message with CE - Switch on the machine - Inform your service agency - Check the software version
231-A081	**Error message** A081 CC%2 cross comparison no.=%4 Var.=%5 MC=%6 CC=%7 **Cause of error** - A difference was found in the input data of the safety core software in a cross-comparison between MC and CC. The requested safety function for the axis group does not match. ("pp_AxGrpStateReq[Var.]", Var.= axis group) **Error correction** - Check the SPLC program - Inform your service agency
231-A081	**Error message** A081 CC%2 cross comparison no.=%4 Var.=%5 MC=%6 CC=%7 **Cause of error** - A difference was found in the input data of the safety core software in a cross-comparison between MC and CC. The motion request for an axis or for the axis group does not match. ("pp_AxGrpActivate[Var.]", Var.= axis group) **Error correction** - Check the SPLC program - Inform your service agency
231-A081	**Error message** A081 CC%2 cross comparison no.=%4 Var.=%5 MC=%6 CC=%7 **Cause of error** - A difference was found in the input data of the safety core software in a cross-comparison between MC and CC. The axis-specific movement release does not match. ("pp_AxFeedEnable[Var.]", Var.= axis index) **Error correction** - Check the SPLC program - Inform your service agency

Error number	Description
231-A081	**Error message** A081 CC%2 cross comparison no.=%4 Var.=%5 MC=%6 CC=%7 **Cause of error** - A difference was found in the input data of the safety core software in a cross-comparison between MC and CC. The request of a stop reaction for the axis group does not match. ("pp_AxGrpStopReq[Var.]", Var.= axis group) **Error correction** - Check the SPLC program - Inform your service agency

("sGenSafe", Var. = No meaning) **Error correction** - Check the SPLC program - Inform your service agency

Error number	Description
231-A081	**Error message** A081 CC%2 cross comparison no.=%4 Var.=%5 MC=%6 CC=%7 **Cause of error** - A difference was found in the output data of the SKERN in a cross-comparison between the A channel and B channel. The axis-dependent brake control for multiple brakes per axis does not match. ("sMultiBrkOnAxisReleaseReq[Var.]", Var.= axis index) **Error correction** - Check the SPLC program - Inform your service agency
231-A081	**Error message** A081 CC%2 cross comparison no.=%4 Var.=%5 MC=%6 CC=%7 **Cause of error** - A difference was found in the input data of the SKERN in a cross-comparison between the A channel and B channel. The value for the feed rate limit does not match. ("pp_AxFeedMax[Var.]", Var.= axis index) **Error correction** - Check the SPLC program - Inform your service agency
231-A082	**Error message** A082 CC%2 NE2 level does not change after 0 during dyn. test **Cause of error** - During the dynamic test of the 2nd emergency stop loop (every 1.5 minutes at the latest), a temporary change to 0 V level is expected at the input (NE2). If a 0 V or 24 V level remains continuously on inside the test window of 100 ms, it causes the error. - The time window for the dynamic test is too small (computing time problems, software errors) **Error correction** - Check the software version - Inform your service agency - Check the wiring - Check the emergency stop button - Exchange the hardware

Error number	Description
231-A082	**Error message** A082 CC%2 cross comparison no.=%4 Var.=%5 MC=%6 CC=%7 **Cause of error** - A difference was found in the input data of the SKERN in a cross-comparison between the A channel and B channel. The value for the readback channels does not match. ("pp_ReadBackOutputs", Var. = Number of the SPLC output) **Error correction** - Check the voltages and wiring of the SPLC output - Check the SPLC program and correct it if necessary - Inform your service agency
231-A083	**Error message** A083 CC%2 S input not equal to 0 in dynamic test **Cause of error** - During the dynamic test of the 2nd emergency stop loop (no later than every 1.5 min), a 0 V level is expected at all safety-related door-contact keylock and switch inputs for a short period. This error appears if a 24 V level continues throughout the test window of 100 ms. - The time window for the dynamic test is too small (computing time problems, software errors) **Error correction** - Check the software version - Inform your service agency - Check the wiring - Check the door contacts and key switches - Exchange the hardware
231-A084	**Error message** A084 S timeout in stop reaction SS2 %4 ObjId=%5 **Cause of error** - The maximum permissible time for a controlled stop (SS2 – braking on the contour) of the axis group (= ObjId) was exceeded. The maximum permissible time is 30 seconds. **Error correction** - Check the SPLC program and PLC program - Inform your service agency.

Error number	Description
231-A085	**Error message** A085 SKERN-CC%2, X%4: Comm.error during EnDat encoder dynamic sampling **Cause of error** A communication error occurred during forced dynamic sampling of the EnDat encoder. Both ignore flags were set at the same time. **Error correction** Inform your service agency.
231-A086	**Error message** A086 SKERN-CC%2: Communications error during dynamic sampling of X%4 **Cause of error** The dynamic sampling of the EnDat22 encoder could not be performed within the prescribed time. **Error correction** Note further error messages. Inform your service agency.
231-A087	**Error message** A087 SKERN-CC%2: illegal Ignore bit for EnDat forced dynamic sampling **Cause of error** An active ignore bit was detected outside of an EnDat forced dynamic sampling. **Error correction** - Restart the control - If the error recurs, inform your service agency
231-A090	**Error message** A090 Drive lock through safety software **Cause of error** - Emergency stop activated (by CC) - A drive is to be switched on, although the system in in the "emergency stop" condition ("-ES.B" or "-NE2" signal is active). - Internal software error **Error correction** - Check the wiring - Check the software version - Inform your service agency

Error number	Description
231-A091	**Error message** A091 Drive lock through safety software **Cause of error** - Emergency stop activated (of MC) - A drive is to be switched on, although the system in in the "emergency stop" condition ("-ES.A" or "-NE1" signal is active). - Internal software error **Error correction** - Check the wiring - Check the software version - Inform your service agency
231-A092	**Error message** A092 Drive lock through safety software **Cause of error** - System test is active - A drive is to be switched on, although the system is still in a test program - Internal software error **Error correction** - Check the software version - Inform your service agency
231-A093	**Error message** A093 Drive lock through FS, stop 1 switch-off active **Cause of error** - Drive locked through functional safety FS - A drive was supposed to be switched on, although the CC has not yet completed a completed a running stop 1 switch-off - Internal software error **Error correction** - Check the software version - Inform your service agency
231-A094	**Error message** A094 Drive lock of spindle, tool holder opened **Cause of error** - A spindle drive was supposed to be switched on while the guard door was open, although the tool holder was open. - Internal software error **Error correction** - Check the wiring - Check the software version - Inform your service agency

Error number	Description
231-A095	**Error message** A095 Spindle drive lock, status of permissive button invalid **Cause of error** - A spindle drive was supposed to be switched on while the guard door was open, although the permissive button is not pressed or was not let go beforehand. - Internal software error **Error correction** - Check the wiring - Check the software version - Inform your service agency
231-A096	**Error message** A096 Spindle drive lock, operating mode is not allowed **Cause of error** - A spindle drive was supposed to be switched on while the guard door was open, although the keylock switch was in the 'BA1' position ('unqualified operator'). - Internal software error **Error correction** - Check the keylock switch position - Check the wiring - Check the software version - Inform your service agency
231-A097	**Error message** A097 Drive lock on spindle, SS2 reaction active **Cause of error** - A spindle drive was supposed to be switched on while the guard door was open, although a stop2 reaction is active for the spindle. - Internal software error **Error correction** - Check the software version - Inform your service agency
231-A098	**Error message** A098 Drive lock on spindle, STO is active **Cause of error** - A spindle drive was supposed to be switched on while the guard door was open, although the STO safety function (safely switched-off torque) is still active. - Internal software error **Error correction** - Check the software version - Inform your service agency

Error number	Description
231-A099	**Error message** A099 CC%2 Drive lock - non-deletable system error **Cause of error** - Drive switch-on was prevented because a non-deletable system error occurred. **Error correction** - Check the cause of the system error (see log entry) and correct if if possible. - Inform your service agency
231-A210	**Error message** A210 Faulty control of brake %1: Step %4 **Cause of error** - Incorrect signal level at the FS input: "-T.BRK.B" during brake control test Test step 2 = Release brake through B channel output: +24 V detected although T.BRK should provide 0 V Test step 3 = Release brake through A channel output: +24 V detected although T.BRK should provide 0 V Test step 4 = Release brake through A and B channel outputs: 0 V detected although T.BRK should provide +24 V **Error correction** - Check external wiring of the motor brake - Generate the service files and notify the service agency
231-A800	**Error message** A800 CC limit switch %1+ **Cause of error** Permissible positive range of traverse exceeded. **Error correction** - Inform your service agency - Check the parameter setting CfgPositionLimits->swLimitSwitchPos1
231-A810	**Error message** A810 CC limit switch %1- **Cause of error** Permissible negative traverse range exceeded. **Error correction** - Customer service agency - Check the setting of parameter CfgPositionLimits->swLimitSwitchNeg1

Error number	Description
231-A820	**Error message** A820 CC speed greater than SRG %1 **Cause of error** The maximum permissible velocity in the SRG operating mode was exceeded. **Error correction** - Reduce the feed rate and shaft speed before opening the safety doors - Check the operating mode (setting of key-operated switch) - Inform your service agency - Check the parameter values
231-A830	**Error message** A830 CC SRG rot. speed = 0 %1 **Cause of error** - The maximum permissible velocity is 0 (as per parameter) - Only spindle drive: the parameter values for the gear ranges are 0 - An illegal operating mode was selected by keylock switch - There is a circuit error, or a disturbance at input I19 of the operator safety module - Internal software error **Error correction** - Check the operating mode version (position of keylock switch) - Check the wiring of the operator safety module inputs. - Check the parameter values - Inform your service agency
231-A840	**Error message** A840 CC SBH rot. speed too high %1 **Cause of error** - The maximal permissible velocity of the standstill monitoring was exceeded. **Error correction** - Inform your service agency - Check the drive
231-A850	**Error message** A850 CC SBH rot. speed = 0 %1 **Cause of error** - Standstill monitoring was set to 0 - Internal software error **Error correction** - Inform your service agency - Check CfgAxisHardware->transmission (traverse per motor revolution)

Error number	Description
231-A860	**Error message** A860 Traverse in SRG too large %1 **Cause of error** - The maximum permissible traverse in the SRG operating mode was exceeded because: - During probing with oriented spindle stop, the spindle axis was moved by more than 2 revolutions. **Error correction** - Check the probing sequence - Close the protective doors - Inform your service agency
231-A870	**Error message** A870 Brake test is not allowed %1 A200 Brake test is not allowed %1 **Cause of error** - Drive ready signal (RDY signal) or inverter enabling signal is missing. - Protective door(s) are not closed, although the parameter settings require it. - The brake to be tested is not assigned to this drive **Error correction** - Check the inverter enabling signals (wiring, PLC program or SPLc program) - Close the protective door(s) - Check the parameter settings, and edit them if necessary. - Inform your service agency
231-A880	**Error message** A880 1st violation of positive software limit range %1 **Cause of error** - The drive moved into the positive limit-switch area for the 1st time **Error correction** - Move the drive out of the positive limit-switch area - Check the parameters for limit-switch areas, and edit them if necessary.
231-A890	**Error message** A890 1st violation of negative software limit range %1 **Cause of error** - The drive moved into the negative limit-switch area for the 1st time **Error correction** - Move the drive out of the negative limit-switch area - Check the parameters for limit-switch areas, and edit them if necessary.

Error number	Description
231-A8A0	**Error message** A8A0 CC nominal-to-actual deviation of position values %1 **Cause of error** - The safety function nominal/actual value monitoring of position values has ascertained an excessive deviation. - The motor is moving while the slide is not, or vice versa - The mechanical motion transmission is interrupted - Thermal expansion of mechanical transmission components - The transmission ratio of the motor to the position encoder is incorrect (machine parameter distPerMotorTurn) - Improper installation of position encoder on ball screw - The entry in the axis-specific parameter maxPosDiff is defined too small **Error correction** - Check the mechanical motion transmission - Check the encoder fastening - Check the thermal expansion of the mechanical transmission components (e.g. recirculating ball screw) - Check the transmission ratio of the motor to the position encoder - Check the installation of the position encoder on the ball screw - Inform your service agency.
231-A8C0	**Error message** A8C0 Drive lock through FS, %1 has not been checked **Cause of error** - Drive locked through functional safety FS - A non-checked drive moved in an operating mode other than "reference run" while the guard door was open. - Internal software error **Error correction** - Check the software version - Inform your service agency
231-A8D0	**Error message** A8D0 SS1 still active—switch-on not allowed %1 **Cause of error** The safety software of the controller unit (SKERN-CC) has prevented the drive from being switched back on. A triggered SS1 stop reaction was not yet fully concluded. **Error correction** - Try to switch the drive on again. - If the problem recurs: Check the process of the SPLC and PLC program and inform your service agency.

Error number	Description
231-A8E0	**Error message** A8E0 Timeout during braking %1 MC timeout during braking (SS2) %2 **Cause of error** - The maximum permissible time for a controlled stop (SS2 – braking on the contour) was exceeded **Error correction** - Check the parameter values: timeLimitStop2: Default time for bringing axes to a controlled standstill for SS2 reaction - Inform your service agency
231-A8F0	**Error message** A8F0 Drive lock %1 - safety function STO is active **Cause of error** - Drive switch-on was prevented because the safety function STO is presently active for this drive. - The STO safety function could not be exited. Exiting the STO safety function requires the following: The activation of the axis group through the SPLC program (PP_AxGrpActivate of the associated axis group) Enabling of the drive by the SPLC program (PP_AxFeedEnable of the associated axis) The switch-on command of the PLC program (PLC Module 9161) - If the message appears during the current controller adjustment of the spindle, the "spindle start" key was not pressed before the adjustment was started. **Error correction** - Press the "spindle start" key before the spindle adjustment - Press the key for moving the axis on the machine control panel for a longer time - Optimize program processes in the PLC and SPLC program - Check the SPLC program and correct if necessary - Inform your service agency
231-A900	**Error message** A900 S traverse range exceeded when braking at contour (SS2) %1 **Cause of error** - When braking at a contour (SS2), the maximum permissible path in the safety-related machine parameter distLimitStop2 was exceeded. **Error correction** - Check the parameter value: distLimitStop2: Axis-specific limit value for maximum permissible path upon SS2 reaction. - Inform your service agency

Error number	Description
231-A910	**Error message** A910 CC Speed/noml. value deviation too large %1 **Cause of error** - The actual velocity deviates for longer than the permissible duration (feed axes: machine parameter timeToleranceSpeed) by the maximum permissible deviation (feed axes: machine parameter speedDiffNom) from the nominal velocity value. - Possible causes: + Machine parameter "timeToleranceSpeed" is defined too small + Machine parameter "speedDiffNom " is defined too small. + I component of the speed controller in the machine parameter "vCtrlIntGain" is defined too small. + Is the speed encoder cable connected? + Motor encoder defective or loose **Error correction** - Check the machine parameter "timeToleranceSpeed" - Check the machine parameter "speedDiffNom" - Check the I component of the speed controller machine parameter "vCtrlIntGain" - Check the speed encoder mounting - Check the cable of the speed encoder - Exchange the speed encoder - Inform your service agency

Error number	Description
231-A920	**Error message** A920 Standstill monitoring SKERN-CC %1 **Cause of error** - SKERN-CC detected an impermissibly large axis movement in the SOS safety condition. The standstill speed (50 mm/min for feed axes or 10 rpm for spindles) was also exceeded. The maximum permissible path in the SOS condition is defined in the machine parameter "positionRangeVmin." Possible causes: - Machine parameter "positionRangeVmin" is defined too small. - The brake was deactivated before the position controller was closed. - The brake was not activated before the position controller was opened. - When an axis was switched on, some existing following error was corrected. - The brake is defective. - There was an attempt to move an axis in the SOS condition (PLC?) - The axis feed-rate enabling by the ApiToSafety datum PP_AxFeedEnable is missing. **Error correction** - Check the entry in machine parameter positionRangeVmin. - Check the sequence of deactivating the brake and closing the position controller. - Check the sequence of activating the brake and opening the position controller. - Check whether there is a following error after an axis is locked. - Check the interface signal of the SPLC PP_AxFeedEnable for the axis - Inform your service agency

Error number	Description
231-A930	**Error message** A930 Safely limited speed (SLS) exceeded %1 **Cause of error** - SKERN-CC detected an impermissibly fast axis movement above the safe reduced speed. (SLS2,SLS3,SLS4) Possible causes: - Guard door was opened (at high speed) during an axis movement. - Machine parameter for reduced speed is defined too small. **Error correction** - Check whether the guard door was opened during an axis movement. - SLS2: Check the entry in machine parameter "speedLimitSom2." - SLS3: Check the entry in machine parameter "speedLimitSom3." - SLS4: Check the entry in machine parameter "speedLimitSom4." - Inform your service agency.
231-A940	**Error message** A940 Path exceeded during restricted spindle operation %1 **Cause of error** In the limited spindle operation, the maximum permissible path of 2 revolutions was exceeded. **Error correction** - Check the path of the spindle during limited spindle operation. - Inform your service agency.

Error number	Description
231-A950	**Error message** A950 Safely limited increment (SLI) exceeded %1 **Cause of error** - The maximum permissible path was exceeded in the Safely Limited Increment (SLI) mode. - Possible causes: - The selected increment exceeds the value from the safe machine parameter distLimitJog - The drive overshoots mechanically when the limit position is reached - Drive is not optimally adjusted. **Error correction** - Enter a smaller jog increment. - Check the entry in the safe machine parameter distLimitJog. - When the jog increment end position is reached, use the control's internal oscilloscope to check the actual position value for overshooting. - Adjust the drive. - Inform your service agency.
231-AC00	**Error message** AC00 CC amplitude too high %1 CC amplitude too high %2 **Cause of error** - The amplitude of the encoder signal is too high or the signal for contamination is active. - Incorrect adjustment between head and encoder, air gap too small (exposed encoders) - Excessive supply voltage **Error correction** - Check the amplitude of the encoder signal - Inform your service agency

Error number	Description
231-AC10	**Error message** AC10 Motor encoder %1 defective C300 Zn track %1 error C310 Z1 track %1 error **Cause of error** - Motor encoder contaminated or defective - Cable defective - Encoder input defective on the control - Signal connector: Poor contact or penetration of humidity - Humidity has entered the motor - No encoder signal available - Interruption in motor encoder cable - Signal amplitude of motor encoder is missing or too small **Error correction** - Inform your service agency - Check the motor encoder connection - Check the motor encoder - Check the amplitude of the encoder signal
231-AC20	**Error message** AC20 CC frequency too high %1 CC frequency too high %2 **Cause of error** - The maximum input frequency was exceeded at an encoder input. - Noise on motor encoder signal - Vibrations on the machine **Error correction** - Inform your service agency - Check the motor encoder connection (ground connection) - Check the motor encoder - Check the encoder signal input frequency - Remove the vibrations
231-AC30	**Error message** AC30 CC ampl. too high %1 (position) **Cause of error** - The amplitude of the position encoder signal is too high - Fault in the encoder signal - Short circuit in the encoder cable - Signal amplitude of encoder is too high **Error correction** - Inform your service agency - Check the encoder connection (ground connection) - Check the encoder

Error number	Description
231-AC40	**Error message** AC40 Position encoder %1 defective **Cause of error** - Encoder contaminated - Encoder defective - Penetration of humidity - Scanning head misaligned (distance, parallelism, etc.) - Encoder cabling defective - Encoder input defective on the control **Error correction** - Inform your service agency - Check the encoder connection - Check the encoder
231-AC50	**Error message** AC50 CC freq. too high %1 (position) **Cause of error** - The maximum input frequency was exceeded at a position encoder input. - Noise on the encoder signal - Vibrations on the machine **Error correction** - Inform your service agency - Check the encoder connection (ground connection) - Check the encoder - Check the input frequency of the encoder signal. - Remove the vibrations
231-B200	**Error message** B200 CC%2 No brake test was conducted %2 **Cause of error** - MC makes no test of the motor brake(s) although it is configured by machine parameter setting. - Cannot enable the motor-brake test(s) - An axis was deselected by PLC module and the corresponding machine parameter for running a brake test for this axis is still set. **Error correction** - Check the machine parameter for conducting a brake test - Generate the service files and notify the Service Department

Error number	Description
231-B300	**Error message** B300 CC%2 No brake line test was conducted %1 **Cause of error** - MC (A channel) makes no test of the brake line, although the machine parameter setting requires it. - Timeout when calling for test of the brake control by the MC. - An axis was deselected by PLC module, although the corresponding machine parameter for running the brake line test is still set. **Error correction** - Check the machine parameter for testing the brake control or brake test - Generate the service files and notify the Service Department
231-B800	**Error message** B800 CC%2 safe inputs %1 not equal CC%2 safe inputs %1 not equal **Cause of error** - A safety-related input of the CC is longer than 400 ms unequal to MC - Different levels at the safety module input: 4 = Acknowledgement of switch-off 8 = Safe reduced velocity of axes/spindle 10 = Safe reduced velocity of auxiliary axes 11 = Operating mode 3(detachable-key switch 1, Pos3) (safe controlled stop of axes/spindle) 18 = Operating mode 2 (detachable-key switch 1,Pos2) 19 = Operating mode 4 (detachable-key switch 2) - Wiring error X65, X66, (X67) – Safety module defective **Error correction** – Check the wiring X65, X66, (X67) – Exchange the safety module - Generate the service files and notify the Service Department

Error number	Description
231-B900	**Error message** B900 CC%2 supply voltage %1 **Cause of error** - The supply voltage Vcc(x) was out of range. - +4 = undervoltage Vcc(+5 V) The load from external components (e.g. encoders) is too large. - +6 = overvoltage Vcc(+5 V) The power supply unit is defective. - +14 = undervoltage Vcc(+15 V) The power supply unit is defective. - +16 = overvoltage Vcc(+15 V) The power supply unit is defective. - -14 = undervoltage Vcc(-15 V) The power supply unit is defective. - -16 = overvoltage Vcc(-15 V) The power supply unit is defective. **Error correction** - Inform your service agency. - Measure the supply voltage Vcc(x). - Vcc(+5 V) < +4.75 V Check the encoder connections. - Vcc(+5 V) > +5.50 V Exchange the power supply unit. - Vcc(+15 V) < +14.25 V Exchange the power supply unit. - Vcc(+15 V) > +16.50 V Exchange the power supply unit. - Vcc(-15 V) < -14.25 V Exchange the power supply unit. - Vcc(-15 V) > -16.50 V Exchange the power supply unit.
231-BA00	**Error message** BA00 CC%2 operating temperature %1 **Cause of error** - Temperature inside the LE was out of permissible range. (-128... 0...+127 = measured temperature value [°C]) - Temperature sensor on board is defective. - The electrical-cabinet ventilation is insufficient (fan defective). - The ambient temperature is too high or too low. **Error correction** - Check the ventilation. - Inform your service agency.
231-BB00	**Error message** BB00 CC%2 MC command %1 to CC software is not allowed **Cause of error** - MC command not permitted for this software variant of the CC - MC command not permitted at this point in time. Decimal code = low byte of the command code (0...255) - Internal software error **Error correction** - Check the software version - Inform your service agency

Error number	Description
231-C000	**Error message** C000 No data exchange with MC **Cause of error** - Communication to the MC was interrupted. - Internal software error. **Error correction** - Inform your service agency. - Check the software version.
231-C001	**Error message** C001 Undefined error Undefined error **Cause of error** Internal software error **Error correction** - Inform your service agency - Check the software version
231-C002	**Error message** C002 MC command invalid **Cause of error** Internal software error **Error correction** - Inform your service agency - Check the software verion
231-C003	**Error message** C003 System clock MC not = CC%2 System clock MC not = CC%2 **Cause of error** - Hardware error (crystal generator) - Internal software error **Error correction** - Inform your service agency - Exchange the drive control board or processor board - Check the software version
231-C005	**Error message** C005 CC hardware is not supported **Cause of error** - The hardware version of the CC controller unit is not supported by installed the NC software - Power supply module (UV/UVR) interferes with I2C bus **Error correction** - Check the NC software version - Check/exchange the X69 ribbon cable - Exchange the power supply module (UV/UVR) - Inform your service agency

Error number	Description
231-C006	**Error message** C006 I-CTRL communication: TIME C008 I-CTRL communication: QUEUE **Cause of error** - Communication error between speed and current controller. **Error correction** - Inform your service agency. - Check the software version.
231-C007	**Error message** C007 DC-link voltage too low **Cause of error** - Line power interrupted - Inverter defective **Error correction** - Check the line power supply - Inform your service agency - Check the inverter
231-C009	**Error message** C009 Stack overflow **Cause of error** - Internal software error **Error correction** - Inform your service agency - Check the software version
231-C00A	**Error message** C00A PWM triangular signal error **Cause of error** - Hardware error: Triangular signal does not oscillate, or it oscillates with incorrect frequency **Error correction** - Inform your service agency - Exchange the drive control board
231-C00B	**Error message** C00B Too little main memory **Cause of error** - Internal software error **Error correction** - Inform your service agency - Check the software version

Error number	Description
231-C00C	**Error message** C00C LSV2, incorrect number of data **Cause of error** - The number of LSV2 data to be read is incorrect - Internal software error **Error correction** - Inform your service agency - Check the software version
231-C00D	**Error message** C00D CC%2 Checksum error in the DSP program code **Cause of error** - A checksum error was discovered in the program code of the CC controller unit - Defective CC controller unit **Error correction** - Exchange the hardware - Inform your service agency
231-C00E	**Error message** C00E Controller software timeout **Cause of error** - Internal software or hardware error **Error correction** - Inform your service agency - Check the software version - Exchange the drive control board
231-C00F	**Error message** C00F Error in software timer **Cause of error** - Internal software error **Error correction** - Inform your service agency - Check the software version
231-C010	**Error message** C010 Bus error in speed controller **Cause of error** - Access violation on controller periphery. **Error correction** - Inform your service agency. - Exchange the controller board.

Error number	Description
231-C011	**Error message** C011 Softw. synchronization err. **Cause of error** - Missing hardware interrupt after DSP start (>900[ms]) - Missing synchronization command of the MC before drive switch-on - Hardware is defective (MC or CC) **Error correction** - Exchange the hardware (MC or CC) - Inform your service agency.
231-C012	**Error message** C012 Pos. control cyc. time err. **Cause of error** - MC is providing erroneous cycle time for CC position controller - Hardware error **Error correction** - Inform your service agency - Check the configuration datum ipoCycle - Exchange the drive control board
231-C013	**Error message** C013 PWM frequency error **Cause of error** - The PWM frequency entered in CfgPowerStage->ampPwm-Freq is outside the permissible input range - The selected PWM frequencies must not be combined **Error correction** - Inform your service agency - Check CfgPowerStage->ampPwmFreq
231-C014	**Error message** C014 Interpolator, PWM invalid **Cause of error** - Invalid relation between interpolator clock pulse and PWM frequency. **Error correction** - Inform your service agency. - Change the ratio of interpolator clock pulse to PWM frequency. - For possible ratios see Technical Manual.

Error number	Description
231-C015	**Error message** C015 Interpolator, PWM changed **Cause of error** - Interpolator clock pulse or PWM frequency was changed. **Error correction** - Restart the control.
231-C016	**Error message** C016 Double speed not possible **Cause of error** - Control loop on X51 or X52 is defined as 'double speed', although the control loop on X53 or X54 is active - Control loop on X55 or X56 is defined as 'double speed', although the control loop on X57 or X58 is active (only CC 4xx with 8 control loops) **Error correction** - Inform your service agency - Define the control loop on X51 or X52 as 'single speed', or deactivate the PWM output X53 or X54 - Define the control loop on X55 or X56 as 'single speed', or deactivate the PWM output X57 or X58 (only CC 4xx with 8 control loops)
231-C017	**Error message** C017 PWM frequency too high **Cause of error** - For a single-speed control loop, in configuration datum ampPwmFreq the double PWM basic frequency, and in iCtrlPwmType one-half of the current controller cycle time has been set. **Error correction** - Inform your service agency - Check the configuration datum ampPwmFreq and iCtrlP-wmType - Use a double-speed control loop instead of single-speed
231-C018	**Error message** C018 Master-slave torque: Axis assignment incorrect **Cause of error** - The axis in master-slave torque control are permissible only at X15/X17 or X16/X18. **Error correction** - Inform your service agency. - Change the axis assignment.

Error number	Description
231-C020	**Error message** C020 Faulty Include file **Cause of error** - The MC and CC software were not compiled with the same Include file. **Error correction** - Check the software version and reload if necessary - Inform your service agency
231-C021	**Error message** C021 Wrong DSP version **Cause of error** - The MC and CC software were not compiled with the same Include file. **Error correction** - Inform your service agency - Check the software version and reload if necessary
231-C022	**Error message** C022 SMB or SPL configuration error **Cause of error** - Configuration error in the HSCI system - Configuration error in the safe machine operating panel MB 6xx S or a safe PL 6xxx S - A new device type has been connected that is not yet supported by the current CC software - Error in the MC's configuration data to the CC **Error correction** - Software update - Inform your service agency
231-C023	**Error message** C023 IRQ stack overflow **Cause of error** - Internal software error **Error correction** - Inform your service agency - Check the software version
231-C025	**Error message** C025 CC-CC communication, CRC error **Cause of error** - An HSCI station causes an offset error - Incorrect message size by MC **Error correction** - Software update - Inform your service agency

Error number	Description
231-C026	**Error message** C026 CC-CC communication, watchdog error **Cause of error** - An HSCI station causes an offset error - Incorrect message size by MC - Message transmission canceled **Error correction** - Software update - Exchange the PL 6xxx S - Inform your service agency
231-C027	**Error message** C027 HSCI message is missing **Cause of error** - HSCI message (low-prio) is missing - An HSCI station causes an error - Message list in MC is faulty **Error correction** - Check the HSCI devices - Software update - Inform your service agency
231-C028	**Error message** C028 MC acknowledgment is missing **Cause of error** - An HSCI message from the CC to the MC was not acknowledged **Error correction** - Software update - Inform your service agency
231-C02B	**Error message** C02B Watchdog error for machine operating panel **Cause of error** - Watchdog of the MB 6xx S was not retriggered - Hardware error on the MB 6xx S **Error correction** - Exchange the MB 6xx S - Inform your service agency
231-C02C	**Error message** C02C Watchdog error for PL / SPL assembly **Cause of error** - Watchdog of the PL 6xxx (S) was not retriggered - Hardware error on the PL 6xxx (S) **Error correction** - Exchange the PL 6xxx (S) - Inform your service agency

Error number	Description
231-C02D	**Error message** C02D Watchdog error, HSCI module **Cause of error** - HSCI module of the CC is defective -> HSCI messages cannot be received any longer -> The watchdog is not retriggered any longer - HSCI cable defective **Error correction** - Check the connection of the HSCI cable - Check/replace the HSCI cable - Exchange the CC - Inform your service agency
231-C02E	**Error message** C02E CC firmware update required **Cause of error** - An update of the firmware is required because of a hardware or software exchange **Error correction** - Inform your service agency
231-C02F	**Error message** C02F Error during control start up **Cause of error** - Internal software error in the MC, CC or an HSCI participant (RunUp) **Error correction** - Inform your service agency
231-C030	**Error message** C030 Alarm with supply voltages CC%2 **Cause of error** - The internal supply voltages of the CC are outside of the specified range. Please pay attention to the diagnostic message "0xC038 voltage monitoring"! **Error correction** - Check the supply voltages on the CC: - Check the wiring of X69 - Cable length at X69 within specification? - Exchange the cable on X69 - Exchange the hardware - Inform your service agency

Error number	Description
231-C031	**Error message** C031 Alarm with supply voltages Supply voltage missing at device **Cause of error** The supply voltages on a device in the HSCI line are outside of the specified range. The HSCI bus diagnosis indicates which HSCI component triggered the error. Possible devices: - MC main computer - PL inputs/outputs - MB machine operating panel - Other CCs in the HSCI chain Possible causes: - Insufficient power supply to the devices - Short circuit in the power supply - Short circuit in PL inputs and outputs **Error correction** - Check the supply voltage in the connected devices - Check the wiring for possible short circuits (e.g. PLC inputs or outputs) - Exchange the hardware - Inform your service agency
231-C032	**Error message** C032 System clock of the MC less than CC%2 **Cause of error** - MC main computer or CC controller unit is defective. **Error correction** - Inform your service agency.
231-C033	**Error message** C033 System clock of the MC greater than CC%2 **Cause of error** - MC main computer or CC controller unit is defective. **Error correction** - Inform your service agency.
231-C034	**Error message** C034 CC%2 self test in S status faulty **Cause of error** - The MC did not correctly end the the self text of the S status signals. - Internal software error **Error correction** - Check the software version - Inform your service agency

Error number	Description
231-C035	**Error message** C035 CC%2 S status test: invalid test sequence **Cause of error** - During the S status test, the MC did not follow the operational sequence of this test - Internal MC software error **Error correction** - Inform your service agency
231-C036	**Error message** C036 CC%2 S status test: invalid signal **Cause of error** - During the S status test, the MC requested an unknown or unsupported signal - Internal MC software error **Error correction** - Inform your service agency
231-C037	**Error message** C037 CC%2 S status test with drives switched on **Cause of error** - The MC requested an S status test while axes are in closed-loop control - The PLC program initiated the self-test of the control (PLC Module 9144) while axes are still in closed-loop control. - Internal MC software error **Error correction** - Check the PLC program and correct if necessary. - Inform your service agency

Error number	Description
231-C038	**Error message** C038 Voltage monitoring CC%2 voltage ID: %4 **Cause of error** - The voltage monitoring of the CC supply voltage reports an error in the CC displayed. - The cause of the error message could be the 5 V power supply of the CCs over the power bus (X69). With large line lengths on the power bus, the 5 V power supply may have to be wired additionally over X74. (Use short line lengths and large line cross section, and check voltage drops on lines between X74.) - Defective power supply unit in the supply module (5 V power pack in the UV). **Error correction** - Establish a 5 V supply between the supply module and the CCs via X74 - Check the 5 V power supply (usually on supply module X74) - Check the 5 V power supply on all CCs (X74/CC) - Check the supply bus (X69) - Check the wiring: - Wiring of the supply bus (X69) - Wiring of the 5 V supply (X74) - Check the cable length of the supply bus (X69), if necessary use double lines - Check the 5 V supply voltage at X74 of all CCs if necessary, increase the wire cross sections or reduce the cable length - Check the voltage attenuation on the cable between X74 on the supply module and X74 on the CCs - Exchange the power supply - Exchange defective hardware (CC) - Inform your service agency, stating the alarm number and Voltage ID
231-C039	**Error message** C039 Hardware error CC%2 assembly ID: %4 **Cause of error** - Hardware error found on the CC controller unit. **Error correction** - Exchange the defective hardware/CC - Read out the log - Inform your service agency

Error number	Description
231-C110	**Error message** C110 Unknown motor type %1 **Cause of error** - Error in motor table. - Internal software error. **Error correction** - Inform your service agency. - Check motor table. - Check the software version.
231-C140	**Error message** C140 Pole pair no. too large %1 **Cause of error** - Incorrect entry in motor table **Error correction** - Inform your service agency - Check the motor table
231-C150	**Error message** C150 Field current error %1 **Cause of error** - Incorrect entry in motor table **Error correction** - Inform your service agency - Check the motor table
231-C160	**Error message** C160 Grating per. motor enc. %1 **Cause of error** - Measured grating period does not agree with the entry in the motor table **Error correction** - Inform your service agency - Check the motor table (line count) - Check the motor
231-C170	**Error message** C170 Rotor time constant err. %1 **Cause of error** - The rotor time constant calculated from the rotor table is invalid **Error correction** - Inform your service agency - Check the motor table

Error number	Description
231-C180	**Error message** C180 Rated speed error %1 **Cause of error** - Incorrect entry in motor table **Error correction** - Inform your service agency - Check the motor table
231-C1D0	**Error message** C1D0 Current sensor voltage %1 **Cause of error** - Incorrect entry in power module **Error correction** - Inform your service agency - Check the power module table
231-C1E0	**Error message** C1E0 Imax of power module %1 **Cause of error** - Incorrect entry in power module table **Error correction** - Inform your service agency - Check the power module table
231-C210	**Error message** C210 Tmax of motor table %1 **Cause of error** - Incorrect temperature entry in motor table **Error correction** - Inform your service agency - Check the motor table
231-C240	**Error message** C240 Rated I of power module %1 **Cause of error** - Incorrect entry in power module table **Error correction** - Inform your service agency - Check the power module table

Error number	Description
231-C250	**Error message** C250 Rated I of motor %1 **Cause of error** - Incorrect entry in motor table **Error correction** - Inform your service agency - Check the motor table
231-C260	**Error message** C260 Imax of motor %1 error **Cause of error** - Incorrect entry in motor table **Error correction** - Inform your service agency - Check the motor table
231-C270	**Error message** C270 Nmax of motor %1 error **Cause of error** - Incorrect entry in motor table **Error correction** - Inform your service agency - Check the motor table
231-C280	**Error message** C280 Field angle %1 error **Cause of error** Incorrect entry in CfgServoMotor->MotFieldAngleAdapStartSpeed or CfgServoMotor->MotFieldAngleAdapMaxAngle **Error correction** - Inform your service agency. Check CfgServoMotor->MotFieldAngleAdapStartSpeed or CfgServoMotor->MotFieldAngleAdapMaxAngle.
231-C290	**Error message** C290 Uz %1 error **Cause of error** - Incorrect entry in CfgPowerStage->ampBusVoltage (dc-link voltage Uz) **Error correction** - Inform your service agency. - Check the entry CfgPowerStage->ampBusVoltage.

Error number	Description
231-C2A0	**Error message** C2A0 Encoder input %1 **Cause of error** Incorrect entry in CfgAxisHardware->selectEncoderIn (speed encoder). Internal software error. **Error correction** Inform your service agency. Check the entry in CfgAxisHardware->selectEncoderIn. Check the software version.
231-C2B0	**Error message** C2B0 PWM output %1 **Cause of error** - Incorrect entry in parameter "CfgAxisHardware->analogOutput" (nominal speed value output). - Internal software error. **Error correction** - Internal software error. - Check parameter "CfgAxisHardware->analogOutput". - Check the software version.
231-C2C0	**Error message** C2C0 Band-pass parameter %1 **Cause of error** - Incorrect entry in CfgSpeedControl->vCtrlFiltDamping1. - Internal software error. **Error correction** - Inform your service agency. - Check the entry in CfgSpeedControl->vCtrlFiltDamping1. - Check the software version.
231-C2D0	**Error message** C2D0 Encoder line count %1 **Cause of error** - Encoder line count was changed **Error correction** - Restart the control
231-C2E0	**Error message** C2E0 Motor pole pair number %1 **Cause of error** - Motor pole pair number was changed **Error correction** - Restart the control

Error number	Description
231-C2F0	**Error message** C2F0 DIR in motor table %1 **Cause of error** - DIR in the motor table was changed **Error correction** - Restart the control
231-C330	**Error message** C330 Motor temp. too high %1 **Cause of error** - Motor encoder cable defective - Temperature sensor defective - Signal connector: Poor contact or penetration of humidity - Humidity has entered the motor **Error correction** - Let the motor cool down - Inform your service agency - Check the motor encoder cable - Measure the temperature sensor
231-C340	**Error message** C340 Unknown counter component %1 **Cause of error** - Parameter error at the active axis in machine parameter speedEncoderInput - Hardware defective (CC) - Motor encoder defective - Incorrect software version **Error correction** - Check the machine parameter (speedEncoderInput) - Check the software version - Operate the motor at another encoder input - Exchange the drive control board - Inform your service agency

Error number	Description
231-C350	**Error message** C350 Axis module %1 not ready **Cause of error** - Safety relay not on (e.g. connectors X71 and X72 of the UV, X73 of the HEIDENHAIN expansion board for Simodrive) - PWM bus cable interrupted - Interruption in the electrical cabinet - Defective axis module - PWM interface on the control defective - No pulse release for the axis module - Uz too high - 5V power supply too weak - Inverter not ready - Motor control board defective - PWM cable defective - Noise signals **Error correction** - Inform your service agency - Check the control and cabling of the pulse release - Check Uz - If the power supply is not regenerative, is the braking resistor connected? - If the power supply is regenerative, is the energy recovery activated? - Check the cable ground and shield - Exchange the power module - For P controls, exchange the interface card - Exchange the motor control board
231-C370	**Error message** C370 Angle error motor encdr. %1 **Cause of error** - Motor encoder defective - Motor encoder exchanged - Motor encoder cable defective - Signal connector: Poor contact or penetration of humidity - Humidity has entered the motor - Drive control board defective **Error correction** - Run a new field orientation after encoder exchange - Inform your service agency - Check motor encoder and leads - Exchange the drive control board

Error number	Description
231-C380	**Error message** C380 Motor %1 not controllable **Cause of error** - Motor encoder cable defective - Motor defective - I2t monitoring has responded - Signal connector: Poor contact or penetration of humidity - Humidity has entered the motor - Motor brake is on **Error correction** - Check the motor cabling - Inform your service agency - Check the motor and the motor encoder cabling - Check the motor table entry - Check I2t monitoring
231-C390	**Error message** C390 Error in 3-D touch probe %1 **Cause of error** - Internal software error - Hardware error on drive control board **Error correction** - Check the software version - Exchange the drive control board - Inform your service agency
231-C3A0	**Error message** C3A0 Incorrect ref. position %1 **Cause of error** - Incorrect motor selected - Grounding error on motor encoder cable (disturbance on reference signal line) - Motor encoder defective **Error correction** - Inform your service agency - Check the motor selection - Check the cabling of the motor encoder (grounding) - Exchange the motor

Error number	Description
231-C3B0	**Error message** C3B0 Motor %1 does not run under max. current **Cause of error** - Motor locked or blocked - Inverter defective - Motor defective - Wrong motor addressed - Assignment of PWM outputs entered incorrectly - Motor power cables mismatched - Motor encoder cable mismatched - Incorrect motor connection - The motor is loaded with the maximum torque **Error correction** - Check the inverter and exchange it if necessary - Inspect the motor and cabling - Check the motor load - Check whether the shaft can run freely - Check the machine parameters - Inform your service agency
231-C3C0	**Error message** C3C0 Motor current %1 too high **Cause of error** - Incorrect current controller parameters - Incorrect parameters in the motor table - Power module defective - Motor cable defective - Motor defective - Humidity has entered the motor - Motor control board defective **Error correction** - Inform your service agency - Are the correct motor and power module selected? - Check the current control adjustment - Check the motor and motor cable for a short circuit - Exchange power module or drive control board
231-C3D0	**Error message** C3D0 PWM component defective %1 **Cause of error** - Internal hardware error **Error correction** - Inform your service agency - Exchange the drive control board

Error number	Description
231-C3E0	**Error message** C3E0 Err. in rated U of motor %1 **Cause of error** - Motor rated voltage outside of permitted input range **Error correction** - Inform your service agency - Check the entry in the motor table
231-C3F0	**Error message** C3F0 EnDat not found %1 **Cause of error** - EnDat communication error - Motor encoder contaminated or defective - Signal cable defective - Encoder input defective on the control - Signal connector: Poor contact or penetration of humidity - Humidity has entered the motor **Error correction** - Inform your service agency - Check the motor table (SYS column) - Exchange the motor control board (or better, the control) - Check the speed encoder cable (defective or too long) - Check the speed encoder - Check the cable ground and shield
231-C400	**Error message** C400 Line count incorrect %1 **Cause of error** - Line count from the motor table does not match the downloaded values **Error correction** - Inform your service agency - Check configuration data for linear distance of one motor revolution and distance for the number of signal periods. - Check the motor table (columns TYPE and STR). - Check the speed encoder

Error number	Description
231-C410	**Error message** C410 Rotor position %1 undefined **Cause of error** - Signal cable defective - Motor encoder contaminated or defective - Encoder input defective on the control - Signal connector: Poor contact or penetration of humidity-Humidity has entered the motor - Motor control board defective **Error correction** - Inform your service agency - Exchange the motor - Check the speed encoder cable - Exchange the motor control board (or better, the control)
231-C420	**Error message** C420 Uncontrollability %1 caused by incorrect parameters **Cause of error** - Feedforward-control parameters are set incorrectly (acceleration, friction) - Excessive acceleration - Controller parameters are set incorrectly (Ki, Kp, Kd) - Filters set incorrectly (band rejection, low pass) - Inverter is defective (IGBT) - Incorrect motor selected in motor table **Error correction** - Inform your service agency - Check the adjustment of the axes - Check the inverter
231-C430	**Error message** C430 Error of position input %1 **Cause of error** - Position encoder input does not exist. - Position encoder input is not correctly connected. - Position encoder input is defective. **Error correction** - Inform your service agency. - Install the position encoder input. - Check the connection of the position encoder input. - Exchange the position encoder input.

Error number	Description
231-C440	**Error message** C440 PWM frequency %1 incorrect **Cause of error** - PWM frequency within a control group is incorrect **Error correction** - Inform your service agency - Check configuration data (PWM frequency) - PWM frequency > 5000 Hz only with suitable hardware and only with PWM outputs X51, X52, X57 and X58. - PWM frequency <= 5000Hz must be identical within the control groups. - PWM frequency > 3200 Hz
231-C450	**Error message** C450 Wrong encoder %1 **Cause of error** - Incorrect entry in motor table column SYS. - Speed encoder cable defective. - Speed encoder defective. - Motor control board defective. **Error correction** - Inform your service agency. - Check the motor table (column SYS). - Check the motor encoder cable. - Exchange the motor. - Exchange the motor control board.
231-C460	**Error message** C460 Motor speed too high %1 **Cause of error** - Motor cannot be servocontrolled. **Error correction** - Inform your service agency. - Check the software version.
231-C470	**Error message** C470 No nominal speed values %1 **Cause of error** - Internal software error - Position controller cycle time too short **Error correction** - Inform your service agency - Check the software version - Check the configuration datum CfgCycleTimes->ipoCycle

Error number	Description
231-C480	**Error message** C480 V/Hz control mode with encoder %1 **Cause of error** - In the motor table, volts-per-hertz control mode is set (STR == 0), but a motor encoder is indicated (SYS <> 0) **Error correction** - Correct the encoder entry in the motor table - Inform your service agency
231-C4A0	**Error message** C4A0 Inverter %1 is not active **Cause of error** - Charging contactor and main contactor on the supply unit is not on (e.g. connector X70 on UV) - Safety relay not on (e.g. connectors X71 and X72 of the UV, X73 of the HEIDENHAIN expansion board for Simodrive) - PWM bus cable interrupted - Interruption in the electrical cabinet (unit bus, PWM ribbon cable) - Defective inverter, (supply unit and/or power modules, compact inverter) - Inverter switched off (PLC, SH1) - Inverter defective - Motor defective - Humidity has entered the motor - Incorrect motor selected in motor table - Motor power cables mismatched - Motor connected incorrectly **Error correction** - Inform your service agency - Check the inverter and wiring - Check the motor and wiring
231-C4C0	**Error message** C4C0 No motor current %1 **Cause of error** - Motor connected incorrectly or not at all (contactor) - Inverter defective - Motor defective - Incorrect motor selected in motor table - Motor power cables mismatched - DC-link voltage missing **Error correction** - Check the connection of the DC link - Check the motor and wiring - Check the inverter - Inform your service agency

Error number	Description
231-C4D0	**Error message** C4D0 Error in torque constant %1 **Cause of error** - If the value for the torque constant is 0 or >9999, it can have the following causes: 1) Motor.mot: No-load voltage and/or rated rpm have an invalid value (or 0) 2) Motor.sn: The entry for the torque constant is 0 or >9999 **Error correction** - Check the motor table
231-C4E0	**Error message** C4E0 Field angle determination %1 is not allowed in this mode **Cause of error** - The selected process for determining the field angle is invalid or impossible with this encoder. **Error correction** - Inform your service agency. - Check the entry in the SYS column of the motor table (see Technical Manual).
231-C4F0	**Error message** C4F0 Command not allowed **Cause of error** - Internal software error **Error correction** - Inform your service agency - Check the software version
231-C500	**Error message** C500 CfgSpeedControl->vCtrlDiffGain %1 too large **Cause of error** - Differential factor is too large (max. value 0.5 [As^2/rev]) **Error correction** - Inform your service agency
231-C510	**Error message** C510 Drive release %1 not allowed **Cause of error** - During readout of the electronic ID label the power module must not be in the "ready" status (-SH1 is inactive). **Error correction** - Inform your service agency - Check the software version

Error number	Description
231-C520	**Error message** C520 Timeout in position controller %1 C660 Timeout in position controller %1 **Cause of error** - Internal software error **Error correction** - Inform your service agency - Check the software version
231-C530	**Error message** C530 Timeout in speed controller %1 **Cause of error** - Internal software error **Error correction** - Inform your service agency - Check the software version
231-C540	**Error message** C540 Timeout in current controller %1 **Cause of error** - Internal software error **Error correction** - Inform your service agency - Check the software version
231-C550	**Error message** C550 Error in calculation of current %1 **Cause of error** - This is an internal software error - Incorrect parameters of the filter in the controller (e.g. bandwidth of the band-rejection filter is very large or the bandwidth = 0 at high center frequency) **Error correction** - Check the machine parameters of the filter for control - Set the bandwidth of band-rejection filter (machine parameter vCtrlFiltBandWidth) to a value unequal to 0 - Inform your service agency.

Error number	Description
231-C560	**Error message** C560 Param. filter 1 invalid %1 **Cause of error** - Incorrect entry in CfgSpeedControl->vCtrlFiltDamping1, CfgSpeedControl->vCtrlFiltFreq1 oder CfgSpeedControl->vCtrlFiltType1 - This is an internal software error **Error correction** - Inform your service agency - Check entries in CfgSpeedControl->vCtrlFiltDamping1, CfgSpeedControl->vCtrlFiltFreq1 or CfgSpeedControl->vCtrlFiltType1 - Check the software version
231-C570	**Error message** C570 Param. filter 2 invalid %1 **Cause of error** - Incorrect entry in CfgSpeedControl->vCtrlFiltDamping2, CfgSpeedControl->vCtrlFiltFreq2 or CfgSpeedControl->vCtrlFiltType2 - This is an internal software error **Error correction** - Inform your service agency - Check entries in CfgSpeedControl->vCtrlFiltDamping2, CfgSpeedControl->vCtrlFiltFreq2 or CfgSpeedControl->vCtrlFiltType2 - Check the software version
231-C580	**Error message** C580 Param. filter 3 invalid %1 **Cause of error** - Incorrect entry in CfgSpeedControl->vCtrlFiltDamping3, CfgSpeedControl->vCtrlFiltFreq3 or CfgSpeedControl->vCtrlFiltType3 - This is an internal software error **Error correction** - Inform your service agency - Check entries in CfgSpeedControl->vCtrlFiltDamping3, CfgSpeedControl->vCtrlFiltFreq3 or CfgSpeedControl->vCtrlFiltType3 - Check the software version

Error number	Description
231-C590	**Error message** C590 Param. filter 4 invalid %1 **Cause of error** - Incorrect entry in CfgSpeedControl->vCtrlFiltDamping4, CfgSpeedControl->vCtrlFiltFreq4 or CfgSpeedControl->vCtrl-FiltType4 - This is an internal software error **Error correction** - Inform your service agency - Check entries in CfgSpeedControl->vCtrlFiltDamping4, CfgSpeedControl->vCtrlFiltFreq4 or CfgSpeedControl->vCtrl-FiltType4 - Check the software version
231-C5A0	**Error message** C5A0 Param. filter 5 invalid %1 **Cause of error** - Incorrect entry in CfgSpeedControl->vCtrlFiltDamping5, CfgSpeedControl->vCtrlFiltFreq5 or CfgSpeedControl->vCtrl-FiltType5 - This is an internal software error **Error correction** - Inform your service agency - Check entries in CfgSpeedControl->vCtrlFiltDamping5, CfgSpeedControl->vCtrlFiltFreq5 or CfgSpeedControl->vCtrl-FiltType5 - Check the software version
231-C5B0	**Error message** C5B0 Illegal reference run of motor encoder %1 **Cause of error** - A touch-probe cycle is active while a reference value is requested by the motor encoder. **Error correction** - Inform your service agency
231-C5C0	**Error message** C5C0 Illegal reference run of position encoder %1 **Cause of error** - A touch-probe cycle is active while a reference value is requested by the position encoder. **Error correction** - Inform your service agency

Error number	Description
231-C5E0	**Error message** C5E0 Machine parameter compIpcJerkFact is faulty **Cause of error** - On the CC 424, the input range for "compIpcJerkFact" (following error in the jerk phase) is 0.0 to 0.5. **Error correction** - Inform your service agency - Check the input value in the parameter "compIpcJerkFact"
231-C5F0	**Error message** C5F0 Wrong position-encod. input **Cause of error** - An incorrect input was selected for the position encoder ("posEncoderInput" parameter) - Possible configurations CC424: 6 control loops: X201 to X206 8 control loops: X201 to X208 10 control loops: PWM outputs X51 to X56: X201 to X206 PWM outputs X57 to X60: X207 to X210 12 control loops: PWM outputs X51 to X56: X201 to X206 PWM outputs X59 to X64: X209 to X214 14 control loops: PWM outputs X51 to X58: X201 to X208 PWM outputs X59 to X64: X209 to X214 16 control loops: PWM outputs X51 to X58: X201 to X208 PWM outputs X59 to X66: X209 to X216 - Possible configuration CC61xx: PWM output <-> position encoder X51 <-> X201 X52 <-> X202 X53 <-> X203 X54 <-> X204 X55 <-> X205 X56 <-> X206 **Error correction** - Inform your service agency - Check the configuration datum posEncoderInput
231-C600	**Error message** C600 Current offset %1 is too large **Cause of error** - The current offset of the power stage is too large **Error correction** - Inform your service agency - Check/replace the PWM cable - Replace the power module - PWM output to CC is defective

Error number	Description
231-C610	**Error message** C610 TRC: PWM freq. too high %1 **Cause of error** - The axis for which the torque ripple compensation was activated through MP2260.x is being driven with a PWM frequency of more than 5000 Hz. **Error correction** - Inform your service agency - Adjust the PWM frequency for the axis to a value less than or equal to 5000 Hz - To deactivate the compensation, delete the entry in MP2260.x
231-C620	**Error message** C620 TRC: Invalid parameter %1 **Cause of error** - Invalid parameters in the compensation file of the axis **Error correction** - Inform your service agency - Find again the compensation parameters with TNCopt under Optimization/Torque Ripple Compensation - To deactivate the compensation, delete the entry in MP2260.x
231-C640	**Error message** C640 PIC switching not possible in %1 **Cause of error** - The nominal value(S in inverter.inv) changed - after DSP start, or - after the current controller adjustment is started, or - after the readiness of the power module is switched. **Error correction** - Check the LT entry (configuration datum ampName) in the machine configuration - Check the nominal value of the PICS (the S column in in inverter.inv) - If necessary, change the PWM frequency (to >= 5 kHz) - If necessary, replace the power module
231-C650	**Error message** C650 No ENDAT interpolation factor %1 **Cause of error** - No ENDAT interpolation factor received by MC - This is an internal software error **Error correction** - Check the software version - Inform your service agency

Error number	Description
231-C670	**Error message** C670 Motor encoder: EnDat 2.2 not possible %1 **Cause of error** - EnDat communication is defective - An encoder with EnDat 2.2 interface is selected in the motor table, although no EnDat 2.2 encoder is connected - The EnDat 2.2 protocol cannot be read - The EnDat measuring system has too low an interpolation rate in EnDat2.2 mode (less than 1024, e.g. EQN 1325). Operation possible only in EnDat2.1 mode **Error correction** - Check whether the encoder supports EnDat 2.2 - Check the motor table (SYS column) - Check the configuration datum motEncType - Check the cable ground and shield - Check the cable (compare the cable ID number with the documentation) - Check the speed encoder cable (defective or too long) - Check the speed encoder - Change EnDat mode (motEncType) - Exchange the motor control board - Inform your service agency
231-C680	**Error message** C680 Position encoder: EnDat 2.2 not possible %1 **Cause of error** - EnDat communication is defective - An encoder with EnDat 2.2 interface is selected in posEncoderType, although no EnDat 2.2 encoder is connected - The EnDat 2.2 protocol cannot be read **Error correction** - Check whether the position encoder supports EnDat 2.2 - Check the configuration datum posEncoderType - Check the cable ground and shield - Check the cable (compare the cable ID number with the documentation) - Check the position encoder cable (defective or too long) - Check the position encoder - Change EnDat mode (posEncoderType) - Exchange the motor control board - Inform your service agency
231-C690	**Error message** C690 DQ communication error %1 **Cause of error** - DRIVE-CLiQ communication is disturbed- DRIVE-CLiQ communication has been interrupted **Error correction** - Inspect the DRIVE-CLiQ cabling - Inform your service agency

Error number	Description
231-C6A0	**Error message** C6A0 Controller software timeout %1 IRQ-ID=%4 BOARD-ID= %2 18092 Controller software timeout BOARD-ID %2 18093 Controller software timeout BOARD-ID %2 **Cause of error** - The time monitor of the controller software reports an expiration. - Internal software error **Error correction** - Inform your service agency
231-C6B0	**Error message** C6B0 DQ init error %1 State=%4 ID=%5 Port=%6 **Cause of error** - DRIVE-CLiQ initialization error **Error correction** - Evaluation of additional information - Inform your service agency
231-C6C0	**Error message** C6C0 DQ PWM frequency was changed %1 **Cause of error** - With DRIVE-CLiQ devices, switching the PWM frequency with AmpPwmFreq does not become effective until after a reboot. **Error correction** - Acknowledge the error and restart the control. - Inform your service agency
231-C6D0	**Error message** C6D0 Motor %1 does not react. Power stage not ready **Cause of error** - Motor does not react. Power module is not ready - The power stage release is faulty - Inverter is defective - PWM cable is defective - Wrong motor selected - Assignment of PWM outputs entered incorrectly **Error correction** - Check the inverter and exchange it if necessary - Inspect the motor and the cabling - Check the motor load - Check whether the motor can run freely - Check the machine parameters - Inform your service agency

Error number	Description
231-C6E0	**Error message** C6E0 Amplitude test in axis %1: speed encoder is incorrect, test %4 **Cause of error** The internal test of encoder-amplitude monitoring at the speed inputs revealed an error: Test 1: The test for "Amplitude too low" failed. Test 2: The test for "Amplitude too high" failed. - The entry in pwmSignalOutput/analogOffset does not match the wiring of the speed encoders. - Incorrect entry in machine parameter motEncType (e.g. Z1-track operation selected for EnDat2.2 encoder) - Speed encoder cable is interrupted, or encoder cable is defective - Speed encoder is defective - CC controller unit is defective **Error correction** - Compare/Check the entry in MP pwmSignalOutput/analogOffset to the speed encoder cabling - Check the entry in machine parameter motEncType - Check the speed encoder cable / Exchange the cable - Exchange the speed encoder - Exchange the CC controller unit - Inform your service agency
231-C6F0	**Error message** C6F0 Amplitude test in axis %1: pos. encoder is incorrect, test %4 **Cause of error** The internal test of encoder-amplitude monitoring at the position inputs revealed an error: Test 1: The test for "Amplitude too low" failed. Test 2: The test for "Amplitude too high" failed. - The entry in posEncoderInput/analogOffset does not match the wiring of the position encoder. - Incorrect entry in machine parameter posEncodeType (e.g. analog encoder signal selected for digital encoder) - Position encoder cable is interrupted, or encoder cable is defective - Position encoder is defective - CC controller unit is defective **Error correction** - Compare/check the entry in MP posEncoderInput/analogOffset to the position encoder cabling - Check the entry in machine parameter posEncodeType - Check the position encoder cable / Exchange the cable - Exchange the position encoder - Exchange the CC controller unit - Inform your service agency

Error number	Description
231-C700	**Error message** C700 DQ-ALM: Line power failure %1 **Cause of error** - A power phase failure was detected at the DRIVE-CLiQ regenerative module ALM. - Power voltage supply is disturbed. **Error correction** - Check the protective devices of the line power voltage supply. - Check the wiring of the line power voltage supply. - Inform your service agency
231-C710	**Error message** C710 Error in drive switch-off %1 **Cause of error** - The drive could not be decelerated to 0 rpm with the time configured in machine parameter vCtrlTimeSwitchOff. - Possible causes: - An IGBT of the power module switched off. - The machine parameter vCtrlTimeSwitchOff is set incorrectly. - The permissible load was exceeded. **Error correction** - Check the machine parameter vCtrlTimeSwitchOff - Check the load - Exchange the CC controller unit - Inform your service agency
231-C720	**Error message** C720 The software is not suitable for the PLASTIC_INJECTION **Cause of error** PLASTIC_INJECTION commands are not permitted **Error correction** Inform your service agency
231-C730	**Error message** C730 CC%2 CPU0 impermissible data processing 13038 UM: CC%2 %1 CPU0 impermissible data processing **Cause of error** Internal software error: There was an attempt to access an impermissible memory area **Error correction** - Please generate a service file soon, reboot the control, and then generate another service file - Transmit both service files to the Service department for further inspections by HEIDENHAIN

Error number	Description
231-C740	**Error message** C740 CC%2 CPU1 impermissible data processing 13039 UM: CC%2 %1 CPU1 impermissible data processing **Cause of error** Internal software error: There was an attempt to access an impermissible memory area **Error correction** - Please generate a service file soon, reboot the control, and then generate another service file - Transmit both service files to the Service department for further inspections by HEIDENHAIN
231-C750	**Error message** C750 CC%2 CPU0 impermissible instruction processing 1303A UM: CC%2 %1 CPU0 impermissible instruction processing **Cause of error** Internal software error: There was an attempt to access an impermissible memory area **Error correction** - Please generate a service file soon, reboot the control, and then generate another service file - Transmit both service files to the Service department for further inspections by HEIDENHAIN
231-C760	**Error message** C760 CC%2 CPU1 impermissible instruction processing 1303B UM: CC%2 %1 CPU1 impermissible instruction processing **Cause of error** Internal software error: There was an attempt to access an impermissible memory area **Error correction** - Please generate a service file soon, reboot the control, and then generate another service file - Transmit both service files to the Service department for further inspections by HEIDENHAIN
231-C770	**Error message** C770 System errors when activating a drive% 1 **Cause of error** A drive was switched on that either - is not active, meaning it is set to inactive in the kinematics configuration, or - its parameterization has not been completed **Error correction** Inform your service agency

Error number	Description
231-C780	**Error message** C780 Error while braking a drive %1 **Cause of error** It was not possible to brake the drive when switching off. An unexpected acceleration of the drive was detected during the braking procedure. Possible causes: - Switch-off time is parameterized to be too brief - Load is too high - Too much noise in the signals of the speed encoder **Error correction** Remedy: - Check the machine parameter timeLimitStop1 (system with integrated functional safety (FS)) or delayTimeSTOatSS1 (system with external safety) - Check the load - Check the speed encoder - Inform your service agency
231-CFF0	**Error message** CFF0 Alarm axis %1 module=%4 line=%5 10022 CC %2 axis %1: Measurement was not finished correctly. 180A5 Axis %1: error occurred during measurement **Cause of error** - This is an internal software error **Error correction** - Inform your service agency
231-D000	**Error message** D000 CC%2 DP RAM area %1 **Cause of error** - Internal software error 1...255 = area number **Error correction** - Inform your service agency. - Check the software version.
231-D100	**Error message** D100 CC%2 software error %1 **Cause of error** - Internal software error 0...255 = code for error in software module/routine **Error correction** - Inform your service agency. - Check the software version.

Error number	Description
231-D300	**Error message** D300 Data transm. SPL to CC, CRC error at HSCI addr.: %1 **Cause of error** - HSCI connecting cable is defective or not connected - Data transmission error in the HSCI system - A safe PL 6xxx FS is transmitting erroneous data - Incorrect HSCI message size (MC software) **Error correction** - Check the HSCI connecting cable - Exchange the safe PL 6xxx FS - Software update - Inform your service agency
231-D400	**Error message** D400 Data transm. SPL to CC, watchdog error at HSCI addr.: %1 **Cause of error** - Data transmission error in the HSCI system - A safe PL 6xxx FS is transmitting erroneous data - The HSCI transmission is disturbed **Error correction** - Software update - Exchange the PL 6xxx FS - Inform your service agency
231-E000	**Error message** E000 Start test of the cut-out channels not possible **Cause of error** - Start of the "tests of cutout channels" by PLC not possible because the control is not in the "AUTO" condition. - The motors of at least one axis group are not yet switched off. **Error correction** - Check the PLC program and correct if necessary. - Inform your service agency.
231-E001	**Error message** E001 Status NR1/NR2 not equal **Cause of error** - NR2 input incorrectly connected - Internal software error **Error correction** - Inform your service agency - Check the wiring - Check the software version

Error number	Description
231-E002	**Error message** E002 Status em.stop input signal not equal to test output: T2 **Cause of error** - The signal level of the test output 'T2' differs from that of the 'Emergency Stop' input of the CC. CC424: '-NE2' signal CC61xx: '-ES.B' signal **Error correction** - Check the wiring - Inform your service agency
231-E003	**Error message** E003 PLC module 9169 illegal **Cause of error** - PLC module 9169 in safety-oriented software (illegal) - Software error **Error correction** - Inform your service agency - Check the PLC program - Check the software version
231-E004	**Error message** E004 SH1 status test on active **Cause of error** - The measured status of the '-SH1' signal is 'high' level - The '-SH1' signal does not change to the 'active' ('low' level) status, although the MC is no longer triggering the corresponding watchdog. **Error correction** - Internal software error - Hardware defective - Inform your service agency
231-E005	**Error message** E005 SH1 status test on inactive **Cause of error** - The measured status of the '-SH1' signal is 'low' level - The '-SH1' signal does not change to the 'inactive' ('high' level) status, although the MC is triggering the corresponding watchdog. **Error correction** - Internal software error - Hardware defective - Inform your service agency

Error number	Description
231-E006	**Error message** E006 CC%2 input (NE2) not equal to 0 **Cause of error** Error in dynamic test of the 2nd emergency-stop loop. In the dynamic test, O V is expected at input NE2 after no later than 1.5 min. If a voltage of 24 V is present here, this error message appears. **Error correction** - Inform your service agency - Check the wiring - Check the emergency-stop button - Exchange the hardware
231-E007	**Error message** E007 CC%2 S input not equal 0 **Cause of error** Error in dynamic test of the 2nd emergency-stop loop. In the dynamic test, O V is expected at all door contacts and key-operated-switch inputs after no later than 1.5 min. If a voltage of 24 V is present here, this error message appears. **Error correction** - Inform your service agency - Check the wiring - Check the door contacts, key-operated switches - Exchange the hardware
231-E008	**Error message** E008 SRG speed too high **Cause of error** - Safe reduced rotational velocity (SRG) was exceeded - No standstill in safe controlled stop (SBH) operating mode **Error correction** Inform your service agency
231-E009	**Error message** E009 Incorrect gear range **Cause of error** - Internal software error **Error correction** - Inform your service agency - Check the software version

Error number	Description
231-E00A	**Error message** E00A Safe machine param. error **Cause of error** - Incorrect CRC checksum found and transferred over SG parameter memory - Communication error MC <-> CC - Wrong CC software - Hardware defect (memory fault) - Software error **Error correction** - Inform your service agency
231-E00B	**Error message** E00B Cutout channels test error **Cause of error** - Illegal code received for conducting the test. **Error correction** - Inform your service agency - Internal software error
231-E00C	**Error message** E00C Error in parameter transfer **Cause of error** - Incorrect parameter for analog spindle. - Software version MC. **Error correction** - Inform your service agency. - Check the parameter. - Check the software version.
231-E00D	**Error message** E00D Error in parameter transfer **Cause of error** - Incorrect parameter for analog spindle. - Software version MC. **Error correction** - Inform your service agency. - Check the parameter. - Check the software version.
231-E00E	**Error message** E00E Illegal pulse deletion test **Cause of error** - Command for pulse deletion test was received, although the previous test is not yet finished. **Error correction** - Inform your service agency - Internal software error

Error number	Description
231-E00F	**Error message** E00F Brake test not performed **Cause of error** - MC runs no test of the motor brake(s) although it is necessary according to parameter settings. - MC does not run the test of the motor brake(s) within 2 seconds. **Error correction** - Inform your service agency
231-E010	**Error message** E010 SH2 status test on active **Cause of error** - The measured status of the '-SH2' signal is 'high' level - The '-SH2' signal does not change to the 'active' ('low' level) status, although the CC is no longer triggering the corresponding watchdog. **Error correction** - Internal software error - Hardware defective - Inform your service agency
231-E011	**Error message** E011 SH2 status test on inactive **Cause of error** - The measured status of the '-SH2' signal is 'low' level - The '-SH2' signal does not change to the 'inactive' ('high' level) status, although the CC is triggering the corresponding watchdog. **Error correction** - Internal software error - Hardware defective - Inform your service agency
231-E012	**Error message** E012 N0 status test on active **Cause of error** - The measured status of the '-N0' signal is 'high' level - The '-N0' signal does not change to the 'active' ('low' level) status **Error correction** - Software error - Hardware defective - Inform your service agency

Error number	Description
231-E013	**Error message** E013 N0 status test on inactive **Cause of error** - CCU shut-off signal: -N0 does not switch to high level - The measured status of the '-N0' signal is 'low' level **Error correction** - Software error - Hardware defective - Inform your service agency
231-E014	**Error message** E014 Err. during -N0 signal test **Cause of error** - Change in the level of the CC1 switch-off signal: -N0 is not recognized by the CC0. - Internal software error - Hardware error **Error correction** - Check the software version - Inform your service agency
231-E015	**Error message** E015 CC protective door open in brake test **Cause of error** - The protective doors of the work envelope were opened during the brake test. **Error correction** - Close the protective doors. - Switch off and then restart the control. - The switch-off test and brake test will be started automatically.

Error number	Description
231-E018	**Error message** E018 CC%2 SPLC alarm ERR-ID=%4 SST0=%5 SST1=%6 OUT=%7 **Cause of error** - Error in the SPLC run-time program Meaning of the alarm ID 100, 101, 102, 104 and 200 to 206: Internal software error Meaning of alarm ID 103: The value of the read-back output with the number "OUT" is "1", although "0" was commanded by the SPLC for this output. **Error correction** - Measure for alarm ID 100, 101, 102, 104 and 200 to 206: Please inform your service agency - Measure for alarm ID 103: Check whether the output with the number "OUT" has a short circuit with +24 V. If this is not the case, please inform your service agency. - Inform your service agency.

Error number	Description
231-E019	**Error message** E019 CC%2 SPLC configuration error ERR-ID=%4 **Cause of error** Alarm ID 1: - Internal software error Alarm ID 2: - Invalid value of machine parameter CfgSafety.inverseInputNoA, CfgSafety.inverseInputNoB, or CfgSafety.testInputNo Alarm ID 3: - The version of the NC software was changed after the safety inspection and acceptance of the machine. - The version of the NC software and the version of the SplcApiMarker.def file being used that is stored in the safety-related machine parameter CfgSafety.s- plcApiVersion do not match. Alarm ID 4: - Permitted number of SPLC markers (1000/2000) was exceeded. Alarm ID 5: - Permitted number of SPLC DWORDs (1000/3000) was exceeded. Alarm ID 6: - Permitted number of PlcToSPLC transfer markers (64) was exceeded. Alarm ID 7: - Permitted number of PlcToSPLC transfer DWORDs (32) was exceeded. Alarm ID 8: - Marker transfer area PlcToSPLC is faulty. Alarm ID 9: - DWORDs transfer area PlcToSPLC is faulty. **Error correction** Alarm ID 1: - Inform your service agency Alarm ID 2: - Check the values of the machine parameters CfgSafety.inverseInputNoA, CfgSafety.inverseInputNoB, and CfgSafety.testInputNo. Alarm ID 3: - Transfer the 'SplcApiMarker.def' file appropriate to the installed NC software version into the SPLC project. - Enter the value of the constant SPLC_API_VERSION from this file into the safety-related machine parameter CfgSafety.splcApiVersion. - Repeat the safety inspection and acceptance of the machine with the appropriate comprehensiveness. Alarm ID 4: - Check the SPLC program and CfgPlcSafety.splcMarkers Alarm ID 5: - Check the SPLC program and CfgPlcSafety.splcDWords Alarm ID 6 and 8:

Error number	Description
	- Check the SPLC program and CfgPlcSafety.splcMarkers-FromPlc[] Alarm ID 7 and 9: - Check the SPLC program and CfgPlcSafety.splcDWords-FromPlc[]

Error number	Description
231-E01A	**Error message** E01A CC%2 FS configuration error ERR-ID=%4 ObjId=%5 Param=%6 **Cause of error** - The transferred configuration data for SKERN are faulty. The ERR ID provides information on the faulty machine parameter: 200 - Machine parameter axisGroup: Assigned axis group out of range 201 - Machine parameter axisGroup: Entered axis group not in use. 202 - Drive type and axis group type do not match. 210 - Permissible number of spindles was exceeded 300 - Machine parameter pwmSignalOutput. Input range exceeded 301 - Machine parameter pwmSignalOutput. The same value was used in two separate entries 400 - Machine parameter timeLimitStop1: Input range exceeded 401 - Machine parameter timeLimitStop2: Input range exceeded 600 - Machine parameter distPerMotorTurn: Input range exceeded 700 - Machine parameter speedLimitSom2, speedLimitSom3, speedLimitSom4, rpmLimitSom2, rpmLimitSom3, rpmLimitSom4: Permissible velocity limit exceeded 800 - An unknown additional function is activated in the config object CfgSafety 810 - Machine parameter timeToEmStopTest: Input range exceeded 820 - Machine parameter watchdogTime: Input range exceeded 900 - Machine parameter brakeAfter: Entered connective operation is not allowed 901 - Machine parameter brakeAfter: A connective operation to yourself is not allowed 1000 - Machine parameters plcCount: PLC / SPLC-MC input range of configured cycle time has been exceeded 1100 - Machine parameters idleState: Configuration of subsequent condition after a stop reaction SS2 is out of the permissible range 1200 - The drive assignment is missing for a safe axis - Faulty parameter values were entered - An internal software error has occurred **Error correction** - Check the ERR ID: 200 - Check the entered value of the axis group 201 - Enter only axis groups that are actually being used 202 - Check the axis group assignment 210 - Check the number of spindles in your system 300 - Check the entity pwmSignalOutput. Input value too large. 301 - Check entity pwmSignalOutput. The same value is in

Error number	Description
	two separate entries. 400 - Check the entered time Parameter value = maximum permissible time 401 - Check the entered time Parameter value = maximum permissible time 600 - Check the entered value 700 - Check the value entered in speedLimitSom for axes, rpmLimitSom for spindles Parameter value = 2 -> SLS_2, Parameter value = 3 -> SLS_3, Parameter value = 4 -> SLS_4 800 - Check the entered additional functions 810 - Check the entered time 820 - Check the entered time 900 - Check the input 901 - Check the input 1000 - Check the input (maximum = 30 ms) 1100 - Check the input 1200 - Check the drive assignment - Inform your service agency.

Error number	Description
231-E023	**Error message** E023 CC%2 Dynamic test ID=%4 aborted: Error in B channel: test ID=%5 **Cause of error** The dynamic test of the PLC peripheral devices (PL, MB, UEC) was was not conducted for the given test ID. - Error in the configuration file (IOC file) - Internal software error **Error correction** - Check the HSCI-BUS diagnostics. If necessary, correct the HSCI configuration - Check the software version. - Inform your service agency.
231-E023	**Error message** E023 CC%2 Dynamic test ID=%4 aborted: Processor check error %5 **Cause of error** Error in the flow of the dynamic test - Internal software error **Error correction** - Check the software version. - Inform your service agency.
231-E023	**Error message** E023 CC%2 Dynamic test ID=%4 aborted: Error in B channel: test ID=%5 **Cause of error** The dynamic test of the PLC peripheral devices (PL, MB, UEC) was was not conducted for the given test ID. - Error in the HSCI configuration file (IOC file) - Internal software error **Error correction** - Check the HSCI-BUS diagnostics. If necessary, correct the HSCI configuration - Check the software version. - Inform your service agency.

Error number	Description
231-E023	**Error message** E023 CC%2 Dynamic test ID=%4 aborted: Error in B channel: test ID=%5 **Cause of error** Error during the dynamic test of the PLC periphery devices (PL, MB, UEC) Missing acknowledgment of the TEST.B output. - Incorrect wiring of the TEST.B output. - Short circuit of the TEST.B output - Incorrect firmware version of the peripheral device **Error correction** - Check the software version. - Check the wiring of the TEST.B output - Run a software or firmware update - Exchange the faulty device. - Inform your service agency.
231-E023	**Error message** E023 CC%2 Dynamic test ID=%4 aborted: Error in B channel: test ID=%5 **Cause of error** Error during the dynamic test of the PLC periphery devices (PL, MB, UEC). No expected switch from 1 to 0 of the test output TEST.B detected. - Incorrect wiring of the TEST.B output. - Short circuit of the TEST.B output - Incorrect firmware version of the peripheral device **Error correction** - Check the software version. - Check the wiring of the TEST.B output - Run a software or firmware update - Exchange the faulty device. - Inform your service agency.

Error number	Description
231-E023	**Error message** E023 CC%2 Dynamic test ID=%4 aborted: Error in B channel: test ID=%5 **Cause of error** Error during the dynamic test of the PLC periphery devices (PL, MB, UEC). No expected switch from 0 to 1 of the test output TEST.B detected. - Incorrect wiring of the TEST.B output. - Short circuit of the TEST.B output - Incorrect firmware version of the peripheral device **Error correction** - Check the software version. - Check the wiring of the TEST.B output - Run a software or firmware update - Exchange the faulty device. - Inform your service agency.
231-E024	**Error message** E024 CC%2 alarm self-test Addr:%4, Dev:%5, Actl:%6, Noml: %7 **Cause of error** The self-test detected an internal process error. **Error correction** - Inform your service agency.
231-E025	**Error message** E025 CC%2 error: self-test ErrId:%4, Par1:%5, Par2:%6, Par3: %7 **Cause of error** The self-test detected an internal process error. **Error correction** - Check the software versions - Inform your service agency.
231-E026	**Error message** E026 CC%2 Illegal MC software installed **Cause of error** An illegal software version of the MC software (autotest version) was detected. **Error correction** - Check the software versions - Inform your service agency.

Error number	Description
231-E027	**Error message** E027 CC%2 Error: Safety function STO AxGrp=%3 ErrId=%4 **Cause of error** The Safe Torque Off safety function (STO) was not complied with for the given axis group. **Error correction** - Check whether this is an aftereffect and, if so, correct its cause. - Inform your service agency.
231-E028	**Error message** E028 CC%2 MB/PLB does not respond. Device ID: %3 **Cause of error** - HSCI components with functional safety (FS) no longer responds (B channel): MB machine operating panel or PLB 6xxx - Component was separated during operation with the HSCI bus - 24 V NC power supply of the component was interrupted - The entered device ID provides information on the affected parameter: 5 = System module on PLB 62xx FS 7 = MB 6xx FS 15 = Expansion PLB (without system module) PLB 61xx FS, PLB 60xx FS 17 = Integrated PLB of the UEC controller unit - Faulty firmware of the PLB or the MB **Error correction** - Check the MB and PLB in the HSCI bus diagnosis - Save service files - Check the HSCI connections - Check the 24 V power supply of the MB and the PLB - Inform your service agency

Error number	Description
231-E029	**Error message** E029 CC%2 Test step not possible (ID=%3) **Cause of error** One of the following steps in the safety self-test is not possible in a drive system with DRIVE-CLiQ inverters due to the hardware. The safety self-test can be configured through safe machine parameters in the configuration datum with CfgSafety. **Error correction** The given ID number indicates the appropriate test that must be deactivated for a system with DRIVE-CLiQ inverters. ID = 100: Test of the brake control. Test the setting in machine parameter testNotBrakeLine. ID = 200: Cutout channel test via signals STO.A.G / STOS.A.G. Check the setting in machine parameter testNotStoGlobal. ID = 300: Cutout channel test via signals internal to the control. Test the setting in machine parameter testNotStoIntrnl. - Note: These settings must be changed only by the machine tool builder. - Inform your service agency.
231-E02A	**Error message** E02A CC%2 SKERN-CC: Response: norm. closed contact unequal A=%4, B=%5 **Cause of error** The acknowledgment signal of the normally closed contact chain PP_GenFB_NCC of the A channel does not match the signal of the B channel. **Error correction** - Check signals FB_NCC.A and FB_NCC.B - Check the wiring of the normally closed contact chain - Check the SPLC program - Inform your service agency
231-E030	**Error message** E030 CC%2 process error in safety self-test %4 **Cause of error** An internal process error has occurred during the self test: - Internal software error **Error correction** - Save the service file - Restart the control. - Inform your service agency.

Error number	Description
231-E031	**Error message** E031 CC%2 FS outputs not "0" 0-31:%4 32-63:%5 E033 CC%2 FS outputs not "0" 64-95:%4 96-127:%5 **Cause of error** - In the safety self-test, the WD.B.SPL FS outputs remain set during the watchdog test, although they were supposed to be reset. 0-31: Bit-encoded status of the FS outputs 0 to 31 31-63: Bit-encoded status of the FS outputs 32 to 63 64-95: Bit-encoded status of the FS outputs 64 to 95 96-127: Bit-encoded status of the FS outputs 96 to 127 - Short circuit of an FS output on +24 V - Hardware defective **Error correction** - Check the wiring of the FS outputs. - Exchange the hardware - Generate the service files and notify the Service Department
231-E032	**Error message** E032 CC%2 power supply unit not ready for operation **Cause of error** - In the safety self-test, the supply unit does not indicate readiness for operation - The RDY.PS signal is inactive for one of the following reasons: - No release at the X70 connector of the supply unit - Short circuit of the KDR commutation reactor - Incorrect wiring of the KDR - Hardware defective **Error correction** - Check the wiring on the connector X70 - Check the KDR wiring - Exchange the hardware - Generate the service files and notify the Service Department
231-E110	**Error message** E110 Timeout in current measurement %1 **Cause of error** - Current measuring during safety self-test exceeds the defined time **Error correction** - Internal software error - Inform your service agency

Error number	Description
231-E120	**Error message** E120 CC safe function call error **Cause of error** - Internal software error **Error correction** - Inform your service agency - Check the software version
231-E130	**Error message** E130 Test current is too small %1 **Cause of error** - The test current measured in the measurement of the current during the safety self-test is too small - The current control loop has not been adjusted - Drive enabling at PWM output is missing at the time of measurement of the current - The current sensor is defective **Error correction** - As a test, switch off the measurement of the current in CfgSafety via safe machine parameter testNotCurrent. The resulting error messages provide information on possibly faulty signals for drive enabling. - Adjust the current controller - Check the current sensor - Inform your service agency
231-E140	**Error message** E140 Mot. current %1 not equal 0 **Cause of error** - The current measured in the pulse deletion test is too great - One of the cutout channels "-AP1.x", "-SH1AB", "-AP2.x" or "-SH2.WD" is not effective **Error correction** - Check the wiring - Inform your service agency
231-E150	**Error message** E150 RDY.x status stays active %1 **Cause of error** - The measured status of the 'RDY.x' signal is active - The 'RDY.x' signal does not change to the 'inactive' ('low' level) status, although the MC is blocking the power module through a corresponding enabling signal. **Error correction** - Internal software error - Hardware defective - Inform your service agency

Error number	Description
231-E160	**Error message** E160 RDY.x status is inactive %1 **Cause of error** - The measured status of the 'RDY.x' signal is inactive - The 'RDY.x' signal does not change to the 'active' ('high' level) status, although the MC is blocking the power module through a corresponding enabling signal. **Error correction** - Internal software error - Hardware defective - Inform your service agency
231-E170	**Error message** E170 Pos. error too large %1 **Cause of error** - Defect in the mounting of the position encoder - Incorrect thermal, linear or nonlinear compensation - Excessive backlash **Error correction** - Check the parameter value (maximum position deviation between MC and CC during operation) - Check the parameter value in CfgAxisComp->linearComp-Value (linear axis error compensation for analog axes) - Check the parameter value in CfgAxis-Comp->backLashType1 (backlash compensation) - Check the mounting of the position encoder- Inform your service agency
231-E180	**Error message** E180 Z1-track amplitude too high %1 **Cause of error** - The amplitude of the Z1-track encoder signal for the speed encoder is too high - Noise on motor encoder signal - Short circuit in the motor encoder cable - Z1-track signal amplitude of motor encoder too high **Error correction** - Check the connection of the motor encoder - Check the cable of the speed encoder - Check the motor encoder - Inform your service agency

Error number	Description
231-E190	**Error message** E190 RDY.x status of axes stays active (safety relay) %1 **Cause of error** - Measured status of the '-STO.A.G' signals remain inactive during the test (high level) - The '-STO.A.G' signal does not change to the 'active' status (low level), even though the MC sets the corresponding signal status - The power stage (inverter) of at least 1 feed axis or auxiliary axis is not locked through the '-STO.A.G' signal. **Error correction** - Check the wiring - Hardware defective - Inform your service agency
231-E1A0	**Error message** E1A0 RDY.x status of axes stays inactive (safety relay) %1 **Cause of error** - Measured status of the '-STO.A.G' signals remain active during the test (high level) - The '-STO.A.G' signal does not change to the 'inactive' status (high level), even though the MC sets the corresponding signal status - The power stage (inverter) of at least 1 feed axis or auxiliary axis is locked through the '-STO.A.G' signal. **Error correction** - Check the wiring - Hardware defective - Inform your service agency
231-E1C0	**Error message** E1C0 RDY.x status of spindle stays active (safety relay) %1 **Cause of error** - Status of the '-STOS.A.G' signals remain inactive during the test (high level) - '-STOS.A.G' signal does not change to the 'active' status (low level), even though the MC assigns the corresponding signal status - The power stage (inverter) of the spindle is not locked through the '-STOS.A.G' signal. **Error correction** - Check the wiring - Hardware defective - Inform your service agency

Error number	Description
231-E1E0	**Error message** E1E0 CC%2 RDY.x status remains active (safety relay)%1 **Cause of error** - An error occurred during the watchdog test WD.A.STO of the PL 6xxxFS. A power stage (inverter) is not switched off through the -STOS.A.G or -STO.A.G signal. - Faulty or missing wiring of -STO.A.G, -STOS.A.G or X71, X72 of the power module (UV, UE) - Error in parameters of the control of X71, X72 through -STO.A.G, -STOS.A.G in SMP - Hardware defective **Error correction** - Check the wiring - Check SMP - Exchange the hardware - Generate the service files and notify the Service Department
231-E200	**Error message** E200 Timeout during emergency stop (SS1) %1 **Cause of error** - The maximum permissible braking time for stopping at the emergency braking ramp (SS1 reaction) was exceeded **Error correction** - Check the machine parameter: timeLimitStop1: Default time for stopping at the emergency braking ramp for SS1 reaction - Inform your service agency

Error number	Description
231-E220	**Error message** E220 Standstill monitoring SKERN-CC %1 **Cause of error** - SKERN-CC detected an impermissibly large axis movement in the SOS safety condition. The standstill speed, however, was not exceeded. The maximum permissible path is defined in the machine parameter MP positionRangeVmin . Possible causes: - Machine parameter "positionRangeVmin" is defined too small. - The brake was deactivated before the position controller was closed. - The brake was not activated before the position controller was opened. - When an axis was switched on, some existing following error was corrected. - The brake is defective. - There was an attempt to move an axis in the SOS condition (PLC?) **Error correction** - Check the entry in machine parameter positionRangeVmin. - Check the sequence of deactivating the brake and closing the position controller. - Check the sequence of activating the brake and opening the position controller. - Check whether there is a following error after an axis is locked. - Inform your service agency.
231-E230	**Error message** E230 Axis %1 STO safety function not fulfilled **Cause of error** The Safe Torque Off safety function (STO) was not complied with for the given axis. **Error correction** - Check whether this is an aftereffect and, if so, correct its cause. - Inform your service agency.

Error number	Description
231-E240	**Error message** E240 Axis %1 faulty braking process **Cause of error** - Axis was incorrectly braked during an SS1 reaction. Possible causes: - Adjusted delay time of the dv/dt monitoring (timeToleranceDvDt) is insufficient. An acceleration might occur after expiration of the delay time. - Drive is not optimally adjusted - Brake ramp in machine parameter motEmergencyStopRamp is not correctly adjusted **Error correction** - Check the entry in machine parameter timeToleranceDvDt - Check the adjusted braking ramp for emergency stops in machine parameter motEmergencyStopRamp - Check the velocity of the drive during the braking process with the control's internal oscilloscope - Adjust the drive. - Inform your service agency

Error number	Description
231-E250	**Error message** E250 Error in cut-out channel %1 Ch:%4 St:%5 St-2ndCh:%6 Sgn:%7 **Cause of error** An error occurred in the self-test for safety. The cut-out channel test detected a fault. Key to abbreviations: Ch (cut-out channel concerned): 1: STO.A.x 2: STO.B.x 3: STO.A.G 4: STOS.A.G St (actual condition of the cut-out channel): 0: Cut-out channel is inactive, although it is supposed to be active 1: Cut-out channel is active, although it is supposed to be inactive St-2ndCh (actual condition of the second cut-out channel): 0: Cut-out channel is inactive 1: Cut-out channel is active The second cutout channel is STO.A.x if Ch=2, and STO.B.x if Ch=1, Ch=3 and Ch=4 Sgn (cut-out signal concerned): 0: STOS.A.MC 1: STO.A.MC.WD 2: STO.A.P.x 3: STO.A.PIC 4: STO.B.CC.WD 5: STO.B.P.x 9: STO.A.T 99: no cut-out signal **Error correction** - Check the wiring (PWM cable) - Replace the defective hardware (power module, controller unit) - Inform your service agency.
231-F000	**Error message** F000 CC%2 S-function call error %1 **Cause of error** - Internal software error **Error correction** - Inform your service agency - Check the software version

Error number	Description
231-F100	**Error message** F100 No brake test was conducted %1 **Cause of error** - MC runs no test of the motor brake(s) although it is necessary according to parameter settings. - The call for testing a motor brake lasts longer than 5 seconds. **Error correction** - Inform your service agency
231-F200	**Error message** F200 No brake line test was conducted %1 **Cause of error** - MC runs no test of the motor brake line although it is necessary according to parameter settings. - The call for testing a brake line lasts longer than 10 seconds. **Error correction** - Inform your service agency
231-F300	**Error message** F300 CC%2 Cancelation of the cutout channel test %1 **Cause of error** - The switch-off test was ended automatically because the maximum permissible delay time was exceeded. - The NC did not properly finish a test section. - The NC does not perform a certain test. **Error correction** - Check whether a previous system error of the NC led to the cancelation of the test section - Check the software version - Inform your service agency
234-0001	**Error message** Insufficient memory **Cause of error** Too many clients are configured for the Ethernet transmission. **Error correction** Inform your service agency
234-0002	**Error message** HSCI Ethernet connection interrupted **Cause of error** The Ethernet transmission is disturbed. **Error correction** - Check the cabling - Inform your service agency

Error number	Description
234-0003	**Error message** HSCI Ethernet configuration without CC **Cause of error** If the HSCI is configured or connected, a CC must also be connected to the HSCI. **Error correction** - Check the cabling - Inform your service agency
234-0004	**Error message** Internal software error **Cause of error** Not enough memory for the job at hand **Error correction** Inform your service agency
234-0005	**Error message** Internal software error **Cause of error** HSCI initialization not completed **Error correction** Inform your service agency
234-0006	**Error message** Internal software error **Cause of error** High-speed inputs not initialized on the PLB 6xxx (HSCI). **Error correction** Inform your service agency
234-0007	**Error message** Fast input does not exist **Cause of error** A high-speed input on a PLB 6xxx (HSCI) adjusted in the configuration data of the control is missing. **Error correction** - Ensure that the input has been configured with IOconfig. - Please keep in mind that the input has to be of the bit data type. - Dual-channel inputs (FS) cannot be used.

Error number	Description
234-0008	**Error message** HSCI total amount of data too great **Cause of error** The number of permissible HSCI data telegrams or their total size was exceeded. **Error correction** Inform your service agency.
234-0009	**Error message** Too many HSCI telegrams **Cause of error** The maximum number of HSCI datagrams was exceeded. The IO configuration contains too many HSCI devices. **Error correction** Inform your service agency.
234-000A	**Error message** HSCI data has reached critical size. **Cause of error** The total number of HSCI data has reached a critical size. This increases the risk of transmission errors. **Error correction** - Reduce the number of HSCI components on the HSCI bus. - Inform your service agency.
234-000B	**Error message** HSCI data size too large for HSCI device **Cause of error** The permissible total data amount for an HSCI device has been exceeded. **Error correction** Inform your service agency.
234-000C	**Error message** Impermissible HSCI device detected on X501 of the MC **Cause of error** At least one HSCI device was detected on the X501 connection of the MC that is not suited for operation on this connection. **Error correction** Check the devices connected to X501. The following devices are not allowed on this connection: - CC controller units (including UECs and UMCs) - PL 6xxx FS - More than one dual-channel machine operating panel (e.g. MB 620FS, PL 6001FS)

Error number	Description
234-000D	**Error message** Error during initialization of the SPI module (MCU) **Cause of error** Could not create memory for the SPI inputs and outputs. **Error correction** Switch the control off and back on. If the error recurs, inform your service agency.
234-000E	**Error message** Maximum number of controller units exceeded **Cause of error** There are too many CC controller units connected to the HSCI bus. **Error correction** - Note the maximum number of the respective HSCI participants. Refer to the Technical Manual for your control for more information about this. - Check the HSCI configuration. - Inform your service agency.
234-000F	**Error message** Maximum number of PLB or MB exceeded **Cause of error** There are too many PLB 6xxx units or MB machine operating panels connected to the HSCI bus. **Error correction** - Note the maximum number of the respective HSCI participants. Refer to the Technical Manual for your control for more information about this. - Check the HSCI configuration. - Inform your service agency.
234-0010	**Error message** Maximum number of HSCI devices exceeded **Cause of error** Too many HSCI devices (CC + UxC + PL 6xxx + MB) were detected on the HSCI bus. **Error correction** - Note the maximum number of the respective HSCI participants. Refer to the Technical Manual for your control for more information about this. - Check the HSCI configuration. - Inform your service agency.

Error number	Description
234-0011	**Error message** HSCI handwheel configuration error **Cause of error** Too many handwheels were detected on HSCI devices, or the handwheels are not allowed for this control **Error correction** - Check the configuration and number of connected handwheels - Inform your service agency
234-0012	**Error message** HSCI touch probe configuration error **Cause of error** Too many touch probes were detected on HSCI devices, or the touch probes are not allowed for this control **Error correction** - Check the configuration and number of touch probes - Inform your service agency
234-0013	**Error message** Error while reading the HSCI information **Cause of error** An error occurred during the import of hardware information for HSCI initialization **Error correction** - Restart the control - Check the HSCI cabling - Inform your service agency
234-0014	**Error message** Fault an HSCI interface X500 of the MC **Cause of error** - Problems at the HSCI interface X500 of the MC main computer - Bad or missing HSCI connection with X500 **Error correction** - Check the connecting element at X500 of the MC - Check the HSCI cable and HSCI devices connected at X500 - Defective main computer (MC) - Inform your service agency

Error number	Description
234-0015	**Error message** Fault an HSCI interface X501 of the MC **Cause of error** - Problems at HSCI interface X501 of the main computer (MC) - Bad or missing HSCI connection with X501 **Error correction** - Check the connecting element at X501 of the MC - Check the HSCI cable and the HSCI devices connected at X501 - Defective main computer (MC) - Inform your service agency
234-0017	**Error message** HSCI data not updated **Cause of error** - HSCI data have not been updated since the last cycle - Internal software error **Error correction** - Check the HSCI connections and the power supply for HSCI devices If the error recurs: - Create service files and save them - Inform your service agency
234-0019	**Error message** Incorrect firmware version of the HSCI master component **Cause of error** The firmware version of the HSCI master FPGAs is incompatible with the installed NC software version. **Error correction** Inform your service agency.
234-001A	**Error message** HSCI telegram list too long **Cause of error** - Too many HSCI devices are connected or configured on the HSCI bus of the main computer (MC). - Main computer (MC) is defective **Error correction** - Reduce the number of devices in the HSCI configuration or HSCI bus - If the error occurs without previous change of the HSCI configuration, then the MC has a hardware error. In this case, exchange the main computer (MC). - Inform your service agency

Error number	Description
234-001C	**Error message** HSCI communication interrupted **Cause of error** During operation, an illegal change in the number of HSCI participants was found on the HSCI bus. You can find additional information on the error location in the bus diagnostics of the control or through the INTERNAL INFO soft key. **Error correction** - Check the HSCI cable connections and HSCI devices including their power supply. - Inform your service agency.
234-001D	**Error message** Error during HSCI initialization **Cause of error** Necessary memory areas could not be created during initialization of the HSCI master component. **Error correction** - Restart the control If the error recurs: - Create service files and save them - Inform your service agency
234-001E	**Error message** Initialization error of HSCI interface X500 **Cause of error** An error occurred during initialization of the interface component for the HSCI interface X500 **Error correction** - Restart the control If the error recurs: - Create service files and save them - Inform your service agency
234-001F	**Error message** Initialization error of HSCI interface X501 **Cause of error** An error occurred during initialization of the interface component for the HSCI interface X501 of the main computer (MC) **Error correction** - Restart the control If the error recurs: - Create service files and save them - Inform your service agency

Error number	Description
234-0020	**Error message** HSCI communication error **Cause of error** The received frame number of an HSCI frame does not match the expected frame number. **Error correction** If the error recurs: - Create service files and save them - Inform your service agency
234-0021	**Error message** HSCI communication error **Cause of error** The DMA from the MC memory to the HSCI master is still active when the HSCI transfer starts. Possible causes: - Internal software error - High number of "failed frames" **Error correction** If the error occurs together with a large number of failed frames, check the HSCI connections. The number of failed frames is shown in the bus diagnostics of the MC HSCI master. If the error recurs: - Create service files and save them - Inform your service agency
234-0022	**Error message** HSCI communication error **Cause of error** There has been no DMA from the MC memory to the HSCI master since the last HSCI data exchange. Possible causes: - Internal software error - High number of "failed frames" **Error correction** If the error occurs together with a large number of failed frames, check the HSCI connections. The number of failed frames is shown in the bus diagnostics of the MC HSCI master. If the error recurs: - Create service files and save them - Inform your service agency

Error number	Description
234-0024	**Error message** HSCI communication error **Cause of error** The HSCI transfer jobs were not yet completed when a new DMA transfer began from the MC memory to the HSCI master. Possible causes: - Internal software error - Too many “failed frames” **Error correction** If the error occurs together with a large number of failed frames, check the HSCI connections. The number of failed frames is shown in the bus diagnostics of the MC HSCI master. If the error recurs: - Create service files and save them - Inform your service agency
234-0025	**Error message** HSCI communication error **Cause of error** - HSCI communication error (by DMA) has occurred. **Error correction** - Create service files and save them - Inform your service agency
234-0026	**Error message** HSCI communication error **Cause of error** - HSCI communication error has occurred. **Error correction** - Create service files and save them - Inform your service agency
235-0001	**Error message** Installation error **Cause of error** The firmware file could not be opened. It was either not found or is faulty. **Error correction** Inform your machine tool builder
235-0002	**Error message** Installation error **Cause of error** The firmware file could not be opened because it is faulty. **Error correction** Inform your service agency

Error number	Description
235-0003	**Error message** Hardware error **Cause of error** Error during download of the firmware file. Either an error occurred during data transmission of the file, or the file has a wrong firmware version. **Error correction** Inform your machine tool builder
235-0004	**Error message** Hardware error **Cause of error** Timeout when downloading the firmware file. The CCU did not respond within the expected time. CCU is defective or the firmware version is incorrect. **Error correction** Inform your machine tool builder
235-0005	**Error message** Hardware error **Cause of error** Timeout during the checksum calculation. The CCU did not respond within the expected time. CCU is defective or the firmware version is incorrect. **Error correction** Inform your machine tool builder
235-0006	**Error message** Hardware error **Cause of error** Firmware checksum check failed. Incorrect CCU checksum. CCU is defective or the firmware version is incorrect. **Error correction** Inform your machine tool builder
235-0007	**Error message** Hardware error **Cause of error** Timeout after downloading the first part of the firmware. The CCU did not respond within the expected time. CCU is defective or the firmware version is incorrect. **Error correction** Inform your machine tool builder

Error number	Description
235-0008	**Error message** Hardware error **Cause of error** Timeout after downloading the second part of the firmware. The CCU did not respond within the expected time. CCU is defective or the firmware version is incorrect. **Error correction** Inform your machine tool builder
235-0009	**Error message** Hardware error **Cause of error** Timeout when checking whether the bootcode is running. The CCU did not respond within the expected time. CCU is defective or the bootcode version is incorrect. **Error correction** Inform your machine tool builder
235-000A	**Error message** Installation error **Cause of error** The bootcode file could not be opened. It was either not found or is faulty. **Error correction** Inform your machine tool builder
235-000B	**Error message** Installation error **Cause of error** The bootcode file could not be read because it is faulty. **Error correction** Inform your service agency
235-000C	**Error message** Hardware error **Cause of error** There are too many HSCI devices connected to the control. **Error correction** Remove some of the HSCI devices. Contact your machine tool builder.

Error number	Description
235-000D	**Error message** Hardware error **Cause of error** HSCI device is not running. The CCU did not respond within the expected time. CCU is defective or the firmware version is incorrect. **Error correction** Inform your machine tool builder
235-000E	**Error message** Hardware error **Cause of error** This CCU is not supported. An unknown CCU is connected to the control. **Error correction** Inform your machine tool builder
235-000F	**Error message** Hardware error **Cause of error** Timeout when checking whether the CCU runs. The CCU did not respond within the expected time. CCU is defective or the firmware version is incorrect. **Error correction** Inform your machine tool builder
235-0010	**Error message** Installation error **Cause of error** Configuration settings for CCU422 missing **Error correction** Inform your service agency
235-0011	**Error message** Installation error **Cause of error** Configuration settings for CCU422 are faulty **Error correction** Inform your service agency
235-0012	**Error message** Hardware error **Cause of error** Error during asynchronous data transfer **Error correction** Inform your machine tool builder

Error number	Description
235-0013	**Error message** Hardware error **Cause of error** Timeout during identification of the CCU software. The CCU did not respond within the expected time. CCU is defective or the firmware version is incorrect. **Error correction** Inform your machine tool builder
235-0014	**Error message** Installation error **Cause of error** Invalid initialization parameters. The configuration settings are faulty. **Error correction** Inform your service agency
235-0015	**Error message** Hardware error **Cause of error** Incompatible security ID of the mainboard and CCU. The mainboard and CCU have different security IDs. **Error correction** Inform your machine tool builder
235-0016	**Error message** Hardware error **Cause of error** Syscon Register check failed. The Syscon registers do not have the expected values. The hardware might be defective. **Error correction** Inform your machine tool builder
235-0017	**Error message** Hardware error **Cause of error** Initialization of the device failed. An error occurred during initialization of the device. **Error correction** Inform your machine tool builder

Error number	Description
235-0018	**Error message** Installation error **Cause of error** Could not open the file for writing. Faulty configuration. **Error correction** Inform your service agency
235-0019	**Error message** Installation error **Cause of error** Could not read the file configuration. Faulty configuration file. **Error correction** Inform your service agency
235-001A	**Error message** Installation error **Cause of error** Could not write the hardware.sys file. The configuration did not give a path for hardware.sys. **Error correction** Inform your service agency
235-001B	**Error message** Hardware error **Cause of error** An error occurred during device initialization. **Error correction** Inform your machine tool builder
235-001C	**Error message** Installation error **Cause of error** The mainboard was not detected. **Error correction** Inform your machine tool builder
235-001D	**Error message** Internal software error **Cause of error** Could not generate server interface **Error correction** Inform your service agency

Error number	Description
235-001E	**Error message** Internal software error **Cause of error** Creation of the interrupt service routine failed **Error correction** Inform your service agency
235-001F	**Error message** Internal software error **Cause of error** Interrupt does not exist **Error correction** Inform your service agency
235-0020	**Error message** Internal software error **Cause of error** Cannot process any further service functions for the given interrupt (max. 3) **Error correction** Inform your service agency
235-0021	**Error message** Internal software error **Cause of error** Undefined error **Error correction** Inform your service agency
235-0022	**Error message** Internal software error **Cause of error** Mainboard is not supported by the hardware server **Error correction** Inform your service agency
235-0023	**Error message** Hardware error **Cause of error** Unknown hardware configuration. The test for whether the processor system is single or dual failed. **Error correction** Inform your machine tool builder

Error number	Description
235-0024	**Error message** Installation error **Cause of error** Software for a single-processor system is running on a dual-processor system. Wrong software. **Error correction** Inform your machine tool builder
235-0025	**Error message** Hardware error **Cause of error** Reading the HIK failed. The hardware might be defective. **Error correction** Maschinenhersteller benachrichtigen
235-0026	**Error message** Hardware error **Cause of error** Reading the glue signature failed. The hardware might be defective. **Error correction** Inform your machine tool builder
235-0027	**Error message** Installation error **Cause of error** Unknown hardware. G50 identification failed. **Error correction** Inform your machine tool builder
235-0028	**Error message** Hardware error **Cause of error** There is no network card or there is an internal software error. Reading the MAC address failed. **Error correction** Inform your machine tool builder
235-0029	**Error message** Internal software error **Cause of error** There is a reading error from PCI base16 **Error correction** Inform your service agency

Error number	Description
235-002A	**Error message** Internal software error **Cause of error** There is a reading error from PCI base32 **Error correction** Inform your service agency
235-002B	**Error message** Installation error **Cause of error** This software does not support this control. Wrong hardware or hardware is defective. **Error correction** Inform your machine tool builder
235-002C	**Error message** Installation error **Cause of error** Wrong hardware. **Error correction** Inform your machine tool builder
235-002D	**Error message** Internal software error **Cause of error** Access to DPRAM failed **Error correction** Inform your service agency
235-002E	**Error message** Hardware will be simulated **Cause of error** The control could not find a CCU and therefore switched into the simulation mode. **Error correction** - Check the CCU - Check the connection to the CCU
235-002F	**Error message** PROFIBUS/PROFINET: Hardware error **Cause of error** The TNC cannot address the PROFIBUS/PROFINET interface. The interface is defective or incompatible with the TNC. **Error correction** Inform your service agency

Error number	Description
235-0030	**Error message** Firmware on ProfiNet interface is faulty or missing **Cause of error** The ProfiNet interface does not have any firmware. **Error correction** Inform your machine tool builder
235-0031	**Error message** Firmware inspection on ProfiNet interface failed **Cause of error** The TNC cannot open the firmware file for the ProfiNet interface. **Error correction** Inform your machine tool builder
235-0032	**Error message** Firmware update on ProfiNet interface failed **Cause of error** The TNC cannot read the firmware file for the ProfiNet interface. **Error correction** Inform your machine tool builder
235-0033	**Error message** Error in firmware file for ProfiNet interface **Cause of error** The TNC found a checksum error in the firmware file for the ProfiNet interface. **Error correction** Inform your service agency
235-0034	**Error message** Firmware update on ProfiNet interface failed **Cause of error** Error during the firmware update on the ProfiNet interface. **Error correction** Inform your machine tool builder

Error number	Description
235-0035	**Error message** ProfiNet: Hardware error **Cause of error** The TNC cannot configure the ProfiNet interface. Possible causes: - The configuration data for the ProfiNet interface are incomplete or incorrect. - The firmware of the ProfiNet interface is not compatible with the control software. **Error correction** Inform your machine tool builder
235-0036	**Error message** ProfiNet: Hardware error **Cause of error** The firmware of the ProfiNet interface is not compatible with TNC. **Error correction** Inform your machine tool builder
235-0037	**Error message** Initialization of ProfiNet interface failed **Cause of error** The TNC cannot read a ProfiNet project file. **Error correction** Inform your machine tool builder
235-0038	**Error message** Initialization of ProfiNet interface failed **Cause of error** The ProfiNet interface requests unavailable project files from the TNC. **Error correction** Inform your machine tool builder
235-0039	**Error message** CBE cannot be started **Cause of error** Unsuccessful start of the ProfiNet interface CBE30. **Error correction** Inform your machine tool builder

Error number	Description
235-003A	**Error message** Error in memory locking **Cause of error** Required memory could not be reserved. **Error correction** Inform your service agency
235-003B	**Error message** Firmware update not possible **Cause of error** Internal error during firmware update! **Error correction** Inform your machine tool builder
235-003C	**Error message** Version information missing in firmware file **Cause of error** No version information was found in a firmware file. **Error correction** Inform your machine tool builder
235-003D	**Error message** Firmware could not be started **Cause of error** Unsuccessful device firmware start. **Error correction** Inform your machine tool builder
235-003E	**Error message** Error in the hardware configuration **Cause of error** An error was found in the hardware configuration. **Error correction** Inform your machine tool builder
235-003F	**Error message** Error in ProfiNet communication **Cause of error** An error occurred during communication with a unit on the ProfiNet bus. **Error correction** - Check all devices and connections - Contact your machine tool builder

Error number	Description
235-0040	**Error message** No access to the configuration **Cause of error** Required configuration data could not be requested from configuration server. **Error correction** Inform your service agency
235-0041	**Error message** No access to event server **Cause of error** Failed access to event server. **Error correction** Inform your service agency
235-0042	**Error message** CC controller unit cannot be started **Cause of error** A CC controller unit cannot be started or the firmware could not be correctly transferred. **Error correction** - CC controller unit - Contact your machine tool builder
235-0043	**Error message** HSCI watchdog could not be deleted **Cause of error** The HSCI watchdog could not be deleted. **Error correction** Inform your service agency
235-0044	**Error message** Error in HSCI communication **Cause of error** An error occurred during communication with a unit on the HSCI bus. **Error correction** - Check all devices and connections - Inform your service agency

Error number	Description
235-0045	**Error message** HSCI connection error **Cause of error** A connection error was found on the HSCI bus. **Error correction** - Check all devices and connections - Check the connector sequence of the HSCI cable (X500 -> X502 or X501 -> X502) - Inform your service agency.
235-0046	**Error message** Error in detection of CC controller unit **Cause of error** An error occurred during detection of the connected CC controller unit. **Error correction** Inform your service agency
235-0047	**Error message** Error in message from CC **Cause of error** Erroneous information was received from a CC. **Error correction** Inform your service agency
235-0048	**Error message** Error in message from PL module **Cause of error** Erroneous information was received from a PL module. **Error correction** Inform your service agency
235-0049	**Error message** PL error **Cause of error** A PL module has reported an error. **Error correction** Inform your service agency
235-004A	**Error message** Software versions of PL module and MC do not match **Cause of error** The software versions of the PL module and the MC computer unit do not match. **Error correction** Inform your machine tool builder

Error number	Description
235-004B	**Error message** PL module could not be started **Cause of error** PL program could not be started. **Error correction** - Check the PL module - Inform your service agency
235-004C	**Error message** PL: No bus model found **Cause of error** No bus module was found in a PL module. **Error correction** - Check the PL module - Inform your service agency
235-004D	**Error message** Unknown PL software **Cause of error** A PL module has unknown software. **Error correction** - Check the PL module - Inform your service agency
235-004E	**Error message** Too many slots on PL module **Cause of error** A PL module has more slots than allowed. **Error correction** - Check the PL module - Inform your service agency
235-004F	**Error message** Error in identification of the hardware **Cause of error** A hardware unit could not be properly identified. **Error correction** Inform your service agency
235-0050	**Error message** Hardware not found **Cause of error** A required hardware unit was not found. **Error correction** - Check all devices and connections - Inform your service agency

Error number	Description
235-0051	**Error message** Error in communication with SPI module **Cause of error** An error occurred during communication with an SPI module. **Error correction** Inform your service agency
235-0052	**Error message** Error in a file operation **Cause of error** A file operation has failed. **Error correction** Inform your service agency
235-0053	**Error message** Error during hardware detection **Cause of error** Error during hardware detection **Error correction** Inform your service agency
235-0054	**Error message** Access of non-supported hardware **Cause of error** A connected hardware unit is not supported by the software in use. **Error correction** Inform your machine tool builder
235-0055	**Error message** Firmware update required (%1) **Cause of error** A firmware update is required on an assembly. The assembly concerned is indicated in the additional information. **Error correction** This firmware update requires a confirmation by the user. Note the following messages.

Error number	Description
235-0056	**Error message** Firmware update required (%1) **Cause of error** A firmware update is required on an assembly. The assembly concerned is indicated in the additional information. **Error correction** - Shut down the control software. - Manually start the firmware update on the HeROS console.
235-0057	**Error message** Firmware update is running (%1) **Cause of error** At present the control is updating the firmware on an assembly. The assembly concerned is indicated in the additional information. **Error correction** Wait until the firmware update has been completed. Note the following messages.
235-0058	**Error message** Firmware update has been completed (%1) **Cause of error** The firmware update was completed successfully. The assembly concerned is indicated in the additional information. **Error correction**
235-0059	**Error message** Firmware update failed (%1) **Cause of error** The firmware update has failed. The assembly concerned is indicated in the additional information. **Error correction** - Note further error messages. - Eliminate the cause of error. - Shut down the control and restart. The firmware update will be repeated automatically the next time the control is started.

Error number	Description
235-005A	**Error message** Firmware update failed (%1) **Cause of error** The firmware update has failed. The assembly concerned is indicated in the additional information. **Error correction** The assembly might now no longer be usable. Inform your service agency.
235-005B	**Error message** Control software shutdown delayed **Cause of error** At present the control software cannot be shut down because a firmware update is in progress. **Error correction** Wait until the firmware update has been completed. The control software then shuts down automatically.
235-0060	**Error message** Not enough main memory (RAM) **Cause of error** There is not enough working memory (RAM) on the MC to operate the control. **Error correction** Inform your service agency
235-0061	**Error message** Incompatible peripheral device (%1) **Cause of error** A peripheral device is incompatible with this control software and they cannot be operated together. The device concerned is indicated in the additional information. **Error correction** - Exchange the device - Inform your service agency

Error number	Description
235-0062	**Error message** Unknown device on HSCI bus (%1) **Cause of error** The NC software identifies every connected device by means of a device table. The table indicates whether the device is supported by the software version installed on the control. A device that the software does not support or that is not yet entered in the device table is connected to the HSCI bus. The device concerned is indicated in the additional information. The device table might have been overwritten by installing an update that was generated by an older software version. **Error correction** - Inform your service agency. - Update the NC software if the device is not supported by the currently installed version of the NC software. - Update the device table. The installed software might be able to control a new device that is not yet listed in the device table. In this case the device table must be updated.
235-0063	**Error message** Unknown device on the ProfiNet interface (%1) **Cause of error** The NC software identifies every connected devices by means of a device table. The table indicates whether the device is supported by the software version installed on the control. A device that the software does not support or that is not yet entered in the device table is connected over the ProfiNet interface. The device concerned is indicated in the additional information. **Error correction** - Inform your service agency - Run an update of the NC software if the device is not supported by the currently installed version of NC software. - Update the device table. A new device that is not yet listed in the device table might be supported by the installed software. In this case an update of the device table is required.

Error number	Description
235-0064	**Error message** Unknown device on the DriveCLiQ interface (%1) **Cause of error** The NC software identifies every connected devices by means of a device table. The table indicates whether the device is supported by the software version installed on the control. A device that the software does not support or that is not yet entered in the device table is connected over the DriveCLiQ interface. The device concerned is indicated in the additional information. **Error correction** - Inform your service agency - Run an update of the NC software if the device is not supported by the currently installed version of NC software. - Update the device table. A new device that is not yet listed in the device table might be supported by the installed software. In this case an update of the device table is required.
235-0065	**Error message** Device table is faulty **Cause of error** The device table is incorrect or cannot be used by the control. **Error correction** Inform your service agency.
235-0066	**Error message** Device (%1) reports error: %2 **Cause of error** A device connected with the control has an error. The device concerned is indicated in the additional information. Possible causes: - The device code programmed on the device is incorrect. - The device's firmware is not compatible with the control software. - The device is defective. **Error correction** Inform your machine tool builder.

Error number	Description
235-0067	**Error message** Error on device (%1) **Cause of error** An error has occurred on a device connected with the control. The device concerned is indicated in the additional information. Possible causes: - The device code programmed on the device is incorrect. - The device's firmware is not compatible with the control software. - The device is defective. **Error correction** Inform your machine tool builder.
235-0068	**Error message** Exchange the peripheral device (%1) **Cause of error** During startup it was discovered that a hardware component connected to the control is not compatible with the current level of the NC software. The device concerned is indicated in the additional information. A required update of the device's firmware is not possible. HEIDENHAIN recommends exchanging the component as soon as possible. **Error correction** Contact your service agency.
235-0069	**Error message** PROFINET: Protocol error PROFINET: Protocol error **Cause of error** A PROFINET end device has transmitted data to the control that the control cannot interpret. It could be that the version of the PROFINET protocol used by the PROFINET end device is not supported by the TNC, The PROFINET end device concerned is indicated in the additional information. **Error correction** Inform your service agency.

Error number	Description
235-006A	**Error message** Error in communication with the PROFINET controller Error in communication with the PROFINET controller **Cause of error** An error occurred in the communication between the control and the PROFINET controller. **Error correction** Inform your service agency.
235-006B	**Error message** IOC file not configured IOC file not configured **Cause of error** No file name was given for the IOC file. **Error correction** Configure the file name IOC file
235-006C	**Error message** Error in IOC file **Cause of error** There is an error in the IOC file. The additional information provides more data. **Error correction** - Check and correct the IOC file with the PC software IOconfig. - Inform your service agency.
235-006D	**Error message** Insufficient or faulty command parameters **Cause of error** A command with faulty or insufficient parameters was transferred to the part of the NC software responsible for the control of the hardware components. **Error correction** - Check the parameters - Inform your service agency.
235-006E	**Error message** IOC file cannot be opened **Cause of error** The IOC file could not be opened. The file name is indicated in the additional information. **Error correction** Check the configuration of the IOC file name.

Error number	Description
235-006F	**Error message** IOC file format error **Cause of error** Control cannot interpret the IOC file. The file format is faulty or unknown. **Error correction** Check the IOC file with the PC software IOconfig.
235-0070	**Error message** Incorrect format version of the IOC file **Cause of error** The IOC file cannot be processed because it is in the wrong format version. Minimum required format version: - PROFIBUS: IOC-V2 - AS-i: IOC-V2 - HSCI: IOC-V3 - PROFINET: IOC-V4 **Error correction** Check the IOC file and provide the correct format version.
235-0071	**Error message** IOC file: No PROFINET controller is configured **Cause of error** The PROFINET controller cannot be configured because there is no data for it in the IOC file. **Error correction** Use the PC software IOconfig to configure the PROFINET controller.
235-0072	**Error message** PROFINET: Too many devices configured **Cause of error** More PROFINET devices were configured than allowed. **Error correction** - Observe the additional information. - Reduce the number of configured devices.
235-0073	**Error message** PROFINET: project setup error **Cause of error** The configuration of the PROFINET topology is faulty. **Error correction** - Observe the additional information. - Correct the IOC file.

Error number	Description
235-0074	**Error message** PROFINET: Process data memory is insufficient **Cause of error** The maximum size of the process data for PROFINET devices has been exceeded. **Error correction** Reduce the number of PROFINET end devices or the connected modules.
235-0075	**Error message** PROFINET: No common RT class supported **Cause of error** A PROFINET end device cannot be activated by the control because the control and the end device have no common RT class. The device concerned is indicated in the additional information. **Error correction** Configure the PROFINET end device that can be operated with RT class 1.
235-0076	**Error message** PROFINET interface not activated **Cause of error** The control cannot activate the PROFINET interface because there is an error. **Error correction** - Note further messages. - Eliminate the cause of error. - Shut the control down and restart it.
235-0077	**Error message** HSCI cabling error: Controller connected to X501 **Cause of error** At least one controller unit (CC, UEC, UMC) was connected via HSCI to X501 of the MC. However, controller units must be connected to X500 of the MC. **Error correction** - Check the HSCI cabling - Connect all controller units (CC, UEC, UMC) an X500 of the MC - If the problem continues, please generate a service file and inform your service agency

Error number	Description
235-0078	**Error message** HSCI cabling error: Too many devices on X501 **Cause of error** There are too many HSCI components connected to X501 of the MC **Error correction** - Check the HSCI cabling. - Use the default values of your control's Technical Manual for the maximum number of HSCI components. - Check the HSCI configuration. It may be possible to connect HSCI components to the X500 connector of the MC. - Generate the service files and inform your service agency.
235-0079	**Error message** No contact to ProfiNet terminal **Cause of error** Interrupted communication between the control and a ProfiNet terminal. **Error correction** Check the hardware setup, the IOC file and the options set. You can find more information in the PROFINET diagnostics.
235-007A	**Error message** Faulty module configuration on ProfiNet terminal **Cause of error** The ACTUAL and NOMINAL configuration do not match on a ProfiNet terminal: - A module is configured, but it has not be plugged into the device. - A different module is configured than is plugged into the device. **Error correction** Check the hardware setup, the IOC file and the options set. You can find more information in the PROFINET diagnostics.

Error number	Description
235-007B	**Error message** Unknown device on SPI bus (%1) **Cause of error** The NC software identifies every connected devices by means of a device table. The table indicates whether the device is supported by the software version installed on the control. A device that the software does not support or that is not yet entered in the device table is connected with the SPI bus. The device concerned is indicated in the additional information. **Error correction** - Inform your service agency. - Run an update of the NC software if the device is not supported by the currently installed version of NC software. - Update the device table. A new device that is not yet listed in the device table might be supported by the installed software. In this case an update of the device table is required.
235-007C	**Error message** Error during read-in of the machine configuration data **Cause of error** The file(s) of the machine configuration or machine parameters cannot be read. It is either missing or damaged. **Error correction** - Start control as a programming station - Check the file(s) of the machine configuration (machine parameters) and, if required, recreate or correct them - Inform your service agency
235-007D	**Error message** PLCE partition has not yet been formatted **Cause of error** The encrypted PLCE partition has not yet been formatted. **Error correction** - Start the PLCE setup dialog - Enter an encryption password - Format the PLCE partition

Error number	Description
235-007E	**Error message** Encryption password for PLCE partition incorrect **Cause of error** The PLCE partition could not be integrated because the encryption password is incorrect or the partition is not yet formatted. **Error correction** - Start the PLCE setup dialog. - Enter the correct encryption password. - Include the partition. or - Enter a new encryption password. - Format the PLCE partition. - Include the partition.
235-007F	**Error message** PLCE partition cannot be integrated **Cause of error** The PLCE partition is already being used at present and therefore cannot be included. **Error correction** - Manually enable the PLCE partition or - Reboot the control
235-0080	**Error message** No password available for PLCE partition **Cause of error** An existing PLCE partition cannot be integrated for the following reasons: - Failure to read the password from the SIK. - Nor is the password available anywhere else. **Error correction** Ensure that the correct SIK is inserted in the MC.
235-0081	**Error message** Machine configuration file (.mcg) %1 is faulty **Cause of error** There is an error in the machine configuration. You will find more detailed information on the error in the additional information. **Error correction** Inform your service agency.

Error number	Description
235-0083	**Error message** Error during import of the machine configuration file (.mcg) %1 **Cause of error** The machine configuration file (.mcg) cannot be imported. You will find more detailed information on the error in the additional information. **Error correction** - Check the configuration datum CfgPlcPath.compCfgFile. - Inform your service agency.
235-0085	**Error message** Topology error in IOC file **Cause of error** The options set in the machine configuration do not match those in the IOC file. You will find more detailed information on the error in the additional information. **Error correction** - Check the options set in the machine configuration and in the IOC file. - Inform your service agency.
235-0086	**Error message** Supervisor takes over control of PROFINET terminal **Cause of error** A supervisor has taken control of a PROFINET terminal connected to the control. The machine cannot be switched back on until the supervisor has returned control. **Error correction** - Tell the supervisor to return control to the NC control - Acknowledge the error - Switch on the machine - You can find more information in the PROFINET diagnostics
235-0087	**Error message** NC software not supported by hardware **Cause of error** – The presently installed NC software version is not supported by this control hardware. - The MC main computer offers too little computing power to support all functions of the installed software. **Error correction** - Check the combination of NC software and control hardware – Inform your service agency

Error number	Description
235-0088	**Error message** Illegal parallel connection of two power modules **Cause of error** - Two different power modules were connected parallel through an adapter. - Only power modules of the same type can be connected in parallel. - The affected devices are shown in the additional information. **Error correction** - Check the connection of the power modules and correct it. - Inform your service agency.
235-008A	**Error message** Not possible to switch the HSCI data rate **Cause of error** The HSCI data rate of 1 Gbit/s was preset in the configuration datum MP_dataRateHsci in CfgHardware. However, the HSCI system cannot be operated with this data rate because - no HSCI device was connected, or - at least one connected HSCI device is not suited for a 1 Gbit/s data rate. **Error correction** Check the connected HSCI devices for suitability for a 1 Gbit/s data rate. In the configuration datum MP_dataRateHsci in CfgHardware, select the data rate 100 Mbit/s or “as fast as possible.”
235-008B	**Error message** Switchover of HSCI data rate has failed **Cause of error** The HSCI data rate of 1 Gbit/s was preset in the configuration datum MP_dataRateHsci in CfgHardware. However, the HSCI system could not be switched to the 1 Gbit/s data rate. There might be connecting cables in the HSCI system that are not made for this data rate. **Error correction** Check the HSCI cable for suitability for the 1 Gbit/s data rate. In the configuration datum MP_dataRateHsci in CfgHardware, select the data rate 100 Mbit/s or “as fast as possible.”

Error number	Description
235-008C	**Error message** Configure the HSCI data rate to 100 Mbit **Cause of error** In the configuration datum MP_dataRateHsci in CfgHardware, the HSCI data rate “as fast as possible” was selected. The control found that all connected HSCI are suited for the 1 Gbit/s data rate, but there is at least one cable in the HSCI system that is not suited for this data rate. Because of this hardware configuration, system startup is delayed. **Error correction** To speed up the system startup, do the following: In the configuration datum MP_dataRateHsci in CfgHardware, select the data rate 100 Mbit/s or check the HSCI cable for suitability for the 1 Gbit/s data rate.
235-008D	**Error message** Required HSCI data rate cannot be attained **Cause of error** There is at least one device in the HSCI system that requires a data rate of 1 Gbit/s for operation. However, this data rate cannot be set because at least one further device in the HSCI system is not suited for a data rate of 1 Gbit/s. **Error correction** Check all HSCI devices for suitability for a 1 Gbit/s data rate.
235-008E	**Error message** Required HSCI data rate cannot be attained. **Cause of error** There is at least one device in the HSCI system that requires a data rate of 1 Gbit/s for operation. However, this data rate cannot be set because at least one connecting cable in the HSCI system is not suited for a data rate of 1 Gbit/s. **Error correction** Check the HSCI connecting cable for suitability for a data rate of 1 Gbits.
235-008F	**Error message** HSCI data rate of 1 Gbit/s is required **Cause of error** The HSCI data rate of 100 Mbit/s was preset in the configuration datum MP_dataRateHsci in CfgHardware. - However, at least one connected HSCI device requires a 1 Gbit/s data rate for operation. **Error correction** In the configuration datum MP_dataRateHsci in CfgHardware, select the 1 Gbit/s setting or “as fast as possible.”

Error number	Description
235-0090	**Error message** No original HEIDENHAIN driver software **Cause of error** Software for the operation of devices of a third manufacturer has been loaded via IOconfig to the control. It is not original HEIDENHAIN software. This software is not activated. **Error correction** - Use only original HEIDENHAIN software. - Inform your service agency.
235-0091	**Error message** Driver software cannot be activated **Cause of error** Software for the operation of devices of a third manufacturer was transferred via IOconfig to the controller. Due to an error, this software cannot be activated. **Error correction** - Note the additional information - Inform your service agency
235-0092	**Error message** Not enough memory on periphery hardware (%1) **Cause of error** Since not enough memory is available on a device, that device cannot be run with this control software. The device concerned is indicated in the additional information. **Error correction** - Exchange device - Inform your service agency
235-0093	**Error message** Identification requested over PROFINET **Cause of error** A participant in a PROFINET network, usually a programming device, is demanding that the control identify itself. **Error correction**
235-0094	**Error message** Error while initializing the device %2, SN: %4 **Cause of error** The device %2 (ID number %3, serial number %4, path %1) could not be initialized. **Error correction** Inform your service agency

Error number	Description
235-0095	**Error message** Excessive propagation time in HSCI system **Cause of error** Too many HSCI participants are connected to the HSCI bus, or the total length of the HSCI cables is too long. **Error correction** - Reduce the number of HSCI participants - Use shorter HSCI cables
235-0096	**Error message** Error while evaluating a filter condition in the IOCP file **Cause of error** DEFINE missing in the MCG file. Faulty filter condition in the IOCP file. The incorrectly evaluated condition is shown in the additional data. The name of the MCG file is shown in the additional data. **Error correction** - Check the MCG file and correct it if necessary - Check the filter condition in the IOCP file and correct it if necessary
235-0097	**Error message** IOC options defined more than once **Cause of error** IOC options are defined twice in the configuration or in the MCG file. **Error correction** Correct the configuration: remove the superfluous IOC options
235-0098	**Error message** Empty IOC option defined **Cause of error** An empty IOC option is defined in the configuration or in the MCG file. **Error correction** Correct the configuration: remove the empty IOC option

Error number	Description
236-A001	**Error message** Command cannot be run **Cause of error** The ProfiNet software module cannot run a command. Possible causes: - The addressed ProfiNet end device is in a condition that prevents execution of the command. - The addressed ProfiNet end device does not exist or is not available. - The command code unknown **Error correction** Inform your service agency
236-A002	**Error message** Error during read-in of ProfiNet configuration data **Cause of error** The ProfiNet software module cannot read its configuration data. **Error correction** Check the configuration data and restart the control.
236-A003	**Error message** Initialization of ProfiNet interface failed **Cause of error** An error occurred during device initialization of the ProfiNet interface. Possible causes: - The TNC cannot speak to the ProfiNet interface. - The firmware of the ProfiNet interface is not compatible with the control software. - The configuration data for the ProfiNet interface are incorrect. **Error correction** Inform your machine tool builder.
236-A004	**Error message** Change of operating mode in ProfiNet interface failed **Cause of error** The ProfiNet interface failed to switch between the asynchronous and cyclic operating modes. Possible cause: Internal error on the ProfiNet interface **Error correction** Inform your machine tool builder

Error number	Description
236-A005	**Error message** ProfiNet: Assignment of drives incorrectly configured **Cause of error** Inconsistent assignment of the drives connected over ProfiNet with the axes managed by the TNC. The configuration data under System/ProfiNet/ParameterSets are incomplete. **Error correction** Check the configuration.
236-A006	**Error message** ProfiNet: Error during assignment of drives **Cause of error** The TNC cannot assign an axis to a drive connected over ProfiNet. Possible causes: - The configuration data under ProfiNet/ParameterSets are incorrect. - There is a fault in a drive. **Error correction** Remove the cause of error and acknowledge the error message
236-A007	**Error message** Watchdog error on the ProfiNet interface **Cause of error** The ProfiNet interface does not react to signals from the MC. Possible cause: ProfiNet interface is defective **Error correction** Inform your machine tool builder
236-A101	**Error message** No contact to ProfiNet end device %1 **Cause of error** The ProfiNet end device does not respond. Possible causes: - Error in project setup - Inconsistent configuration of the ProfiNet end device name - Interrupted connection between TNC and ProfiNet end device - There is a fault in the ProfiNet end device. **Error correction** Check the ProfiNet topology and project setup. Acknowledge the error.

Error number	Description
236-A102	**Error message** Error during access to ProfiNet end device %1 **Cause of error** The TNC cannot initialize the ProfiNet end device. **Error correction** Acknowledge the error
236-A103	**Error message** Contact lost to ProfiNet end device %1 **Cause of error** Interrupted communication between TNC and a ProfiNet end device. Possible causes: - The end device was separated from the control. - There is a fault in the end device. **Error correction** Check the ProfiNet end device. Acknowledge the error
236-A104	**Error message** Error during access to ProfiNet end device %1 **Cause of error** An error occurred during initialization of the ProfiNet end device. The TNC cannot find any configuration data for a slot on the end device, or the data are erroneous. **Error correction** Check the configuration data under System/ProfiNet/Slots. Acknowledge the error
236-A121	**Error message** Error during access to ProfiNet end device %1 **Cause of error** An error occurred during initialization of the ProfiNet end device. The TNC cannot access the configuration data of the ProfiNet end device. **Error correction** Check the configuration and acknowledge the error
236-A122	**Error message** Error during access to ProfiNet end device %1 **Cause of error** An error occurred during initialization of the ProfiNet end device. The ProfiNet end device does not support the TNC-compatible version of the ProfiDrive profile. **Error correction** Check the configuration and acknowledge the error

Error number	Description
236-A123	**Error message** Error during access to ProfiNet end device %1 **Cause of error** An error occurred during initialization of the ProfiNet end device. There are more drive objects logged in on the ProfiNet end device for cyclic data exchange with the TNC as on the ProfiNet interface. **Error correction** Check the ProfiNet project setup and acknowledge the error
236-A201	**Error message** ProfiNet: Error while initializing the drive %1 **Cause of error** The TNC cannot initialize the drive. There are no correct configuration data for this drive. **Error correction** Check Configuration data and system/ProfiNet/Slots as well as the telegram project data. Acknowledge the error
236-A202	**Error message** ProfiNet: Error while initializing the drive %1 **Cause of error** The TNC cannot initialize the drive. Possible causes: - The TNC cannot access the configuration data of the drive. - The type of drive is not supported by the TNC or is configured incorrectly on the TNC. - The TNC and drive have different telegram types configured for cyclic data exchange. - The TNC cannot access the buffer memory for fault messages. - The TNC cannot access the buffer memory for warnings. **Error correction** Check the project setup data and acknowledge the error
236-A203	**Error message** ProfiNet: Drive %1 does not react **Cause of error** The drive does not react to the control signals of the TNC. There is a fault in the drive. **Error correction** Eliminate the cause and acknowledge the error

Error number	Description
236-A204	**Error message** ProfiNet: Drive %1 does not react **Cause of error** The drive does not react. Possible causes: - The connection between the TNC and drive was interrupted. - There is a fault in the drive. **Error correction** Eliminate the cause and acknowledge the error
236-A211	**Error message** ProfiNet: Drive %1 reports a fault **Cause of error** The drive reports a fault. Watch further messages for more detailed information on the type of fault. **Error correction** Eliminate the cause and acknowledge the error
236-A212	**Error message** ProfiNet: Drive %1 reports error code %2 **Cause of error** The drive reports a fault. **Error correction** Remove the cause of error and acknowledge the message.
236-A213	**Error message** ProfiNet: Drive %1 reports warning code %2 **Cause of error** The drive is sending a warning. **Error correction** Remove the cause and acknowledge the message.
236-A221	**Error message** ProfiNet: Drive %1 cannot be switched on **Cause of error** The TNC cannot switch on the drive. Possible cause: There is a fault in the drive. **Error correction** Eliminate the cause, acknowledge the error, and switch on again.

Error number	Description
236-A222	**Error message** Error during parameter set switchover to drive %1 **Cause of error** An error occurred during a parameter set switchover on the drive. Possible cause: There is a fault in the drive. **Error correction** Eliminate the cause, acknowledge the error, and switch on again.
236-A301	**Error message** Error when homing the axis %2 **Cause of error** The TNC cannot home the axis. Possible cause: There is a fault in the drive. **Error correction** Eliminate the cause and acknowledge the error.
236-A302	**Error message** Probe failed: Axis %2 **Cause of error** An error occurred during the probing process. Possible cause: There is a fault in the drive. **Error correction** Eliminate the cause and acknowledge the error.
236-A401	**Error message** Faulty motor encoder (drive/encoder: %1) **Cause of error** The drive encoder reports an error. The error code is provided in the additional information. **Error correction** Eliminate the cause and acknowledge the error.
236-A402	**Error message** Motor encoder (drive/encoder: %1) does not react **Cause of error** The encoder does not react to the control signals of the TNC. Possible causes: - The connection between the TNC and drive was interrupted. - There is a fault in the drive controller. **Error correction** Eliminate the cause and acknowledge the error.

Error number	Description
236-A403	**Error message** Data transfer over PROFINET was interrupted **Cause of error** The PROFINET controller did not complete the process data transfer in time. **Error correction** Inform your service agency.
237-10001	**Error message** 10001 CC%2 Alarm for software test **Cause of error** - In the automatic software test an alarm was released **Error correction** - Inform your service agency
237-10003	**Error message** 10003 CC%2 System error in error memory management %4 %5 **Cause of error** - Control was not properly shut down - Hardware problem **Error correction** - Shut down the control, the switch it off and on. - Inform your service agency
237-10004	**Error message** 10004 CC%2 Active drive during switch-off process **Cause of error** - A drive was still in the feedback loop during the switch-off process - A drive was switched on during the switch-off process **Error correction** - Check the PLC program - Inform your service agency

Error number	Description
237-10005	**Error message** 10005 Drive switch-off error code: %4 **Cause of error** - Switch-off due to an external emergency stop signal - Error code: 1 = Signal -ES.A (emergency stop input on PL, MB) 2 = Signal -ES.A.HW (emergency stop input of the handwheel) 3 = Signal -ES.B (emergency stop input on PL, MB) 4 = Signal -ES.B.HW (emergency stop input of the handwheel) Further error codes: internal code **Error correction** - Check additional information from alarm message 0x10005. - Check the position of the emergency stop switch. - Inform your service agency.
237-10006	**Error message** 10006 CC%2 SPLC-RTS status change=%4, new=%5 **Cause of error** **Error correction**
237-10007	**Error message** 10007 CC%2 Follow condition for AxGrp=%4, CC=%5, MC=%6, Cause=%7 **Cause of error** - **Error correction** -

Error number	Description
237-10008	**Error message** 10008 Error in data format of ASCII command, alarm code %4 **Cause of error** - The CC controller has detected a syntax error in a transmitted ASCII command. - The faulty command was either sent by the commissioning tool TNCopt, or - the syntax of the compensation file in machine parameter compTorqueRipple is faulty. The results of adjustments through TNCopt are saved in the compensation file. **Error correction** - If TNCopt was used, repeat the affected measurement with TNCopt. - Deactivate syntax monitoring for ASCII commands with MiscCtrlFunctions bit 7 = 1. - Deactivate the compensation file in the parameter compTorqueRipple. - Inform your service agency.
237-10009	**Error message** 10009 CC%2 Follow condition for genSafe Id=%4, timer=%5, %6, %7 **Cause of error** **Error correction**
237-1000A	**Error message** 1000A CC%2 SS2 Request of IO device DeviceVariant=%4, count=%5 **Cause of error** **Error correction**
237-1000B	**Error message** 1000B CC%2 Force the S status bit - bit=%4, mode=%5 **Cause of error** **Error correction**
237-1000C	**Error message** 1000C CC%2 axis group: stop=%4 cause=%5 axis group=%6 condition=%7 **Cause of error** **Error correction**

Error number	Description
237-1000E	**Error message** 1000E CC%2 file access action=%4, %5, %6 **Cause of error** Error when accessing file Additional info 0: Action 2: Open 4: Write 5: Read 6: Delete 7: Rename 8: Directory 103: Close 250: ASYNC interface was not enabled 251: Waiting for ASYNC acknowledge from MC 252: The MC hasn't sent any hcFILE_IO (acknowledge) 253: The MC hasn't sent any ASYNC telegram 300: Not allowed during an interrupt 301: File header is corrupt Additional info 1, 2: MC error message **Error correction** - Inform your service agency
237-10010	**Error message** 10010 CC%2 ACC parameter ID=%4 Info1=%5 **Cause of error** There is an error in the ACC parameter file: - This file was created with a wrong version of TNCopt - The file contains invalid parameter data **Error correction** - Use TNCopt to generate a new ACC parameter file - Check the software version. ID=1 Option missing ID=2 Invalid axis entry ID=10 Use is possible only on hardware with limited number of axes ID=300 Missing acceleration feedforward control (MP2600) ID=301 Motor's mass moment of inertia is missing from the motor table ID=302 Constant for torque calculation is missing from the motor table - Inform your service agency

Error number	Description
237-10011	**Error message** 10011 Syntax in %4 in line %5 in column %6 **Cause of error** - Syntax error in displayed file. - Function is not supported in the displayed file with this software version **Error correction** - Check the syntax in the displayed file - Use TNCopt to regenerate the displayed file - Use appropriate machine parameters to deactivate the function - Inform your service agency
237-10013	**Error message** 10013 NOD input in %4 in line %5 is incorrect **Cause of error** - Syntax error in displayed file. - Function is not supported in the displayed file with this software version **Error correction** - The maximum number of nodes was exceeded. - Reduce the number of nodes (NOD) - Use TNCopt to regenerate the displayed file - Use appropriate machine parameters to deactivate the function - Inform your service agency
237-10014	**Error message** 10014 Invalid axis in %4 in line %5 (SAX) **Cause of error** - Syntax error in displayed file. - Axis coupling not permissible or not possible **Error correction** - Axis coupling (SAX) is not possible because the axis is on another board - Axis coupling (SAX) is not possible because the axis is deselected - Use appropriate machine parameters to deactivate the function - Use TNCopt to regenerate the displayed file - Inform your service agency

Error number	Description
237-10015	**Error message** 10015 Compensation point errors in %4 in line %5 **Cause of error** - Syntax error in the displayed file - Compensation point (NODE) not defined **Error correction** - Too many compensation points (NODx) in defined in the displayed file - Use TNCopt to regenerate the displayed file - Use appropriate machine parameters to deactivate the function - Inform your service agency
237-10016	**Error message** 10016 Max. number of blocks in %4 exceeded **Cause of error** - Syntax error in the displayed file - Maximum number of interpolation blocks has been exceeded **Error correction** - Maximum number of interpolation blocks has been exceeded - Reduce the number of interpolation blocks - Use TNCopt to regenerate the displayed file - Inform your service agency
237-10017	**Error message** 10017 Controller unit performance too low **Cause of error** - The computing performance of the controller unit is not enough for the selected function - Too many axes were configured for the controller unit **Error correction** - Deactivation of the expanded compensations - Check the power of the controller unit used - Inform your service agency
237-10018	**Error message** 10018 Compensation point errors in %4 **Cause of error** - Syntax error in the displayed file - Compensation points are incorrectly defined **Error correction** - Faulty compensation points (NODx) in the displayed file - Compensation points (NODx) have to be in ascending order - Use TNCopt to regenerate the displayed file - Inform your service agency

Error number	Description
237-10019	**Error message** 10019 Error in %4 in line %5 **Cause of error** - Syntax error in the displayed file - Faulty signal (SIGx) in the displayed line **Error correction** - The signal (SIGx) is not possible because the index is unknown - Use appropriate machine parameters to deactivate the function - Use TNCopt to regenerate the displayed file - Inform your service agency
237-1001A	**Error message** 1001A File %4 does not exist **Cause of error** Displayed file could not be opened **Error correction** - Use TNCopt to regenerate the displayed file - Edit machine parameters to deactivate the relevant function - Inform your service agency
237-1001C	**Error message** 1001C %4 1001D %4 1001E %4 18053 %4 %1 18054 %4 %1 18055 %4 %1 **Cause of error** No help text available
237-1001F	**Error message** 1001F Condensation water on supply module **Cause of error** - Temperature in electrical cabinet is too low Condensation water on supply module **Error correction** - Check the electrical cabinet temperature - Inform your service agency

Error number	Description
237-10020	**Error message** 10020 Controller unit defective: CC%2 **Cause of error** - The given CC controller unit is defective and must be exchanged. **Error correction** - Exchange the CC controller unit - Inform your service agency
237-10021	**Error message** 10021 CC%2 file access action=%4, %5, %6 **Cause of error** Warning about file access Additional data 2: Opening of file not executed Additional data 1,2: MC error message Additional data[2] = 11: EAGAIN **Error correction**
237-10025	**Error message** 10025 CC FSuC reports error %1 **Cause of error** The FSuC (Functional Safety Microcontroller) on the CC reports an error. For further information, note the following alarm messages (239-xxxx)! **Error correction**
237-10026	**Error message** 10026 CC%2: UEC dc-link current too high (I-nom: %4, I-act: %5) **Cause of error** - Excessive DC-link current of the UEC - Machine is overloaded while machining the workpiece **Error correction** - Continue working, but with less power (reduce the feed rate, replace a blunt tool, etc.) - Reduce the power being consumed simultaneously by all drives - Reduce or limit the spindle power - Reduce the spindle acceleration - Ensure that the spindle and axes accelerate at different times - Reduce the cutting depths

Error number	Description
237-10027	**Error message** 10027 CC%2: UEC dc-link voltage too high (U-min: %4, U-act: %5) **Cause of error** - DC-link voltage of the UEC is too high **Error correction** - Check the braking resistor of the UEC and exchange it if necessary - Check the wiring of the braking resistor - Check the line fuses - For operation with an optional RM regenerative module: - Check the regenerative module and exchange it if necessary - Check the wiring of the regenerative module (power grid side and DC link) - Replace the UEC if necessary
237-10028	**Error message** 10028 CC%2: UEC dc-link voltage too low (U-min: %4, U-act: %5) **Cause of error** - DC-link voltage of the UEC is too low **Error correction** - Check the wiring of the UEC - Check the 3-phase voltage supply of the UEC - Check the line fuses - Monitor for sporadic power failures
237-10029	**Error message** 10029 CC%2: UEC dc-link voltage too high with RM (U-max: %4, U-act: %5) **Cause of error** The DC-link voltage is too high despite the use of an RM regenerative module. **Error correction** - For operation with an optional RM regenerative module: - Check the regenerative module and exchange it if necessary - Check the wiring of the regenerative module (power grid side and DC link) - Check the line fuse - For operation without an RM regenerative module: - Deactivate the machine parameter uecRecoveryModule

Error number	Description
237-1002A	**Error message** 1002A CC%2: too many UM units connected to one CC **Cause of error** - Too many UM inverters are connected to the stated CC controller unit. - For each CC, the maximum number of UM inverters (or motor connections) is limited to the number of axes possible on the CC. **Error correction** - Distribute the UM inverters over other CC controller units or adapt the configuration - Remove UM inverters that aren't being used (or use one-axis modules instead of two-axis modules) - Inform your service agency
237-1002B	**Error message** 1002B CC%2: inconsistent hardware configuration **Cause of error** Correct operation of the CC controller unit is not possible. A fundamental step during hardware identification of the CC revealed an inconsistent/damaged configuration. There are two ways for such a possibility to arise: 1. Problems in the voltage supply to the CC, such as electrical contact problems, electromagnetic interference, or phenomena in the power-up sequence of the power source. 2. A hardware defect within the CC, possibly caused by problems in the voltage supply **Error correction** - Check the voltage supply, especially ribbon cables of the CC and the redundant 5V supply over X74 - Check for bent pins in the X69 box headers - Exchange the affected CC - Inform your service agency

Error number	Description
237-1002C	**Error message** 1002C CC%2: missing HFL LP transmission **Cause of error** Possible causes: Electromagnetic noise or faulty electrical contacts: - of the 24V supply voltage - of the DC-link voltage - in the motor cabling - in the brake cabling - Contamination or poor optical coupling of the HFL **Error correction** - No immediate corrective action is necessary, since no error situation has occurred yet - Recommended preventive measures: - Check the machine for correct shield connection and grounding - Check the power cables for correct clamping - Check the HFL for correct routing and clamping, and also for contamination
237-1002D	**Error message** 1002D CC%2 %1: notable HFL transmission; error code: %4 **Cause of error** Possible causes: Electromagnetic noise or faulty electrical contacts: - of the 24V supply voltage - of the DC-link voltage - in the motor cabling - in the brake cabling - Contamination or poor optical coupling of the HFL **Error correction** - No immediate corrective action is necessary, since no error situation has occurred yet - Recommended preventive measures: - Check the machine for correct shield connection and grounding - Check the power cables for correct clamping - Check the HFL for correct routing and clamping, and also for contamination

Error number	Description
237-1002E	**Error message** 1002E CC%2 %1: notable HFL transmission (ext.); error code: %4 **Cause of error** Possible causes: Electromagnetic noise or faulty electrical contacts: - of the 24V supply voltage - of the DC-link voltage - in the motor cabling - in the brake cabling - Contamination or poor optical coupling of the HFL **Error correction** - No immediate corrective action is necessary, since no error situation has occurred yet - Recommended preventive measures: - Check the machine for correct shield connection and grounding - Check the power cables for correct clamping - Check the HFL for correct routing and clamping, and also for contamination
237-1002F	**Error message** 1002F CC%2 %1: faulty HFL transmission; error code: %4 **Cause of error** Possible causes: Electromagnetic noise or faulty electrical contacts: - of the 24V supply voltage - of the DC-link voltage - in the motor cabling - in the brake cabling - Contamination or poor optical coupling of the HFL **Error correction** - Check the machine for correct shield connection and grounding - Check the power cables for correct clamping - Check the HFL for correct routing and clamping, and also for contamination - Exchange the UM3 - Exchange the CC3 - Inform your service agency

Error number	Description
237-10030	**Error message** 10030 CC%2 %1: faulty HFL transmission (ext.); error code: %4 **Cause of error** Possible causes: Electromagnetic noise or faulty electrical contacts: - of the 24V supply voltage - of the DC-link voltage - in the motor cabling - in the brake cabling - Contamination or poor optical coupling of the HFL **Error correction** - Check the machine for correct shield connection and grounding - Check the power cables for correct clamping - Check the HFL for correct routing and clamping, and also for contamination - Exchange the UM3 - Exchange the CC3 - Inform your service agency
237-10031	**Error message** 10031 CC%2 Schnittstellenverletzung MC-Kommando %4 Real-time-buffer transfer from integr. oscill. is beginning Current status of the axis not received The DCC calculation module was activated Tool is inconsistent 3-D simulation graphic is being recalculated... FT and FMAXT are not supported with this NC software FN15: PRINT is not supported with this NC software FN25: PRESET is not supported with this NC software
237-13000	**Error message** 13000 CC%2: inverter reports error %1 **Cause of error** UM inverter or compact inverter reports errors. For further information, note the following alarm messages (13xxx)! **Error correction**

Error number	Description
237-13003	**Error message** 13003 UM: IGBT error %1 (maximum current: %4A, phase %5) **Cause of error** - Undervoltage monitor or short-circuit monitor of an IGBT has responded in the UM inverter or UEC compact inverter. **Error correction** - Check the current controller adjustment - Check for proper motor connection and short circuit - Check the motor for an interwinding fault - Inform your service agency - Exchange the power module
237-13004	**Error message** 13004 UM: HW overcurrent shutdown %1 (maximum current: %4A, phase %5) **Cause of error** The fast hardware overcurrent monitoring in the UM inverter or UEC compact inverter has responded - Possible causes: - Current controller parameterized incorrectly - Short-circuit - Defective power module - Excessive current ripple, for example due to an unfavorable combination of motor, inverter, and PWM frequency **Error correction** - Check the current controller adjustment - Check the motor connection for a short circuit - Check the motor for an interwinding fault - If necessary, use a stronger inverter - Increase the PWM frequency - If necessary, replace defective power module - Inform your service agency

Error number	Description
237-13005	**Error message** 13005 UM: PWM nominal value faulty %1 **Cause of error** - The controller unit supplies no PWM nominal value or an invalid one for the motor, or provides the nominal value too late - Controller configuration (machine parameters) faulty - Internal software error **Error correction** - Check the controller configuration or machine parameters for PWM frequency, encoder inputs/outputs and nominal value outputs - Check the software version - Check the machine for correct shield connections and grounding - Check the motor and power cables for correct shield connections and terminal connections - Inform your service agency
237-13006	**Error message** 13006 UM: Communication error in FO connection CC%2 %1 (info = %4) **Cause of error** - UM inverter or UEC compact inverter reports errors in communication via an optical fiber (HFL, HEIDENHAIN Fiber Link) with the controller unit - Info provides information about the exact cause of the error for the diagnosis **Error correction** - Check the optical fiber connections (HFL): - Is the green LED on? - Is the optical fiber plug fully engaged? - Is the tip of the optical fiber clean? - Ensure the proper bend radius - Exchange the optical fiber - Check the machine for correct shield connections and grounding - Check the motor and power cables for correct shield connections and terminal connections
237-13008	**Error message** 13008 UM: Voltage monitor B CC%2 %1 (voltage ID: %4) **Cause of error** - Voltage monitoring on the inverter has responded **Error correction** - Check the voltage supply - Inform your service agency - Exchange the power module

Error number	Description
237-13009	**Error message** 13009 UM: DRIVE OFF signal is active %1 **Cause of error** - Power supply unit (UVR or UEC) reports a fault **Error correction** - Check the power supply unit - Inform your service agency
237-1300A	**Error message** 1300A UM: Heatsink temp. greater than warning thrshld. %1 (value: %4°C) **Cause of error** - Heat sink temperature has exceeded a defined warning threshold **Error correction** - Let the UM inverter or UEC compact inverter cool off - Check the fan for function and contamination
237-1300B	**Error message** 1300B UM: Heatsink temp. greater than max. value %1 (value: %4°C) **Cause of error** - Heat sink temperature has exceeded the maximum permissible value **Error correction** - Let the UM inverter or UEC compact inverter cool off - Check the fan for function and contamination
237-1300E	**Error message** 1300E UM: SW overcurrent monitoring %1 (actual value: %4Aeff) **Cause of error** - Software overcurrent monitoring in the UM inverter or UEC compact inverter has responded **Error correction** Check the current controller adjustment. - Check the motor connection for a short circuit - Check the motor for an interwinding fault - Inform your service agency - Exchange the power module

Error number	Description
237-1300F	**Error message** 1300F UM power-up test: HIK faulty CC%2 %1 %10 **Cause of error** - An error in the hardware identification key (HIK) was detected in the switch-on test of the UM converter or UEC compact inverter **Error correction** - Inform your service agency - Exchange the power module
237-1300F	**Error message** 1300F UM power-up test: internal component faulty CC%2 %1 %10 **Cause of error** - An inadmissible internal component identifier (FPGA ID) was detected or the component could not be accessed during the switch-on test of the UM or UEC compact inverter **Error correction** - Inform your service agency - Check the software version
237-1300F	**Error message** 1300F UM power-up test: analog interface faulty CC%2 %1 %10 **Cause of error** - During the switch-on test of the UM or UEC compact inverter, it was determined that an analog interface in the inverter is not functioning properly **Error correction** - Restart the control - Inform your service agency
237-1300F	**Error message** 1300F UM power-up test: temp. measurement not possible CC%2 %1 %10 **Cause of error** - It was not possible to read the values of the heat sink temperature sensor in the switch-on test of the UM or UEC compact inverter - Sensor or associated interface (I2C) defective **Error correction** - Inform your service agency

Error number	Description
237-1300F	**Error message** 1300F UM power-up test: memory component (FRAM) defective CC%2 %1 %10 **Cause of error** - The FRAM could not be identified in the switch-on test of the UM converter or UEC compact inverter **Error correction** - Restart the control - Inform your service agency
237-1300F	**Error message** 1300F UM power-up test: serial interface (SPI) faulty CC%2 %1 %10 **Cause of error** - During the switch-on test of the UM or UEC compact inverter, it was determined that the serial interface (SPI) to the FSuC in the inverter is not functioning properly **Error correction** - Restart the control - Inform your service agency
237-1300F	**Error message** 1300F UM power-up test: meas. of current faulty CC%2 %1 %10 (info = %5) **Cause of error** - During the switch-on test of the UM or UEC compact inverter, it was determined that the measurement of current in the inverter is faulty - When the drive has been switched off, the permissible maximum offset current has been exceeded in one or more phases: (info is displayed decimally but is to be interpreted as binary) - Bit 0: Phase U - Bit 1: Phase V - Bit 2: Phase W **Error correction** - Inform your service agency

Error number	Description
237-1300F	**Error message** 1300F UM power-up test: temp. value faulty CC%2 %1 %10 (value=%5°C) **Cause of error** - In the switch-on test of the UM converter or UEC compact inverter, a heat sink temperature outside the permitted range was read out - Heat sink too hot - Sensor or associated interface defective **Error correction** - Let the device cool off - Inform your service agency
237-1300F	**Error message** 1300F UM power-up test: fan defective CC%2 %1 %10 **Cause of error** During the switch-on test of the UM inverter or UEC compact inverter, it was determined that the fan for cooling of the electronics in the inverter is not functioning properly. **Error correction** - Check the fan - Exchange the inverter - Inform your service agency
237-1300F	**Error message** 1300F UM power-up test: internal lead defective CC%2 %1 %10 **Cause of error** During the switch-on test of the UM inverter or the UEC compact inverter, it was determined that an internal lead to the FSuC (Functional Safety Microcontroller) is defective. **Error correction** - Exchange the inverter - Inform your service agency
237-13012	**Error message** 13012 UM: WD monitoring has responded %1 (received:%4, expected:%5) **Cause of error** - UM inverter or UEC compact inverter reports that watchdog on controller unit is no longer being updated **Error correction** - Restart the control - Check the machine for correct shield connections and grounding - Check the motor and power cables for correct shield connections and terminal connections - Inform your service agency

Error number	Description
237-13014	**Error message** 13014 UM: Optical waveguide connection faulty %1 **Cause of error** - UM inverter or UEC compact inverter reports faults in the FO connection (fiber optic connection between controller unit and inverter) **Error correction** - Check the optical fiber connection: - Is the green LED on? - Is the optical fiber plug fully engaged? - Is the tip of the optical fiber clean? - Ensure the proper bend radius - Exchange the optical fiber
237-13015	**Error message** 13015 UM: Erroneous heatsink temperature value %1 **Cause of error** - The UM inverter or UEC compact inverter reports errors when accessing the I2C bus for reading the heat sink temperature sensor - No temperature sensor is connected or the connection is faulty - Temperature sensor is defective - I2C controller is defective **Error correction** - Restart the control - Inform your service agency
237-13016	**Error message** 13016 UM: Invalid UM debug channel %4 %1 **Cause of error** - Invalid UM debug signal selected in the oscilloscope **Error correction** - Select another signal
237-13017	**Error message** 13017 UM: Erroneous heatsink temperature value %1 **Cause of error** - The UM inverter or UEC compact inverter reports errors when accessing the I2C bus for reading the heat sink temperature sensor - No temperature sensor is connected or the connection is faulty - Temperature sensor is defective - Improper function of I2C controller **Error correction** - Restart the control - Inform your service agency

Error number	Description
237-1301A	**Error message** 1301A UM: FO signal weaker than warng threshld CC%2 %1 (value=-%4dB) 10023 CC%2: X%6 FO sign. strgth below warng threshld %1 (value = -%4dB) **Cause of error** - The signal strength of the FO connection (fiber optic cable to the UM converter) has fallen below a defined warning threshold **Error correction** - Check the optical fiber connections: - Is the green LED on? - Is the optical fiber plug fully engaged? - Is the tip of the optical fiber clean? - Ensure the proper bend radius - Exchange the optical fiber
237-1301B	**Error message** 1301B UM: FO signal weaker than minimum value CC%2 %1 (value=-%4dB) 10024 CC%2: X%6 FO signal weaker than minimum value %1 (Wert = -%4dB) **Cause of error** - The signal strength of the fiber optic connection (fiber optic cable to the UM converter) has fallen below a permissible minimum value **Error correction** - Check the fiber optic connection: - Is the green LED on? - Is the optical fiber plug fully engaged? - Is the tip of the optical fiber clean? - Ensure the proper bend radius - Exchange the optical fiber

Error number	Description
237-1301C	**Error message** 1301C UM: communication fault CC%2 %1, error code=%4 **Cause of error** The HFL communication component of the inverter reports an error Possible causes: - Electromagnetic disturbances - Hardware defective - Optical fibers (HFL) not connected correctly - Insufficient bend radius of the optical fibers (HFL) **Error correction** - Create a service file (error code gives information about the exact cause of the error for the diagnosis at HEIDENHAIN) - Inform your service agency - If required, exchange the hardware - Use TNCdiag to check the damping of the fiber-optic connections (HFL). If the damping is too high: - Check the optical fiber connections - Comply with the guidelines in the Technical Manual regarding the cable routing - Check the machine for correct shield connections and grounding - Check the motor and power cables for correct shield connections and terminal connections
237-1301D	**Error message** 1301D UM: logical disturbance of data reception CC%2 %1, error code=%4 **Cause of error** The communication component for the optical fiber connection (HFL) to the inverters reports an error Possible causes: - Hardware defective - Electromagnetic disturbances - Optical fibers (HFL) not connected correctly - Insufficient bend radius of the optical fibers (HFL) **Error correction** - Create a service file (error code gives information about the exact cause of the error for the diagnosis at HEIDENHAIN) - Inform your service agency - If required, exchange the hardware - Use TNCdiag to check the damping of the fiber-optic connections (HFL). If the damping is too high: - Check the optical fiber connections - Comply with the guidelines in the Technical Manual regarding the cable routing - Check the machine for correct shield connections and grounding - Check the motor and power cables for correct shield connections and terminal connections

Error number	Description
237-1301E	**Error message** 1301E UM: physical disturbance of data reception CC%2 %1, error code=%4 **Cause of error** The communication component for the optical fiber connection (HFL) to the inverters reports an error Possible causes: - Hardware defective - Electromagnetic disturbances - Optical fibers (HFL) not connected correctly - Insufficient bend radius of the optical fibers **Error correction** - Create a service file (error code gives information about the exact cause of the error for the diagnosis at HEIDENHAIN) - Inform your service agency - If required, exchange the hardware - Use TNCdiag to check the damping of the fiber-optic connections (HFL). If the damping is too high: - Check the optical fiber connections - Comply with the guidelines in the Technical Manual regarding the cable routing - Check the machine for correct shield connections and grounding - Check the motor and power cables for correct shield connections and terminal connections
237-1301F	**Error message** 1301F UM: Inverter not ready %1 (info = %4) **Cause of error** - Since a UM converter or UEC compact inverter is not ready, it is not possible to switch on the drive - Reason for lack of inverter readiness: (information is shown decimally. Please interpret as binary) - Bit 0: "STO.A.P.x" - Bit 1: "STO.B.H.P.x" - Bit 2: "STO.B.L.P.x" - Bit 3: Signal for PWM release not set - Bit 4: Error in switch-on test - Bit 5: Drive motor is not (fully) configured **Error correction** - Inform your service agency - Exchange the power module if necessary

Error number	Description
237-13020	**Error message** 13020 UM: Readiness was lost %1 (info = %4) **Cause of error** - UM inverter or UEC compact inverter was switched off during operation - Reason for lack of inverter readiness: (information is shown decimally. Please interpret as binary) - Bit 0: "STO.A.P.x" - Bit 1: "STO.B.H.P.x" - Bit 2: "STO.B.L.P.x" - Bit 3: Signal for PWM release not set - Bit 4: Error in switch-on test **Error correction** - Check the entry in MP_delayTimeSTOatSS1 and increase the value if necessary (the parameterized time here must be greater than the value in MP_vCtrlSwitchOffDelay) - Inform your service agency - Exchange the power module if necessary
237-13021	**Error message** 13021 UM: Faulty Include file CC%2 %1 **Cause of error** - Software from CC controller unit, UM inverter or UEC compact inverter have not been compiled with the same include file. **Error correction** - Check the software version and update it if necessary - Inform your service agency
237-13025	**Error message** 13025 UM: Stack overflow CC%2 %1 **Cause of error** - Internal software error on the UM inverter or UEC compact inverter **Error correction** - Inform your service agency - Check the software version
237-13026	**Error message** 13026 UM: IRQ stack overflow CC%2 %1 **Cause of error** - Internal software error on the UM inverter or UEC compact inverter **Error correction** - Inform your service agency - Check the software version

Error number	Description
237-13029	**Error message** 13029 UM: Temperature sensor provides invalid measured values %1 1302D UM: Temperature sensor provides invalid measured values %1 **Cause of error** The temperature sensor on the heat sink of the UM inverter or UEC compact inverter provides invalid measured values: - No temperature sensor is connected or the connection is missing - Temperature sensor is defective **Error correction** - Restart the control - Inform your service agency
237-1302A	**Error message** 1302A UM: leakage current too high %1 **Cause of error** Isolation problem (e.g. defective motor, contamination within the inverter, humidity) **Error correction** - Replace the motor of the affected axes or check for a ground fault - Replace the power cable of the affected axes or check for a ground fault - Replace the inverter of the affected axes or check for a ground fault - Inform your service agency
237-1302C	**Error message** 1302C UM: Test software loaded **Cause of error** The inverter has a software version that has not been released yet, and has no valid checksum - This software has neither been tested nor released **Error correction** - After acknowledging the error message you can use this software for test purposes - Check the software version - Create service files - Contact your service agency

Error number	Description
237-1302E	**Error message** 1302E UM: Controller software timeout %1 1302F UM: Controller software timeout %1 **Cause of error** - The time monitor of the inverter software is reporting an exceedance - Internal software error **Error correction** - Inform your service agency
237-13032	**Error message** 13032 UM3xx must be exchanged or rebuilt %1 (Ser-Nr.: %4) **Cause of error** Umrichter mit Bremsschaltung ohne internen Pullup-Widerstand werden ab 27.05.2019 nicht mehr unterstützt **Error correction** Hardware umbauen oder tauschen (Bei Fragen an Georg Zehentner (Tel. 1845) wenden)
237-13033	**Error message** 13033 UM FSuC reports error CC%2 %1 %10 **Cause of error** The FSuC (Functional Safety Microcontroller) on the inverter reports an error. For further information, note the following alarm messages (239-xxxx)! **Error correction**
237-13034	**Error message** 13034 UM: Parameters for the thermal model are missing %1 (Ser-Nr.: %4) **Cause of error** Umrichter ohne HIK-Parameter für das thermische Modell werden bald nicht mehr unterstützt **Error correction** HIK umprogrammieren lassen
237-13035	**Error message** 13035 UM: barrier layer temp. > warning threshold %1 (value: %4°C) **Cause of error** The calculated barrier layer temperature has exceeded a defined warning threshold. **Error correction** - Reduce the profile load - Let the UM inverter or UEC compact inverter cool off - Check the fan for function and contamination

Error number	Description
237-13036	**Error message** 13036 UM: barrier layer temp. > maximum value %1 (value: %4°C) **Cause of error** The calculated barrier layer temperature has exceeded the maximum permissible value. **Error correction** - Reduce the profile load - Let the UM inverter or UEC compact inverter cool off - Check the fan for function and contamination
237-1303C	**Error message** 1303C UM: fan speed too low CC%2 %1 **Cause of error** The speed of the fan for cooling of the electronics in the inverter has fallen below the monitoring threshold. **Error correction** - Check the fan - Exchange the inverter - Inform your service agency
237-1303D	**Error message** 1303D UM: short circuit of brakes was detected %1 (Info: %4) **Cause of error** - The inverter detected a short circuit in the motor brake. - Info provides information about the exact cause of the error: Info = 1: Short circuit between BR+ and BR- Info = 2: Short circuit between BR+ and housing **Error correction** Warning: Hanging axes cannot be supported under certain circumstances. The axis can drop. Do not enter the area of danger under the axis! - Move the axis to a safe position before power-off - Inform your service agency - Check controls for motor brakes - Exchange motor
237-1303F	**Error message** 1303F UM: faulty FSuC Include file CC%2 %1 **Cause of error** The interface versions of internal components (SOC and FSuC) on the inverter do not match. **Error correction** - Check the software version and run an update if necessary - Inform your service agency

Error number	Description
237-13040	**Error message** 13040 UM: too many faulty CC telegrams in sequence %1 **Cause of error** Too many telegrams in sequence were lost during transmission of the nominal voltage values from the CC to the UM. Electromagnetic noise or faulty electrical contacts: - of the 24V supply voltage - of the DC-link voltage - in the motor cabling - in the brake cabling - Contamination or poor optical coupling of the HFL **Error correction** - Check the machine for correct shield connection and grounding - Check the power cables for correct clamping - Check the HFL for correct routing and clamping, and also for contamination - Exchange the UM3 - Exchange the CC3 - Inform your service agency
237-13041	**Error message** 13041 UM: too many faulty CC telegrams during the monitoring period %1 **Cause of error** Too many telegrams were lost during transmission of the nominal voltage values from the CC to the UM during the monitoring period. Electromagnetic noise or faulty electrical contacts: - of the 24V supply voltage - of the DC-link voltage - in the motor cabling - in the brake cabling - Contamination or poor optical coupling of the HFL **Error correction** - Check the machine for correct shield connection and grounding - Check the power cables for correct clamping - Check the HFL for correct routing and clamping, and also for contamination - Exchange the UM3 - Exchange the CC3 - Inform your service agency

Error number	Description
237-13042	**Error message** 13042 UM: excessive error frequency of CC telegrams %1 **Cause of error** The frequency of faulty telegrams during transmission of the nominal voltage values from the CC to the UM is above the limit value. Electromagnetic noise or faulty electrical contacts: - of the 24V supply voltage - of the DC-link voltage - in the motor cabling - in the brake cabling - Contamination or poor optical coupling of the HFL **Error correction** - Check the machine for correct shield connection and grounding - Check the power cables for correct clamping - Check the HFL for correct routing and clamping, and also for contamination - Exchange the UM3 - Exchange the CC3 - Inform your service agency
237-13043	**Error message** 13043 UM: conspicuous CC telegrams during the monitoring period %1 **Cause of error** There are peculiar telegrams during transmission of the nominal voltage values from the CC to the UM. Electromagnetic noise or faulty electrical contacts: - of the 24V supply voltage - of the DC-link voltage - in the motor cabling - in the brake cabling - Contamination or poor optical coupling of the HFL **Error correction** - Check the machine for correct shield connection and grounding - Check the power cables for correct clamping - Check the HFL for correct routing and clamping, and also for contamination - Exchange the UM3 - Exchange the CC3 - Inform your service agency

Error number	Description
237-13044	**Error message** 13044 UM: conspicuous CC telegrams outside the monitoring period %1 **Cause of error** There are peculiar telegrams during transmission of the nominal voltage values from the CC to the UM. Electromagnetic noise or faulty electrical contacts: - of the 24V supply voltage - of the DC-link voltage - in the motor cabling - in the brake cabling - Contamination or poor optical coupling of the HFL **Error correction** - Check the machine for correct shield connection and grounding - Check the power cables for correct clamping - Check the HFL for correct routing and clamping, and also for contamination - Exchange the UM3 - Exchange the CC3 - Inform your service agency
237-13045	**Error message** 13045 UM: overload / IGBT (emergency stop) %1 (%4°C) 13046 UM: overload / IGBT (STO) %1 (%4°C) 13035 UM: overload / IGBT (warning) / %1 (%4°C) 13036 UM: overload / IGBT %1 (%4°C) 1300A UM: overload / heat sink (warning) %1 (%4°C) 1300B UM: overload / heat sink %1 (%4°C) **Cause of error** An excessive temperature of the power electronics or the heat sink was detected in the UM inverter or the UEC compact inverter. Possible causes: - Excessive cutting power - Excessive feed rate - Excessive continuous load - Axis moved against an obstacle or limit stop - Holding brake of axis applied during machining - Excessive temperature in the electrical cabinet (cooling failed) - Excessive axis or spindle acceleration - Fan of the UM inverter or UEC compact inverter defective

Error number	Description
237-13048	**Error message** 13048 UM3: sequencer sync pulse outside the tolerance range %1 **Cause of error** The synchronization pulse for an internal sequencer in the inverter was (too often) outside of the specified tolerance range. Electromagnetic noise or faulty electrical contacts: - of the 24 V supply voltage - of the DC-link voltage - in the motor cabling - in the brake cabling - Contamination or poor optical coupling of the HFL **Error correction** - Check the machine for correct shield connection and grounding - Check the power cables for correct clamping - Check the HFL for correct routing and clamping, and also for contamination - Exchange the UM3 - Exchange the CC3 - Inform your service agency
237-13049	**Error message** 13049 UM: missing HFL LP transmission **Cause of error** Possible causes: Electromagnetic noise or faulty electrical contacts: - of the 24V supply voltage - of the DC-link voltage - in the motor cabling - in the brake cabling - Contamination or poor optical coupling of the HFL **Error correction** - No immediate corrective action is necessary, since no error situation has occurred yet - Recommended preventive measures: - Check the machine for correct shield connection and grounding - Check the power cables for correct clamping - Check the HFL for correct routing and clamping, and also for contamination

Error number	Description
237-1304A	**Error message** 1304A UM: notable HFL transmission CC%2 %1; error code: %4 **Cause of error** Possible causes: Electromagnetic noise or faulty electrical contacts: - of the 24V supply voltage - of the DC-link voltage - in the motor cabling - in the brake cabling - Contamination or poor optical coupling of the HFL **Error correction** - No immediate corrective action is necessary, since no error situation has occurred yet - Recommended preventive measures: - Check the machine for correct shield connection and grounding - Check the power cables for correct clamping - Check the HFL for correct routing and clamping, and also for contamination
237-1304B	**Error message** 1304B UM: notable HFL transmission (ext.) CC%2 %1; error code: %4 **Cause of error** Possible causes: Electromagnetic noise or faulty electrical contacts: - of the 24V supply voltage - of the DC-link voltage - in the motor cabling - in the brake cabling - Contamination or poor optical coupling of the HFL **Error correction** - No immediate corrective action is necessary, since no error situation has occurred yet - Recommended preventive measures: - Check the machine for correct shield connection and grounding - Check the power cables for correct clamping - Check the HFL for correct routing and clamping, and also for contamination

Error number	Description
237-1304C	**Error message** 1304C UM: faulty HFL transmission CC%2 %1; error code: %4 **Cause of error** Possible causes: Electromagnetic noise or faulty electrical contacts: - of the 24V supply voltage - of the DC-link voltage - in the motor cabling - in the brake cabling - Contamination or poor optical coupling of the HFL **Error correction** - Check the machine for correct shield connection and grounding - Check the power cables for correct clamping - Check the HFL for correct routing and clamping, and also for contamination - Exchange the UM3 - Exchange the CC3 - Inform your service agency
237-1304D	**Error message** 1304D UM: faulty HFL transmission (ext.) CC%2 %1; error code: %4 **Cause of error** Possible causes: Electromagnetic noise or faulty electrical contacts: - of the 24V supply voltage - of the DC-link voltage - in the motor cabling - in the brake cabling - Contamination or poor optical coupling of the HFL **Error correction** - Check the machine for correct shield connection and grounding - Check the power cables for correct clamping - Check the HFL for correct routing and clamping, and also for contamination - Exchange the UM3 - Exchange the CC3 - Inform your service agency
237-137FF	**Error message** 137FF UM: Alarm %1 module = %4 line = %5 **Cause of error** - Internal error in the UM inverter or UEC compact inverter **Error correction** - Inform your service agency

Error number	Description
237-13800	**Error message** 13800 UM (FS.B):CRC error in FS communication %1 (nom.:%4,act.:%5) **Cause of error** - Checksum (CRC) in cyclic communication with SKERN-CC is faulty. **Error correction** - Inform your service agency
237-13801	**Error message** 13801 UM (FS.B):FS communication telegram counter %1 nom.:%4 act.:%5 **Cause of error** - Telegram counter in cyclic communication with SKERN-CC is faulty. **Error correction** - Inform your service agency
237-13802	**Error message** 13802 UM (FS.B):UM-DriveID error in FS communicatn. %1 nom.:%4 act.:%5 **Cause of error** - UM.driveID contains errors in cyclic communication with SKERN-CC **Error correction** - Inform your service agency
237-13803	**Error message** 13803 UM (FS.B):Error during deactivation of the FS communication %1 **Cause of error** - Error during deactivation of the FS communication with the UM or UEC - The signals STO.B and SBC.B were not set during the deactivation of the axis. **Error correction** - Drives must be turned off before deactivating an axis. - Check the (S)PLC program, and adapt it if necessary.

Error number	Description
237-13804	**Error message** 13804 UM (FS.B):Topology checking of UM parameters failed %1 **Cause of error** - Received parameters do not match the topology of the setup - Configuration of the machine parameters MP_hsciCcIndex, MP_inverterInterface, or MP_motorConnector is incorrect **Error correction** - Check the configuration of MP_hsciCcIndex, MP_inverterInterface, and MP_motorConnector, and adapt if necessary - Inform your service agency
237-13805	**Error message** 13805 UM (FS.B): FS configuration data were falsified %1 **Cause of error** - UM parameters were corrupted and do not match the calculated checksum (UM.DRIVE-ID) **Error correction** - Reboot of the control - Inform your service agency
237-13806	**Error message** 13806 UM (FS.B): UM-DriveID from UM(FS.A) and UM(FS.B) are unequal %1 **Cause of error** - Calculated checksums (UM-DRIVE.ID) for UM parameters between UM(FS.A) and UM(FS.B) are different **Error correction** - Inform your service agency
237-13807	**Error message** 13807 UM (FS.B):Error during the parameterization of the UM (FS.A) %1 **Cause of error** - Faulty data transfer between UM(FS.A) and UM(FS.B). - The received data were corrupted on the bus line or recognized as invalid by the UM(FS.A). **Error correction** - Inform your service agency - If necessary, replace the inverter

Error number	Description
237-13808	**Error message** 13808 UM (FS.B): reconfiguration of UM3 parameters not possible %1 **Cause of error** - Safety-relevant parameters of the inverter were changed (delayTimeSTOatSS0/SS1, delayTimeSBCatSS0/SS1 or driveOffGroup) **Error correction** - Restart the control in order to apply the new parameters
237-13809	**Error message** 13809 UM (FS.B):Switch-on readiness lacking %1 1:%4 2:%5 3:%6 4:%7 5:%8 **Cause of error** - The conditions for the switch-on readiness of the UM are not given: -- Info1 = 1: No valid configuration received for this axis -- Info2 = 1: SS0 stop reaction active for this axis -- Info3 = 1: Self-test for this axis has not yet run without error -- Info4 = 1: STEST.PERMIT set as release for the UM self-test -- Info5 = 1: Restart prevented due to the previous SS0 and SS1F **Error correction**
237-1380A	**Error message** 1380A UM (FS.B): CRC error in PAE communication %1 (nom.:%4,act.:%5) **Cause of error** - Checksum (CRC) in cyclic communication with PAE is faulty. **Error correction** - Inform your service agency
237-1380B	**Error message** 1380B UM (FS.B): PAE communication telegram counter %1 nom.:%4 act.:%5 **Cause of error** - Telegram counter in cyclic communication with PAE is faulty. **Error correction** - Inform your service agency

Error number	Description
237-1380C	**Error message** 1380C UM (FS.B): error during deactivation, %1 not in safe state **Cause of error** - The axis is to be deactivated, but the axis is not in a safe state - STO and SBC are still enabled **Error correction** - Put the axis in a safe state before deactivating it
237-13820	**Error message** 13820 UM (FS.B): 3.3 V (FS.A) voltage monitor exceeded CC %2 %1 **Cause of error** - The internal voltage monitor found that the 3.3 V voltage of the FS.A is too high **Error correction** Restart the control; if the error occurs again, then: - Check the X76 jumper plugs - Replace device - Inform your service agency
237-13821	**Error message** 13821 UM (FS.B): 3.3V(FS.A) voltage monitor below limit CC %2 %1 **Cause of error** - The internal voltage monitor detected that the 3.3 V voltage of the FS.A is too low **Error correction** Restart the control; if the error occurs again, then: - Check the X76 jumper plugs - Replace device - Inform your service agency
237-13822	**Error message** 13822 UM (FS.B): 5V voltage monitor exceeded CC%2 %1 **Cause of error** - The internal voltage monitor detected that the 5 V voltage is too high **Error correction** Restart the control; if the error occurs again, then: - Check the X76 jumper plugs - Replace device - Inform you service agency

Error number	Description
237-13823	**Error message** 13823 UM (FS.B): 5V voltage monitor below limit CC%2 %1 **Cause of error** - The internal voltage monitor found that the 5 V voltage is too low **Error correction** Restart the control; if the error occurs again, then: - Check the X76 jumper plugs - Replace device - Inform your service agency
237-13824	**Error message** 13824 UM (FS.B): Watchdog FS.A has responded CC%2 %1 **Cause of error** - UM inverter or UEC compact inverter reports that watchdog of the A-channel (FSuC) is no longer being updated **Error correction** - Restart the control - Inform your service agency
237-13825	**Error message** 13825 UM (FS.B): Temp. greater than warning threshold CC %2 %1 (%4°C) **Cause of error** - Processor temperature has exceeded a defined warning threshold **Error correction** - Let the UM inverter or UEC compact inverter cool off - Check the fan for function and contamination
237-13826	**Error message** 13826 UM (FS.B): Temp. greater than maximum value CC%2 %1 (%4°C) **Cause of error** - Processor temperature has exceeded the maximum permissible value **Error correction** - Let the UM inverter or UEC compact inverter cool off - Check the fan for function and contamination

Error number	Description
237-13827	**Error message** 13827 UM (FS.B): Error in the safety self-test CC%2 %1 %10 Info0: %4 **Cause of error** - Error during FS self-test. Info 0: 0 = Emergency stop during the self-test 1 = Test-initialization 2 = Test of the brake control, part 1 3 = Test of the brake control, part 2 4 = Test of the brake control, part 3 5 = Test of the STO cut-out signal, part 1 6 = Test of the STO cutout signal, part 2 7 = Test of the STO cutout signal, part 3 8 = Test of the PWM pulse inhibitor, positive test 9 = Test of the PWM pulse inhibitor, low-side negative test 10 = Test of the PWM pulse inhibitor, high-side negative test 11 = Test of the watchdog, channel A 12 = Test of the watchdog, channel B 13 = Test of the voltage monitor, channel B lower limit 14 = Test of the voltage monitor, channel B upper limit 15 = Test of the voltage monitor, channel A 16 = Test of temperature value measurement, channel B 17 = Test of the SS0 stop request 18 = Test of the SS1 stop request 19 = Test of the timers, channel A timer 1 20 = Test of the timers, channel A timer 2 21 = Test of the timers, channel B 22 = Not all required tests have been performed **Error correction** - When Info 0 = 0: If necessary, unlock emergency stop, and restart the control. - When Info 0 = 2-4: Error of the brake control. Inspect the wiring of the holding brakes. - When Info 0 = 5-21: Inform your service agency. If required, exchange the hardware. - When Info 0 = 1/22: Inform your service agency.
237-13828	**Error message** 13828 UM (FS.B): SS1F request from UM(FS.A) CC%2 %1 **Cause of error** -SS1F request (REQ.SS1F signal) from UM(FS.A) active. **Error correction** Note further pending error messages.

Error number	Description

237-13832	**Error message** 13832 UM (FS.B): Faulty start condition for PAE test %1 Info0:%4 **Cause of error** The condition for starting the self-test of the PAE module is not given on the B channel side: At the time of the self-test, the drive must be set to STO and SBC. Info 0 describes the cause bit-encoded - Bit 0: STO.B.H not active - Bit 1: STO.B.L not active - Bit 2: SBC.B not active **Error correction** - Stop the drive before the start of the self-test (STO and SBC must be active) - Inform your service agency

Error number	Description
237-13833	**Error message** 13833 UM (FS.B): Faulty start condition for self-test %1 Info0:%4 **Cause of error** The condition for starting the self-test of the UM is not given At the time of the self-test, the drive must be set to STO and SBC. Further conditions must also be met. Info 0 describes the cause bit-encoded - Bit 0: STEST.Permit missing - Bit 1: STO.A not active - Bit 2: STO.B.H not active - Bit 3: STO.B.L not active - Bit 4: SBC.A not active - Bit 5: SBC.B not active - Bit 6: SEU error occurred - Bit 7: STEST.OK of PAE missing **Error correction** - Stop the drive before the start of the self-test (STO and SBC must be active) - Check the (S)PLC program, and adapt it if necessary - Inform your service agency
237-13834	**Error message** 13834 UM (FS.B): PAE reports internal error (-REQ.SS1F) %1 **Cause of error** The PAE-H PL module reports an internal error (switch-off due to -REQ.SS1F) Possible causes: - Maximum temperature exceeded - Supply voltage not correct - PAE module not connected correctly - Internal PAE error **Error correction** - Check the expanded information in the bus diagnostics - Stay within the temperature range - Check the power supply - Exchange the PAE-H module - Inform your service agency
237-13835	**Error message** 13835 UM (FS.B):Temperature below warning threshold CC %2 %1 (%4°C) **Cause of error** The processor temperature has fallen below a defined warning threshold. The ambient temperature in the electrical cabinet must be greater than +1°C. **Error correction** - Check the temperature conditions in the electrical cabinet - Exchange the hardware - Inform your service agency

Error number	Description
237-13836	**Error message** 13836 UM (FS.B):Temperature lower than min. value CC%2 %1 (%4°C) **Cause of error** The processor temperature has fallen below the permissible minimum value. The ambient temperature in the electrical cabinet must be greater than 0°C. **Error correction** - Check the temperature conditions in the electrical cabinet - If present: Check the climate control unit - Exchange the hardware - Inform you service agency
237-13837	**Error message** 13837 UM (FS.B): brake control faulty CC%2 %1 %10 Info0: %4 **Cause of error** The test of the brake control detected a fault. Refer to Info0 for the possible cause. Info 0: 1 = Brake configured but not detected 2 = Short-circuit of the high-side or of the brake with 24V 3 = Short-circuit of the low-side or of the brake with 0V 4 = Short-circuit of the high-side with 24V and short-circuit of the low-side with 0V 5 = Supply voltage too low (< 23.75 V) **Error correction** - Check the supply voltage (23.75 V to 26.25 V) - Check the wiring of the brake - Inform your service agency
237-13838	**Error message** 13838 UM (FS.B): An SS0 or SS1F is preventing a restart %1 **Cause of error** - A previous SS0 or SS1F reaction of the inverter is preventing the drive from being switched on. **Error correction** - Restart the control.

Error number	Description
237-13839	**Error message** 13839 UM (FS.B): unreleased testing software loaded: CC%2 %1 **Cause of error** An unreleased test software is installed on the inverter: - This software has neither been tested nor officially released - No checksum will be calculated for this software This software is intended solely for testing purposes! **Error correction** This software or firmware must be replaced by a software or firmware that has been officially released: - Create service files - Inform your service agency
237-1383A	**Error message** 1383A UM: Checksum error in the program code CC%2 %1 **Cause of error** - A checksum error was detected in the program code of the inverter. - Inverter defective. **Error correction** - Inform your service agency - If required, exchange the hardware
237-13890	**Error message** 13890 UM (FS.B): faulty FS Include file CC%2 %1 (act: %4 nom: %5) **Cause of error** - SKERN-CC and UM (FS.B) software have not been compiled with the same Include file. **Error correction** - Check the NC software version, and reinstall it if necessary - Inform your service agency
237-13F00	**Error message** 13F00 UMFSSW: error while deactivating axis %1 **Cause of error** Deactivation of a safe axis is not supported by the functional safety (SKERN-CC). **Error correction** Restart the control without deactivating the safe axis

Error number	Description
237-17FFC	**Error message** 17FFC Axis %1: PLC module 9311 no longer supported. **Cause of error** This function is no longer supported by this software version. **Error correction** Inform your service agency
237-17FFD	**Error message** 17FFD CC %2 controller clock slave axis %1 not identical to master axis **Cause of error** The parameters MP_ctrlPerformance and MP_ampPwmFreq are parameterized differently for the master and slave. **Error correction** - Check the entries in MP_ctrlPerformance and MP_ampPwmFreq, and set them to the same values for master and slave. - Inform your service agency.
237-17FFE	**Error message** 17FFE Axis %1: Measurement canceled **Cause of error** - Note further messages. **Error correction** - Repeat the measurement.
237-17FFF	**Error message** 17FFF Axis %1: Amplitude of excitation signal is too high **Cause of error** Limit of provided current or voltage reached during the measurement. **Error correction** - Reduce the amplitude of the excitation signal
237-18000	**Error message** 18000 CC %2: Not enough memory available. **Cause of error** - The memory requirements for the requested measurement are too high. **Error correction** - Reduce the recording time. - Reduce the recording rate.

Error number	Description
237-18001	**Error message** 18001 Axis %1 Alarm for software test **Cause of error** - In the automatic software test an alarm was released **Error correction** - Inform your service agency
237-18003	**Error message** 18003 kv factor of the cmp file is not equal to MP %1 **Cause of error** - The kv factors in a cmp file and parameter file are different **Error correction** - Change the kv factor (kvfactor) in the machine parameter file to the value from the cmp file (compTorqueRipple) - Inform your service agency.
237-18004	**Error message** 18004 ki factor of the cmp file is not equal to MP %1 **Cause of error** - The ki factors in a cmp file and machine parameter file are different **Error correction** - Change the ki factor (vCtrlIntGain) in the parameter file to the value from the cmp file (compTorqueRipple) - Inform your service agency.
237-18006	**Error message** 18006 DQ-ALM %1: Uz nominal value too low **Cause of error** - The DC-link voltage of a DRIVE-CLiQ ALM power supply as defined in the machine parameter "ampBusVoltage" is smaller than the rectified line voltage. **Error correction** - Check the entry in machine parameter "ampBusVoltage." - Inform your service agency.

Error number	Description
237-18007	**Error message** 18007 EnDat para. invalid: axis %1code:%4 value: %5 **Cause of error** - During the initialization of the EnDat motor encoder for the given axis, a parameter value was detected that is not supported. - The code of the error message describes the cause: 100: EnDat 2.1 Parameters of the encoder manufacturer, word 20/21: "Measuring step or measuring steps per revolution" = 0 is not supported by the controller software if it is needed to calculate the commutation of a motor. 101: EnDat 2.1 Parameters of the encoder manufacturer, word 17: "Number of distinguishable revolutions" is supported only up to 65534. 102: EnDat 2.1 Parameters of the encoder manufacturer, word 13: CC424 "Number of clock pulses to transmit the position value (transmission format)" is supported up to 32. 200: EnDat 2.2 Parameters of the encoder manufacturer, word 4: "Scaling factor for temperature" unknown. **Error correction** - Exchange the encoder - Inform your service agency
237-18008	**Error message** 18008 EnDat parameter invalid in axis:%1 Code:%4 Value:%5 **Cause of error** - During the initialization of the EnDat position encoder for the given axis, a parameter value was detected that is not supported. - The code of the error message describes the cause: 101: EnDat 2.1 Parameters of the encoder manufacturer, word 17: "Number of distinguishable revolutions" is supported only up to 65534. 200: EnDat 2.2 Parameters of the encoder manufacturer, word 4: "Scaling factor for temperature" unknown. **Error correction** - Exchange the encoder - Inform your service agency.

Error number	Description
237-18009	**Error message** 18009 Communic. error, EnDat motor enc. %1, err. code %4 **Cause of error** - An error occurred with the EnDat motor encoder - The error code describes the cause: - 101 and 102: The encoder generated an internal error message. A further alarm 0x1800F describes the exact cause. - 103, 104 and 105: An error occurred in communication. Possible causes: - Defective encoder line - Encoder line is not suitable for digital EnDat communication at high clock frequency - Disturbances on the encoder line (e.g. through insufficient shielding) **Error correction** - Check additional information from alarm message 0x1800F - Check the encoder line - Check whether the encoder line is suited for digital transmission at high frequency - Exchange the encoder - Exchange the hardware (CC) - Inform your service agency.
237-1800A	**Error message** 1800A Communic. error, EnDat pos. encoder %1, error code %4 **Cause of error** - An error occurred with the EnDat position encoder - The error code describes the cause: - 101 and 102: The encoder generated an internal error message. A further alarm 0x18010 describes the exact cause. - 103, 104 and 105: An error occurred in communication. Possible causes: - Defective encoder line - Encoder line is not suitable for digital EnDat communication at high clock frequency - Disturbances on the encoder line (e.g. through insufficient shielding) **Error correction** - Check additional information from alarm message 0x18010 - Check the encoder line - Check whether the encoder line is suited for digital transmission at high frequency - Exchange the encoder - Exchange the hardware (CC) - Inform your service agency.

Error number	Description
237-1800B	**Error message** 1800B Axis %1 inverter switch off over -STO.A.x (signal: %4) **Cause of error** - The inverter was switched off by a signal within the control: 1 = "-STO.A.MC.WD" 2 = "-STO.A.P.x" 3 = "-STO.A.PIC" 4 = "-STO.A.CC" **Error correction** - Check the entry in MP_vCtrlTimeSwitchOff (up to NCK version 597110-13) or MP_delayTimeSTOatSS1 (as of NCK version 597110-14) and, if necessary, increase the value in MP_delayTimeSTOatSS1 or reduce the value in MP_vCtrlSwitchOffDelay. - Inform your service agency
237-1800C	**Error message** 1800C Reinitialization of the motor %1 is required **Cause of error** - The drive has to be reinitialization because the max. encoder frequency (VCtrlEncoderInputFunctions, bit 0) was changed **Error correction** - Reinitialize the encoder - Deselect the axis with the machine parameter axisMode (bit x = 0) - Exit the MP editor: - Reactivate the axis in machine parameter axisMode (bit x = 0) and set posEncoderType to the desired value - Re-exit the MP editor - or reset the control (restart) - Inform your service agency
237-1800D	**Error message** 1800D Encoder frequency up to 800 kHz not supported %1 **Cause of error** - The max. encoder frequency of 800 kHz was selected for the motor encoder (VCtrlEncoderInputFunctions, bit 0 = 1) The hardware does not support this frequency. **Error correction** - Set the max. encoder frequency to 500 kHz (VCtrlEncoderInputFunctions, bit 0 = 0) - Inform your service agency

Error number	Description
237-1800E	**Error message** 1800E Excessive motor encoder frequency %1 **Cause of error** - The permissible encoder frequency at the motor encoder input was far exceeded. The monitoring thresholds are: - VCtrlEncoderInputFunctions, bit 0 = 0: 600 kHz - VCtrlEncoderInputFunctions, bit 1 = 1: 1000 kHz **Error correction** - Reduce the max. motor speed - Set the parameter of the motor encoder's input circuit to high frequency (not with CC 424): VCtrlEncoderInputFunctions bit 0 = 1 - Inform your service agency
237-1800F	**Error message** 1800F Error in EnDat motor encoder %1, error code %4 **Cause of error** - The EnDat motor encoder reports an error - The error code describes the cause: 1 = Failure of the illumination 2 = Incorrect signal amplitude 4 = Incorrect position value 8 = Overvoltage in the power supply 16 = Undervoltage in the power supply 32 = Overcurrent 64 = Battery exchange needed **Error correction** - Check the installation of the encoder - Check the power supply of the encoder - If required, exchange the battery - Exchange the encoder - Inform your service agency.

Error number	Description
237-18010	**Error message** 18010 Error in EnDat position encoder %1, error code %4 **Cause of error** - The EnDat position encoder reports an error - The error code describes the cause: 1 = Failure of the illumination 2 = Incorrect signal amplitude 4 = Incorrect position value 8 = Overvoltage in the power supply 16 = Undervoltage in the power supply 32 = Overcurrent 64 = Battery exchange needed **Error correction** - Check the installation of the encoder - Check the power supply of the encoder - If required, exchange the battery - Exchange the encoder - Inform your service agency.
237-18011	**Error message** 18011 Motor encoder: %1 Cause: %4, source: %5, alarm: %6 **Cause of error** - An error occurred during forced dynamic sampling of error statuses in the EnDat 2.2 motor encoder **Error correction** - Check the encoder cable - Check the encoder and, if necessary, exchange it - Check the CC controller unit or UEC and, if necessary, exchange it - Inform your service agency Please indicate the complete error text: cause, source and alarm
237-18012	**Error message** 18012 Position encoder: %1 Cause: %4, source: %5, alarm: %6 **Cause of error** - An error occurred during forced dynamic sampling of error statuses in the EnDat 2.2 position encoder **Error correction** - Check the encoder cable - Check the encoder and, if necessary, exchange it - Check the CC controller unit or UEC and, if necessary, exchange it - Inform your service agency Please indicate the complete error text: cause, source and alarm

Error number	Description
237-18013	**Error message** 18013 DQ encoder %1: error condition %4 determined **Cause of error** - One of the safety signals of the DRIVE-CLiQ encoder reports a device error. - Meaning of the additional information: 101 = Internal error bit F1 is set. 102 = Internal error bit F2 is set. 103 = Internal bit "Position Ok PO" is missing. 104 = Internal error bit "Fault Severity 0 XG1" is set. **Error correction** - Exchange the defective encoder. - Inform your service agency.
237-18014	**Error message** 18014 Sp. head change err. in DQ axis %1, port %4, err. %5 **Cause of error** An error occurred during a spindle head change accompanied by PHY Power Down and Up. The corresponding PHY is assigned to the given port. Error = error code (BMCR = "Basic mode control" register of the PHY): 1: BMCR before PHY Power Down not OK 2: BMCR after PHY Power Down not OK 3: BMCR after PHY Power Up not OK 4: BMCR after PHY Power Up is OK, but timeout **Error correction** Inform your service agency.
237-18015	**Error message** 18015 PWM freq. axis %1 <= 4 kHz. Restart required. **Cause of error** During initial servicing of the control the PWM frequency of an axis is less than or equal to 4 kHz. This axis is not assigned to the I2C master CC. **Error correction** - Switch the control off and on again - Alarm occurs in spite of repeated restarts: - Exchange defective CC or - Exchange the backup battery of the MC - Inform your service agency.

Error number	Description
237-18017	**Error message** 18017 SPI expansion module: transmission error %4 **Cause of error** - The SPI plug-in board (module for CC or MC) for controlling analog axes or for reading analog actual values cannot respond correctly. - SPI plug-in module is defective. - Wiring error on the SPI plug-in module **Error correction** - Check the external wiring, especially analog inputs and outputs connected to the SPI plug-in module. - Exchange the SPI plug-in board (module for CC or MC). - Inform your service agency.
237-18018	**Error message** 18018 SPI expansion module: error in module, number %4 **Cause of error** - The SPI plug-in board (module for CC or MC) for controlling analog axes or for reading analog actual values cannot respond correctly. - SPI plug-in module is defective. - Wiring error on the SPI plug-in module **Error correction** - Check the external wiring, especially analog inputs and outputs connected to the SPI plug-in module. - Exchange the SPI plug-in board (module for CC or MC). - Inform your service agency.
237-18019	**Error message** 18019 Clearable positioning error %1, ES %4 **Cause of error** A clearable positioning error has occurred (following error too large) due to an active emergency-stop input. In this case, the CC controller unit brakes the drive immediately. The result is a following error. The additional info indicates the active emergency-stop input: 1 = Emergency stop A (ES.A) 2 = Emergency stop A with handwheel (ES.A.HW) 3 = Emergency stop B (ES.B) 4 = Emergency stop B with handwheel (ES.B.HW) 5 = Emergency stop B Functional Safety 6 = Emergency stop B Functional Safety with handwheel **Error correction** - Check the external wiring, especially the emergency stop inputs. - Inform your service agency

Error number	Description
237-1801A	**Error message** 1801A Non-clearable positioning error %1, ES %4 **Cause of error** A positioning error that cannot be cleared (excessive servo lag) occurred as the result of an active emergency-stop input. In this case, the CC controller unit brakes the motor immediately. This results in a servo-lag error. The additional information indicates the active emergency-stop input: 1 = Emergency Stop A 2 = Emergency Stop A Handwheel 3 = Emergency Stop B 4 = Emergency Stop B Handwheel 5 = Emergency Stop B Functional Safety 6 = Emergency Stop B Functional Safety Handwheel 7 = Emergency Stop A Functional Safety 8 = Emergency Stop A Functional Safety Handwheel **Error correction** - Check the external wiring, especially the emergency-stop inputs - Inform your service agency
237-1801B	**Error message** 1801B SPI module in wrong slot **Cause of error** A single SPI module (e.g. CMA-H) solely in SPI slot 2 is not permissible. **Error correction** - Insert the SPI module in slot 1 of the controller unit. Only once the control has been switched off and is free of potential! - If the problem continues, inform your service agency.
237-1801C	**Error message** 1801C SPI expansion board not supported **Cause of error** - Hardware (CC controller) does not support the SPI expansion board. - CC controller assembly is too old. **Error correction** - Replace CC controller assembly with a current model. - Inform your service agency.

Error number	Description
237-1801D	**Error message** 1801D Overcurrent at analog output on SPI expansion module **Cause of error** Current at output exceeds 20 mA Possible causes: - Short circuit to 0 V or to other voltage sources - Short circuit to other outputs **Error correction** - Check the connection of the shield (on both sides, low impedance. Refer to your control's Technical Manual). - Check the cabling for short circuits to 0 V, to voltage sources or outputs of other channels. - Check the input impedance of the receiver. - Inform your service agency.
237-1801E	**Error message** 1801E Excessive temperature at SPI expansion module **Cause of error** Temperature in the output driver exceeded 105 °C. **Error correction** Inform your service agency.
237-1801F	**Error message** 1801F Supply voltage on the SPI expansion module too low **Cause of error** Supply voltage of the output driver is too low: - Voltage drop due to overload or short circuit - Supply voltage through CC/UEC/MC too low **Error correction** - Check the supply voltage. - Check the wiring of the outputs. - Avoid overloads by deactivating one or more output channels. - Inform your service agency.
237-18020	**Error message** 18020 Overcurrent on the analog output of the SPI expansion module **Cause of error** Message accompanies the ¿SHORT_CIRCUIT¿, error message if the error occurred only briefly and corrected itself. **Error correction** No remedial actions required because the error has been settled.

Error number	Description
237-18021	**Error message** 18021 Error in the CMP file: Supply pointer (SP) is faulty **Cause of error** CMP file: Supply pointer (SP) "UCCS" compensations is faulty. The supply pointer points to the infeed point for which the respective compensation is active. Possible input values: -1: Void -> Output value of the block can be used for UCCP. 0: UCCS block 0 1: UCCS block 1 2: UCCS block 0 3: UCCS block 3 4: UCCS block 4 5: UCCS block 5 6: IqNom 7: WNom **Error correction** - Deactivate CMP file in machine parameters - Create CMP file again. - Inform your service agency.
237-18022	**Error message** 18022 CMP file: Axis transfer in the "UCCS" compensation is faulty. **Cause of error** CMP file: The axis transfer in the "UCCS" compensations is faulty. The axis information from the MC, i.e. the transferred axis index does not agree with the axis index of the active axis. There is an internal software error. **Error correction** - Deactivate CMP file in machine parameters - Create CMP file again. - Inform your service agency.

Error number	Description
237-18023	**Error message** 18023 CMP file: Def. function (FUNC) in UCCS compensations is faulty **Cause of error** CMP file: A faulty function (FUNC) was used in the UCCS compensations. The following functions are possible: 0: DoNothing (-> deactivation) 1: Polynomial 2: Inverse polynomial 3: IIR filter, 2nd order 4: Sine 5: Hyperbolic sine 6: Segment-defined function 7: Adaptive filter **Error correction** - Deactivate CMP file in machine parameters - Create CMP file again. - Inform your service agency.

Error number	Description
237-18024	**Error message** 18024 CMP file: Signal definition SIG0 or SIG1 of UCCS is faulty **Cause of error** CMP file: Definition of the input signals SIG0 or SIG1 von UCCS/UCCP is faulty. The following input quantities are allowed: –1: Not active 0: Value entered in the machine parameter (only UCCP) 1: Output value for block 0 2: Output value for block 1 3: Output value for block 2 4: Output value for block 3 5: Output value for block 4 6: Feedforward current 7: Feedforward acceleration 8: Feedforward velocity 9: Nominal speed 10: Following error 11: Nominal current 12: Integral current 13: Nominal voltage 14: Ud 15: Uq 16: IqNom 17: IdNom 18: IqAct 19: IdAct 20: Motor temperature 21: Commutation angle **Error correction** - Deactivate CMP file in machine parameters - Create CMP file again. - Inform your service agency.
237-18025	**Error message** 18025 CMP file: Axis index (SAX) in the UCCS compensations is faulty **Cause of error** CMP file: Axis index (SAX) in the UCCS compensations is faulty. The axis index points at its own axis or another axis that must be located on the same CC board. The given index is with respect to the index of the machine-parameter file. **Error correction** - Deactivate CMP file in machine parameters - Create CMP file again. - Inform your service agency.

Error number	Description
237-18026	**Error message** 18026 CMP file: Entry (ENTR) in the "UCCS" compensations is faulty **Cause of error** CMP file: Entry (ENTR) in the "UCCS" compensations is faulty. "Entry" defines whether the UCCS compensation is applied additively or multiplicatively. The following input is allowed: 0: Application deactivated 1: Additive application 2: Multiplicative application **Error correction** - Deactivate CMP file in machine parameters - Create CMP file again. - Inform your service agency.
237-18027	**Error message** 18027 "Expanded compensations" and "TRC" are not simultaneous **Cause of error** The "TRC = Torque Ripple Compensation" and "Expanded compensations" functions could not be used at the same time. **Error correction** - Deselect the TRC compensation through the appropriate machine parameter or - Select the expanded compensations - Inform your service agency
237-18028	**Error message** 18028 CC%2: invalid command %4 received 1803B CC%2: command %4 received with invalid addressing %5 **Cause of error** A communication error occurred between the main computer (MC) and the controller unit (CC). Possible causes: - HSCI cabling is faulty - Internal software error - The installed software version has not been enabled. **Error correction** - Check the HSCI cabling - Check the the HSCI connector (is it correctly plugged in?) - Check the software version. - Inform your service agency.

Error number	Description
237-18029	**Error message** 18029 CC%2 incrmtl. actl. val. measrmt. w/ motor enc. %1 **Cause of error** - Encoder defective - Data transfer from encoder faulty - Internal software error **Error correction** - Check the encoder cable and its connection - Exchange the encoder cable - Exchange the encoder - Check the software version. - Inform your service agency.
237-18030	**Error message** 18030 CC%2 incrmtl. actl. value measrmt. w/ pos. enc. %1 **Cause of error** - Encoder defective - Data transfer from encoder faulty - Internal software error **Error correction** - Check the encoder cable and its connection - Exchange the encoder cable - Exchange the encoder - Check the software version. - Inform your service agency.
237-18031	**Error message** 18031 CC%2 nominal speed value (PWM) incorrect %1 **Cause of error** The controller unit provides no valid nominal speed value for the motor, or provides it too late: - Controller configuration (machine parameters) faulty - Internal software error **Error correction** - Check the controller configuration or machine parameters for PWM frequency, encoder inputs/outputs and nominal value outputs - Check the software version. - Inform your service agency.
237-18032	**Error message** 18032 Maximum number of CCs was exceeded **Cause of error** The permissible number of CC controller units has been exceeded. **Error correction** - Reduce the number of CCs. - Inform your service agency.

Error number	Description
237-18033	**Error message** 18033 Syntax error in PAC compensation file **Cause of error** - Syntax error in the compensation file for PAC - Faulty function type in the compensation file for PAC **Error correction** - Use TNCopt to recreate a compensation file for PAC - Inform your service agency
237-18034	**Error message** 18034 Invalid axis assignment in PAC compensation file **Cause of error** - Invalid axis assignment in the compensation file for PAC - Syntax error in the compensation file for PAC **Error correction** - Check the axis assignment in the compensation file for PAC - Use TNCopt to recreate a compensation file for PAC - Inform your service agency
237-18035	**Error message** 18035 Syntax error in CTC compensation file **Cause of error** - Invalid input point in the compensation file for CTC - Syntax error in the compensation file for CTC **Error correction** - Use TNCopt to recreate a compensation file for CTC - Inform your service agency
237-18036	**Error message** 18036 CC%2 Drive:%1 stop=%4 cause=%5 axis group=%6 condition=%7 **Cause of error** **Error correction**
237-18037	**Error message** 18037 Required software option not enabled: %4 **Cause of error** The entered software option has not been enabled, although you tried to activate a function connected with it. **Error correction** - Check the software options using the SIK code number - Contact a representative of the machine manufacturer or HEIDENHAIN.

Error number	Description
237-18038	**Error message** 18038 Incorrect entry in CTC compensation file **Cause of error** - Syntax error in the compensation files of the “expanded compensation” of the CTC function **Error correction** - Use TNCopt to recreate a compensation file for CTC - Inform your service agency
237-18039	**Error message** 18039 Speed encoder line count of %1 is incorrect. %4 was expected. **Cause of error** Rotary encoders: - Encoder line count in the parameter is not equal to the EnDat line count found - The entry in machine parameter "cfgServoMotor --> motStr" is incorrect - Incorrect entry under STR in motor table - EnDat 2.2 rotational speed encoder without line count information must be defined as STR = 1 or "cfgServoMotor --> motStr=1" Linear encoders: - the grating period in the parameter deviates from the grating period found by EnDat - The entry in machine parameter posEncodeType or posEncoderIncr is faulty - For EnDat 2.2 linear encoders without specified grating period, the value of the measuring step (e.g. 1 nm or 10 nm) must be parameterized **Error correction** Rotary encoders: - Enter the correct line count in machine parameter "cfgServoMotor --> motStr" - Enter the displayed line count under STR in the motor table Linear encoders: - Enter the displayed grating period in machine parameter posEncoderDist or posEncoderIncr Inform your service agency.

Error number	Description
237-1803A	**Error message** 1803A Configuration error %1 posEncoderDist=%4, posEncoderIncr=%5 **Cause of error** Faulty configuration: - The context from the machine parameters CfgAxisHardware->posEncoderDist to CfgAxisHardware->posEncoderIncr does not agree with the values from the EnDat encoder - With EnDat 2.2: See the Technical Manual of the control **Error correction** - Check the entries of the machine parameters CfgAxisHardware->posEncoderDist or CfgAxisHardware->posEncoderInc and replace them with the displayed values - Inform your service agency.
237-1803C	**Error message** 1803C Incorrect parameter entry in CC compensation file under UCCS **Cause of error** - Invalid entry in the compensation files of the expanded compensation (CTC, PAC, LAC, ...) - The installed software version does not support this entry **Error correction** - Check the entries of the compensation files - Inform your service agency
237-1803D	**Error message** 1803D Incorrect entry in PAC compensation file **Cause of error** - Invalid entry in the compensation file for PAC - Installed software version does not support this entry **Error correction** - Check the entries of the compensation file - Inform your service agency
237-1803E	**Error message** 1803E Error in current controller **Cause of error** In spite of the given nominal current, the current controller could not measure any actual current (= 0). Possible causes: - Line to motor interrupted - Error in the control of the wye-delta contactor - Defective power module **Error correction** - Check the motor lines - Check the wiring and function of the wye-delta contactor - Exchange the power module, if necessary - Inform your service agency

Error number	Description
237-1803F	**Error message** 1803F Syntax error in compensation file LAC **Cause of error** Error in the syntax of the "expanded compensations" Type of the "Load Adaptive Control" function is unknown **Error correction** Generation of a new LAC compensation files through TNCopt Inform your service agency.
237-18041	**Error message** 18041 Number of maximum compensation blocks (CTC/PAC) exceeded **Cause of error** – Maximum number of CTC blocks exceeded – Maximum number of PAC blocks exceeded – Maximum number of other blocks of the extended compensations exceeded **Error correction** – Revise extended compensation files with TNCopt – Deactivation of extended compensations via MP2700/CfgControllerComp.enhancedComp - Inform your service agency
237-18042	**Error message** 18042 Syntax error in compensation file MAC **Cause of error** Error in the syntax of the "expanded compensations" Type of the "Motion Adaptive Control" function is unknown **Error correction** - Use TNCopt to generate a new MAC compensation file - Inform your service agency
237-1804B	**Error message** 1804B There is no compensation file for UCCP 18044 There is no compensation file for CTC 18045 There is no compensation file for PAC 18046 There is no compensation file for LAC 18047 There is no compensation file for MAC 18048 There is no compensation file for ACC 1804A There is no compensation file for UCCS **Cause of error**

Error number	Description
237-1804C	**Error message** 1804C EnDat position encoder: Transmission rate axis %1 **Cause of error** - The communication with the encoder is not possible at the velocity required for servo control. **Error correction** - Check the cable and connecting elements of the signal path - Exchange the encoder - Exchange the CC - Inform your service agency
237-1804D	**Error message** 1804D EnDat motor encoder: Transmission rate axis %1 **Cause of error** - The communication with the encoder is not possible at the velocity required for servo control. **Error correction** - Check the cable and connecting elements of the signal path - Exchange the encoder - Exchange the CC - Inform your service agency
237-1804E	**Error message** 1804E SPI trigger card activates %1 trigger rate %4 Hz **Cause of error** - The synchronization of external encoders through an SPI trigger card in the CC was activated with CfgCCAuxil.miscCtrlFunct1, bit 10 **Error correction** - Check the entry in CfgCCAuxil.miscCtrlFunct1, bit 10 - Inform your service agency

Error number	Description
237-1804F	**Error message** 1804F EnDat2.2 configured but not detected %1 info %4 %5 %6 **Cause of error** An EnDat2.2 encoder was configured, but the control could not switch it to the EnDat2.2-Modus mode. Info contains the following three additional information data: 1) 1: This is about the shaft speed encoder 2: This is about the position encoder 2) Connector offset e.g. connector offset = 3 and additional info 1) = 2: Connector X204 is affected 3) EnDat error word **Error correction** - Check the entry in Machine Parameter CfgAxisHardware-posEncoderType: The value CC_EXTERN_ENDAT_2_2 must not be set unless the position encoder is an EnDat 2.2 encoder. - Check the selected motor: The current settings expect a motor with EnDat2.2 encoder. - Check the entry in Machine Parameter CfgServoMotor-motEncType. - Check the status of the EnDat2.2 encoder with the aid of DriveDiag: Check the pending alarms.
237-18050	**Error message** 18050 CC%2 %1 AVD parameter ID=%4 **Cause of error** There is an error in the AVD parameter file: - The file contains invalid parameter data - An incorrect version of TNCopt may have been used to create it **Error correction** - Deactivate AVD in the configuration (enhancedComp/MP2700) - Make a new AVD file with a current version of TNCopt - Check the software version ID=10 Can only be used on hardware with a limited number of axes - Inform your service agency ID=107 Kv factor of position controller does not match AVD parameter PAR7 ID=108 Kp factor of speed controller does not match AVD parameter PAR8 ID=109 Ki factor of speed controller does not match AVD parameter PAR9 ID=205 File version not valid ID=300 Motor overcurrent due to incorrect AVD parameter assignment

Error number	Description
237-18051	**Error message** 18051 Axis %2: Number of the UV is in error **Cause of error** - Number of the UV power supply unit in the machine parameter is faulty **Error correction** - Check the number of the UV power supply unit in the machine parameter - Inform your service agency
237-18052	**Error message** 18052 Axis %2: Faulty entry in ICTRL compensation file **Cause of error** - Invalid entry in the compensation file for ICTRL - Installed software version does not support this entry **Error correction** - Check the entries in the compensation file for ICTRL - Inform your service agency
237-18056	**Error message** 18056 CC %2 axis %1: Filter %4 in the speed control loop is instable **Cause of error** - The filter parameter set is inconsistent. - The filter frequency defined in the machine parameter MP_vCtrlFilterFreqX is too low or too high. **Error correction** - Check the entries in the machine parameters MP_vCtrl-FilterTypeX, MP_vCtrlFilterFreqX, MP_vCtrlFilterDampingX and MP_vCtrlFilterBandWidthX, whereby X stands for the displayed filter number. - Inform your service agency
237-18057	**Error message** 18057 CC %2 axis %1: Filter %4 in the position control loop is instable **Cause of error** - The filter parameter set is inconsistent - The filter frequency defined in the machine parameter MP_vCtrlFilterFreqX is too low or too high **Error correction** - Check the entries in the machine parameters MP_vCtrl-FilterTypeX, MP_vCtrlFilterFreqX, MP_vCtrlFilterDampingX and MP_vCtrlFilterBandWidthX, whereby X stands for the displayed filter number. - Inform your service agency

Error number	Description
237-18058	**Error message** 18058 CC %2 axis %1: IPC is instable %4 **Cause of error** - IPC time constant is too large **Error correction** - Check machine parameters MP_compIpcT1 and MP_compIpcT2 - Inform your service agency
237-18059	**Error message** 18059 CC %2 axis %1: AVD instable %4 1805A CC %2 axis %1: AVD instable %4 **Cause of error** - The adjusted AVD frequency is too low or too high. **Error correction** - Inspect the AVD frequency with a current version of TNCopt - Generation of a new AVD file through TNCopt - Inform your service agency
237-1805B	**Error message** 1805B CC %2 axis %1: AVD filter is instable %4 **Cause of error** - The parameter set of the AVD filter 13 (type 22) is inconsistent - The defined frequency of the AVD filter 13 (type 22) is too high or too low - The adjusted AVD frequency is too high or too low. **Error correction** - Use the current TNCopt version to check the AVD filter 13. - Inspect the AVD frequency using TNCopt - Generation of a new AVD file through TNCopt - Inform your service agency
237-1805C	**Error message** 1805C CC %2 axis %1: Measurement with AVD is instable %4 18063 CC %2 axis %1: ACC instable %4 18064 CC %2 axis %1: ACC instable %4 18065 CC %2 axis %1: ACC instable %4 18066 CC %2 axis %1: ACC instable %4 1806B CC %2 axis %1: Filter is instable %4 **Cause of error** - Internal software error

Error number	Description
237-1805D	**Error message** 1805D Maximum number of function blocks exceeded %1 **Cause of error** - Maximum number of LAC function blocks exceeded - Maximum number of function blocks of the extended compensations exceeded **Error correction** - Revise extended compensation files with TNCopt - Deactivation of extended compensations via <ParameterSet>.CfgControllerComp.enhancedComp - Inform your service agency
237-1805E	**Error message** 1805E Feed-in point in %4 in line %4 is faulty **Cause of error** - Syntax error in the displayed file - The given feed-in point is not supported **Error correction** - Generation of a new compensation file through TNCopt - Deactivation of extended compensations - Inform your service agency
237-1805F	**Error message** 1805F Error in %4 in line %5 **Cause of error** - Syntax error in the displayed file - Signal index (SIGx) in the displayed line is faulty **Error correction** - Use TNCopt to regenerate the displayed file - Deactivation of extended compensations via <ParameterSet>.CfgControllerComp.enhancedComp - Inform your service agency
237-18060	**Error message** 18060 Faulty assignment in %4 **Cause of error** - Input or output cannot be accessed for compensation (e.g. is on another controller board) - Faulty assignment in the displayed file **Error correction** - Use TNCopt to regenerate the compensation file - Compensations by axis coupling possible only for axes on the same controller board - Inform your service agency

Error number	Description
237-18062	**Error message** 18062 CC %2 axis %1: AVD Filter 1%4 in position control loop instable **Cause of error** - The filter parameter set is inconsistent - The filter frequency is defined too high or too low **Error correction** - Use the current TNCopt version to check the AVD filters 11 and 12 - Generation of a new AVD file through TNCopt - Inform your service agency
237-18067	**Error message** 18067 CC %2 axis %1: CPF is instable %4 **Cause of error** - Separation frequency of the Crossover Position Filters (CPF) is too low **Error correction** - Check the separation frequency (MP_compActDampFreq) - Inform your service agency
237-18068	**Error message** 18068 Axis %1: FSC filter instable (%4) 18069 Axis %1: FSC filter instable (%4) **Cause of error** The FSC filter parameters are faulty. **Error correction** - Check the FSC parameters - Use TNCopt to optimize the FSC parameters - Deactivate FSC (set FscAccTolq to 0) - Inform your service agency
237-1806C	**Error message** 1806C "Machine Parameter" in %4 in line %5 is in error **Cause of error** - Syntax error in displayed file. - The given machine parameter is not supported **Error correction** - Generation of a new compensation file through TNCopt - Deactivation of the expanded compensations - Inform your service agency

Error number	Description
237-1806D	**Error message** 1806D Syntax error in FN22 function **Cause of error** - Error in FN22 syntax **Error correction** Inspect the syntax in the FN22 function Deactivate the FN22 function or the superimposed cycle Inform your service agency
237-1806E	**Error message** 1806E Faulty assignment in %4 **Cause of error** - Faulty assignment in the displayed file **Error correction** - Use TNCopt to regenerate the compensation file - Inform your service agency
237-1806F	**Error message** 1806F Cycle 239 has been canceled **Cause of error** Cycle 239 was canceled No mass/mass moment of inertia was estimated **Error correction** Repeat Cycle 239
237-18070	**Error message** 18070 CC%2 %1 Current limit in control loop **Cause of error** The current limitation in the control loop responded The AVD function was deactivated. Possible causes: - Excessive acceleration - Feedforward-control parameter(s) incorrect - Type of AVD damping incorrect - AVD damping factor too high **Error correction** - Check the nominal acceleration - Check the feedforward-control parameter(s) - Check the AVD parameterization - Adapt the parameter(s) if necessary - - Inform your service agency

Error number	Description
237-18071	**Error message** 18071 CC%2 function only available with EnDat encoder %1 **Cause of error** The crossover position filter is possible only with an EnDat encoder. **Error correction** Deselect the crossover position filter Use of an EnDat linear encoder Inform your service agency
237-18072	**Error message** 18072 Spindle overload %1 **Cause of error** - The spindle was briefly overloaded **Error correction** - Reduce the feed rate - Reduce the infeed - Check the cutting data
237-18074	**Error message** 18074 CC%2 %1 measured mass moment of inertia: %4 [kg'*m*m*0.001] **Cause of error** **Error correction**
237-18076	**Error message** 18076 CC%2 %1 acceleration threshold not reached: %4 [percent] **Cause of error** The required axis acceleration was not reached during the weighing run. The mass or mass moment of inertia can be estimated only if a specific minimum acceleration is reached. **Error correction** - Set override potentiometer to 100% - Increase the traverse distance for the weighing run
237-18078	**Error message** 18078 CC %2 axis %1: parameter %4 not supported by the software. **Cause of error** - Machine parameters are no longer supported by the installed NC software version. **Error correction** - Delete the machine parameters or set them to their initial value. - Inform your service agency

Error number	Description
237-18079	**Error message** 18079 CC%2: disturbance in UM communication, error code=%4 **Cause of error** The communication component for the optical fiber connection (HFL) to the inverters reports an error Possible causes: - Hardware defective - Electromagnetic disturbances - Optical fibers (HFL) not connected correctly - Insufficient bend radius of the optical fibers **Error correction** - Create a service file (error code gives information about the exact cause of the error for the diagnosis at HEIDENHAIN) - Inform your service agency - If required, exchange the hardware - Use TNCdiag to check the damping of the fiber-optic connections (HFL). If the damping is too high: - Check the optical fiber connections - Comply with the guidelines in the Technical Manual regarding the cable routing - Check the machine for correct shield connections and grounding - Check the motor and power cables for correct shield connections and terminal connections
237-1807A	**Error message** 1807A CC%2: Internal connection fault, Error code=%4 **Cause of error** The communication component of an internal connection is reporting an error. Possible causes: - Electromagnetic interference - Hardware defective **Error correction** - Check the encoder cables, particularly shield connections - Comply with the guidelines in the Technical Manual regarding the cable routing - Exchange the hardware - Create a service file (error code gives information about the exact cause of the error for the diagnosis at HEIDENHAIN) - Inform your service agency

Error number	Description
237-1807B	**Error message** 1807B CC%2: logical disturbance of data reception %1, error code=%4 **Cause of error** The communication component for the optical fiber connection (HFL) to the inverters reports an error Possible causes: - Hardware defective - Electromagnetic disturbances - Optical fibers (HFL) not connected correctly - Insufficient bend radius of the optical fibers **Error correction** - Create a service file (error code gives information about the exact cause of the error for the diagnosis at HEIDENHAIN) - Inform your service agency - If required, exchange the hardware - Use TNCdiag to check the damping of the fiber-optic connections (HFL). If the damping is too high: - Check the optical fiber connections - Comply with the guidelines in the Technical Manual regarding the cable routing - Check the machine for correct shield connections and grounding - Check the motor and power cables for correct shield connections and terminal connections
237-1807C	**Error message** 1807C CC%2: Internal port %5 fault, Error code=%4 **Cause of error** The communication component of an internal connection is reporting an error Possible causes: - Electromagnetic interference - Defective hardware **Error correction** - Check the encoder cables, particularly shield connections - Comply with the guidelines in the Technical Manual regarding the cable routing - Exchange the hardware - Create a service file (error code gives information about the exact cause of the error for the diagnosis at HEIDENHAIN) - Inform your service agency

Error number	Description
237-1807D	**Error message** 1807D CC%2: physical disturbance of data reception %1, error code=%4 **Cause of error** The communication component for the optical fiber connection (HFL) to the inverters reports an error. Possible causes: - Hardware defective - Electromagnetic disturbances - Optical fibers (HFL) not connected correctly - Insufficient bend radius of the optical fibers **Error correction** - Use TNCdiag to check the damping of the optical fiber connections (HFL); if the damping is too high: - Check the optical fiber connections - Comply with the guidelines in the Technical Manual regarding the cable routing - If necessary, exchange the hardware - Create a service file (error code gives information about the exact cause of the error for the diagnosis at HEIDENHAIN) - Inform your service agency - Check the machine for correct shield connections and grounding - Check the motor and power cables for correct shield connections and terminal connections
237-1807E	**Error message** 1807E CC%s: Internal connection fault, Error code=%4 **Cause of error** The component for internal optical fiber connections reports an error Possible causes: - Electromagnetic disturbances - Hardware defective **Error correction** - Check the encoder cables, particularly shield connections - Refer to the guidelines in the Technical Manual regarding the cable routing - Exchange the hardware - Create a service file (error code information about the exact cause of the error for the diagnosis at HEIDENHAIN) - Contact your service agency

Error number	Description
237-1807F	**Error message** 1807F UM 3xx inverter not found %1 **Cause of error** - No communication with the inverter of the displayed axis - Optical fibers connected incorrectly or not at all - Supply voltage of the inverter is missing - The machine parameters CfgAxisHardware->inverterInter-face, CfgAxisHardware->motorConnector, or CfgAxisHardware->hsciCcIndex are not parameterized correctly. - Inverter defective **Error correction** - Check the cabling - Check the supply voltage of the inverters - Check the entries in the machine parameters - Replace the inverter - Contact your service agency
237-18082	**Error message** 18082 There is no input for position encoder %1 **Cause of error** - A non-existent input was selected for the position encoder (entry in MP_posEncoderInput) **Error correction** - Check machine parameter MP_posEncoderInput - Inform your service agency
237-18083	**Error message** 18083 There is no input for speed encoder %1 **Cause of error** - A non-existent input was selected for the tachometer (entry in MP_speedEncoderInput) **Error correction** - Check machine parameter MP_speedEncoderInput - Inform your service agency
237-18084	**Error message** 18084 No outlet for optical waveguide %1 **Cause of error** - A non-existent output was selected for the fiber-optic cable to the inverter UM (entry in MP_inverterInterface) **Error correction** - Check the machine parameter MP_inverterInterface - Inform your service agency

Error number	Description
237-18085	**Error message** 18085 There is no motor connection on the inverter %1 **Cause of error** - The selected motor connection (entry in MP_motorConnector) is not present on the UM inverter or UEC compact inverter. **Error correction** - Check the machine parameter MP_motorConnector - Inform your service agency
237-18089	**Error message** 18089 WD monitoring has responded %1 (received:%4, expected:%5) **Cause of error** CC controller unit or UEC compact inverter reports that watchdog is no longer updated on UM inverter or UEC compact inverter **Error correction** - Restart the control - Check the machine for correct shield connections and grounding - Check the motor and power cables for correct shield connections and terminal connections - Inform your service agency
237-1808A	**Error message** 1808A Initial communication with inverter failed CC%2 %1 **Cause of error** No communication could be established with the inverter when booting the control. **Error correction** - Check the power supply - Inform your service agency - Replace the inverter
237-1808B	**Error message** 1808B ICTRL_xx.cmp parameter file faulty **Cause of error** - Incorrect entry in parameter file ICTRL_xx.cmp **Error correction** - Generation of a new parameter file via TNCopt - Variable parameter unknown - Variable parameter not permitted for this function - Inform your service agency

Error number	Description
237-1808C	**Error message** 1808C Parameter entered: "%1 WearAdaptFriction = %4" **Cause of error** - Wear parameter(s) defined **Error correction**
237-1808D	**Error message** 1808D Error in the determination of "WearAdaptFriction" **Cause of error** An error occurred while determining "WearAdaptFriction" - The velocity profile is not suitable for determining the wear parameter - The velocity profile is too long; as a result, the data recording is aborted too soon. - The velocity profile is too short; as a result, no constant velocity is reached for measured-value recording. **Error correction** - Adapt the velocity profile for determining the characteristic value for the wear - Inform your service agency
237-1808E	**Error message** 1808E PWM switching not permitted during operation **Cause of error** - The parameter for the PWM frequency was changed during operation. - The initial machine parameters contain a different PWM frequency. **Error correction** - All machine parameter subfiles must have the same PWM settings. - For all subfiles and all axes that are on the same PWM output, change the PWM frequency to the same value. - Inform your service agency.

Error number	Description
237-1808F	**Error message** 1808F CC%2 incompatible motor system %1, X%4 connection **Cause of error** The configured encoder input of the controller unit can evaluate only digital, purely serial measuring systems This input does not support encoders with 1Vpp signals. **Error correction** - If the motor encoder being used is a 1Vpp encoder: use inputs X401 to X406 of this CC and configure them through CfgAxisConfig/MP_speedEncoderInput. - If it is an encoder with purely serial EnDat interface: set the parameter CfgServoMotor/MP_motEncType to the correct value. - Inform your service agency.
237-18090	**Error message** 18090 CC%2 incompatible position encoder %1, X%4 connection **Cause of error** The configured encoder input of the controller unit can evaluate only digital, purely serial measuring systems This input does not support encoders with 1Vpp signals. **Error correction** - If the position encoder being used is a 1Vpp encoder: use inputs X401 to X406 of the CC and configure them through CfgAxisConfig/MP_posEncoderInput. - If it is an encoder with purely serial EnDat interface: set the parameter CfgAxisHardware/MP_posEncoderType to the correct value. - Inform your service agency
237-18091	**Error message** 18091 Speed controller: P factor or reset time too small in axis %1 **Cause of error** - P-factor of the speed controller in MP_vCtrlPropGain under CfgSpeedControl is too small - Reset time of the speed controller MP_vCtrlPropGain or MP_vCtrlIntGain is too short - Bit 20 of MP_miscCtrlFunct0 under CfgCCAuxil is set, although P factor and reset time are not too small **Error correction** - Increase the P factor in MP_vCtrlPropGain - Reduce the I factor in MP_vCtrlIntGain - Reset bit 20 of MP_miscCtrlFunct0

Error number	Description
237-18094	**Error message** 18094 CC%2 error during EnDat3 initialization %1 **Cause of error** - A problem occurred during initialization of the EnDat3 interface (AddInfo[0] == 0). - Communication with the EnDat3 encoder is not possible (AddInfo[0] == 1). **Error correction** - Restart the control - Exchange the CC controller unit - Check the encoder connecting cable - Remove the encoder from power for at least 5 seconds (disconnect the encoder from the control) and then restart the control - Exchange the encoder
237-18096	**Error message** 18096 Parameters of current controller are not correct %1 info %4 **Cause of error** - The current controller (CfgCurrentControl) is not parameterized correctly Info = 1: Mixed parameterization is not permitted: Please use only (iCtrlPropGain and iCtrlIntGain) or (iCtrlPropGainD, iCtrlIntGainD, iCtrlPropGainQ, and iCtrlIntGainQ) Info = 2: iCtrlPropGain = 0, even though iCtrlIntGain > 0 Info = 3: iCtrlPropGainD = 0, even though iCtrlIntGainD > 0 Info = 4: iCtrlPropGainQ = 0, even though iCtrlIntGainQ > 0 **Error correction** - Correct the parameterization of the current controller Info = 1: Set (iCtrlPropGain = 0 and iCtrlIntGain = 0) or (iCtrlPropGainD = 0, iCtrlIntGainD = 0, iCtrlPropGainQ = 0, and iCtrlIntGainQ = 0) Info = 2: Set iCtrlPropGain > 0 or iCtrlIntGain = 0 Info = 3: Set iCtrlPropGainD > 0 or iCtrlIntGainD = 0 Info = 4: Set iCtrlPropGainQ > 0 or iCtrlIntGainQ = 0
237-18097	**Error message** 18097 Axis %1: measurement not possible **Cause of error** The axis was moved beyond the traverse limit during the measurement. **Error correction** Position the axis so that there is sufficient clearance to the traverse limits. Reduce the underlying velocity.

Error number	Description
237-18098	**Error message** 18098 Axis %1: Application of the excitation signal canceled. **Cause of error** Drive is off or was switched off while the excitation signal was applied. **Error correction** Repeat the measurement with all drives switched on.
237-18099	**Error message** 18099 Shaft-speed-dependent PWM frequency switching not possible %1 **Cause of error** - A shaft-speed-dependent switching of the PWM frequency is configured with CfgCurrentControl/MP_iCtrlPwmType = 2. The software version being used does not yet support this functionality for Gen 3 drives. **Error correction** - Set the parameter CfgCurrentControl->iCtrlPwmType to 0. - If necessary, permanently set the PWM frequency to the higher value. - Inform your service agency.
237-1809A	**Error message** 1809A TNCopt adjustment sequence was started **Cause of error** An automatic adjustment sequence was started in TNCopt. TNCopt is controlling the control. The movement of the axes can be started automatically. **Error correction** - Check whether TNCopt is connected to the control and an adjustment sequence was started.
237-1809B	**Error message** 1809B Axes %1: Oscillation detected. **Cause of error** An oscillation was detected during the measurement. **Error correction** Reduce the amplitude of the excitation signal. Ensure that the control loops have sufficient stability reserves.

Error number	Description
237-1809C	**Error message** 1809C Type of referencing not permissible %1 **Cause of error** The mode set in the parameter CfgReferencing->refType is not possible with the present encoder. **Error correction** Enter a referencing mode suitable to the encoder in the stated parameter.
237-1809D	**Error message** 1809D CC%2: faulty internal connection **Cause of error** Interrupted communication to a device-internal controller. Possible causes: - Supply voltage outside of the permissible tolerance - Hardware defective **Error correction** - Check the supply voltage of the affected CC and dimension it according to the manual. - Exchange the CC. - Inform your service agency.
237-1809E	**Error message** 1809E CC%2: faulty internal connection **Cause of error** Interrupted communication to a device-internal controller. Possible causes: - Supply voltage outside of the permissible tolerance - Hardware defective **Error correction** - Check the supply voltage of the affected CC and dimension it according to the manual. - Exchange the CC. - Inform your service agency.
237-1809F	**Error message** 1809F Axis %1: value of amplitude not in permissible range **Cause of error** The value of the amplitude of the excitation signal for the measurement of the frequency response is outside of the permissible range. **Error correction** - Inform your machine tool builder - Check the OEM macro for Cycle 238 (Measure machine status, CfgSystemCycle->OEM_MACHSTAT_MEAS) - Check the value for the excitation amplitude - Recommended setting: Enter the amplitude as a factor of the rated current. A typical value is 0.3.

Error number	Description
237-180A0	**Error message** 180A0 Non-released inverter software loaded **Cause of error** The inverter contains test software that has not been released. This software may only be used for internal testing purposes. **Error correction** - Check the software version - Generate service files - Inform your service agency
237-180A1	**Error message** 180A1 "Time exceeded" trigger **Cause of error** The event that triggers the trigger did not occur in time. The programmed feed rate was not reached. **Error correction** Reduce the programmed feed rate.
237-180A2	**Error message** 180A2 Axis %1: %4 is not supported by the CC controller unit **Cause of error** The configured function is not supported in combination with the controller unit being used (CC or UxC). **Error correction** - Deactivate the function - Inform your service agency
237-180A3	**Error message** 180A3 Axis %1: zero crossover of the %4 speed in '%5' measurement **Cause of error** While recording the Bode plot, a zero crossover of a measured velocity was detected. For this type of measurement, non-linear effects of friction at velocity=0 should be avoided. **Error correction** Increase the ratio of the underlying velocity to the excitation amplitude

Error number	Description
237-180A4	**Error message** 180A4 CC%2: maximum computing load has risen for axis %1 **Cause of error** Due to a changed or newly activated set of machine parameters, the computing load of the CC has increased compared to the load through the initial or previous set of machine parameters. Factors in the computing load are the parameters for the PWM frequency (CfgPowerStage > ampPwmFreq), the controller performance (CfgAxisHardware > ctrlPerformance), and the current controller cycle time (CfgCurrentControl > iCtrlPwmType). **Error correction** - Reboot the control to initially load the changed set of parameters while booting. - Initially load the set of machine parameters with the highest computing load (if necessary with the attribute Axes->PhysicalAxes->(axis designation)->deactivatedAtStart = TRUE) and only then activate the set of machine parameters appropriate for the current hardware configuration (with less computing load).
237-180A6	**Error message** 180A6 Axis %1: waterfall diagram measurement: v_nom not constant **Cause of error** The nominal velocity v_nom is not constant while recording the waterfall chart. **Error correction** - Inform your machine manufacturer - Check/correct the OEM macro for Cycle 238 Measure Machine Status (CfgSystemCycle > OEM_MACHSTAT_MEAS) - Increase the lead and lag time

Error number	Description
237-180A7	**Error message** 180A7 CC%2: communication error w/ EnDat3 speed encoder, error code %6 180A8 CC%2: communication error w/ EnDat3 pos. encoder, error code %6 **Cause of error** - An error occurred during communication with the EnDat3 encoder - The error code describes the cause: - 0, 1: Error in the physical layer (PHY) - 2: CRC error of the HPF or an LPF - 3: WD error; no response from the encoder was detected during the timeout - Possible causes: - Defective encoder - Defective encoder connecting cable - Noise on the encoder connecting cable **Error correction** - Exchange the encoder - Check the connecting cable, and exchange it if necessary - Exchange the CC controller unit
237-180A9	**Error message** 180A9 CC %2: EnDat3 speed encoder reports error, error code %6 180AA CC %2: EnDat3 position encoder reports error, error code %6 **Cause of error** The EnDat3 encoder reports an error during cyclic communication The error code describes the cause: - 6: Generation of data failed or encoder system failure - 7: Singleturn position faulty - 8: Multiturn position faulty - 9: Permissible ambient conditions of the encoder exceeded (e.g. temperature) - 10: Permissible electrical operating conditions exceeded (current and/or voltage too high or too low) - 11, 12, 13, 14: Device-specific error message 0-3 (note the encoder documentation) - 15: Unspecified error message **Error correction** - Check the encoder - Ensure the correct ambient conditions of the encoder - Exchange the encoder

Error number	Description
237-180AB	**Error message** 180AB CC%2: error in cyclic com. w/ EnDat3 speed encoder, error code %6 180AC CC%2: error in cyclic com. w/ EnDat3 pos. encoder, error code %6 **Cause of error** The encoder reports an error during cyclic communication The error code describes the cause: - 4: Invalid position data were transmitted - 5: A request code is not supported by the encoder - 6: An error that cannot be associated was signaled **Error correction** - Check the encoder - Check any additional queries - Exchange the encoder - Exchange the CC controller unit - Inform your service agency
237-180AD	**Error message** 180AD CC%2: warning by EnDat3 encoder to %10; warning code: %6 **Cause of error** A warning was signaled during communication with the encoder The warning code describes the cause: - 0: Encoder status/maintenance - 1: Close to the limits of the permissible ambient conditions (e.g. temperature) - 2: Close to the limits of the permissible electrical operating conditions (current/voltage) - 3: Temperature warning threshold exceeded - 4: Almost down to minimum battery charge - 5-8: Encoder-specific warning 0-3 - 9: Unspecified warning from encoder - 10: A warning that cannot be associated is being signaled A serious encoder error could occur soon **Error correction** Measures depending on the warning code: - 0: Servicing of the encoder is recommended - 1, 4: Check compliance with the ambient conditions (e.g. temperature) and initiate measures - 2: Check compliance with the electrical operating conditions (e.g. ensure the voltage supply) - 3: Ensure compliance with the electrical operating conditions, change the battery soon - 5-8: Initiate measures as per the encoder documentation - 9, 10: Check the encoder; exchange the encoder; inform your service agency

Error number	Description
237-180B1	**Error message** 180B1 Time exceeded during communication with UM 3xx at %1 **Cause of error** The described UM 3xx did not react to a communication request from the CC in time. Possible causes - Electromagnetic noise or faulty electrical contacts of the 24V supply voltage - Electromagnetic noise or faulty electrical contacts of the DC-link voltage - Electromagnetic noise or faulty electrical contacts in the motor cabling - Electromagnetic noise or faulty electrical contacts in the brake cabling - Contamination or poor optical coupling of the HFL **Error correction** - Check the machine and wiring for correct shield connection and grounding - Check the power cables for correct clamping - Check the HFL for correct routing, and also for contamination and correct clamping - Exchange the UM 3xx inverter - Exchange the CC 3xx controller unit - Generate a service file and inform your service agency
237-180B2	**Error message** 180B2 Error in communication with UM 3xx at %1 **Cause of error** Telegrams were lost during transmission of the actual current values from the UM to the CC. Possible causes - Electromagnetic noise or faulty electrical contacts of the 24V supply voltage - Electromagnetic noise or faulty electrical contacts of the DC-link voltage - Electromagnetic noise or faulty electrical contacts in the motor cabling - Electromagnetic noise or faulty electrical contacts in the brake cabling - Contamination or poor optical coupling of the HFL- - Internal system error **Error correction** - Check the machine and wiring for correct shield connection and grounding - Check the power cables for correct clamping - Check the HFL for correct routing, and also for contamination and correct clamping - Exchange the UM 3xx inverter - Exchange the CC 3xx controller unit - Generate a service file and inform your service agency

Error number	Description
237-180B3	**Error message** 180B3 Time exceeded during communication with internal component at %1 **Cause of error** The position-value converter component assigned to the connector did not react to a communication request from the processor in time. Possible causes - Electromagnetic noise or faulty electrical contacts of the 24V supply voltage - Electromagnetic noise or faulty electrical contacts in the encoder cabling - Electromagnetic noise or faulty electrical contacts in the shield connection - Internal system error **Error correction** - Check the machine and wiring for correct shield connection and grounding - Check the encoder cabling for correct clamping - Exchange the affected encoder or other encoders in the same column - so for X401 also X402, X431, or X432 - so for X403 also X404, X433, or X434 - so for X405 also X406, X435, or X436 - Exchange the CC 3xx controller unit - Generate a service file and inform your service agency
237-180B4	**Error message** 180B4 Error in communication with internal component at %1 **Cause of error** Communication with the position-value converter component for the described connector is impaired. Possible causes - Electromagnetic noise or faulty electrical contacts of the 24V supply voltage - Electromagnetic noise or faulty electrical contacts in the encoder cabling - Electromagnetic noise or faulty electrical contacts in the shield connection - Internal system error **Error correction** - Check the machine and wiring for correct shield connection and grounding - Check the encoder cabling for correct clamping - Exchange the affected encoder or other encoders in the same column - so for X401 also X402, X431, or X432 - so for X403 also X404, X433, or X434 - so for X405 also X406, X435, or X436 - Exchange the CC 3xx controller unit - Generate a service file and inform your service agency

Error number	Description
237-180B5	**Error message** 180B5 Too many faulty telegrams of a UM 3xx in sequence %1 **Cause of error** Too many telegrams in sequence were lost during transmission of the actual current values from the UM to the CC. Possible causes - Electromagnetic noise or faulty electrical contacts of the 24V supply voltage - Electromagnetic noise or faulty electrical contacts of the DC-link voltage - Electromagnetic noise or faulty electrical contacts in the motor cabling - Electromagnetic noise or faulty electrical contacts in the brake cabling - Contamination or poor optical coupling of the HFL **Error correction** - Check the machine and wiring for correct shield connection and grounding - Check the power cables for correct clamping - Check the HFL for correct routing, and also for contamination and correct clamping - Exchange the UM 3xx inverter - Exchange the CC 3xx controller unit - Generate a service file and inform your service agency
237-180B6	**Error message** 180B6 Too many faulty telegrams of a UM 3xx %1 **Cause of error** Too many telegrams were lost during transmission of the actual current values from the UM to the CC during the monitoring period. Possible causes - Electromagnetic noise or faulty electrical contacts of the 24V supply voltage - Electromagnetic noise or faulty electrical contacts of the DC-link voltage - Electromagnetic noise or faulty electrical contacts in the motor cabling - Electromagnetic noise or faulty electrical contacts in the brake cabling - Contamination or poor optical coupling of the HFL **Error correction** - Check the machine and wiring for correct shield connection and grounding - Check the power cables for correct clamping - Check the HFL for correct routing, and also for contamination and correct clamping - Exchange the UM 3xx inverter - Exchange the CC 3xx controller unit - Generate a service file and inform your service agency

Error number	Description
237-180B7	**Error message** 180B7 Excessive error frequency for telegrams of UM 3xx %1 **Cause of error** The frequency of faulty telegrams during transmission of the actual current values from the UM to the CC is above the limit value. Possible causes - Electromagnetic noise or faulty electrical contacts of the 24V supply voltage - Electromagnetic noise or faulty electrical contacts of the DC-link voltage - Electromagnetic noise or faulty electrical contacts in the motor cabling - Electromagnetic noise or faulty electrical contacts in the brake cabling - Contamination or poor optical coupling of the HFL **Error correction** - Check the machine and wiring for correct shield connection and grounding - Check the power cables for correct clamping - Check the HFL for correct routing, and also for contamination and correct clamping - Exchange the UM 3xx inverter - Exchange the CC 3xx controller unit - Generate a service file and inform your service agency
237-180B8	**Error message** 180B8 Conspicuous telegrams of UM 3xx %1 below the reporting threshold **Cause of error** There are peculiar telegrams during transmission of the actual current values from the UM to the CC. Possible causes - Electromagnetic noise or faulty electrical contacts of the 24V supply voltage - Electromagnetic noise or faulty electrical contacts of the DC-link voltage - Electromagnetic noise or faulty electrical contacts in the motor cabling - Electromagnetic noise or faulty electrical contacts in the brake cabling - Contamination or poor optical coupling of the HFL **Error correction** - No immediate corrective action is necessary, since no error situation has occurred yet - Possible preventive measure: check the machine for correct shield connection and grounding - Possible preventive measure: check the power cables for correct clamping - Possible preventive measure: check the HFL for correct routing, and also for contamination and correct clamping

Error number	Description
237-180B9	**Error message** 180B9 Conspicuous telegrams of UM 3xx %1 **Cause of error** There are peculiar telegrams during transmission of the actual current values from the UM to the CC. Possible causes - Electromagnetic noise or faulty electrical contacts of the 24V supply voltage - Electromagnetic noise or faulty electrical contacts of the DC-link voltage - Electromagnetic noise or faulty electrical contacts in the motor cabling - Electromagnetic noise or faulty electrical contacts in the brake cabling - Contamination or poor optical coupling of the HFL **Error correction** - No immediate corrective action is necessary, since no error situation has occurred yet - Possible preventive measure: check the machine for correct shield connection and grounding - Possible preventive measure: check the power cables for correct clamping - Possible preventive measure: check the HFL for correct routing, and also for contamination and correct clamping
237-180BA	**Error message** 180BA CC%2 EnDat2.2 incremental: faulty absolute value %1 **Cause of error** - Reference run was faulty - Reversal during the reference run - The same reference mark was traversed more than once **Error correction** - Separate the encoder from the power supply (for at least 10 seconds) - Switch off the power supply of the machine (main power switch off and on)
237-180BB	**Error message** 180BB Faulty FSuC Include file CC%2 %1 **Cause of error** The interface versions of internal components (SOC and FSuC) on the CC do not match. **Error correction** - Check the software version and run an update if necessary - Inform your service agency

Error number	Description
237-180BC	**Error message** 180BC Field-angle adjustment: chkPosHoldFieldAdj = 0 axis %1 **Cause of error** - A field angle adjustment was started even though the parameter CfgControllerAuxil > chkPosHoldFieldAdj has the value 0 - Only for spindles is it possible to deactivate position monitoring during a field angle adjustment - This is not permitted for axes **Error correction** - Set CfgControllerAuxil > chkPosHoldFieldAdj to a value greater than 0
237-180BD	**Error message** 180BD Position monitoring for field-angle adjustment %1, ES %4 **Cause of error** - The maximum position deviation was exceeded during the field angle adjustment. The additional information indicates the active emergency-stop input, if set: 0 = No emergency-stop input is set 1 = Emergency Stop A 2 = Emergency Stop A Handwheel 3 = Emergency Stop B 4 = Emergency Stop B Handwheel 5 = Emergency Stop B Functional Safety 6 = Emergency Stop B Functional Safety Handwheel 7 = Emergency Stop A Functional Safety 8 = Emergency Stop A Functional Safety Handwheel **Error correction** - Check the parameter CfgControllerAuxil > chkPosHoldField-Adj and increase it, if necessary - Check the external wiring, especially the emergency-stop inputs - Check the encoder and motor data
237-180BE	**Error message** 180BE Monitoring of servo lag inactive %1 **Cause of error** - The parameter CfgPosControl > servoLagMax2 has the value 0 - Only for spindles is it possible to deactivate servo-lag monitoring. This is not permitted for axes. **Error correction** - Set CfgPosControl > servoLagMax2 to a value greater than 0

Error number	Description
237-18500	**Error message** 18500 SKERN-CC%2: encoder error CRC X%4 **Cause of error** - Checksum error for the encoder data **Error correction** - Reboot the control - Exchange the controller unit (CC or UEC) if necessary - Inform your service agency
237-18501	**Error message** 18501 SKERN-CC%2: encoder error BlockID X%4 **Cause of error** - Block ID error for the encoder data **Error correction** - Reboot the control - Exchange the controller unit (CC or UEC) if necessary - Inform your service agency
237-18502	**Error message** 18502 SKERN-CC%2: encoder error amplitude too small X%4 18800 SKERN-CC%2: encoder warning amplitude too small X%4 **Cause of error** - Amplitude of encoder is too low **Error correction** - Check power supply of the encoder - Check encoder cabling - Replace encoder - Inform your service agency
237-18503	**Error message** 18503 SKERN-CC%2: encoder error amplitude too large X%4 **Cause of error** - Amplitude of encoder is too high **Error correction** - Check encoder cabling - Replace encoder if necessary - Inform your service agency
237-18504	**Error message** 18504 SKERN-CC%2: encoder error frequency incorrect X%4 **Cause of error** - Frequency error in the encoder signals **Error correction** - Check encoder cabling including the shielding - Replace encoder if necessary - Inform your service agency

Error number	Description
237-18505	**Error message** 18505 SKERN-CC%2: encoder error latch counter not incremented X%4 **Cause of error** - Faulty latch counter in the encoder data - No new encoder data received **Error correction** - Reboot the control - Exchange the controller unit (CC or UEC) or encoder (only if EnDat) if necessary - Check the encoder connection and cabling - Inform your service agency
237-18506	**Error message** 18506 SKERN-CC%2: encoder error pin ID X%4 **Cause of error** - PIN ID in the encoder data incorrect **Error correction** - Exchange the controller unit (CC or UEC) if necessary - Inform your service agency
237-18507	**Error message** 18507 SKERN-CC%2: encoder error EnDat22 F1 bit set X%4 **Cause of error** - Error bit F1 set in the EnDat22 encoder **Error correction** - Pay attention to the subsequent alarms - Check/replace encoder cabling - Replace encoder - Inform your service agency
237-18508	**Error message** 18508 SKERN-CC%2: encoder error EnDat22 F2 bit set X%4 **Cause of error** - Error bit F2 set in the EnDat22 encoder **Error correction** - Pay attention to the subsequent alarms - Check/replace encoder cabling - Replace encoder - Inform your service agency

Error number	Description
237-18509	**Error message** 18509 SKERN-CC%2: encoder error EnDat22 CRC X%4 **Cause of error** - Checksum error for the EnDat22 encoder data **Error correction** - Check/replace encoder cabling - Replace encoder - Inform your service agency
237-18510	**Error message** 18510 SKERN-CC%2: encoder error invalid overflow value X %4 **Cause of error** - Invalid overflow value for the encoder data **Error correction** - Inform your service agency
237-18511	**Error message** 18511 SKERN-CC%2: encoder error: group error in the EnDat master X%4 **Cause of error** There is an error with the encoder (EnDat master). **Error correction** Inform your service agency
237-18520	**Error message** 18520 SKERN-CC%2: CRC error in cyclic inverter communication %1 18523 UM (FS.B): CRC error during cyclic UM communication CC%2 %1 **Cause of error** - CRC error in cyclic FS communication with the inverter **Error correction** - Reboot the control - Inform your service agency
237-18521	**Error message** 18521 SKERN-CC%2: counter error in cyclic inverter communication %1 18524 UM (FS.B): counter error during cyclic UM communication CC%2 %1 **Cause of error** - Faulty packet counter in cyclic FS communication with the inverter **Error correction** - Reboot the control - Inform your service agency

Error number	Description
237-18522	**Error message** 18522 SKERN-CC%2: checksum faulty %1 18525 UM (FS.B): checksum error CC%2 %1 **Cause of error** - Checksum error of the UM-DriveID in cyclic FS communication with the inverter **Error correction** - Reboot the control - Inform your service agency
237-18530	**Error message** 18530 SKERN-CC%2: axis state during SMP change not STO %1 **Cause of error** - The axis was not in STO when one of the following parameters was changed: hsciCcIndex, inverterInterface, motorConnector **Error correction** - Switch the affected drive off or put it in STO before changing the parameter(s) - Check the PLC/SPLC program, and adapt it if necessary - Inform your service agency
237-18531	**Error message** 18531 SKERN-CC%2: watchdog error SKERN B400 SKERN-CC%2: watchdog error interface **Cause of error** - Internal software error (watchdog low priority cycle) **Error correction** - Inform your service agency
237-18540	**Error message** 18540 Encoder at X%4: Error during test of signal amplitude **Cause of error** An encoder with incremental signals is connected to the indicated connection. An error occurred with this encoder while testing the signal amplitude: - The dynamic sampling of an excessively high signal amplitude could not be completed successfully - The dynamic sampling of an excessively low signal amplitude could not be completed successfully **Error correction** - Check connections and cable of the encoder - Replace encoder or cable - Inform your service agency

Error number	Description
237-18541	**Error message** 18541 EnDat encoder at X%4: Forced dynamic sampling failed **Cause of error** An encoder with EnDat interface is connected to the indicated connection. An error occurred with this encoder during forced dynamic sampling. Possible causes: - Encoder not connected correctly - Encoder defective **Error correction** - Check connections and cable of the encoder - Replace encoder or cable - Inform your service agency
237-18542	**Error message** 18542 SKERN-CC%2: single-event-upset error (SEU) was determined SKERN-MC: single-event-upset error (SEU) was determined **Cause of error** - Internal software error - Possible sporadic error due to EMC irradiation **Error correction** - Restart the control - Check the shielding or shield connection of the devices - Shield or remove possible EMC interferences - Inform your service agency
237-18544	**Error message** 18544 SKERN-CC%2: Inverter SS0 request axis %1 18554 UM (FS.B): CC%2 SS0 request %1 **Cause of error** - The inverter requests an SS0 stop function through the cyclic UM(FS.B) communication **Error correction** - Note any further messages from the inverter - Reboot the control
237-18545	**Error message** 18545 SKERN-CC%2: Inverter SS1F request axis %1 18555 UM (FS-B): UM requests SS1F CC%2 %1 **Cause of error** - The inverter requests an SS1F stop function through the cyclic UM(FS.B) communication **Error correction** - Note any further messages from the inverter - Reboot the control

Error number	Description
237-18546	**Error message** 18546 SKERN-CC%2: Inverter watchdog error FSuC axis %1 18556 UM (FS.B): watchdog error UM-FS.A CC%2 %1 **Cause of error** - FS.B of the inverter reports a watchdog error FS.A (WDF.A) - FS.A of the inverter is no longer ready **Error correction** - Reboot the control - Inform your service agency - Exchange the inverter, if necessary
237-18547	**Error message** 18547 SKERN-CC%2: Inverter FS.A supply voltage faulty axis %1 18557 UM (FS.B): UM-FS.A improper power supply CC%2 %1 **Cause of error** - An internal supply voltage is too high or too low **Error correction** - Note any further messages from the inverter - Check the supply voltage of the inverter (jumper plug X76) - Reboot the control - Inform your service agency - Exchange the inverter, if necessary
237-18548	**Error message** 18548 SKERN-CC%2: Inverter requests an SS1 reaction axis %1 18558 UM (FS.B): UM requests SS1 reaction CC%2 %1 **Cause of error** - The inverter requests an SS1 stop reaction through the cyclic UM(FS.B) communication **Error correction** - Note any further messages from the inverter
237-18549	**Error message** 18549 SKERN-CC%2: Inverter requests an SS2 reaction axis %1 18559 UM (FS.B): UM requests SS2 reaction CC%2 %1 **Cause of error** - The inverter requests an SS2 stop reaction through the cyclic UM(FS.B) communication **Error correction** - Note any further messages from the inverter

Error number	Description
237-18550	**Error message** 18550 Test command was received in released software! 13F01 Test command was received in released software! **Cause of error** Error injection was demanded for a release software. This is not permissible! **Error correction** - Use autotest software! - Inform your service agency
237-18552	**Error message** 18552 SKERN-CC%2: Stuck-At error on the temperature channel **Cause of error** - The A/D converter channel (on the controller unit) for measuring the board temperature is defective - The firmware of the controller unit has detected a fault **Error correction** - Exchange the controller unit (CC or UEC) if necessary - Inform your service agency
237-18553	**Error message** 18553 SKERN-CC%2: Stuck-at error in voltage channel %4 **Cause of error** - Controller unit is defective (ADC channel). - Driver problem of the firmware of the controller unit (CC, UEC). **Error correction** - Inform your service agency. - Exchange the controller unit (CC, UEC), if necessary.
237-1855A	**Error message** 1855A SKERN-CC%2: EnDat forced dynamic sampling not performed **Cause of error** Checking of the Endat22 forced dynamic sampling at the end of the first self-test failed. No successful EnDat forced dynamic sampling performed in the last 168 hours was detected. **Error correction** - Check the encoder for a defect or fault - Exchange the encoder

Error number	Description
237-1855B	**Error message** 1855B SKERN-CC%2: interval violation upon EnDat forced dynamic sampling **Cause of error** - The minimum time interval (4 hours) until the next EnDat forced dynamic sampling was violated (AddInfo[4] = 2) - The maximum time interval (168 hours) until the next EnDat forced dynamic sampling was violated (AddInfo[4] = 1) **Error correction** - Restart the control - If the error recurs, inform your service agency
237-1855C	**Error message** 1855C SKERN-CC%2: errors during EnDat forced dynamic sampling **Cause of error** The detected dynamic error bit does not match the forced dynamic sampling error. **Error correction** - Restart the control - - Check the encoder for a defect or fault - Exchange the encoder - If the error recurs after exchanging the encoder, inform your service agency
237-18801	**Error message** 18801 Autotest manipulation via hcS_AUTO_TEST_SK-ERN_CC is active! **Cause of error** - An error injection was triggered - No officially released software version is installed **Error correction** - Check the software version of the control - Install a released software version - Inform your service agency

Error number	Description
237-18802	**Error message** 18802 SKERN-CC: Test software without safety approval is loaded **Cause of error** The CC contains a test software with safety approval - This software has neither been tested nor released - No checksum will be calculated **Error correction** - After acknowledging the error message you can use this software only for tests - Check the software version - Create service files - Contact your service agency
237-18803	**Error message** 18803 CC%2 synchronization of SPLC run-time system lost **Cause of error** The mechanism for the synchronization of the SPLC run-time system routine on all CC controller units returned an error. **Error correction** - Generate a service file - Contact your service agency - Restart the control

Error number	Description
237-19000	**Error message** 19000 DQ-LT %1: Overcurrent ID=%4; fault value=%5 **Cause of error** The power module of the encoder detected overcurrent. - Closed-loop control is incorrectly parameterized - Motor has a short circuit or ground fault - Volts-per-hertz mode: Run-up ramp is set too small - U/f mode: Rated current of the motor is significantly greater than that of the motor module - Incoming power: High discharging and recharging currents in the event of line power failure - Incoming power: High recharging currents in the event of motor overload and failure of the DC-link voltage - Incoming power: Short circuit currents during switch-on due to missing commutating reactor. - Power lines are not correctly connected. - The power lines exceed the maximum permissible length. - Power module defective. Fault value (interpret bit-wise): Bit 0: Phase U. Bit 1: Phase V. Bit 2: Phase W. **Error correction** - Check the motor data; if required, repeat initial servicing - Check the motor circuit configuration (wye-delta). - Volts-per-hertz mode: Increase the run-up ramp - U/f mode: Check the assignment of the rated currents of the motor and motor modules - Incoming power: Check the line power quality - Incoming power: Decrease the motor load - Incoming power: Correct connection of the line commutating reactor - Check the power cable connections. - Check the power cables for short-circuit or ground fault. - Check the length of the power cable connections. - Exchange the power module

Error number	Description
237-19001	**Error message** 19001 DQ-MotEnc %1: ref. mark distance ID=%4; fault value= %5 **Cause of error** The measured reference-mark distance does not correspond to the parameterized reference-mark distance. For distance-coded encoders, the reference-mark distance is determined from detected pairs of reference marks. This means that if a reference mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. Fault value (interpret decimal value): Last measured reference-mark distance in increments (4 increments = 1 encoder pulse). The algebraic sign designates the direction of motion when detecting the reference-mark distance. **Error correction** - Check that the encoder cables are routed in compliance with EMC. - Check the plug connections. - Check the encoder type (encoder with equidistant reference marks). - Replace the encoder or encoder cable.
237-1F300	**Error message** 1F300 CC%2 Cancelation of the cutout channel test %4 1F300 CC%2 Cancelation of the cutout channel test %4 1F300 CC%2 Cancelation of the cutout channel test %4 1F300 CC%2 Cancelation of the cutout channel test %4 1F300 CC%2 Cancelation of the cutout channel test %4 1F300 CC%2 Cancelation of the cutout channel test %4 1F300 CC%2 Cancelation of the cutout channel test %4 1F300 CC%2 Cancelation of the cutout channel test %4 1F300 CC%2 Cancelation of the cutout channel test %4
237-1F300	**Error message** 1F300 CC%2 Cancelation of the cutout channel test %4 **Cause of error** The cutout channel test was ended autonomously because of an error. An error occurs in the pp_GenFB_NCC signal (PL system module). The control does not finish a test step correctly **Error correction** - Check whether a previous system error of the control led to the cancellation of a test section - Check the wiring of the signal pp_GenFB_NCC - Inform your service agency

237-3820	**Error message** 13820 UM-SOC: Spannungsüberwachung 3,3V-FSuC überschritten **Cause of error** **Error correction**
237-3891	**Error message** 13891 UM-SOC: Fehlerhafte Include-Datei (erhaltene Version: %4 - erwartete Version:%5) **Cause of error** - Software von Reglereinheit und Umrichter(FS) sind nicht mit der gleichen Include-Datei compiliert worden. **Error correction** - Softwareversion prüfen und gegebenenfalls neu laden - Kundendienst benachrichtigen
237-8800	**Error message** 18800 SKERN-CC: Geberwarnung Amplitude zu niedrig X%4 **Cause of error** **Error correction**
238-1000	**Error message** 1000 UVR%2 overcurrent **Cause of error** The power supply unit hat detected an exceedance of the permissible current on its supply connection **Error correction** Inform your service agency
238-1001	**Error message** 1001 UVR%2 phase current too high **Cause of error** The line current consumed by the power supply unit is close to the maximum permissible value **Error correction** - Inspect the design of the inverter system - Reduce the power consumption of the inverter system - Inform your service agency
238-1002	**Error message** 1002 UVR%2 DC-link voltage too high **Cause of error** The power supply unit has detected that the DC-link voltage is too high **Error correction** Inform your service agency

Error number	Description
238-1003	**Error message** 1003 UVR%2 error in power supply **Cause of error** The supply unit hat detected a faulty power supply network. **Error correction** - Check the supply connection, and ensure correct supply connection - Inform your service agency
238-1004	**Error message** 1004 UVR%2 DC-link voltage too low **Cause of error** The power supply unit is reporting that the DC-link voltage is too low. **Error correction** - Check the supply connection - Check the parameters and stability of the supply network - Inform your service agency
238-1006	**Error message** 1006 UVR%2 leakage current too high **Cause of error** The leakage current monitor of the power supply unit has detected an impermissibly high value. **Error correction** - Check the wiring of the power modules and motors - Check the motor lines and DC link for sufficient insulation resistance to ground - Inform your service agency
238-1007	**Error message** 1007 UVR%2 temperature too high at heat sink **Cause of error** The temperature of the heat sink in the UVR exceeds a critical value. **Error correction** Reduce the load
238-1008	**Error message** 1008 UVR%2 error in control of IGBT **Cause of error** The supply unit has detected an error with the IGBT drive circuit **Error correction** Inform your service agency

Error number	Description
238-100A	**Error message** 100A UVR%2 temperature at heat sink critically high **Cause of error** The heat-sink temperature in the UVR supply unit is reaching critical values. **Error correction** - Reduce the power drawn from the DC link - Check the temperature or climate control unit of the electrical cabinet - Check for ventilation clearances around the power supply unit - Inform your service agency
238-100B	**Error message** 100B UVR%2 error in DC-link charge **Cause of error** The power supply unit has detected a fault during charging of the DC link. **Error correction** - Check the DC-link bus mounting or the DC-link wiring for a short circuit - Inform your service agency.
238-100C	**Error message** 100C UVR%2 service mode activated **Cause of error** The service mode of the UVR has been activated. Control of the UVR now occurs over the service interface. **Error correction** End the service mode at the service interface.
238-100D	**Error message** 100D UVR%2 faulty PWM control **Cause of error** The PWM drive circuit monitor is reporting an error **Error correction** Inform your service agency
238-100E	**Error message** 100E UVR%2 hardware detection faulty **Cause of error** The hardware detection of the power supply unit (so-called HIK) is faulty **Error correction** Inform your service agency

Error number	Description
238-100F	**Error message** 100F UVR%2 configuration error **Cause of error** The configuration of the UVR power supply unit is faulty. **Error correction** - Check the configuration of the power supply unit, and correct it as necessary (CfgSupplyModule3xx) - Inform your service agency
238-1010	**Error message** 1010 UVR%2 low voltage faulty **Cause of error** The supply voltage monitor in the supply unit is reporting an error **Error correction** Inform your service agency
238-1011	**Error message** 1011 UVR%2 failure of fan for power supply unit **Cause of error** The UVR power supply unit has detected a fault in the supply unit fan. **Error correction** - Check the supply unit fan for whether it is possibly blocked by objects or contamination - Inform your service agency
238-1012	**Error message** 1012 UVR%2 software error **Cause of error** Internal fault of the power supply unit **Error correction** Inform your service agency
238-1013	**Error message** 1013 UVR%2 error during self-test **Cause of error** A fault has arisen in the power supply unit during the internal self-test. **Error correction** - Check the wiring of the supply unit - Inform your service agency

Error number	Description
238-1014	**Error message** 1014 UVR%2 control error **Cause of error** A fault has arisen in the regulator in the power supply unit **Error correction** Inform your service agency
238-1015	**Error message** 1015 UVR%2 overload in the +24V of the integrated power supply unit **Cause of error** The current consumption of the 24 V consumers on the integrated power supply unit of the UVR exceeds the maximum permissible value. **Error correction** - Check the wiring of the +24 V (X76, X90) of the power supply unit integrated into the UVR - Check consumers on +24 V, and reduce as needed - Check the planning of the machine according to the technical manual of your inverter system - Check the configuration of CfgSupplyModule3xx/MP_ps24VMaxLoadCurr - Inform your service agency
238-1016	**Error message** 1016 UVR%2 CRC error during HSCI transmission **Cause of error** A checksum error was detected during data transmission over HSCI. **Error correction** - Check the HSCI connections and HSCI cables - Inform your service agency
238-1017	**Error message** 1017 UVR %2 maximum permissible DC-link capacity exceeded **Cause of error** The UVR power supply unit has detected an impermissibly high DC-link capacity. **Error correction** - Check the design of the inverter system - Reduce the number of modules connected to the DC-link (UM, CMH) - Inform your service agency

Error number	Description
238-1018	**Error message** 1018 UVR%2 processor temperature reaching critical values **Cause of error** The processor temperature in the UVR is reaching critical values. **Error correction** - Check the temperature in the electrical cabinet - Check the climate control unit for proper functioning - Inform your service agency
238-1019	**Error message** 1019 UVR%2 maximum temperature of processor exceeded **Cause of error** The maximum temperature of the processor in the supply unit has been exceeded. **Error correction** - Check the temperature in the electrical cabinet - Check the climate control unit for proper functioning - Reduce the power of the inverter system - Inform your service agency
238-101A	**Error message** 101A UVR%2 synchronization with line power supply failed **Cause of error** The synchronization between the supply unit and the supply network was not successful. **Error correction** - Check for a faulty connection of the main supply conductors - Check SITOR fuses for the inverter system - Check the power supply network - Inform your service agency
238-101B	**Error message** 101B UVR%2 value of DC-link center voltage too high **Cause of error** The UVR power supply unit has detected that the amount of the DC-link mean voltage is reaching impermissibly high values. **Error correction** - Check the supply voltages of the UVR (line voltage). - Ensure that operation occurs on a TN network. Operation on TT or IT networks is not permitted. Please refer to the technical manual of your inverter system. - Inform your service agency.

Error number	Description
238-101C	**Error message** 101C UVR%2 faulty measurement of voltage **Cause of error** The supply unit is reporting an error in the DC-link voltage measurement **Error correction** Inform your service agency
238-101D	**Error message** 101D UVR%2 configured DC-link voltage too low **Cause of error** The DC-link voltage configured in MP_dcLinkVoltage is too small. The configured DC-link voltage must be greater than the rectifier value of the live line voltage. If a power supply unit is operated, for example, with a line voltage of 3AC 480 V, the machine manufacturer must increase the DC-link voltage to be generated to DC 720 V by means of MP_dcLinkVoltage. **Error correction** - Check the entry in the parameter CfgSupplyModule3xx/MP_dcLinkVoltage and adjust it if necessary. - Inform your service agency.
238-101E	**Error message** 101E UVR%2 temperature sensor is supplying faulty data **Cause of error** The temperature sensor in the supply unit is defective or is returning faulty data. **Error correction** - Inform your service agency
238-101F	**Error message** 101F UVR%2 wrong or no KDR connected **Cause of error** The inductance of the commutating reactor was determined to be too low. Perhaps no commutating reactor is connected, or the connection is faulty. **Error correction** - Check whether the commutating reactor is connected correctly - Check the inductance of the commutating reactor - Inform your service agency

Error number	Description
238-1021	**Error message** 1021 UVR%2 DC-link voltage too low **Cause of error** The power supply unit reports that the DC-link voltage is too low. **Error correction** - Check the power connection - Inform your service agency
238-1022	**Error message** 1022 UVR%2 DC-link voltage low: charging circuit activated **Cause of error** The charging circuit of the power supply unit was activated because the DC-link voltage was too low. **Error correction** - Check the power connection - Inform your service agency
239-0001	**Error message** 1 CC-FSUC: internal error CC%2 %1 2 MC-FSUC: internal error 3 UM-FSUC: internal error CC%2 %1 %10 **Cause of error** Internal software error (unexpected program sequence) **Error correction** - Generate the service file - Inform your service agency
239-0004	**Error message** 4 CC-FSUC: voltage error CC%2 %1 5 MC-FSUC: voltage error 6 UM-FSUC: voltage error CC%2 %1 %10 **Cause of error** Voltage monitoring reports an error. **Error correction** - Check the voltage supply of the affected units ("24 V" status LED on the unit) - Inform your service agency
239-0007	**Error message** 7 CC-FSUC: temperature error CC%2 %1 (temperature: %6, %7°C) 8 MC-FSUC: temperature error (temperature: %6,%7°C) **Cause of error** Temperature monitoring reports an error. **Error correction** - Check the temperature in the electrical cabinet - Inform your service agency

Error number	Description
239-000A	**Error message** A CC-FSUC: parameterization failed CC%2 %1 **Cause of error** The FS microcontroller received invalid parameter data. **Error correction** - Generate the service file - Inform your service agency
239-000C	**Error message** C UM-FSUC: FS parameters inconsistent CC%2 %1 %10 **Cause of error** The FS microcontroller received inconsistent parameter data. **Error correction** - Generate the service file - Inform your service agency
239-000D	**Error message** D CC-FSUC: cyclic communication failed CC%2 %1 **Cause of error** Cyclic communication between the MC and CC FS micro-controller failed. **Error correction** - Generate the service file - Inform your service agency
239-000F	**Error message** F UM-FSUC: cyclic communication failed CC%2 %1 %10 **Cause of error** Cyclic communication between the MC and UM FS micro-controller failed. **Error correction** - Generate the service file - Inform your service agency
239-0010	**Error message** 10 CC-FSUC: software inconsistent CC%2 %1 11 MC-FSUC: software inconsistent 12 UM-FSUC: software inconsistent CC%2 %1 %10 **Cause of error** Internal software error (software corrupt) **Error correction** - Generate the service file - Inform your service agency

23A-0052	**Error message** Internal access error on device: %2 **Cause of error** Diagnostics Flash: hardware test failed %1 ID number: %3, serial number: %4 **Error correction** - Restart the control - If the problem recurs, generate a service file and inform your service agency

Error number	Description
23A-0053	**Error message** Internal error on device: %2 **Cause of error** - Error during program run - Invalid image size %1 ID number: %3, serial number: %4 **Error correction** - Generate the service file and inform your service agency
23A-0054	**Error message** Faulty boot image on device: %2 **Cause of error** - Image data are incomplete or inconsistent - Application software not found %1 ID number: %3, serial number: %4 **Error correction** - Generate the service file and inform your service agency
23A-0055	**Error message** Faulty boot image on device: %2 **Cause of error** - Image data are incomplete or inconsistent - Boot image not found %1 ID number: %3, serial number: %4 **Error correction** - Generate the service file and inform your service agency
23A-0056	**Error message** Faulty boot image on device: %2 **Cause of error** - Image data are incomplete or inconsistent - Fall-back boot image not found %1 ID number: %3, serial number: %4 **Error correction** - Generate the service file and inform your service agency

Error number	Description
23A-0057	**Error message** Faulty boot image on device: %2 **Cause of error** - Image data are incomplete or inconsistent - Primary boot image not found %1 ID number: %3, serial number: %4 **Error correction** - Generate the service file and inform your service agency
23A-0058	**Error message** Faulty boot image on device: %2 **Cause of error** Fall-back boot image: incorrect image offset %1 ID number: %3, serial number: %4 **Error correction** - Generate the service file and inform your service agency
23A-0059	**Error message** Faulty boot image on device: %2 **Cause of error** Primary boot image: incorrect image offset %1 ID number: %3, serial number: %4 **Error correction** - Generate the service file and inform your service agency
23A-005A	**Error message** Faulty boot image on device: %2 **Cause of error** Image offset incorrect %1 ID number: %3, serial number: %4 **Error correction** - Generate the service file and inform your service agency
23A-005B	**Error message** Faulty boot image on device: %2 **Cause of error** Image data are incomplete or inconsistent - Generate the service file and inform your service agency No authentication data are available %1 ID number: %3, serial number: %4 **Error correction** - Generate the service file and inform your service agency

Error number	Description
23A-005C	**Error message** Faulty boot image on device: %2 **Cause of error** Byte converter: image data are incomplete or inconsistent %1 ID number: %3, serial number: %4 **Error correction** - Generate the service file and inform your service agency
23A-005D	**Error message** Internal error on device: %2 **Cause of error** -Received data invalid - Terminal: invalid character %1 ID number: %3, serial number: %4 **Error correction** - Restart the control - If the problem recurs, generate a service file and inform your service agency
23A-005E	**Error message** Internal error on device: %2 **Cause of error** -Received data invalid - Terminal: input too long %1 ID number: %3, serial number: %4 **Error correction** - Restart the control - If the problem recurs, generate a service file and inform your service agency
23A-0060	**Error message** Faulty boot image on device: %2 **Cause of error** Info section: image data are incomplete or inconsistent %1 ID number: %3, serial number: %4 **Error correction** - Restart the control - If the problem recurs, generate a service file and inform your service agency

Error number	Description
23A-0061	**Error message** Faulty boot image on device: %2 **Cause of error** Info section: image data are incomplete or inconsistent %1 ID number: %3, serial number: %4 **Error correction** - Restart the control - If the problem recurs, generate a service file and inform your service agency
23A-0062	**Error message** Faulty boot image on device: %2 **Cause of error** Info section: image data are incomplete or inconsistent %1 ID number: %3, serial number: %4 **Error correction** - Restart the control - If the problem recurs, generate a service file and inform your service agency
23A-0063	**Error message** Faulty boot image on device: %2 **Cause of error** Info section: image data are incomplete or inconsistent %1 ID number: %3, serial number: %4 **Error correction** - Restart the control - If the problem recurs, generate a service file and inform your service agency
23A-0064	**Error message** Faulty boot image on device: %2 **Cause of error** Info section: image data are incomplete or inconsistent %1 ID number: %3, serial number: %4 **Error correction** - Restart the control - If the problem recurs, generate a service file and inform your service agency

Error number	Description
23A-0065	**Error message** Faulty boot image on device: %2 **Cause of error** Info section: image data are incomplete or inconsistent %1 ID number: %3, serial number: %4 **Error correction** - Restart the control - If the problem recurs, generate a service file and inform your service agency
23A-0066	**Error message** Faulty boot image on device: %2 **Cause of error** Info section: image data are incomplete or inconsistent %1 ID number: %3, serial number: %4 **Error correction** - Restart the control - If the problem recurs, generate a service file and inform your service agency
23A-0067	**Error message** Faulty boot image on device: %2 **Cause of error** Info section: image data are incomplete or inconsistent %1 ID number: %3, serial number: %4 **Error correction** - Restart the control - If the problem recurs, generate a service file and inform your service agency
23A-0068	**Error message** Faulty boot image on device: %2 **Cause of error** Info section: image data are incomplete or inconsistent %1 ID number: %3, serial number: %4 **Error correction** - Restart the control - If the problem recurs, generate a service file and inform your service agency

Error number	Description
23A-0069	**Error message** Faulty boot image on device: %2 **Cause of error** Info section: image data are incomplete or inconsistent %1 ID number: %3, serial number: %4 **Error correction** - Restart the control - If the problem recurs, generate a service file and inform your service agency
23A-006A	**Error message** Faulty boot image on device: %2 **Cause of error** Info section: image data are incomplete or inconsistent %1 ID number: %3, serial number: %4 **Error correction** - Restart the control - If the problem recurs, generate a service file and inform your service agency
23A-006B	**Error message** Internal error on device: %2 **Cause of error** - Device index invalid %1 ID number: %3, serial number: %4 **Error correction** - Restart the control - If the problem recurs, generate a service file and inform your service agency
23A-006C	**Error message** Error while executing command on device: %2 **Cause of error** -Device index invalid - Driver assignment not possible %1 ID number: %3, serial number: %4 **Error correction** - Restart the control - If the problem recurs, generate a service file and inform your service agency

Error number	Description
23A-006D	**Error message** Error while executing command on device: %2 **Cause of error** - Device index invalid - Command was not processed %1 ID number: %3, serial number: %4 **Error correction** - Restart the control - If the problem recurs, generate a service file and inform your service agency
23A-006E	**Error message** Internal error on device: %2 **Cause of error** Interface designation invalid %1 ID number: %3, serial number: %4 **Error correction** - Restart the control - If the problem recurs, generate a service file and inform your service agency
23A-006F	**Error message** Internal error on device: %2 **Cause of error** - Error during program run - Error during main initialization phase %1 ID number: %3, serial number: %4 **Error correction** - Generate the service file and inform your service agency
23A-0070	**Error message** Faulty boot image on device: %2 **Cause of error** Image authentication: image data are incomplete or inconsistent %1 ID number: %3, serial number: %4 **Error correction** - Restart the control - If the problem recurs, generate a service file and inform your service agency

Error number	Description
23A-0071	**Error message** Error while detecting device for device: %2 **Cause of error** - Program or hardware configuration faulty - Capture limit reached %1 ID number: %3, serial number: %4 **Error correction** - Generate the service file and inform your service agency
23A-0072	**Error message** Error while detecting device for device: %2 **Cause of error** - Image data are incomplete or inconsistent - Faulty entry %1 ID number: %3, serial number: %4 **Error correction** - Restart the control - If the problem recurs, generate a service file and inform your service agency
23A-0073	**Error message** Error while detecting device for device: %2 **Cause of error** Device at full capacity or not ready for operation %1 ID number: %3, serial number: %4 **Error correction** - Restart the control - If the problem recurs, generate a service file and inform your service agency
23A-0074	**Error message** Internal error on device: %2 **Cause of error** FPGA ID: program or hardware configuration faulty %1 ID number: %3, serial number: %4 **Error correction** - Generate the service file and inform your service agency

Error number	Description
23A-0075	**Error message** Error while executing command on device: %2 **Cause of error** - Command invalid - No HIK available for reading out %1 ID number: %3, serial number: %4 **Error correction** - Generate the service file and inform your service agency
23A-0076	**Error message** Internal error on device: %2 **Cause of error** HIK: invalid parameter transfer %1 ID number: %3, serial number: %4 **Error correction** - Generate the service file and inform your service agency
23A-0077	**Error message** Error while executing command on device: %2 **Cause of error** - Parameter transfer invalid - Maximum command size (in) exceeded %1 ID number: %3, serial number: %4 **Error correction** - Generate the service file and inform your service agency
23A-0078	**Error message** Error while executing command on device: %2 **Cause of error** - Parameter transfer invalid - Maximum command size (out) exceeded %1 ID number: %3, serial number: %4 **Error correction** - Generate the service file and inform your service agency
23A-0079	**Error message** Error while executing command on device: %2 **Cause of error** - Parameter transfer invalid - Error in the command sequence %1 ID number: %3, serial number: %4 **Error correction** - Generate the service file and inform your service agency

Error number	Description
23A-007A	**Error message** Error while executing command on device: %2 **Cause of error** - Parameter transfer invalid - Address invalid %1 ID number: %3, serial number: %4 **Error correction** - Generate the service file and inform your service agency
23A-007D	**Error message** Error while executing command on device: %2 **Cause of error** - Parameter transfer invalid - Message ID invalid %1 ID number: %3, serial number: %4 **Error correction** - Restart the control - If the problem recurs, generate a service file and inform your service agency
23A-007E	**Error message** Error while executing command on device: %2 **Cause of error** - Parameter transfer invalid - Command invalid %1 ID number: %3, serial number: %4 **Error correction** - Generate the service file and inform your service agency
23A-007F	**Error message** Faulty boot image on device: %2 **Cause of error** Encoder FPGA info section: image data are incomplete or inconsistent %1 ID number: %3, serial number: %4 **Error correction** - Generate the service file and inform your service agency

Error number	Description
23A-0080	**Error message** Faulty boot image on device: %2 **Cause of error** Encoder FPGA info section: image data are incomplete or inconsistent %1 ID number: %3, serial number: %4 **Error correction** - Generate the service file and inform your service agency
23A-0081	**Error message** Internal error on device: %2 **Cause of error** - Program or hardware configuration faulty - Test environment is active %1 ID number: %3, serial number: %4 **Error correction** - Generate the service file and inform your service agency
23A-0082	**Error message** Internal error on device: %2 **Cause of error** - Hardware initialization failed - Internal XADC voltage reference is active %1 ID number: %3, serial number: %4 **Error correction** - Restart the control - If the problem recurs, generate a service file and inform your service agency
23A-0083	**Error message** Initialization of interface faulty for device: %2 **Cause of error** HFL: self-test of interface failed (VMK) %1 ID number: %3, serial number: %4 **Error correction** - Check the interface connections and restart the control - If the problem recurs, generate a service file and inform your service agency

Error number	Description
23A-0084	**Error message** Initialization of interface faulty for device: %2 **Cause of error** HFL: self-test of interface failed (VSK) %1 ID number: %3, serial number: %4 **Error correction** - Check the interface connections and restart the control - If the problem recurs, generate a service file and inform your service agency
23A-0085	**Error message** Initialization of interface faulty for device: %2 **Cause of error** HFL: self-test of interface failed (VMLS) %1 ID number: %3, serial number: %4 **Error correction** - Check the interface connections and restart the control - If the problem recurs, generate a service file and inform your service agency
23A-0086	**Error message** Initialization of interface faulty for device: %2 **Cause of error** HFL: self-test of interface failed (VMS) %1 ID number: %3, serial number: %4 **Error correction** - Check the interface connections and restart the control - If the problem recurs, generate a service file and inform your service agency
23A-0087	**Error message** Initialization of interface faulty for device: %2 **Cause of error** HFL: self-test of interface failed (VMPS) %1 ID number: %3, serial number: %4 **Error correction** - Check the interface connections and restart the control - If the problem recurs, generate a service file and inform your service agency

Error number	Description
23A-0088	**Error message** Initialization of interface faulty for device: %2 **Cause of error** HFL: self-test of interface failed (VSLPS) %1 ID number: %3, serial number: %4 **Error correction** - Check the interface connections and restart the control - If the problem recurs, generate a service file and inform your service agency
23A-0089	**Error message** Initialization of interface faulty for device: %2 **Cause of error** HFL: an error occurred at the interface (VMTX) %1 ID number: %3, serial number: %4 **Error correction** - Check the interface connections and restart the control - If the problem recurs, generate a service file and inform your service agency
23A-008A	**Error message** Initialization of interface faulty for device: %2 **Cause of error** HFL: an error occurred at the interface (VSTX) %1 ID number: %3, serial number: %4 **Error correction** - Check the interface connections and restart the control - If the problem recurs, generate a service file and inform your service agency
23A-008B	**Error message** Initialization of interface faulty for device: %2 **Cause of error** HFL: an error occurred at the interface (VMTO) %1 ID number: %3, serial number: %4 **Error correction** - Check the interface connections and restart the control - If the problem recurs, generate a service file and inform your service agency

Error number	Description
23A-008C	**Error message** Initialization of interface faulty for device: %2 **Cause of error** HFL: an error occurred at the interface (VSTO) %1 ID number: %3, serial number: %4 **Error correction** - Check the interface connections and restart the control - If the problem recurs, generate a service file and inform your service agency
23A-008D	**Error message** Initialization of interface faulty for device: %2 **Cause of error** HFL: an error occurred at the interface (VMRX) %1 ID number: %3, serial number: %4 **Error correction** - Check the interface connections and restart the control - If the problem recurs, generate a service file and inform your service agency
23A-008E	**Error message** Initialization of interface faulty for device: %2 **Cause of error** HFL: an error occurred at the interface (VSRX) %1 ID number: %3, serial number: %4 **Error correction** - Check the interface connections and restart the control - If the problem recurs, generate a service file and inform your service agency
23A-008F	**Error message** Initialization of interface faulty for device: %2 **Cause of error** HFL: an error occurred at the interface (VMSTX) %1 ID number: %3, serial number: %4 **Error correction** - Check the interface connections and restart the control - If the problem recurs, generate a service file and inform your service agency

Error number	Description
23A-0090	**Error message** Initialization of interface faulty for device: %2 **Cause of error** HFL: an error occurred at the interface (VMI) %1 ID number: %3, serial number: %4 **Error correction** - Check the interface connections and restart the control - If the problem recurs, generate a service file and inform your service agency
23A-0091	**Error message** Initialization of interface faulty for device: %2 **Cause of error** HFL: an error occurred at the interface (VSI) %1 ID number: %3, serial number: %4 **Error correction** - Check the interface connections and restart the control - If the problem recurs, generate a service file and inform your service agency
23A-0092	**Error message** Initialization of interface faulty for device: %2 **Cause of error** HFL: an error occurred at the interface (VMSRX) %1 ID number: %3, serial number: %4 **Error correction** - Check the interface connections and restart the control - If the problem recurs, generate a service file and inform your service agency
23A-0093	**Error message** Initialization of interface faulty for device: %2 **Cause of error** HFL: an error occurred at the interface (VMPE) %1 ID number: %3, serial number: %4 **Error correction** - Check the interface connections and restart the control - If the problem recurs, generate a service file and inform your service agency

Error number	Description
23A-0094	**Error message** Initialization of interface faulty for device: %2 **Cause of error** HFL: an error occurred at the interface (VSPE) %1 ID number: %3, serial number: %4 **Error correction** - Check the interface connections and restart the control - If the problem recurs, generate a service file and inform your service agency
240-07D0	**Error message** No permission to write **Cause of error** Sie haben eine schreibgeschützte Datei zum Editieren angewählt. **Error correction** Vor dem Editieren Schreibschutz aufheben: Schlüsselzahl 86357 eingeben.
240-07D1	**Error message** File '%1' not found **Cause of error** Diese Datei wurde nicht gefunden **Error correction** Datei neu anlegen oder generieren lassen
240-07D2	**Error message** File type of '%1' incorrect **Cause of error** Sie haben eine falsche Datei angewählt **Error correction** Wählen Sie eine andere Datei an
240-07D3	**Error message** File '%1' is encrypted **Cause of error** Sie haben eine verschlüsselte Datei angewählt **Error correction** Geben Sie den Schlüsselcode ein

Error number	Description
240-07D4	**Error message** Access to '%1' is blocked **Cause of error** You tried to edit an NC program while it was running in a Program Run mode. **Error correction** - Stop the NC program run
240-07D5	**Error message** Invalid file path: '%1' **Cause of error** **Error correction**
240-0800	**Error message** Key non-functional **Cause of error** The key is not allowed in this status or it has no function. **Error correction** Press another key or soft key.
240-0804	**Error message** NC program not saved **Cause of error** The NC program is write protected and therefore cannot be saved. **Error correction** - Open the file manager and cancel the write protection for the NC program. Then use the Programming mode of operation to select and save the NC program. - Or, as an alternative, save the NC program under another name.
240-0CA3	**Error message** Error in internal communication **Cause of error** Internal software error. **Error correction** Inform your service agency
240-0CA4	**Error message** Error in an internal process **Cause of error** Internal software error. **Error correction** Inform your service agency

Error number	Description
241-09C4	**Error message** Machine configuration error **Cause of error** A machine parameter has a faulty value. For more information see the soft key INTERNAL INFORMATION (Text0...2). **Error correction** - Correct the machine parameter - Inform your service agency
241-09C5	**Error message** Internal software error **Cause of error** Internal control error: - Insufficient memory - Other, nonspecified errors **Error correction** Inform your service agency.
241-09C6	**Error message** Data record already locked **Cause of error** The table editor was instructed to edit a locked data record. **Error correction** Release the lock (e.g.: terminate the NC program or tool change) and repeat the instruction.
241-09C7	**Error message** Data record with incorrect length **Cause of error** In the table editor, a table was entered containing at least one line whose length differs from the length of the line with the column name. **Error correction** Open the table with the text editor and shorten the problem line at its end or fill it with spaces. Alternatively, for example if several lines are faulty, you can use the file manager to copy the table into a new fault-free table.
241-09C8	**Error message** Pocket table incorrect **Cause of error** - The pocket table contains more spindle pockets than are given in the machine parameter CfgAxes.spindleIndices. **Error correction** - Delete the invalid pockets from the pocket table

Error number	Description
241-09C9	**Error message** Incorrect value \`%1\` in update rule \`%2\` **Cause of error** Incorrect syntax of the update rule: - The keyword is missing or spelled incorrectly - The keyword is unknown - Invalid number for a rule - Incorrect or unknown symbolic table name - The entered column is missing in the table - Column list is unequal during a copying statement **Error correction** - Note the additional information on the error message. - Remember that the error can also be before the indicated place! - Enter the statement in the correct syntax, or contact your machine tool builder.
241-09CA	**Error message** Update rule "%1" erroneous **Cause of error** The update rule for updating a table is faulty and cannot be applied. **Error correction** - Please pay attention to other pending error messages. - Enter the statement for updating the table in the correct syntax, or contact your machine tool builder.
241-09CB	**Error message** Error while importing the table '%1' in '%2' **Cause of error** Table import failed. **Error correction** - Note the additional data on the error message. To do so, press the INTERNAL INFO soft key. - Note further pending error messages. - Inform your service agency.
241-09CC	**Error message** Table '%1' erroneous **Cause of error** The update to the table failed since the table is faulty. **Error correction** Please ensure that the table - has the correct syntax - exists - is not write-protected If necessary, contact your machine tool builder

Error number	Description
241-09CD	**Error message** Error while updating table '%1' **Cause of error** The update of the table failed. **Error correction** - Please pay attention to other pending error messages. - Pay attention to the additional information regarding the error message or contact your machine tool builder.
241-09D0	**Error message** Access to file %1 during update denied **Cause of error** - The file cannot be updated because access to the table is not possible - The file might still be in use by the control **Error correction** - Press NC stop, close all files and try again. - If an update is still not possible: restart the control until the power-interrupted message appears. Then restart the update.
241-09D1	**Error message** File %1 changed through import **Cause of error** The entered file was automatically modified during import: - Program name - Special characters removed - End block inserted **Error correction** - Check the file - Note the changes and check - Use the file only if you feel that it is correct
241-0C03	**Error message** File or file path '%1' invalid **Cause of error** The file name or path for the file operation update is incorrect. Update failed. **Error correction** - Note the additional data on the error message. To do so, press the INTERNAL INFO soft key. - Note further pending error messages. - Check the syntax of the file name and path for the file operation. - Check whether the file and path actually exist. - Inform your service agency.

Error number	Description
241-0C04	**Error message** Error during update in file operation **Cause of error** File operation of an update rule failed. **Error correction** - Note the additional data on the error message. To do so, press the INTERNAL INFO soft key. - Note further pending error messages. - Inform your service agency.
241-0C05	**Error message** Update rule "%1" erroneous **Cause of error** The update rule for the file operation is faulty and has failed. **Error correction** - Note the additional data on the error message. To do so, press the INTERNAL INFO soft key. - Note further pending error messages. - Check the syntax of the command for the file. - Inform your service agency
242-07D1	**Error message** File invalid **Cause of error** - The file to be inserted in the text was not found - No file selected - Selected file is already being edited by the text editor - Selected file is already being edited by another application - Invalid file **Error correction** - Select another file - Close the file in another application
242-07D3	**Error message** Intermediate memory empty **Cause of error** You attempted to insert blocks from intermediate memory, although you haven't copied anything since power has been on. **Error correction** Before you can insert anything from intermediate memory you must first fill it using the copy function.

Error number	Description
242-07D4	**Error message** Text not found Text not found **Cause of error** The ASCII editor could not find the desired text in a file. **Error correction** Search for another text (note upper and lower case letter).
242-07D5	**Error message** Input error **Cause of error** You enter a value that exceeds the permissible input range. **Error correction** Check input value.
242-07D7	**Error message** No permission to write **Cause of error** The called file is write-protected. Sometimes it can no longer be saved under this name. **Error correction** - Save the file under another name - Select another file - Cancel write protection
242-07DA	**Error message** File not saved **Cause of error** The file is write-protected and could not be saved. **Error correction** - Cancel the write-protection in the file management. Select the text editor and save the file again. - Save the file under another name.
243-00F5	**Error message** Serial number? **Cause of error** **Error correction**
245-03F5	**Error message** Configuration server not ready **Cause of error** The system-inherent communication over the data interface to the configuration server is not ready. **Error correction** Inform your service agency.

Error number	Description
245-03F6	**Error message** Unable to open configuration server queue Unable to open configuration server queue **Cause of error** Error in the system-inherent communication. **Error correction** Inform your service agency.
245-03F7	**Error message** Unable to read configuration data '%1' Unable to read configuration data '%1' Unable to write configuration data '%1' **Cause of error** Error in the system-inherent communication. **Error correction** Inform your service agency.
245-03F8	**Error message** Unable to write configuration data '%1' **Cause of error** Error in the system-inherent communication. **Error correction** Inform your service agency.
245-03F9	**Error message** Error in the PGM-MGT configuration %1 **Cause of error** Invalid for incorrect data in the configuration of the file management **Error correction** Correct the corresponding data and save
245-03FA	**Error message** Internal error! **Cause of error** Internal software error in the file management **Error correction** Inform your service agency
245-03FB	**Error message** Process not available **Cause of error** A process entered in the configuration data cannot be activated. **Error correction** Inform your service agency.

Error number	Description
245-03FC	**Error message** ClientQueue (%1) could not be opened **Cause of error** Error in system-inherent communication **Error correction** Inform your service agency.
245-03FD	**Error message** General error in internal system queue (%1) **Cause of error** Error in system-inherent communication **Error correction** Inform your service agency.
245-03FE	**Error message** No receiver for internal system message **Cause of error** Error in system-inherent communication **Error correction** Inform your service agency.
245-03FF	**Error message** Processor check error **Cause of error** Internal software error **Error correction** Inform your service agency
245-0401	**Error message** Failed to send internal message **Cause of error** Error in system-inherent communication **Error correction** Inform your service agency.
245-040D	**Error message** Ext. in-/output not ready **Cause of error** - The interface is not connected - The external device is not switched on or is not ready - The transmission cable is defective or incorrect **Error correction** Check the data transmission line.

Error number	Description
245-0413	**Error message** Problems recognizing the USB device! **Cause of error** - The USB device in use has not been detected - The USB device could not be integrated into the system **Error correction** - Remove the USB device and try again - Try it with another USB device
245-0414	**Error message** Problems removing the USB device! **Cause of error** - The USB device used was not correctly removed or was not logged off by means of the soft-key function - A file is still open on the USB device - The USB device could not be released from the system **Error correction** - Use the soft-key function to log the relevant USB device off correctly - Close the applications with access to a file on the USB device
245-0416	**Error message** Serial data transmission is faulty **Cause of error** - The interface is not correctly configured - The transmission cable is defective or incorrect - Invalid file for the selected interface configuration **Error correction** - Check the interface configuration of both communication partners - Check the data transmission line - Check whether a valid file is available for transmission
245-0851	**Error message** Display program could not be started. **Cause of error** A selection box is still open for starting an external display program **Error correction** Bring the hidden selection box back into the foreground, if necessary with the HeROS task bar - Either select the desired display program for further editing, - or cancel the selection of the display program

Error number	Description
245-0861	**Error message** Changing the access rights is not permitted: %1 **Cause of error** Changing of the access rights to the file or directory is permitted only for the owner or the "root" user. **Error correction**
250-138B	**Error message** Program was edited **Cause of error** The current NC program, or one of the NC programs that have called the current NC program, was changed. It is therefore impossible to go back into the program. **Error correction** - Check whether the changed program should be started Use the mid-program startup function or the GOTO function to select the desired location to go back into the program. HEIDENHAIN recommends using the mid-program startup function to go back into the program.
250-138C	**Error message** Not enough main memory (RAM) **Cause of error** The control has too little physical main memory. **Error correction** Equip the hardware with at least 128 MB RAM.
250-138D	**Error message** Current program not selected. Select with file manager. **Cause of error** The displayed program was not selected in the program run. **Error correction** Use the file manager to select a program at the beginning.
250-138E	**Error message** Program was edited during program run! **Cause of error** A program was edited during program run. **Error correction** Check whether the edited program should be run.

Error number	Description
250-138F	**Error message** Cycle Query dialog box could not be opened! **Cause of error** A dialog box is already open. **Error correction** Close the open dialog box, and restart the program.
250-1390	**Error message** Application cannot be activated: %1 **Cause of error** The other application has not been started or has another title. **Error correction** Start the other application manually.
250-1391	**Error message** Error while transferring command to PLC server Error while transferring command to PLC server **Cause of error** Internal software error. **Error correction** Inform your service agency.
250-1392	**Error message** Error while transferring command to SQL server **Cause of error** Internal software error. **Error correction** Inform your service agency.
250-1393	**Error message** Error in internal communication **Cause of error** Internal software error. **Error correction** Inform your service agency.
250-1394	**Error message** Error in an internal process **Cause of error** Internal software error. **Error correction** Inform your service agency.

Error number	Description
250-1395	**Error message** Error in an internal process **Cause of error** Internal software error. **Error correction** Inform your service agency.
250-1396	**Error message** Program resumption not possible Program resumption not possible **Cause of error** The program cannot be continued from the point of interruption. **Error correction** Use GoTo to position to the start of program, or select the program again. If you are machining a pallet, then update the pallet table (perhaps set W-STATUS to BLANK). Then the program can be started.
250-1397	**Error message** Axis movement canceled **Cause of error** A reference run in an axis was stopped or canceled before the target position was reached. **Error correction** - Check the axis, acknowledge the error, and restart the reference run - If appropriate, press the permissive button to confirm that a non-referenced or non-checked axis is to be moved
250-1398	**Error message** File access not possible **Cause of error** The file cannot be accessed. Perhaps it was deleted. **Error correction** Select another file.
250-1399	**Error message** File access not possible **Cause of error** The file is not a valid NC program for this control. **Error correction** Select another program.

Error number	Description
250-139A	**Error message** NC program not selected **Cause of error** The NC program was not selected through the file management (PGM MGT key). **Error correction** To be able to start this program, select it in the file management (PGM MGT key) of start it with the selected program in mid-program startup.
250-13A7	**Error message** Connection setup to DNC not possible Connection setup to DNC not possible **Cause of error** Cannot connect with the DNC. **Error correction**
250-13A8	**Error message** Connection setup to DNC not possible **Cause of error** Cannot connect with the DNC. TeleService is already being used by another application. **Error correction** - Restart the control. - If the problem continues, inform your service agency.
250-13A9	**Error message** Connection setup to DNC not possible **Cause of error** Cannot connect with the DNC. The machine parameter for TeleService is improperly configured. **Error correction** The machine parameter for TeleService, "CfgServiceRequest," must be correctly configured.
250-13AA	**Error message** TeleService request is in error **Cause of error** TeleService could not be activated or deactivated. **Error correction**

Error number	Description
250-13AB	**Error message** TeleService request is in error TeleService request is in error **Cause of error** Unable to send TeleService request. **Error correction** Check the network connections and retry.
250-13AC	**Error message** TeleService request is in error TeleService request is in error **Cause of error** The machine parameter for TeleService is improperly configured. **Error correction** The machine parameter for TeleService, "CfgServiceRequest," must be correctly configured.
250-13AE	**Error message** Table access not possible **Cause of error** The table cannot be accessed. The file was probably deleted. **Error correction** Make a new table.
250-13AF	**Error message** Preset table is faulty **Cause of error** No preset is marked as active in the preset table, or multiple presets are marked at the same time. **Error correction** Correct the preset table. Only one preset can be marked as active.
250-13B6	**Error message** Configuration parameter cannot be saved **Cause of error** The control tried to write data to a write-protected configuration file. **Error correction** - Inform your service agency

Error number	Description
250-13B7	**Error message** Table cannot be selected **Cause of error** A configuration parameter required for selecting the table could not be written to. **Error correction** - Inform your service agency.
250-13B8	**Error message** Machine kinematic configuration has too many rotary axes **Cause of error** You have defined more than two axes as rotary axes. The working plane cannot be tilted with more that two rotary axes. Machine kinematics with more than two rotary axes are not supported by the control. **Error correction** - Change the machine configuration: Use a kinematic configuration with no more than 2 rotary axes.
250-13BD	**Error message** PLC pop-up window (Module 9216) not possible **Cause of error** A PLC pop-up window (PLC Module 9216) cannot be shown in the current operating situation. **Error correction** Activate the machine operation or close a dialog already open.
250-13BE	**Error message** Tool number does not exist **Cause of error** The tool number required for selection of a pocket number is not in the table. **Error correction** - Correct the tool table
250-13BF	**Error message** Tool does not exist **Cause of error** The tool is not present in the tool table. **Error correction** - Correct the tool table - Select a tool table that contains the tool.

Error number	Description
250-13C0	**Error message** No tool pocket available **Cause of error** There is no fitting tool pocket in the pocket table for the tool. **Error correction** - Provide a fitting tool pocket
250-13C1	**Error message** Pop-up window (Module 9217) not possible **Cause of error** A PLC pop-up window (PLC Module 9217) cannot be shown in the current operating situation. **Error correction** Activate the Machine operating mode or close an already open dialog box.
250-13C2	**Error message** Cycle Query dialog is not possible in this state! **Cause of error** A cycle query dialog (PLC Module 9291) cannot be shown in the current operating situation. **Error correction** - Check the PLC program and correct if necessary
250-13C3	**Error message** Check the "Evaluation of EnDat" dialog window **Cause of error** The "Evaluation of EnDat encoder" dialog window cannot be displayed because is overlapped by a background operating mode. **Error correction** Activate a machine operating mode and confirm the "Evaluation of EnDat encoder" dialog window.
250-13C4	**Error message** Program selection not possible **Cause of error** The selection of an NC program is presently not allowed. **Error correction** Select the Program Run mode of operation

Error number	Description
250-13C6	**Error message** Program start not supported **Cause of error** The start of the NC program is not supported in this condition. **Error correction** - Move the axes over the reference marks - Reconduct the program start
250-13C7	**Error message** Operation not supported **Cause of error** The control cannot be operated while it is in this state. **Error correction** Please wait until the axes have been referenced.
250-13CA	**Error message** Start the program in the Program Run mode **Cause of error** An error occurred in the previous program run **Error correction** Switch to the Program Run mode of operation and restart the program
250-17D3	**Error message** Reference run is not possible **Cause of error** The reference run is not possible at present because the axis is in use. **Error correction** Restart the reference run at a later time.
250-F306	**Error message** Program selection not possible **Cause of error** An external program selection (over DNC, OPC UA, or the PLC) could not be executed because the file manager is open. **Error correction** - Select the program and close the file manager. - Or close the file manager and select the program externally (over DNC, OPC UA, or the PLC).

Error number	Description
250-F308	**Error message** File manager was closed through an external program selection **Cause of error** While the file manager was open, the control received a command for an external program start (over DNC, OPC UA, or the PLC). The file manager was closed and the external program selection was conducted. **Error correction**
250-F30C	**Error message** Preset table is faulty **Cause of error** No preset is marked as active in the preset table, or multiple presets are marked at the same time. **Error correction** Correct the preset table
250-F319	**Error message** Function could not be executed %1 **Cause of error** The function called (e.g. pressing of a soft key) could not be executed. **Error correction** - Call the function again later - If the problem continues, inform your service agency
250-F31A	**Error message** Execution canceled -- next start from beginning of table **Cause of error** - Program aborted by user - Program aborted because of an NC error - Attempt at starting failed because of a missing table entry **Error correction** Remove the cause of the error. The next program start will take place from the beginning of the table.
250-F31D	**Error message** Host computer operation is not possible **Cause of error** Host computer operation cannot be enabled because a machining process is currently running. **Error correction** Terminate the current operation and then activate host computer operation.

Error number	Description
250-F322	**Error message** Illegal program type **Cause of error** The program type of the file is not valid. **Error correction** Select a valid NC program
250-F323	**Error message** 3DROT active: Axis positions cannot be tested **Cause of error** You have attempted to test an axis even though the function "Rotate working plane" is active. Axis positions cannot be tested if the working plane is tilted. **Error correction** Deactivate "Tilt the working plane" and test the axis positions again
250-F324	**Error message** Component %1 cannot be displayed due to limits currently configured **Cause of error** Possible causes: - A component with fewer than four limits was entered in the machine configuration under CfgComponentMon/components[] - The values of the limits are not in ascending order. **Error correction** - Correct the machine configuration under CfgComponentMon/components[] or select another component in the "CM Detail" tab
250-F329	**Error message** Monitoring task %1 cannot be displayed. **Cause of error** Possible causes: - A monitoring task with fewer than four limits was entered in the machine configuration under Monitoring/CfgMonPreferences/monitoringTasks[] - The values of the limits of the entry in CfgMonComponent are not in ascending order. - No value is entered for CfgMonComponent/display. **Error correction** - Check and if necessary correct the machine configuration under Monitoring/CfgMonComponent, or - Select another monitoring task in the "MON Detail" tab

Error number	Description
250-F32A	**Error message** Table cannot be activated **Cause of error** Activation of a different datum or compensation table is not possible while a block is being machined. **Error correction** Either wait until the active block has finished, or (if possible without danger) press the "Internal stop" soft key while the block is being machined.
250-F32E	**Error message** Monitoring task %1 cannot be displayed. **Cause of error** The monitoring task cannot be displayed. Possible causes: - The display settings for this monitoring task are incomplete or faulty - The configured limits do not permit display of the monitoring task **Error correction** - Check the configuration and adapt it if necessary: CfgMonComponent > display - Select a different monitoring task
250-F332	**Error message** Program cannot be run **Cause of error** Either there is an error in the program, or the program has been modified. **Error correction** - Check whether the program is free of errors, and execute a GOTO or reset before restarting - Use the GOTO function in order to select the desired starting point for the restart. Or use a reset to restart the simulation from the beginning of the program.
250-F333	**Error message** Preset was not stored **Cause of error** An error occurred while saving the preset. **Error correction** - Check the preset table and correct it if necessary - Restart the control - Try to save the preset again - If the error recurs, save the service file and inform your service agency

Error number	Description
250-F334	**Error message** Preset was not reset **Cause of error** An error occurred while resetting the preset. **Error correction** - Check the preset table and correct it if necessary - Restart the control - Try to save the preset again - If the error recurs, save the service file and inform your service agency
250-F335	**Error message** This file cannot be displayed **Cause of error** Access to the file was denied. **Error correction** Check the access rights for the file
250-F33C	**Error message** Check the "Evaluation of EnDat" dialog window **Cause of error** The "Evaluation of EnDat encoder" dialog window can't be opened, because the "Traverse reference points" dialog box is not active. **Error correction** Activate the "Traverse reference points" dialog box and confirm the "Evaluation of EnDat encoder" dialog window.
250-F33D	**Error message** GPS: settings have not been saved yet **Cause of error** You edited entries in the global program settings but did not save these entries. **Error correction** Apply or discard the settings
251-0D92	**Error message** Communication error when reading the configuration data Unexpected answer when reading the active parameter set Login for reading the configuration data has failed **Cause of error** An internal communication error has occurred in the internal oscilloscope during interrogation of the configuration data. **Error correction** - Check the configuration of the parameter set and correct if necessary - Inform your service agency

Error number	Description
251-0D95	**Error message** Internal communication error in oscilloscope **Cause of error** An internal communication error has occurred in the internal oscilloscope during log-in to the Channel Manager. **Error correction** Inform your service agency.
251-0D96	**Error message** Internal communication error in oscilloscope **Cause of error** An internal communication error has occurred in the internal oscilloscope during registration for operating modes. **Error correction** Inform your service agency.
251-0D97	**Error message** Step function has been deactivated **Cause of error** Due to an operating mode change, the jump function was deactivated in the integrated oscilloscope. **Error correction** Run the jump function in manual mode
251-0D98	**Error message** Incorrect operating mode was selected for step function **Cause of error** The jump function can be activated only in manual mode. **Error correction** Change to the manual operating mode
251-0D99	**Error message** Parameter set cannot be read **Cause of error** Interrogation of the active parameter set of an axis has failed. **Error correction** Check the parameter sets of the axis
251-0D9B	**Error message** Initializing parameters cannot be read **Cause of error** An error occurred during import of the initialization parameters for the jump function of the active axis. **Error correction** Check the initialization file

Error number	Description
251-0D9C	**Error message** Error while restoring the parameters **Cause of error** The restoration of and the original parameters of an axis has failed. **Error correction** Check the axis parameters after deactivation of the jump function
251-0D9D	**Error message** Parameter-set code of an axis does not exist **Cause of error** The identifier of the parameter set for restoring the original axis parameters is missing. **Error correction** After deactivation of the jump function, check the parameters of the axis and correct them if necessary
251-0D9F	**Error message** Step function cannot be activated **Cause of error** The reference marks for one or more axes were not scanned. **Error correction** - Home the axes - Reselect the jump function in the integrated oscilloscope
251-0DA0	**Error message** Step function cannot be activated **Cause of error** An internal communication error has occurred. The status of the axis's parameter set or the status of the reference run could not be ascertained. **Error correction** - Reselect the jump function in the integrated oscilloscope - Inform your service agency if the error occurs repeatedly
251-0DA1	**Error message** Parameter set cannot be initialized **Cause of error** The active parameter set of an axis could not be initialized for the jump function. **Error correction** - Reselect the jump function in the integrated oscilloscope - Inform your service agency if the error occurs repeatedly

Error number	Description
251-0DA6	**Error message** Step function cannot be activated **Cause of error** An error occurred during import of the initialization parameters or the parameter sets for the jump function. **Error correction** Check the parameter sets and initialization parameters, and correct if required.
251-0DA7	**Error message** Actual-to-nominal value transfer is faulty **Cause of error** No actual-to-nominal value transfer could be executed after deactivation of the jump function. **Error correction** Inform your service agency if this error occurs repeatedly
251-0DB7	**Error message** The selected signal is not supported **Cause of error** The selected position signal is not supported by the control hardware. **Error correction** Choose another signal.
251-0DD5	**Error message** Selected CC signal is not available **Cause of error** When the data record is started, the selected signal can not be assigned to the CC. **Error correction** If the error occurs repeatedly, please inform your service agency.
251-0DD6	**Error message** Error in synchronization of data channels to the PLC **Cause of error** Synchronization error between IPO and PLC at start of data recording. Signals from the PLC are to be recorded, but the IPO does not receive a response from the PLC. **Error correction** If the error occurs repeatedly, please inform your service agency.

Error number	Description
251-0DD7	**Error message** Error in synchronization of CC signals **Cause of error** Synchronization error between IPO and CC at start of data recording. CC signals are to be recorded, but the IPO does not receive a response from the CC. **Error correction** If the error occurs repeatedly, please inform your service agency.
251-0DD8	**Error message** Number of CC signals exceeded **Cause of error** The permissible number of CC signals has been exceeded. **Error correction** Limit the number of CC signals to the permissible maximum.
251-0DD9	**Error message** Unexpected sampling rate during acknowledgment of CC data channel **Cause of error** When a CC data channel is acknowledged, the cycle time of the acknowledgment does not correspond to the expected cycle time. **Error correction** Check the parameter settings for the cycle time.
251-0DDA	**Error message** Number of data channels for recording with CC clock exceeded. **Cause of error** When recording with the CC clock, the number of data channels is limited. **Error correction** Limit the number of data channels when recording with CC clock to the permissible maximum.
251-0DE2	**Error message** The selected signal is not supported **Cause of error** The right to IPO-/CC-Dbg signals is missing **Error correction**

Error number	Description
251-0DE3	**Error message** The signal cannot be recorded **Cause of error** The right needed to record IPO or CC-Dbg signals is missing. **Error correction** Log on to the control as a user who has the right to read OEM interface data (e.g. as the function user 'oemdataaccessread').
251-0DE4	**Error message** The signal cannot be recorded **Cause of error** The right to record PLC signals is missing **Error correction**
251-0DE5	**Error message** The application cannot be started **Cause of error** The right to run the internal control oscilloscope is missing **Error correction**
251-0DE6	**Error message** The selected signal is not supported **Cause of error** The right to PLC signals is missing **Error correction**
251-0E18	**Error message** Check data of the SCO file **Cause of error** You opened an older version of a SCO file; this file is not compatible with the current version. **Error correction** Check the loaded data.
251-0E28	**Error message** The trace file could not be saved **Cause of error** Trace file cannot be written to. **Error correction** Check whether write-access is granted for the selected partition (e.g. PLC).

Error number	Description
251-0E29	**Error message** File could not be read **Cause of error** A file could not be accessed for reading. **Error correction** Check whether read-access is granted for the selected partition (e.g. PLC).
251-0E2A	**Error message** Necessary right for recording a signal is missing **Cause of error** When loading a file or initializing the control, changed user rights have caused a signal to not have the necessary rights for recording The signal is set to OFF in the selection dialog box of the integrated oscilloscope. **Error correction**
251-0E2B	**Error message** Signal ID not found in list of enabled signals **Cause of error** The signal ID used was not found in the list of permitted signals. The signal is set to OFF in the selection dialog box of the integrated oscilloscope. **Error correction**
251-0E2C	**Error message** Recording of signal not permitted **Cause of error** There is no recording right for this signal. The signal is set to OFF in the selection dialog box of the integrated oscilloscope. **Error correction**
251-0E2D	**Error message** Signal ID not found in selection list **Cause of error** The signal ID used was not found in the list of of the selection dialog box of the integrated oscilloscope. The signal is set to OFF. The registered user might not have the right to access the signal. **Error correction** Log-on as a user with the necessary access right

Error number	Description
251-0E34	**Error message** Selected UVR signal is not available **Cause of error** When data recording is started, the selected signal of the UVR cannot be assigned. **Error correction** If the error occurs repeatedly, please inform your service agency.
251-0E35	**Error message** Error in synchronization of CC or UVR signals **Cause of error** Synchronization error between interpolator, CC controller unit, or UVR at start of data recording. CC or UVR signals are to be recorded, but the interpolator receives no response from the CC or UVR. **Error correction** If the error occurs repeatedly, please inform your service agency.
251-0E36	**Error message** Trigger condition Signal [SAVED] not fulfilled in reference trace **Cause of error** A signal was set to [SAVED] even though a trigger condition has not been fulfilled for the reference trace. **Error correction** Before the signal state [SAVED] can be used, a trigger condition must be fulfilled for the reference trace, otherwise the signal curve cannot be associated chronologically.
251-0E37	**Error message** Trigger condition Signal [SAVED] not fulfilled in current trace **Cause of error** The signal state [SAVED] is being used even though no trigger condition has been fulfilled for the current trace. **Error correction** If the signal state [SAVED] is to be used, then a trigger condition must be fulfilled for the current trace. Otherwise the signal curve cannot be associated chronologically.
260-01FB	**Error message** Cannot find PLC module: %1 **Cause of error** Cannot find the selected PLC module. **Error correction** Select another PLC module or inform your service agency.

Error number	Description
260-01FC	**Error message** Error in temporary file **Cause of error** The temporary file could not be generated. **Error correction** Select another PLC program or inform your service agency.
260-01FD	**Error message** Compiler not found **Cause of error** The PLC compiler / PET interpreter could not be loaded. **Error correction** Inform your service agency.
260-01FE	**Error message** Program/table with invalid format **Cause of error** The PLC program / the PET table has an incorrect format. **Error correction** Correct the program/table.
260-01FF	**Error message** PLC compiler configuration incorrect **Cause of error** The configuration file for the PLC compiler contains errors. **Error correction** Correct the configuration file. Note further error messages regarding this.
260-0200	**Error message** Insufficient memory for the PLC compiler/PET **Cause of error** Insufficient memory to load the PLC compiler / PET. **Error correction** Release some memory and compile again.

Error number	Description
260-0202	**Error message** System error in the PLC **Cause of error** The following causes of error are intended to help the service personnel to isolate and correct the PLC system error. - A PLC program cannot be loaded because the control type is configured incorrectly. - A PLC program cannot be loaded because the error table for the PLC compiler is configured incorrectly. - A PLC program cannot be loaded because an unexpected file system error occurred. - Symbol definitions for the PLC program cannot be read or contain unexpected data. - There is another internal PLC system error **Error correction** Inform your service agency.
260-0203	**Error message** Command cannot be executed at present **Cause of error** The command cannot be executed at present because either an NC program is running or a compiler process is already active. **Error correction** Stop the program run and restart the compiler process.
260-0204	**Error message** The command cannot be executed at present **Cause of error** The command cannot be executed at present because autostart is already active. **Error correction** End autostart and restart the compiler process.
260-0205	**Error message** PLC program could not be started **Cause of error** The PLC program was compiled correctly but the PLC could not be started. **Error correction** Select another PLC program and compile it; or inform your service agency.

Error number	Description
260-0206	**Error message** No active PLC program **Cause of error** The PLC program has not started and therefore no program for tracing is active. **Error correction** Select another PLC program and compile it; or inform your service agency.
260-0207	**Error message** No access to PLC symbol file (%1) **Cause of error** A PLC symbol file cannot be accessed. **Error correction** Compile the PLC program again or select another PLC program.
260-0208	**Error message** Local symbol. Cannot be displayed **Cause of error** **Error correction**
260-0209	**Error message** No valid PLC operand **Cause of error** The input contains no valid PLC operands. **Error correction** Please enter the correct PLC operand name.
260-020A	**Error message** Update of operand data not possible **Cause of error** The operand data update is not possible at present. **Error correction** Compile the PLC-Programm again or inform your service agency.
260-020B	**Error message** Source file invalid **Cause of error** **Error correction**

Error number	Description
260-020C	**Error message** No active error table **Cause of error** The error table is not active. **Error correction** Reselect the error table and compile.
260-020D	**Error message** Compilation of PLC program failed **Cause of error** The PLC program could not be compiled. **Error correction** Select another PLC program and compile.
260-020E	**Error message** Compilation of PLC error table failed **Cause of error** The error table could not be compiled. **Error correction** Select another error table and compile.
260-020F	**Error message** Operand being loaded in watchlist.... **Cause of error** **Error correction**
260-0210	**Error message** Operand not recognized! **Cause of error** **Error correction**
260-0211	**Error message** Operand %1 loaded in watchlist **Cause of error** **Error correction**
260-021D	**Error message** Command not possible at this time: Trace function is active **Cause of error** The command cannot be executed at present. An external tracer is active, which is why the command is not permissible. **Error correction** End the external tracer and give the command again.

Error number	Description
260-021E	**Error message** Command not possible at this time: Self-test is active **Cause of error** The command cannot be executed at present. The safety self-test is active, which is why the command is not permissible. **Error correction** Wait for the end of the self-test, and then give the command again.
260-0221	**Error message** Operand %1 not activated/deactivated **Cause of error** The given operand could not be activated or deactivated in the I/O force list. **Error correction** Please check the I/O force list and correct it if necessary.
260-0224	**Error message** Operand %1 was set twice **Cause of error** The given operand was entered more than once in the I/O force list **Error correction** - Adapt selection. PLC operands of the same name should be listed only once in the I/O force list. - If there are multiple entries, the last operand in the list applies!
260-0235	**Error message** Data request not permitted **Cause of error** Due to missing user rights, no data can be requested from the PLC. **Error correction** - Check the user rights - If necessary, grant the current user the necessary additional rights
270-0001	**Error message** System error in SQL server **Cause of error** A software error has occurred in the SQL server. **Error correction** Inform your service agency.

Error number	Description
270-0002	**Error message** System error in SQL server **Cause of error** A function of the SQL server has been called, although the function has not yet been implemented. **Error correction** Inform your service agency.
270-0003	**Error message** System error in SQL server **Cause of error** The SQL server cannot determine the sender of a message. **Error correction** Inform your service agency.
270-0004	**Error message** System error in SQL server **Cause of error** The SQL server cannot contact the sender of a message. **Error correction** Inform your service agency.
270-0005	**Error message** Symbolic name %1 is not resolvable **Cause of error** A given symbolic table name cannot be resolved with the configuration data. **Error correction** – Check the configuration data - Contact your machine tool builder
270-0006	**Error message** Table %1 not found **Cause of error** A table file cannot be found in the given path. **Error correction** - Correct the given path name - Copy or move the file to the given location

Error number	Description
270-0007	**Error message** Error while accessing file %1 **Cause of error** An error occurred while accessing the indicated file: - The file is not ISO Latin-15 encoded and begins with a Byte Order Mark (BOM) - The file contains impermissible control characters, particularly the string 'NUL' - Reading of the file is not permissible - The file is to be deleted, but may not be written - The file is to be renamed, but may not be written - A previous access to the already open file failed - There are already too many open files in the file system - The file system does not permit the creation of any more files - The file system reports some other error **Error correction** - Check the encoding of the file, change it if necessary, and remove the Byte Order Mark - Check whether the file contains impermissible control characters and remove them - Check and adapt the access rights to this file if necessary - Check the status of the file system, and repair the file system if necessary
270-0008	**Error message** Table %1 erroneous **Cause of error** A given table file contains incorrect syntax in the table description. **Error correction** Edit the table description so that it has, in this sequence and spelling, the keyword BEGIN, the table name, and optionally the keyword MM or INCH for the unit of measure; or contact your machine tool builder.
270-0009	**Error message** Table %1 incomplete **Cause of error** A give table file does not end with the keyword [END]. This file might be incomplete. **Error correction** - Check whether the table file is complete. If necessary, add the keyword [END] on its own line at the end of the file - If necessary, contact your machine tool builder

Error number	Description
270-000A	**Error message** Definition of column %1 is faulty or missing **Cause of error** The table contains a column for which either there is no description in the configuration data or in the table itself, or whose description in the table is faulty. **Error correction** - Add to or correct the column description - If necessary, contact your machine tool builder
270-000B	**Error message** Field name %1 already assigned **Cause of error** A given table file contains one field name more than once. **Error correction** - Correct the table - If necessary, contact your machine tool builder
270-000C	**Error message** Syntactically incorrect SQL statement **Cause of error** A given SQL statement has incorrect syntax. **Error correction** - Enter the statement in the correct syntax - If necessary, contact your machine tool builder
270-000D	**Error message** Literal not concluded **Cause of error** A literal in a given SQL statement does not end with the required ' character. **Error correction** Enter the statement in the correct syntax, or contact your machine tool builder.
270-000E	**Error message** Field name %1 not found **Cause of error** An SQL statement was given with a field name that is not contained in the table. **Error correction** - Enter the statement in the correct syntax - If necessary, contact your machine tool builder

Error number	Description
270-000F	**Error message** Data record already locked **Cause of error** There was an attempt to lock access to or to edit a data record that was already locked from somewhere else. **Error correction** - Remove the external lock and repeat the statement - If necessary, contact your machine tool builder
270-0010	**Error message** Data record with incorrect length **Cause of error** A given table contains at least one data record whose length differs from the length of the line with the field names. **Error correction** - Shorten the data record or fill it with space characters - If necessary, contact your machine tool builder
270-0011	**Error message** No further data records found **Cause of error** No further data records were found in response to an SQL query. **Error correction** Reformulate the query if the desired data record has not already been found.
270-0012	**Error message** Incorrect default value for field **Cause of error** There was an attempt to insert a data record in a table, where an incorrect default value was given for at least one field in the description. **Error correction** - Correct the default value. In most cases it cannot be saved in the available field length. - If necessary, contact your machine tool builder
270-0013	**Error message** Incorrect value for field **Cause of error** There was an attempt to edit a data record in a table, where an incorrect value was given for at least one field. **Error correction** - Correct the given value. Usually it cannot be saved in the available field length. - If necessary, contact your machine tool builder

Error number	Description
270-0014	**Error message** Incorrect number of values **Cause of error** There was an attempt to insert or change a data record in a table, where the number of values do not match the number of selected fields. **Error correction** - Correct the statement - If necessary, contact your machine tool builder
270-0015	**Error message** System error in SQL server **Cause of error** Unknown error in the SQL server. **Error correction** Inform your service agency.
270-0016	**Error message** Table synonym already exists **Cause of error** An attempt was made to generate for the table a logical name that already exists. **Error correction** Select another name or delete the existing name first.
270-0017	**Error message** Table synonym not found **Cause of error** There was an attempt to delete or edit a nonexistent logical name for a table. **Error correction** Select another name.
270-0018	**Error message** Table already exists **Cause of error** An attempt was made to create a new table, although a table with this name already exists. **Error correction** Select another table name.

Error number	Description
270-0019	**Error message** Table is still open **Cause of error** An attempt was made the change a table description or delete a table, although the table is still open. **Error correction** Close the table first.
270-001A	**Error message** Configuration datum cannot be modified **Cause of error** An attempt was made to create or change a logical name for a table. However, the corresponding configuration datum cannot be written. **Error correction** Stop the machining and then try again to generate or change the logical name.
270-001B	**Error message** Description of the columns cannot be read **Cause of error** No description of the columns can be found for the table, because the type of table is not included in the configuration data, or the description of columns saved in the table itself is incomplete or syntactically incorrect. **Error correction** Check the configuration data and add a description of the type of table. Open the table with a text editor and delete or edit the column description saved in the table.
270-001C	**Error message** Table contains no columns **Cause of error** An attempt was made to make or open a table without columns. **Error correction** Delete the table and make a new one.
270-001D	**Error message** Table is write-protected **Cause of error** There was an attempt to make or edit a table on a write-protected storage medium or on one marked as write protected. **Error correction** Remove the write protection.

Error number	Description
270-001E	**Error message** Column %1 already exists in table **Cause of error** An attempt was made in a table to insert an existing column twice. **Error correction** Enter another column name.
270-001F	**Error message** Index already defined **Cause of error** An attempt was made to create an index for a table using an index name that was already defined. **Error correction** Check the SQL statement and enter a different index name.
270-0020	**Error message** Index not found **Cause of error** An attempt was made to delete an index that does not exist. **Error correction** Enter a valid name.
270-0021	**Error message** Value %1 is not unique **Cause of error** The indicated value appears more than once in a column configured for unique values. **Error correction** Change the values in the column such that each value is unique.
270-0022	**Error message** Column %1 cannot be indexed **Cause of error** An attempt was made to create an index for a column that was not configured for unique values. **Error correction** Change the values in the column such that each value is unique and configure the column for unique values, or enter a different column for indexing.

Error number	Description
270-0023	**Error message** Caption of the column %1 too long **Cause of error** The key name given for the column configuration is just as long as or longer than the given column width. **Error correction** - Enter a larger value for the column width - If necessary, contact your machine tool builder
270-0024	**Error message** Configuration datum %1 - %2 contains no value **Cause of error** The designated attribute of the column configuration contains an empty string. **Error correction** - Enter a valid value - Delete the attribute if no default value is needed - If necessary, inform your machine manufacturer
270-0025	**Error message** Configuration datum %1 - %2 contains syntactically incorrect value %3 **Cause of error** The designated attribute of the column configuration contains a syntactically incorrect value. **Error correction** - Enter a valid value - If necessary, inform your machine manufacturer
270-0026	**Error message** Configuration datum %1 - %2 contains a value %3 that is too long **Cause of error** The designated attribute of the column configuration contains a value that cannot be entered in the column with the given width **Error correction** - Enter a larger value for the column width - Enter another value for the attribute - If necessary, inform your machine manufacturer

Error number	Description
270-0027	**Error message** Unnecessary configuration datum %1 - %2 **Cause of error** The indicated attribute for the column configuration is not defined for the data type of the column. **Error correction** Delete the attribute or contact your machine tool builder.
270-0028	**Error message** Configuration datum %1 - %2 contains value %3 out of range **Cause of error** The designated attribute of the column configuration lies outside of the value range. It might, for example, be smaller than the minimum value. **Error correction** - Enter a valid value - If necessary, inform your machine manufacturer
270-0029	**Error message** Configuration of table type %1 refers to undefined column %2 **Cause of error** The column designated in the configuration of the table type is not defined. **Error correction** - Check the column name - Delete the column - Delete the column from the configuration of the table type - If necessary, contact your machine tool builder
270-002A	**Error message** Primary key of table type %1 refers to undefined column %2 **Cause of error** The designated primary key is not a column of the table type. **Error correction** - Check the primary key - Enter the column designated in the list of columns as the primary key of the table - If necessary, inform your machine manufacturer

Error number	Description
270-002B	**Error message** Foreign key of table type %1 refers to undefined column %2 **Cause of error** The indicated foreign key is not a column of this table type. **Error correction** Check the entry for the foreign key, or enter a column identified in the list of columns as the foreign key for this table, or contact your machine tool builder.
270-002C	**Error message** Foreign key of the table type %1 contains invalid referential action %3 **Cause of error** Incorrect syntax in the referential action for the designated foreign key. **Error correction** - Check the given referential action - If necessary, inform your machine manufacturer
270-002D	**Error message** Configuration datum %1 - %2 contains errors **Cause of error** The indicated configuration datum contains errors. The erroneous values were replaced by default values for operating the SQL server. **Error correction** - Correct the indicated configuration datum - Check whether the primaryKey parameter has the correct initial value for the table column - If necessary, inform your machine manufacturer
270-002E	**Error message** Configuration datum %1 - %2 contains errors **Cause of error** The given configuration datum has errors and was not accepted for operating the SQL server. **Error correction** - Correct the given configuration datum - If necessary, inform your machine manufacturer

Error number	Description
270-002F	**Error message** No column given **Cause of error** The SQL does not specify a column. **Error correction** Enter at least one column in the statement.
270-0030	**Error message** Primary key may not be altered **Cause of error** The column for the primary key may not be renamed or removed from the table. **Error correction** Check the entered SQL statement.
270-0031	**Error message** Update %1 not possible **Cause of error** An attempt was made to change a value in the column indicated as primary key for the table. **Error correction** Check the entered SQL statement.
270-0032	**Error message** Value of primary key %1 missing **Cause of error** An attempt was made to enter a line in the table, even though there was no value entered in the primary key column of the table. **Error correction** Check the entered SQL statement.
270-0033	**Error message** Column %1 contains no value **Cause of error** An attempt was made to delete a value from the indicated column. However, a value must be entered in this column. **Error correction** Check the entered SQL statement and assign a valid value to the column.

Error number	Description
270-0034	**Error message** Erroneous value for %1 **Cause of error** An attempt was made to enter a syntactically incorrect value to the column. **Error correction** Check the entered SQL statement and assign a valid value to the column.
270-0035	**Error message** Value for %1 is too long **Cause of error** An attempt was made to enter a value wider than the column width to the column. **Error correction** Check the entered SQL statement and assign a valid value to the column.
270-0036	**Error message** Erroneous value for %1 **Cause of error** An attempt was made to enter a value outside the value range to the column. **Error correction** Check the entered SQL statement and assign a valid value to the column.
270-0037	**Error message** Data record %1 cannot be inserted, changed or deleted **Cause of error** There was an attempt to insert, change or delete a data record that either makes reference through a foreign key to a non-available data record or to which at least one other data record makes reference through a foreign key. The specified referential action would leave an invalid reference. **Error correction** Check the SQL statement and correct the references first.
270-0038	**Error message** Data record %1 cannot be changed **Cause of error** There was an attempt to change a data record that uses a foreign key to refer to another data record. The specified referential action would change a data record that was already changed by the SQL statement itself. **Error correction** Check the SQL statement and correct the references first.

Error number	Description
270-0039	**Error message** Data record already deleted **Cause of error** There was an attempt to access a data record that was already deleted by another statement. **Error correction** - Correct the statement - If necessary, contact your machine tool builder
270-003A	**Error message** Error in table name or table type %1 **Cause of error** The given table name or type has incorrect syntax. Table names and types must begin with a letter and can otherwise contain letters, numerals and the underscore character. **Error correction** Check and correct the table name or type.
270-003B	**Error message** Data medium almost full **Cause of error** When table files were closed, it was impossible to save a compact version of the files due to insufficient space remaining on the data medium. **Error correction** Delete any unnecessary files on the data medium.
270-003C	**Error message** The modification key does not designate a time stamp column **Cause of error** A modification key was entered in the table configuration, but the corresponding column does not have the type TSTAMP. **Error correction** Select the column type TSTAMP or configure another time stamp column as modification key.
270-003D	**Error message** The modification key designates a read only column **Cause of error** A modification key was entered in the table configuration and the corresponding column was declared only readable. This is not allowed because this column must always take the current time stamp for changes. **Error correction** Remove READONLY in the column configuration or configure another column as modification key.

Error number	Description
270-003E	**Error message** The modification key designates a unique column **Cause of error** A modification key was entered in the table configuration and the corresponding column was declared unique. This is not allowed because the same time stamp might be saved in two or more lines when changes are close together in time. **Error correction** Remove UNIQUE in the column configuration or configure another column as modification key.
270-003F	**Error message** Merging of incompatible tables **Cause of error** Two tables were entered for merging that have different basic types. The basic types are derived from the file footers and headers in the tables. **Error correction** Check the file footers and headers of both table files and their configuration. If the tables have different basic types, they cannot be merged.
270-0040	**Error message** Column %1 for special functions is not allowed **Cause of error** The column given for a special function (primary key, foreign key, timestamp or password) does not exist, has the wrong file type or is too narrow. Further information: - Columns for a foreign key have to have the same data type as the column for the primary key. - The column for the timestamp must have the TSTAMP data type and be at least 19 characters wide. - The column for the password must have the TEXT data type and be at least 15 characters wide. - The columns for the timestamp and password must not be write-protected or ambiguous. **Error correction** Correct the description of the table type or the column in the configuration data

Error number	Description
270-0041	**Error message** Data record %1 is protected by password **Cause of error** You tried to delete, edit or cancel the password protection of a table's password-protected data record. **Error correction** - To change the data record, reenter the password in the password column or cancel the password protection. - Cancel the password protection before deleting the data record. - To cancel the password protection, enter the exclamation mark character "!" in the password column and immediately enter the password.
270-0042	**Error message** Data record %1 was changed without authorization **Cause of error** The checksum calculated for table's data record does not agree with the stored checksum. The table file was manipulated by an external application or damaged on the storage medium. **Error correction** Import a backup copy of the affected table file.
270-0043	**Error message** The table file %1 might have been manipulated **Cause of error** Not all data records in the table file have checksums saved in the column for the password. Data records might have been changed by an external application. **Error correction** Check all data records for correctness or import a backup copy of the table file.
280-0064	**Error message** FN 14: error code %1 **Cause of error** Error forced by the function FN14 (ISO: D14). This function calls preprogrammed messages of the machine tool builder (for example from an OEM cycle). If with FN14 (D14) is reached during a program run or test run, the program is interrupted and the corresponding message is displayed. **Error correction** Look for a description of the error in the machine tool manual. Restart the program after the cause of the error has been removed.

Error number	Description
280-03E9	**Error message** Tool axis is missing **Cause of error** You programmed a positioning block with tool radius compensation without first calling a tool. **Error correction** Edit the part program.
280-03EE	**Error message** Rotation not permitted **Cause of error** Rotation was programmed before a touch probe cycle. **Error correction** Reset the rotation cycle.
280-03EF	**Error message** Scaling factor not permitted **Cause of error** A scaling factor was programmed before a touch probe cycle. **Error correction** Reset the scaling factor or the axis-specific scaling cycles.
280-03F0	**Error message** Mirroring not permitted **Cause of error** Mirroring was programmed before a touch probe cycle. **Error correction** Reset the mirroring cycle.
280-03F1	**Error message** Datum shift not permitted **Cause of error** Datum shift is active. **Error correction** Reset the datum shift.
280-03F4	**Error message** Wrong sign programmed **Cause of error** The programmed dwell time in the Dwell Time cycle, Peck Drilling cycle, or Tapping cycle is negative (through Q parameter). **Error correction** Edit the cycle parameter.

Error number	Description
280-03F6	**Error message** Touch point inaccessible **Cause of error** No touch point was reached during the TCH-PROBE 0 cycle (ISO: G55) or when using the manual probing cycles. **Error correction** - Pre-position the touch probe closer to the workpiece.
280-03F8	**Error message** Contradictory entry Contradictory entry **Cause of error** The values that you entered are contradictory. **Error correction** Check the input values.
280-03FC	**Error message** Wrong rpm Wrong rpm **Cause of error** The programmed spindle speed does not lie in the existing pattern of spindle speed stages. **Error correction** Enter the correct rotational speed.
280-03FD	**Error message** Radius comp. undefined **Cause of error** You programmed a radius-compensated single-axis positioning block which without the radius compensation does not result in tool movement (e.g. IX+0 R+, ISO: G7). **Error correction** Edit the part program.
280-03FE	**Error message** Rounding-off not permitted **Cause of error** In the positioning block before a rounding arc (RND, ISO: G25) either you programmed a movement only in the tool axis or you used the M function M98 to cancel compensation. **Error correction** Edit the part program.

Error number	Description
280-0400	**Error message** Program start undefined **Cause of error** Type of interpolation undefined. **Error correction** Restart the part program.
280-0401	**Error message** Excessive subprogramming **Cause of error** You nested more than 8 subprogram calls (CALL LBL xx, ISO: Lx,0). **Error correction** Check whether all your subprograms are concluded with LBL 0 (ISO:G98 L0).
280-0413	**Error message** No datum table active **Cause of error** Probing cycle for datum setting: The measured point is to be written in a datum table. However, you have not activated a datum table in a program run mode. **Error correction** In the Program Run, Single Block or Program Run, Full Sequence mode, activate a datum table in which the point is to be written.
280-042C	**Error message** Datum table? **Cause of error** A datum table is required to run an NC program. However, there is no table saved in the control's NC memory, or there are more than one table but none of them is activated. **Error correction** Activate a datum table in the Program Run, Full Sequence operating mode.
280-0430	**Error message** Tolerance exceeded Tolerance exceeded **Cause of error** The limits entered in the tool table TOOL.T in the LTOL or RTOL column were exceeded. **Error correction** Check the limit values for the active calibration tool.

Error number	Description
280-0431	**Error message** Mid-program startup active Mid-program startup active **Cause of error** Mid-program startup is not permitted with the programmed function. **Error correction** Mark the programmed function with "skip blocks" and activate this setting. Then run the mid-program startup again.
280-0432	**Error message** ORIENTATION not permitted **Cause of error** - Your machine does not offer spindle orientation - Spindle orientation not possible **Error correction** - Refer to your machine manual! - Check machine parameter mStrobeOrient and enter the numerical designation of the M function or -1 for spindle orientation by the NC. Refer to your machine manual!
280-0433	**Error message** 3-D ROT not permitted 3DROT not permitted **Cause of error** You tried to conduct one of the following functions while the working plane was tilted: - Setting a reference point - A touch probe cycle 40x for measuring a misalignment **Error correction** Deactivate the tilted working plane function and restart the program.
280-0434	**Error message** Activate 3DROT Activate 3DROT **Cause of error** In the Manual operating mode, the Tilt Working Plane function is inactive. **Error correction** Activate 3DROT in Manual mode.

Error number	Description
280-0435	**Error message** Check the depth sign Check the depth sign **Cause of error** The cycle can only run in negative direction (positive in Cycle 204) because the configuration datum "displayDepthErr" is set to on. **Error correction** - Enter the depth as a negative value (positive in Cycle 204) to run the cycle - To run the cycle in the positive direction (negative in Cycle 204,), set the configuration datum "displayDepthErr" to off
280-0436	**Error message** Q303 in meas. cycle undefined! Q303 in meas. cycle undefined! **Cause of error** In one of the measuring cycles 410 to 418, you did not define the parameter Q303 (measured value transfer)(current value = -1). For reasons of security, however, selection of the measured value transfer is required to write the results of measurement in a table (datum table or preset table). **Error correction** Change parameter Q303 (measured value transfer) in the measuring cycle that is causing the error: - Q303=0: Write the measured values with respect to the active workpiece coordinate system into the active datum table (activate in the program with Cycle 7!). - Q303=1: Write the measured values with respect to the active machine-based coordinate system (REF values) into the preset table (activate in the program with Cycle 247!). - Q303=-1: Measured value transfer is undefined. This value is automatically generated by the TNC when you download a program that was written on a TNC 4xx or with an old software level of the iTNC 530, or if during the cycle definition you skipped the prompt for the measured value transfer with the END key.
280-0437	**Error message** Tool axis not allowed Tool axis not allowed **Cause of error** - You called probing cycle 419 with an illegal tool axis. - You called the PATTERN DEF function in connection with an illegal tool axis. **Error correction** - Only call probing cycle 419 with the tool axis X, Y or Z. - Use the PATTERN DEF function only with the tool axis Z (TOOL CALL Z).

Error number	Description
280-0438	**Error message** Calculated values incorrect Calculated values incorrect **Cause of error** In probing cycle 418, the TNC calculated too large a value. You may have defined in an incorrect sequence for the four holes to be probed. **Error correction** Check the probing sequence. Refer to the User's Manual for Touch Probe Cycles.
280-0439	**Error message** Contradictory measuring points Contradictory measuring points **Cause of error** - In one of the probing cycles 400, 403 or 420, you defined a contradictory combination of measuring points and measuring axes. - The selection of measuring points in Cycle 430 results in division by 0. **Error correction** - For measuring axis = reference axis (Q272=1), the parameters Q264 and Q266 are defined at different values. - For measuring axis = minor axis (Q272=2), the parameters Q263 and Q265 are defined at different values. - For measuring axis = probe axis (Q272=3), the parameters Q263 and Q265 or Q264 and Q266 are defined at different values. - Select the measuring points so that they always have different coordinates in all axes.
280-043A	**Error message** Incorrect clearance height! Incorrect clearance height! **Cause of error** In Cycle 20 (ISO: G120), you entered a clearance height (Q7) that is lower than the coordinate of the workpiece surface (Q5). **Error correction** Enter a clearance height (Q7) that is higher than the coordinate of the workpiece surface (Q5).

Error number	Description
280-043B	**Error message** Contradictory plunge type! Contradictory plunge type! **Cause of error** The plunging strategy defined in Cycles 251 to 254 contradicts the defined plunging angle of the active tool. **Error correction** Change parameter Q366 in one of the Cycles 251 to 254 or the plunging angle ANGLE of the tool in the tool table. Permissible combinations of parameter Q366 and the plunging ANGLE are: For perpendicular plunging: Q366 = 0 and ANGLE = 90 For helical plunging: Q366 = 1 and ANGLE > 0 For inactive tool table, define Q366 with 0 (only perpendicular plunging allowed).
280-043C	**Error message** This fixed cycle not allowed This fixed cycle not allowed **Cause of error** - You attempted to run a fixed cycle in connection with Cycle 220 or 221 although it cannot be combined with these cycles. - You tried to run the Cycle 209 with a feed rate factor for retraction (Q403). **Error correction** - You cannot combine Cycles 220 and 221 with the following fixed cycles: - Cycles of the SLI and SLII groups - Cycles 210 and 211 - Cycles 230 and 231 - Cycle 254 - Feed rate factor 403 is allowed only with a setting in MP3010 unequal to 7.

Error number	Description
280-043D	**Error message** Line is write-protected Line is write-protected **Cause of error** - You tried to edit or erase a write-protected line in the preset table. - You tried to write a value in the active line of the preset table. **Error correction** - Overwriting the active preset is not allowed. Use another preset number. - The write protection was activated by your machine manufacturer. Maybe fixed datum was defined in this line. If you want to cancel write protection, contact your machine tool builder. - You defined the write protection in the TNC.SYS file. If required, cancel the write-protection there. - You tried to change line 0. It cannot be changed.
280-043E	**Error message** Oversize greater than depth Oversize greater than depth **Cause of error** SL cycles II or milling cycles 25x: You have entered an allowance for floor greater than the milling depth. **Error correction** - SL cycles II: Check Q4 in Cycle 20 (ISO: G120). - Milling cycles 25x: Check allowance Q369 and depth Q201.
280-043F	**Error message** No point angle defined Point angle not defined **Cause of error** In Cycle 240 Centering you defined parameter Q343 such that centering is done with respect to the diameter. In a drilling cycle you defined parameter Q395 such that the depth is in reference to the tool diameter. You programmed a cycle for chamfering. The point angle for this must be between 1 and 179 degrees. However, no point angle is defined for the active tool. **Error correction** - Set parameter Q343=0 (centering to entered depth). - Set parameter Q395=0 (depth in reference to the tool tip). - Define the point angle in the column T-ANGLE of the tool table TOOL.T.

Error number	Description
280-0440	**Error message** Contradictory data Contradictory data **Cause of error** The combination of the parameters Depth (Q201) and Diameter (Q344) defined in Cycle 240 Centering under Select depth/diameter (Q343) is not allowed. **Error correction** Possible definitions: Q343=1 (entered diameter active): Q201 must be equal to 0 and Q344 must not be equal to 0. Q343=0 (entered depth active): Q201 must not be equal to 0 and Q344 must be equal to 0.
280-0441	**Error message** Slot position 0 not allowed! Slot position 0 not allowed! **Cause of error** You tried to run Cycle 254 with the slot position 0 (Q367=0) in conjunction with the point pattern Cycle 221. **Error correction** Use slot position Q367 = 1, 2 or 3 if you want to run Cycle 254 with the point pattern cycle 221
280-0442	**Error message** Enter an infeed not equal to 0 Enter an infeed not equal to 0. **Cause of error** You defined a fixed cycle with the depth 0. **Error correction** Enter a depth unequal to 0.
280-0443	**Error message** Switchover of Q399 not allowed **Cause of error** You tried to switch on the touch probe cycle 441 to switch on the angle tracking, although this function is deactivated by configuration datum. **Error correction** In the probe table, set the angle tracking in the TRAC column to ON and then recalibrate the touch probe.

Error number	Description
280-0447	**Error message** Software option not active Software option not active **Cause of error** You tried to use a software option that is not enabled on your TNC. **Error correction** Contact your machine tool builder or the control manufacturer to purchase the software option.
280-0448	**Error message** Kinematics cannot be restored Kinematics cannot be restored **Cause of error** You tried to restore kinematics that do not match the currently active kinematics. **Error correction** Restore only kinematics that you have saved previously from an identical kinematics description.
280-0449	**Error message** Function not permitted Function not permitted **Cause of error** You tried to use a feature that is not enabled on your TNC by the Feature Content Level (FCL) management. **Error correction** By default, FCL functions are locked after a software update. By entering the code number 65535 in the SIK menu, you can enable these functions for a certain period of time for test purposes. You can enable FCL functions permanently by purchasing and entering a code number. For more information, contact your machine tool builder or the control manufacturer.
280-044A	**Error message** Contradictory workpc. blank dim. Contradictory workpc. blank dim. **Cause of error** The workpiece blank dimensions you have defined in a fixed cycle are smaller than the dimensions of the finished part. **Error correction** Check the cycle definition and correct the input values.

Error number	Description
280-044B	**Error message** Measuring position not allowed Measuring position not allowed **Cause of error** The kinematic measurement resulted in a measuring position of 0° in one of the three rotary axes. This is not allowed. **Error correction** Select the starting angle, stopping angle and, if applicable, number of measurements on all three axes in a way that does not result in any 0° positions.
280-044C	**Error message** Kinematic access not possible **Cause of error** The control could not access the active kinematic description (read or write). - There is no valid kinematic description. - The kinematic description is write-protected. **Error correction** - Use a valid kinematic description. - Cancel write-protection for a kinematic description.
280-044D	**Error message** Meas. pos. not in traverse range **Cause of error** You have defined a measured position that lies outside of the rotary axis's traverse range. **Error correction** Select the start angle and/or end angle in the cycle so that the measured position lies within the traverse range.
280-044E	**Error message** Preset compensation not possible **Cause of error** You tried to run a compensation of the preset although not all the entries required for it are in the kinematic description. You can only run the preset compensation if transformations in three separate axes in the machine coordinate system are entered in the kinematic description. **Error correction** Change the number of measuring points in the cycle so that the control can run a preset compensation. If necessary, contact the machine manufacturer.

Error number	Description
280-044F	**Error message** Tool radius too large **Cause of error** - The dimensions you defined in one of the Cycles 251 to 254 are too small. - The lateral oversize in one of the Cycles 251 to 254 is too large. **Error correction** - Use a smaller tool - Reduce the oversize.
280-0450	**Error message** Plunging type is not possible **Cause of error** In one of the cycles 251 to 254 you defined a plunging strategy that is not possible with the dimensions defined in the cycle. **Error correction** Use a smaller tool or another plunging strategy. Set the configuration datum suppressPlungeErr to "on" in order to suppress this monitoring, or use RCUTS in the tool table. Use a tool with a sufficiently large cutting width and define this width in the RCUTS column of the tool table.
280-0451	**Error message** Plunge angle incorrectly defined **Cause of error** You defined an incorrect plunge angle (ANGLE column in the tool table) for the selected plunging strategy. **Error correction** Define a plunge angle greater than 0° and smaller than 90°.
280-0452	**Error message** Angular length is undefined **Cause of error** You defined in the cycle an angular length of 0°. **Error correction** Define an angular length greater than 0° in the cycle definition.

Error number	Description
280-0453	**Error message** Slot width is too large **Cause of error** You defined the circular slot width at least as large as the pitch circle diameter. **Error correction** Enter a slot width smaller than the pitch circle diameter in the cycle definition.
280-0454	**Error message** Scaling factors not equal **Cause of error** You attempted to scale a circular contour element with differing axis-specific scaling factors. **Error correction** Scale the axes of circular contour elements with the
280-0455	**Error message** Tool data inconsistent **Cause of error** A tool whose data do not match those calibrated by the touch probe is active. **Error correction** Transmit the calibrated data of the touch probe to the tool table and perform a TOOL CALL in order to load the changed data.
280-0456	**Error message** MOVE not possible **Cause of error** In a KinematicsOpt cycle you selected a rotary axis positioning with the MOVE function although that is not possible with the existing configuration. **Error correction** Deactivate the MOVE function: - Enter a retraction height Q408 greater than 0. - Define the retraction height Q408 high enough to allow rotary movements without collisions.

Error number	Description
280-0457	**Error message** Presetting not allowed! **Cause of error** - You tried to save a datum in the preset table, although this function is locked by machine parameter. - Touch Probe Cycle 403: Setting the datum in the axis you select is not allowed. It would lead to errors during the tilting of the working plane or in connection with TCPM (M128). **Error correction** - Set the machine parameter MP7295 = 0 for the axes X, Y and Z. If necessary, consult with your machine tool builder. - Check the compensation axis you selected. A datum can be set in the compensation axis only in the first rotary table axis (seen from the workpiece).
280-0458	**Error message** Thread angle too small! **Cause of error** Sum of overrun and pitch is larger than the thread length. **Error correction** - Increase the thread length (in Cycle 831 the length of the overrun is as large as the pitch)
280-0459	**Error message** 3-D ROT status is contradictory! **Cause of error** The 3-D Rot status for the MANUAL and AUTOMATIC operating modes does not match. **Error correction** In 3-D Rot in the MANUAL and AUTOMATIC operating modes, set the same status (ACTIVE/INACTIVE).
280-045A	**Error message** Configuration is incomplete **Cause of error** The configuration data are not prepared for this application. **Error correction** - Inform your machine tool builder.
280-045B	**Error message** No turning tool is active **Cause of error** A turning tool is required for the executed function. **Error correction** - Insert a turning tool (defined via TYPE column in the tool table).

Error number	Description
280-045C	**Error message** Tool orientation is inconsistent **Cause of error** The tool orientation TO does not agree with the selected operation. **Error correction** Check the entry for the tool orientation of the turning tool and the selection (AXIAL / RADIAL) of the cycle being used.
280-045D	**Error message** Angle not possible! **Cause of error** The entered angle is not possible. A taper angle cannot be 0 or 180 degrees. **Error correction** - Correct the value for the entered angle. - Enter a taper angle between 0 and 180 degree, or between 0 and -180 degrees.
280-045E	**Error message** Radius too small! **Cause of error** The radius of the programmed circle is too small. Thread milling: The offset for countersinking on the face is too small. **Error correction** - Check the programmed values for the circle block. - Thread milling: Program an offset greater than 0 for countersinking on the face.
280-045F	**Error message** Thread runout too short! **Cause of error** The thread runout is too short. The minimum length is calculated as: thread runout * thread depth / safety clearance. **Error correction** - Increase the value for the thread runout.

Error number	Description
280-0460	**Error message** Contradictory meas. points **Cause of error** The measured points result in two parallel lines: cannot calculate an intersection. Cannot calculate a straight line from identical measuring points. **Error correction** Choose measuring points so that all the individual points have different coordinates. Two measuring points on a straight line have to have different coordinates.
280-0461	**Error message** Too many limits **Cause of error** Too many limits were selected for face milling. **Error correction** Set no more than 3 limits for face milling.
280-0462	**Error message** Machining strategy with limits not possible **Cause of error** Spiral machining strategy: face milling with limits is not possible **Error correction** Deactivate the limits or select another machining strategy.
280-0463	**Error message** Machining direction not possible **Cause of error** The machining direction is not possible in compliance with the overlap factor. **Error correction** Select another machining direction.
280-0464	**Error message** Check the thread pitch! **Cause of error** The programmed thread pitch differs from the thread pitch of the active tool. **Error correction** Check the value of the thread pitch (PITCH column) in the tool table. If the value of the thread pitch for the active tool is 0, there is no monitoring.

Error number	Description
280-0465	**Error message** Angle cannot be calculated **Cause of error** The inclination angle cannot be calculated. There is no appropriate tilting axis configured in the kinematic description. The programmed inclination angle lies outside of the tilting axis's traverse range. The indexable insert of the tool has been rotated. **Error correction** Check the programmed angle and the preferred direction. Ensure that no rotation (SPB-INSERT) is entered in the tool table.
280-0466	**Error message** Eccentric turning not possible **Cause of error** Control is not configured for eccentric turning. A coupling function is already active through the machine manufacturer. **Error correction** The machine manual provides further information. Check the entry in the configuration datum eccLimSpeedFactor.
280-0467	**Error message** No milling tool is active **Cause of error** The active tool is not defined as a milling cutter. **Error correction** In the tool table, check the entry in the TYPE column. Cycle 880: The hob must be defined as a milling cutter. Cycle 292: Without option 50, a turning tool must also be defined as a milling cutter.
280-0468	**Error message** Insufficient length of cutting edge **Cause of error** Die angegebene Schneidenlänge des aktiven Werkzeugs ist für die Bearbeitung nicht ausreichend. **Error correction** Definieren Sie in der Spalte LCUTS der Werkzeugtabelle die Länge der Werkzeugschneiden. Prüfen Sie bei Zyklus 880 den Eintag in Q553. Ist LCUTS gleich 0 so überwacht Zyklus 880 keine Schneidenlänge.

Error number	Description
280-0469	**Error message** Gear definition is inconsistent or incomplete **Cause of error** Module, tooth number and head diameter are incomplete or contradictory **Error correction** You have to enter at least 2 of the 3 parameters for module/ tooth number/tip circle diameter (not equal to 0). Check the module, tooth number and tip circle diameter , because the given values are contradictory.
280-046A	**Error message** No finishing allowance provided **Cause of error** Es ist kein Aufmaß programmiert, obwohl im Bearbeitungsumfang nur Schlichten angewählt ist. **Error correction** Definieren Sie für die Schlichtbearbeitung ein Aufmaß.
280-046B	**Error message** Line does not exist in table **Cause of error** The programmed action cannot be executed because the given table line does not exist. **Error correction** Check your NC program. Create the given line in your preset or datum table.
280-046C	**Error message** Probing process not possible **Cause of error** There is no workpiece touch probe in the spindle. No direction or path is defined for probing. **Error correction** Insert a touch probe in the spindle. Select the desired angle probing direction by soft key.
280-046D	**Error message** Coupling function not possible **Cause of error** The commanded coupling function cannot be performed. **Error correction** A coupling function has already been activated by the machine tool builder. The kinematic design of the axis to be coupled is not supported. The machine manual provides further information.

Error number	Description
280-046E	**Error message** Fixed cycle is not supported by this NC software **Cause of error** The programmed machining cycle is not supported by this control. **Error correction** Cycle 290 Interpolation turning: - Adapt the NC program - Use Cycle 291 or 292
280-046F	**Error message** Touch probe cycle is not supported by this NC software **Cause of error** The programmed touch probe cycle is not supported by this NC software. **Error correction** Replacement for Cycle 441: Fast probing: Assign a line from the touch-probe table with the desired properties to a tool index.
280-0470	**Error message** NC program aborted **Cause of error** The NC program was aborted through operator action. **Error correction** If required, check the data in your NC program. After the cancellation of the NC program, continue with NC start.
280-0471	**Error message** Touch probe data incomplete **Cause of error** The data of the touch probe are incomplete or incorrectly defined. **Error correction** Check the entries of the touch probe table(TYPE column).
280-0472	**Error message** LAC function not possible **Cause of error** The LAC function is not configured for this axis. **Error correction** Check whether the axis concerned exists (CfgChannelAxis-->progAxis). Check whether LAC is activated for the axis concerned (CfgControllerComp-->enhancedComp). Contact your machine tool builder.

Error number	Description
280-0473	**Error message** Rounding radius or chamfer is too large! **Cause of error** Input parameter Q220: Rounding radius or chamfer is too large **Error correction** Check parameter Q220 and correct the input value if required.
280-0474	**Error message** Axis angle not equal to tilt angle **Cause of error** Probing function not permitted while working plane is inactive: the position of the tilted axes is not equal to 0°. Probing function not permitted while working plane is active: the position of the tilted axes does not match the active angular values. **Error correction** Working plane is inactive: move the tilting axes to the home position. Working plane is active: move the tilting axes to the correct position or adapt the angular values.
280-0475	**Error message** Character height not defined **Cause of error** The transfer value in the input parameters Q513 “Character height” and Q574 “Text length” is 0. **Error correction** In the input parameter Q513, define the desired character height. In the input parameter Q574, define the maximum permissible text length. Define the value 0 for character height in Q513 if you want to scale the engraving to the value defined for text length in Q574.
280-0476	**Error message** Excessive character height **Cause of error** The programmed engraving with the defined character height Q513 results in a longer text than is defined in Q574. **Error correction** Reduce the character height in Q513 so that the programmed engraving is no longer than defined in Q574. Set the value for Q574 higher or to zero in order to make a longer engraving possible. Enter the value 0 in Q513 if you want to scale the engraving to the text length set in Q574.

Error number	Description
280-0477	**Error message** Tolerance error: Workpiece rework **Cause of error** The probed dimension on the workpiece is outside of the defined tolerance. Too little material was removed. The workpiece can be reworked. **Error correction**
280-0478	**Error message** Tolerance error: Workpiece scrap **Cause of error** The probed dimension on the workpiece is outside of the defined tolerance. Too much material was removed. The workpiece is scrap. **Error correction**
280-0479	**Error message** Faulty dimension definition **Cause of error** The definition of a measure or a tolerance cannot be interpreted. **Error correction** Note the rules for defining a measured or tolerance.
280-047A	**Error message** Illegal entry in compensation table **Cause of error** There is a faulty entry in the corresponding compensation table. - The AXIS columns must not refer to linear axes. - The PLC columns must contain no entries. **Error correction** Adapt the configuration or the contents of the compensation table.

Error number	Description
280-047B	**Error message** Transformation not possible **Cause of error** Some transformations between the working plane and basic coordinate system are not allowed for the function performed. Rotations between the tool cutting edge and tool spindle, for example in the tool carrier, are not allowed. **Error correction** Remove the basic rotation and mirroring between the working plane and basic coordinate system. Try out rotations between the tool cutting edge and the tool spindle.
280-047C	**Error message** Tool spindle incorrectly configured **Cause of error** There is an error in the tool spindle configuration. **Error correction** Contact your machine tool builder. Check whether the spindle is listed in CfgAx-es/spindleIndices. Check the attributes “progKind” and “dir” in CfgProgAxis.
280-047D	**Error message** Offset of the turning spindle unknown **Cause of error** A offset set in the rotary spindle for the milling operation cannot be considered for the necessary coupling of the eccentric turning. An offset can be defined by the workpiece datum, pallet datum or PLC datum. **Error correction** If you can ensure that no offset is needed, you can continue machining. In order to consider the offset, the configuration must be changed. Contact your machine tool builder. The rotary spindle must be included as axis in turning mode in the programmable axes (CfgChannelAxes/progAxes or CfgKinSimpleModel/progAxes). This rotary axis must make reference to the active channel spindle (CfgProgAxis/relatedAxis).

Error number	Description
280-047E	**Error message** Global program settings are active **Cause of error** The selected function is not possible with active global program settings. **Error correction** Deactivate the global program settings in order to perform the selected function.
280-047F	**Error message** Faulty configuration of OEM macros **Cause of error** Only one of the two macros for interpolation turning was configured. **Error correction** Contact your machine tool builder. Configure the macro either under CfgSystemCycle OEM_INTERPTURN_ON and OEM_INTERPTURN_OFF, or don't use either of the two macros.
280-0480	**Error message** The combination of programmed oversizes is not possible **Cause of error** A combination of programmed oversizes is not possible. **Error correction** Define either an equidistant oversize or a longitudinal and transverse.
280-0481	**Error message** Measured value not captured **Cause of error** No measured value was ascertained within a probing function. **Error correction** Check whether the probing process was performed. The points can only be evaluation only if a probing process has been successfully conducted.
280-0482	**Error message** Check the monitoring of the tolerance **Cause of error** A consideration of the tolerance is not possible due to an inconsistent working plane. **Error correction** Check the measurement result or correct the settings for the tilted working plane.

Error number	Description
280-0483	**Error message** Hole is smaller than the stylus tip **Cause of error** The diameter of the stylus tip is greater than the diameter of the hole to be measured. **Error correction** Use a smaller stylus tip to measure this hole.
280-0484	**Error message** Preset cannot be set **Cause of error** A correct reference point cannot be written due to an inconsistent machining plane. **Error correction** Correct the setting for tilting the working plane. This monitoring is active due to the configuration of the machine parameter CfgPresetSettings.chkTiltingAxes. If necessary, contact your machine tool builder.
280-0485	**Error message** Alignment of a rotary table is not possible **Cause of error** There is no suitable rotary table in the active machine kinematic model. The axis of the rotary table is not perpendicular in the current workpiece coordinate system. **Error correction** Make sure that there is a rotary table axis with which you can align the workpiece. If necessary, check whether a 3-D basic rotation prevents meaningful alignment.
280-0486	**Error message** Alignment of rotary axes is not possible **Cause of error** Aligning rotary axes to a determined plane is supported only if the basic rotation is also adopted. Aligning a rotary table is not supported if the determined angle is also to be used as a basic rotation. **Error correction** Check the values in the input parameters Q1121 and Q1126.

Error number	Description
280-0487	**Error message** Infeed limited to length of cutting edge **Cause of error** If a cutting edge length is specified in the LCUTS column in TOOL.T, the TNC restricts the infeed to this value. **Error correction** Check the value of the cutting edge length (LCUTS in TOOL.T) and the programmed infeed. Enter the value 0 as the cutting length to switch off this monitoring.
280-0488	**Error message** Machining depth defined as 0 **Cause of error** There is no machining because the machining depth has been programmed with the value zero. **Error correction** Program the machining depth with a value unequal to zero.
280-0489	**Error message** Tool type is unsuitable **Cause of error** In the tool table, a tool type that is not suitable for this operation is defined in the TYP column. **Error correction** Check and correct the entry in the tool table
280-048A	**Error message** Finishing allowance not defined **Cause of error** No machining operation will be performed, since neither an allowance for the side nor an allowance for the depth was programmed for the finishing operation. **Error correction** Check the input parameters for the finishing allowances and the machining strategy, and correct them if required.

Error number	Description
280-048B	**Error message** Machine datum could not be written **Cause of error** The value of the machine datum (MP_refPos) cannot be changed. The required change amount is greater than MP_maxModification/5, or MP_positionDiffRef/5. **Error correction** If you restore this data record the active machine kinematics might be inaccurate. Check the values and make the necessary adjustments manually. If necessary, inform your machine manufacturer.
280-048C	**Error message** Spindle for synchronization could not be ascertained **Cause of error** Could not determine the spindle to be synchronized. The spindle can be determined automatically only if exactly two spindles are configured in the system. The spindle to be synchronized must not be the active channel spindle. **Error correction** - If more than two spindles are configured, the spindle to be synchronized must be defined in the macro OEM_CYCLGEAR_PRE. - Contact your machine tool builder.
280-048D	**Error message** Function is not possible in the active operating mode **Cause of error** The programmed function is not possible in the active operating mode. **Error correction** For example, use FUNCTION MODE MILL or FUNCTION MODE TURN to activate the operating mode intended for the programmed function.
280-048E	**Error message** Oversize defined too large **Cause of error** The programmed allowance is greater than the entire machining depth. With gear teeth the machining depth corresponds to the tooth height: tooth height = 2 * module + trough-to-tip clearance **Error correction** Check the value of the programmed allowance.

Error number	Description
280-048F	**Error message** Number of teeth not defined **Cause of error** The number of teeth has not been defined for the active tool. The programmed machining operation requires the information about the number of teeth. **Error correction** In CUT column of the tool table, define the number of teeth.
280-0490	**Error message** Machining depth does not increase monotonously **Cause of error** A calculated machining depth does not increase monotonously. The programmed entries result in a machining depth that was already exceeded by a previous cut. **Error correction** Reduce either the first infeed or the number of infeeds. The last infeed must be smaller than the first one. Check the following entries: - First infeed Q586 - Last infeed Q587 - Number of infeeds Q584
280-0491	**Error message** Infeed does not decrease monotonously **Cause of error** A calculated infeed does not decrease strictly monotonously. The programmed entries result in at least one infeed that is greater than or equal to the previous one. **Error correction** Increase the number of infeeds or the first infeed. Reduce the last infeed. The last infeed must be smaller than the first one. Check the following entries: - First infeed Q586 - Last infeed Q587 - Number of infeeds Q584

Error number	Description
280-0492	**Error message** Tool radius not defined correctly **Cause of error** The physical tool radius (sum of R and DR from the tool table) is less than zero. If the physical tool radius equals zero, the selected machining cycle instead uses the programmed delta value DR. The effective tool radius (sum of R and DR from the tool table and the programmed delta value DR) is less than or equal to zero. **Error correction** Enter the correct radius of the tool in the tool table. A programmed delta value DR must not lead to an effective tool radius of less than or equal to zero.
280-0493	**Error message** Mode for retraction to clearance height not possible **Cause of error** The programmed mode for retraction to clearance height will be ignored for manual pre-positioning. **Error correction** When manually pre-positioning to the probing object, make sure that this movement is without collision.
280-0494	**Error message** Gear wheel definition incorrect **Cause of error** The definition of the tooth geometry is incomplete or contradicts itself. The module and number of teeth are necessary for the definition of a gear tooth system according to DIN 3990 (ISO 6336). Outside diameter and tooth height are optional entries. The outside diameter must be greater than the inside diameter. **Error correction** Enter the module and the number of teeth. If there are deviations from DIN 3990 (ISO 6336) then you can define the outside diameter and tooth height. Check the definition of the outside diameter and tooth height.

Error number	Description
280-0495	**Error message** Probing object contains different types of dimension definition **Cause of error** You didn't use the same type of dimension definition for all coordinates of an object to be probed. - For manual pre-positioning: Enter a question mark (?) at the beginning of a dimension definition in order to define manual pre-positioning. - For defining the actual position: Enter the at sign (@) after stating the nominal position in order to define the actual position. **Error correction** You must program the same type of dimension definition in the principal, secondary, and tool axes of an object to be probed. Correct the faulty dimension definition.
280-0496	**Error message** Dimension definition contains impermissible characters **Cause of error** A dimension definition contains impermissible characters. - There is more than one decimal separator in a value. - There are other characters after a dimension definition. - Impermissible characters were used. **Error correction** Correct the dimension definition.
280-0497	**Error message** Actual value in dimension definition faulty **Cause of error** The actual value is not indicated correctly in a dimension definition: - The preceding delimiter '@' is missing. - The definition of a value after the delimiter '@' is missing. The indicated Q parameter may not be used after the delimiter. **Error correction** Correct the definition of the actual value. You can only use Q1900 to Q1999 to transfer variable values.

Error number	Description
280-0498	**Error message** Starting point of hole too deep **Cause of error** The starting point Q379 of a hole is defined to be larger or equivalent to the total depth Q201 of the hole. **Error correction** Define the starting point to be within the specified hole depth.
280-0499	**Error message** Dimension def.: Nominal value missing for manual pre-positioning **Cause of error** When probing with manual pre-positioning, the nominal values are missing for all directions at one position. **Error correction** Define a nominal value for at least one direction. You should define a nominal value in at least the directions that you can specify exactly with the probing process. For manual pre-positioning, define the nominal value after the '?'.
280-049A	**Error message** A replacement tool is not available **Cause of error** The programmed tool is locked or the tool life has expired and no replacement tool is available. **Error correction** Check the columns TL, RT, CUR_TIME, and TIME2 of the programmed tool. If you programmed a tool number then the replacement tool is defined in the column RT. If you are using a tool name then define the same name for the replacement tool.
280-049B	**Error message** OEM macro is not defined **Cause of error** No macro is configured for this cycle. **Error correction** - In CfgSystemCycle, create a key with the name OEM_MACHSTAT_MEAS and store a macro - Contact your machine tool builder

Error number	Description
280-049C	**Error message** Measurement not possible with auxiliary axis **Cause of error** An OEM macro defined an axis to be measured that is not possible with this type of measurement. This measurement cannot be performed with auxiliary axes (PLC axes). **Error correction** - Change the type of measurement or the axis to be measured - Contact your machine tool builder
280-049D	**Error message** Start position not possible with modulo axis **Cause of error** The movement commanded in the OEM macro leads through the zero crossover of a modulo axis. **Error correction** - Pre-position the modulo axis such that the commanded movement does not lead through the zero crossover - Contact your machine tool builder
280-049E	**Error message** Function only possible if door is closed **Cause of error** The function you selected can be executed only if the guard doors are closed. **Error correction** Close the guard doors.
280-049F	**Error message** Number of possible records exceeded **Cause of error** Not enough memory is available in order to process the data. Cycle 453: Excessive number of measuring points. **Error correction** Reduce the number of records. Cycle 453: Reduce the number of rows in the compensation table (*.kco). Contact your machine tool builder.

Error number	Description
280-04A0	**Error message** Inconsistent machining plane due to axis angle with basic rot. **Cause of error** Das Schwenken der Bearbeitungsebene mit Achswinkeln in Kombination mit einer Grunddrehung führt zu einer inkonsistenten Bearbeitungsebene. Die Achswinkel stimmen nicht mit den Schwenkwinkeln überein. Das kann zu fehlerhaften Bearbeitungen führen. **Error correction** Vermeiden Sie die Kombination von Grunddrehung und Bearbeitungsebene schwenken mit Achswinkel.
280-04A1	**Error message** Transfer parameter contains an impermissible value **Cause of error** A transfer parameter from an OEM macro to the cycle is not in the permitted range. **Error correction** - Check the values transferred from the OEM macro to the cycle - Contact your machine manufacturer
280-04A2	**Error message** Tooth width RCUTS is defined too large **Cause of error** The tooth width RCUTS is defined too large for helical or reciprocating plunging in cycles 251 to 254. **Error correction** For helical or reciprocating plunging the tooth width must be less than the tool radius Correct the value for tooth width RCUTS in the tool table.
280-04A3	**Error message** Usable length LU of the tool is too small **Cause of error** The programmed machining depth is greater than the usable length of the tool. **Error correction** Check the usable length LU in the tool table. Correct the machining depth or use a different tool.

Error number	Description
280-04A4	**Error message** The defined chamfer is too large **Cause of error** The programmed chamfer is too large. **Error correction** Define a greater machining depth for the tip of the tool. Use a tool with a larger radius.
280-04A5	**Error message** Chamfer angle cannot be machined with the active tool **Cause of error** The programmed angle of the chamfer cannot be machined with the active tool. **Error correction** Check the value in input parameter Q354: The chamfer angle must be half of the point angle (T-ANGLE) of the tool. Enter the value 0 in Q354 in order to create a chamfer with half of the point angle (T-ANGLE) of the tool.
280-04A6	**Error message** The allowances do not define any stock removal **Cause of error** No stock removal is defined. The programmed allowance at the beginning of the machining operation is not greater than the allowance remaining at the end of the operation. **Error correction** Define the lateral allowance at the beginning of the machining operation (Q368) to be greater than the allowance at the end of the operation (Q14).

Error number	Description
280-04A7	**Error message** Spindle angle not unique **Cause of error** You tried to orient the tool spindle even though the relative position between the input and tool coordinate systems prevents an unambiguous determination of the spindle angle. During a probing operation the center offset (CAL_OF1 and CAL_OF2) defined for the touch probe cannot be taken into account correctly. **Error correction** Avoid a spindle orientation under these conditions: - Status of the transformations and position of tilting axes - Active turning operation Probing: - Exactly align the touch probe mechanically and do not define any values for the center offset (CAL_OF1 and CAL_OF2).
280-04A8	**Error message** Internal software error: wrong or faulty command **Cause of error** An internal software error has occurred. An unexpected or faulty command was received. **Error correction** Inform your service agency
280-04A9	**Error message** Probing procedure is not possible **Cause of error** The defined probing procedure cannot be performed with the active tool. **Error correction** Check whether the active tool is a touch probe. If the tool is not a touch probe, then you can apply the current coordinates with the actual position capture key.
280-04AA	**Error message** Type of the object to be probed is not possible **Cause of error** The type of the object selected to be probed cannot be probed in this situation. **Error correction** Select a different object to be probed. - Inform your service agency.

Error number	Description
280-04AB	**Error message** Input value not permitted **Cause of error** One of the input values is not in the valid range. **Error correction** Check and correct the input values.
280-04AC	**Error message** No data available for processing **Cause of error** No data found to be processed. **Error correction** Select the rows with the data you want to process. Enter nominal values for the processing.
280-04AD	**Error message** Object to be probed cannot be repeated **Cause of error** The object you selected to be probed cannot be re-probed. Changes to the basic rotation or the rotary-axis offset prevent correct calculation of the overall result. **Error correction** If necessary, re-probe all objects to be probed with the probing function.
280-04AE	**Error message** Limitation for island missing **Cause of error** In the definition of an island, the associated boundary is missing. **Error correction** Use Cycles 1281 or 1282 to define a boundary geometry for an island (Q650=1).
280-04AF	**Error message** Cannot process the data **Cause of error** The selected information cannot be used by this processing method. A basic rotation or an offset cannot be written to a datum table. A basic rotation cannot be written to a pallet preset. The combination of offset and shift (X,Y,Z) cannot be written to a pallet preset. **Error correction** Change the information selected. Use a different processing method.

Error number	Description
280-04B0	**Error message** Rotation of the tool coordinate system not permitted **Cause of error** An impermissible rotation of the tool coordinate system is in effect. This rotation can result in an improper motion during lift-off. **Error correction** Reset this rotation, for example with Cycle 801. Contact your machine tool builder.
280-04B1	**Error message** NC Start was ignored **Cause of error** NC Start was ignored since the current situation does not permit it. **Error correction** - Check the entries and correct them if necessary - Only press NC Start when the operational situation permits it
280-04B2	**Error message** Circle cannot be calculated **Cause of error** Could not calculate a circle from the measured points. The number of points or the distance between them is insufficient. **Error correction** Check the number and positions of the points for circle calculation.
280-04B3	**Error message** Probing of an extrusion not possible **Cause of error** An extrusion that cannot be probed was defined as probing object. An extrusion cannot be combined with a manual pre-positioning task for which a '?' is programmed in the position definition. **Error correction** Check your entries in Cycle 1493. Check the definition of the position of the probing object.

Error number	Description
280-04B4	**Error message** Nominal position not defined correctly **Cause of error** No nominal position is defined, or it contains tolerances. **Error correction** Enter a nominal position for all coordinate directions. Enter a tolerance along the surface-normal vector instead of for the nominal position.
280-04B5	**Error message** Retraction behavior not possible with multiple plunging **Cause of error** Only linear retraction is possible with multiple plunging. **Error correction** If necessary, adjust the input parameters Q462 Retraction mode and Q562 Multiple plunging.
280-04B6	**Error message** Basic rotation will be rescinded **Cause of error** A basic rotation is in effect in the active preset. In order for the sequence to work correctly, the called probing cycle requires that this basic rotation be rescinded. **Error correction** Check your entries. Clear this message and press NC-START in order to rescind the basic rotation and continue with the probing cycle. Or perform an internal stop in order to cancel the probing cycle and check your entries.
280-04B7	**Error message** Repeat last measurement? **Cause of error** The last measurement could not be performed correctly. **Error correction** Refer to the preceding messages concerning the last measurement. You can acknowledge these messages and then repeat the last measurement with NC Start.

Error number	Description
280-04B8	**Error message** Continue with next measurement? **Cause of error** This measurement cannot be performed correctly. **Error correction** Refer to the preceding messages concerning the measurement. Check the configuration for this measurement. You can acknowledge these messages and jump to the next measurement with NC Start.
280-04B9	**Error message** File not found **Cause of error** The specified file could not be found. **Error correction** Ensure that the specified file exists and that the given path is correct.
280-04BA	**Error message** The entire plunging depth is greater than the tooth height The entire plunging depth is less than the tooth height **Cause of error** The sum of the defined infeeds does not match the tooth height. Twice the tooth height results from the difference between the outside diameter and the inside diameter. If the total infeed is greater than the tooth height, the machining operation is not carried out. If the total infeed is less than the tooth height, the machining operation can still be carried out. **Error correction** Check the sum of all infeeds in the INFEED column, and correct them if necessary.
280-04BC	**Error message** File cannot be opened **Cause of error** Could not open the file specified in the cycle. **Error correction** Check whether the file is there, whether the path is correct, and whether the file is in a readable format.

Error number	Description
280-04BF	**Error message** Status of transformations for simultaneous turning is not correct **Cause of error** The status of the transformations is not correct for the requested simultaneous turning operation with a FreeTurn tool. TCPM must be activated before the cycle can run. Before the cycle was run, a transformation was activated that is not possible with this type of operating mode. **Error correction** Activate TCPM before calling the cycle. Check your corrections in the WPL-CS, such as: FUNCTION CORRDATA WPL.
280-04C0	**Error message** Preset cannot be modified after probe objects have been probed **Cause of error** The modifications to the preset are not possible. Modifications to the preset are only possible as long as no object has been probed yet. **Error correction** Discard objects that have already been probed by ending the manually selected probing function. Then you can make the changes to the preset.
280-04C1	**Error message** Tolerance does not match probing direction **Cause of error** The result of a probing motion is outside of the tolerance, and the direction of the probing motion does not match the defined tolerance. **Error correction** Check the programmed tolerances regarding the defined probing direction and the extrusion direction.
280-05DC	**Error message** Error in pallet management **Cause of error** Internal control error. **Error correction** Inform your service agency.

Error number	Description
280-05DD	**Error message** Error in pocket table **Cause of error** Error in pocket table: - Pockets or tools appear twice. - There is no value in column T for the spindle pocket. - The tool in the spindle is not in the tool table. - The TOOL_P symbol does not point to a pocket table or it is not set. - The pocket table is write-protected or it does not exist. **Error correction** - Correct the pocket table. - There is no value in column T for the spindle pocket. - The tool in the spindle is not in the tool table. - The TOOL_P symbol does not point to a pocket table or it is not set. - The pocket table is write-protected or it does not exist.
280-05DE	**Error message** Fixture not activated **Cause of error** Pallet changer: The started NC program belongs to a fixture that is not on the pallet. **Error correction** Activate the correct fixture.
280-05DF	**Error message** Wrong pallet **Cause of error** Pallet changer: The NC program that was started belongs to a pallet that is not at the machining position. The LOCATION column of the pallet table does not contain "MA". **Error correction** Change to the proper pallet (LOCATION == MA).
280-05E0	**Error message** Pallet line locked! **Cause of error** You attempted to run a locked pallet line. **Error correction** To resume program run, unlock the line or continue with the next line. If necessary, refer to your machine manual.

Error number	Description
280-05E1	**Error message** Datum table missing **Cause of error** You selected a datum table that does not exist in the control's NC memory. **Error correction** Select an existing datum table or make the desired table.
280-05E2	**Error message** Measuring probe not defined Touch probe not defined **Cause of error** - You called a touch probe that is not defined in the touch probe table. - The touch probe table is write-protected or it does not exist. **Error correction** - Add the missing touch probe to the touch probe table. - Create a touch probe table or cancel the write protection.
280-05E3	**Error message** Incorrect tool data **Cause of error** Incorrect tool data: - Tool appears twice. - TOOL symbol does not point to a tool table or it is not set. - The tool table is write-protected or it does not exist. - Tool table is locked because of the Test Run or Programming operating mode. **Error correction** - Correct the tool table. - Reassign the TOOL symbol or create an equivalent tool table. - Create a tool table or cancel the write protection. - Close the the Test Run or Programming operating mode.
280-05E4	**Error message** Tool number 0 not permitted **Cause of error** A tool definition with the number "0" is not permitted. **Error correction** Edit the part program.

Error number	Description
280-05E6	**Error message** No appropriate tool found **Cause of error** Automatic tool search: No suitable tool was found in the tool table. **Error correction** Check the tool table.
280-05E7	**Error message** Calculated tool number too large **Cause of error** - Calculation of a tool number from a Q parameter resulted in a value outside the permissible range of 0 to 32767. - You have called a tool number that is greater than the number of tools defined in the tool table. **Error correction** Edit the part program.
280-05E8	**Error message** Tool definition is missing Tool definition is missing **Cause of error** In a TOOL CALL (ISO: T..) you entered a tool number for which there is no definition in the program. **Error correction** Edit the part program.
280-05E9	**Error message** Tool number already assigned **Cause of error** You attempted to give a tool more than one definition. **Error correction** Edit the part program.
280-05EA	**Error message** Tool definition not permitted **Cause of error** You programmed a tool definition with radius or length (TOOL DEF, ISO: G99). **Error correction** - Delete the TOOL DEF block (G99 block). - Use the tool preselection without radius and length(TOOL DEF, ISO: G51).

Error number	Description
280-05EB	**Error message** TOOL DEF w/o length or radius **Cause of error** The definition of a tool (TOOL DEF, ISO: G99) is missing the value for tool length or tool radius. **Error correction** Complete the TOOL DEF block (G99 block).
280-05EC	**Error message** Max. tool age expired **Cause of error** The service life of the called tool has expired and you have not defined a replacement tool. **Error correction** Check the tool and, if necessary, exchange it or define a replacement tool.
280-05ED	**Error message** Tool locked **Cause of error** The tool was locked (e.g. after breakage). **Error correction** Check the tool and, if necessary, change it or unlock it in the tool table.
280-05EE	**Error message** Tool table is missing **Cause of error** Either you did not select a tool table or the selected table is not in the control's NC memory. **Error correction** Select an available tool table or create one.
280-05EF	**Error message** FN14_1519 **Cause of error** FN14_1519 **Error correction** FN14_1519
280-05F0	**Error message** Helical plunging not possible **Cause of error** Q366 = 1 **Error correction** Edit the part program

Error number	Description
280-05F1	**Error message** FN14_1521 **Cause of error** FN14_1521 **Error correction** FN14_1521
280-05F2	**Error message** No touch probe data **Cause of error** - No touch probe inserted - No tool axis active for the touch probe - Contradictory touch probe data **Error correction** - Insert the touch probe - Define the tool axis in the touch probe call - Check the touch probe data
280-05F3	**Error message** SQL command failed **Cause of error** An SQL command used in the cycle could not be executed. **Error correction** Inform your service agency.
280-05F4	**Error message** FN14_1524 **Cause of error** FN14_1524 **Error correction** FN14_1524
280-05F5	**Error message** FN14_1525 **Cause of error** FN14_1525 **Error correction** FN14_1525
280-05F6	**Error message** FN14_1526 **Cause of error** FN14_1526 **Error correction** FN14_1526

Error number	Description
280-05F7	**Error message** Error in pallet management **Cause of error** Error in pallet management: - The pallet table does not exist or is write-protected. - TARGET and FN17/18 ID510 NR22 are used simultaneous-ly in the PAL row. **Error correction** - Create a pallet table or cancel write-protection. - Do not use TARGET and FN17/18 ID510 NR22 simultane-ously in the PAL row.
280-05F8	**Error message** Error in preset table Error in preset table **Cause of error** The preset table is faulty. Possible causes: - The preset table is write-protected or it does not exist. - Line 0 does not exist. - The is no line with ACTNO = 1. **Error correction** - Please make the preset table or cancel the write protection - Enter the line 0 in the preset table - Set ACTNO in one line to zero
280-05F9	**Error message** Incorrect datum table **Cause of error** Incorrect datum table: - The datum table is write-protected or it does not exist. **Error correction** - Create a datum table or cancel the write protection.
280-05FA	**Error message** Tool change during mid-program startup not possible **Cause of error** Tool change not possible during mid-program startup. The active tool is not in the spindle for program run after mid-program startup. **Error correction** Please contact your machine tool builder.

Error number	Description
280-05FB	**Error message** Calibrate touch probe **Cause of error** You tried to automatically measure a tool although the tool touch probe is not yet calibrated. **Error correction** Calibrate the TT tool touch probe with the cycle TCH PROBE 30.
280-05FC	**Error message** Tool axis is missing **Cause of error** You called a fixed cycle without first activating a tool. **Error correction** Edit the NC program.
280-05FD	**Error message** CYCL DEF incomplete **Cause of error** - You deleted part of a cycle - You inserted other NC blocks within a cycle **Error correction** - Redefine the complete cycle - Delete NC blocks within a cycle
280-05FE	**Error message** TOOL.T: Enter number of teeth **Cause of error** Automatic tool measurement: Number of teeth not entered into tool table. **Error correction** Enter the number of teeth (CUT) into TOOL.T.
280-05FF	**Error message** Enter tool radius greater than 0 **Cause of error** You defined the cutter radius for the active tool in the tool table as less than or equal to 0. **Error correction** You can only measure a tool with a positive radius. Change the radius in the table.

Error number	Description
280-0600	**Error message** Tolerance in the parameter measureTolerance[1;2] is too low **Cause of error** The tolerance entered in the "measureTolerance1" parameter cannot be achieved during tool radius measurement with the TT. **Error correction** - Increase the permissible tolerance for finding tool teeth with spindle orientation in the "measureTolerance2" parameter - Reduce the positioning window of the spindle in the "posTolerance" parameter - Check whether a burr has formed on the probe contact. Remove the burr, if there has. - Exchange the tool touch probe, if required
280-0601	**Error message** Tool locked **Cause of error** The tool was locked (e.g. after breakage). **Error correction** Check the tool and, if necessary, change it or unlock it in the tool table.
280-0602	**Error message** Error in tool measurement configuration **Cause of error** The configuration of the tool measurement is incorrect or incomplete. **Error correction** Check the tool measurement configuration and edit or extend it, if required.
280-0603	**Error message** Tool measurement locked **Cause of error** Tool measurement is disabled. **Error correction** Check the tool measurement configuration and edit it, if required.

Error number	Description
280-0604	**Error message** Tool measurement: Functionality not yet implemented **Cause of error** The desired functionality is not implemented. - The tool axis is not the Z axis. (NC program: TOOL CALL) - Sum of "YL + DYL" is greater than +/– 5.0 mm. (Tool table) - Value of SPB-INSERT does not equal 0 degrees. (Tool table) - Value of ANGLE is greater than 90 degrees or sum of ANGLE + PANGLE is greater than or equal to 180 degrees. (Tool table) - The value TO is not supported for tool types. (Tool table) - The value of stylusAxis is not Z_Positive. (Configuration) **Error correction** Check the NC program, tool table, and tool measurement configuration and edit them as necessary.
280-0605	**Error message** Orientation not configured **Cause of error** - Your machine might not offer spindle orientation - Spindle orientation not possible **Error correction** - Refer to your machine manual! - Check the "spindleOrientMode" machine parameter and use the NC to enter -1 or the value of the M function for spindle orientation.
280-0606	**Error message** Arithmetical error **Cause of error** Internal calculations have resulted in a non-representable numerical value. **Error correction** Check the input values.
280-0607	**Error message** Cycle error **Cause of error** Internal control error **Error correction** Inform your service agency

Error number	Description
280-0608	**Error message** Tool broken **Cause of error** Automatic tool measurement: The breakage tolerance (LBREAK or RBREAK) from the tool table was exceeded. **Error correction** Check the tool and, if necessary, replace it.
280-0609	**Error message** Calibrate TT in tilted plane **Cause of error** You attempted to run a cycle for tool measurement while the tilted-plane function was active, although the touch probe was not calibrated in the tilted working plane. **Error correction** Run the calibration cycle 30 while the working plane is tilted.
280-060A	**Error message** Calibrate TT in non-tilted plane **Cause of error** You attempted to run a cycle for tool measurement, although the touch probe was last calibrated in a tilted working plane. **Error correction** Run the calibration cycle 30 when the working plane is not tilted.
280-060B	**Error message** TT not parallel to tool axis **Cause of error** You attempted to run a cycle for tool measurement although the touch probe axis is not parallel to the tool axis. **Error correction** Position the axes so that the touch probe axis and tool axis are parallel.
280-060C	**Error message** Tool index not allowed **Cause of error** You called a fixed cycle for tool measurement with a step drill. **Error correction**

Error number	Description
280-060D	**Error message** Turning tool incompletely defined Turning tool incompletely defined **Cause of error** - You called a turning tool that is not defined in the turning tool table. - The turning tool table is faulty or missing. **Error correction** - Add the missing tool to the turning tool table. - Create or correct the turning tool table.
280-060E	**Error message** Probing direction not in probe plane **Cause of error** You configured a probing direction that does not lie in the touch probe plane. **Error correction** Correct the machine parameter probingDirRadial
280-060F	**Error message** Unbalance detection failed **Cause of error** Fehler bei Unwuchterfassung aufgetreten **Error correction** Weitere Fehlermeldungen beachten
280-0610	**Error message** Excessive unbalance **Cause of error** Maximale Unwuchtamplitude überschritten **Error correction** Unwucht neu erfassen und kompensieren
280-0611	**Error message** Configuration for unbalance detection wrong **Cause of error** Die Konfiguration der Unwuchterfassung ist fehlerhaft oder unvollständig. **Error correction** Konfiguration der Unwuchterfassung überprüfen und ggf. anpassen oder erweitern.

Error number	Description
280-0612	**Error message** Radius of replacement tool not suitable **Cause of error** - During automatic exchange of a replacement tool (M101), the TNC did not find a suitable tool in the tool table. - The total radius R + DR of the replacement tool is greater and/or R2 + DR2 is less than the radius of the current tool when 3-D compensation is active. **Error correction** - Define a replacement tool with suitable radii. - Perhaps use M107 to deactivate monitoring of the tool radii.
280-0613	**Error message** Invalid tool axis programmed **Cause of error** You have programmed a tool axis other than Z. **Error correction** Edit the NC program.
280-0614	**Error message** Tool table locked **Cause of error** The tool file (TOOL.T) cannot be edited while the TNC is executing a tool call. Pressing the EDIT ON/OFF soft key provokes this error message. **Error correction** Exit the mode by selecting the "EDIT ON/OFF" soft key. Then acknowledge the message and resume program run with NC Start.
280-0615	**Error message** Unbalance calculation failed **Cause of error** An error occurred while calculating the unbalance. The entered value is not in the unbalance table. **Error correction** - Modify the entered value - Expand the unbalance table
280-0617	**Error message** Traverse mode for retraction not possible **Cause of error** The “tilted system” and “tool axis” traverse modes are not possible because of the machine configuration. **Error correction** Select the “machine axes” or “thread” traverse modes and repeat the retraction.

Error number	Description
280-0618	**Error message** Tool life expired **Cause of error** The remaining tool life is not enough for the precalculated machining time. - The service life of the called tool is insufficient and you haven’t defined a sister tool. - The tool-usage file is not available or not up to date. **Error correction** - The tool is to be used anyway: acknowledge the message and continue the NC program with NC start. - The tool is not to be used: cancel the NC program with an INTERNAL STOP. o Check the tool and, if necessary, exchange it or define a replacement tool. o Create or update a tool-usage file. Run the desired program in the Test Run mode of operation. Ensure that creation of a tool usage file is activated in the configuration.
280-0619	**Error message** Tool life expired **Cause of error** The remaining tool life is not enough for the precalculated machining time. - The service life of the called tool has expired and you have not defined a sister tool. - The tool usage file is not available or not up to date. **Error correction** - Check the tool and, if necessary, exchange it or define a sister tool. - Create or update a tool usage file. - Run the desired program in the Test Run mode of operation. - Ensure that the tool usage file is activated in the configuration.
280-061A	**Error message** Feed rate limiting has been canceled **Cause of error** - Feed rate limiting was canceled by the operator. - Reactivation of the feed rate limiting is not possible in the Retraction operating mode. **Error correction** - Use the feed rate potentiometer F to limit the feed rate. - Be very careful when moving the axes.

Error number	Description
280-061B	**Error message** Pallet line with completed part **Cause of error** The pallet line under the cursor is marked as a completed part and can therefore no longer be executed. **Error correction** Select a pallet line in which a workpiece blank or an incomplete part is entered.
280-061C	**Error message** Access to pallet preset table failed **Cause of error** Access to pallet preset table was not possible. The pallet preset table might not exist or is faulty. **Error correction** Inform your service agency.
280-061D	**Error message** Automatic continuation of pallet machining not possible **Cause of error** Automatic continuation of pallet machining not possible. **Error correction** - Pallet machining was not continued by the OEM cycle. - Check the entry for the OEM macro in OEM_PAL_RESUMPTION. - Inform your service agency.
280-061F	**Error message** Thread-cutting process was interrupted **Cause of error** Automatic continuation of pallet machining not possible. **Error correction** - Note any further error messages. - Correct the cause of error and repeat the operation. - Inform your service agency.
280-0620	**Error message** Pallet table locked **Cause of error** An editor locked any further execution of the pallet table **Error correction** - Exit the editing or input mode - Then acknowledge the message and resume the pallet machining with NC start.

Error number	Description
280-0621	**Error message** Tool not defined completely **Cause of error** You called a tool that is not completely defined in the tool table: - There is no value for the tool radius and/or length. **Error correction** - Check and complete the tool entries. - Use another tool.
280-0622	**Error message** Row does not exist in preset table **Cause of error** Could not activate the programmed preset. The given line does not exist in the preset table. **Error correction** - Check the preset table - Add the given line to the preset table.
280-0623	**Error message** Row does not exist in pallet preset table **Cause of error** Could not activate the programmed number of the pallet preset. The given line does not exist in the pallet preset table. **Error correction** - Check the pallet preset table - Add the given line to the pallet preset table.
280-06A4	**Error message** Camera not reacting Camera not responding **Cause of error** The image processing cycle cannot communicate with the camera or does not answer. **Error correction** Restart the NC software or remove the image processing cycle from the NC program. - Inform your service agency.
280-06A6	**Error message** File for camera position does not exist **Cause of error** The control cannot move the camera to the desired position because the table with the position data is missing. **Error correction** Inform your service machine tool builder.

Error number	Description
280-06A7	**Error message** Line does not exist in the position table **Cause of error** The control cannot move the camera to the desired position because the desired line number is missing in the table for position data. **Error correction** Inform your machine tool builder
280-06A8	**Error message** Communication with camera not possible **Cause of error** The image processing cycle cannot communicate with the camera because the internal data structure for communication is missing. **Error correction** - Inform your service agency.
280-06A9	**Error message** Camera provides no images **Cause of error** No live image was received from the camera. **Error correction** - Test whether the live image is shown correctly in the Manual operating mode - If this is not the case, restart the control - If both actions don't help, contact your service agency
280-06AA	**Error message** A name for the monitoring point is missing **Cause of error** The monitoring point has no name **Error correction** Enter a name for the monitoring point in the image processing cycle
280-06AB	**Error message** Not allowed to call an unbalance cycle in milling mode **Cause of error** A unbalance cycle cannot be started in milling mode **Error correction** Start the unbalance cycle in turning mode

Error number	Description
280-07D0	**Error message** Invalid error consequence **Cause of error** Invalid error consequence **Error correction** Internal error
280-07D1	**Error message** No space released **Cause of error** No location released for inserting the tool. On the wheel head there are no are no locations released for inserting the grinding wheel. Error correction: Release locations for inserting the tool (table: WHEEL.PGW). **Error correction** Release locations for inserting the tool (table: WHEEL.PGW).
280-07D2	**Error message** No valid physical space **Cause of error** No valid, physical location on wheel head. Selected location on wheel head is invalid. Location number is greater than 9. **Error correction** Select valid location (0...9).
280-07D3	**Error message** Space not released **Cause of error** Location for inserting the tool not released. The selected location on the wheel head has not been released and therefore cannot be accept a grinding wheel. **Error correction** Select another location for insertion.
280-07D4	**Error message** Tool is already inserted **Cause of error** The tool to be inserted is already clamped in another location. **Error correction** Select another tool (other tool number) or remove the tool from another location (not only physical, but also logical).

Error number	Description
280-07D5	**Error message** No space released **Cause of error** No released location found. No other vacant location was found on the wheel head. **Error correction** Remove tool from another location and use the set-up function to release the location.
280-07D6	**Error message** No identical space **Cause of error** No released, identical location found. There is no other logical location on the wheel head with the same physical position. **Error correction** Remove tool from another location and use the set-up function to release the location.
280-07D7	**Error message** No further tool found **Cause of error** No other tool found that meets the search criteria. **Error correction** Adapt the search criteria.
280-07D8	**Error message** No further tool found **Cause of error** No tool found that meets the search criteria. **Error correction** Adapt the search criteria.
280-07D9	**Error message** Invalid tool type **Cause of error** An unsupported tool type was selected, or the tool type is not permitted together with a function. **Error correction** Check the tool type.

Error number	Description
280-07DA	**Error message** Tool type not allowed **Cause of error** Tool type not allowed, not released. In the set-up function a tool was selected that is not supported at present. **Error correction** Select another tool type.
280-07DB	**Error message** Data not loaded **Cause of error** Data were not accepted because the tool number was changed. In the set-up function, the number (reference) of the current tool was changed. Because of this, all edited data were discarded and the data of the tool with the new number were loaded. **Error correction** None
280-07DC	**Error message** No entry in table **Cause of error** No entry in table / Access failed. An attempt to access a table failed. It could be that the desired entry is missing or the format of a column doesn't fit. **Error correction** Check the values.
280-07DD	**Error message** Invalid parameter value **Cause of error** Invalid parameter value. A parameter has an invalid value. **Error correction** Check the values of the parameters.
280-07DE	**Error message** Invalid command **Cause of error** Invalid command. An invalid command (FN19 command) was programmed to the PLC. **Error correction** Check the command / Check the PLC program.

Error number	Description
280-07DF	**Error message** Error in table access **Cause of error** Error in table access (no handle). An attempt to access a table failed. It could be that the desired entry is missing, the format of a column doesn't fit, the table doesn't exist, etc. **Error correction** Check the values.
280-07E0	**Error message** No grinding wheel **Cause of error** Current tool is not a grinding wheel. It is expected that the current tool be a grinding wheel, which is not the case. To find the location of a dresser, for example, the current tool must be a grinding wheel. **Error correction** Exchange the grinding wheel.
280-07E1	**Error message** Invalid tool number **Cause of error** Invalid tool number. The tool number is out of range. **Error correction** Enter the correct number (1...99).
280-07E2	**Error message** Invalid alignment **Cause of error** Invalid dresser alignment. The alignment of a dresser doesn't fit the selected grinding wheel edge. **Error correction** Select another wheel edge or another dresser alignment.
280-07E3	**Error message** No dresser defined **Cause of error** No dresser defined. A function expects that a dresser has been defined/programmed, which is not the case. **Error correction** Define/program a dresser.

Error number	Description
280-07E4	**Error message** Dresser not defined **Cause of error** Dresser not captured for this wheel. You tried to work with a dresser whose location hasn't been found for the current wheel. **Error correction** Capture/set-up the dresser.
280-07E5	**Error message** Not a valid wheel type **Cause of error** Not a valid wheel type. Invalid wheel type programmed. **Error correction** Select the correct wheel type.
280-07E6	**Error message** Ref. of dresser to wheel edge **Cause of error** Reference of dresser to wheel edge is incorrect. The dresser is being used in reference to another wheel edge, as if it were captured/set-up. **Error correction** Repeat the capture/setup of the dressing attachment.
280-07E7	**Error message** Relieved wheel not possible **Cause of error** Wheel side: Relieved wheel not possible. The length of the relief is not possible, or the combination with other parameters of the wheel side is not possible. **Error correction** Check the parameters of the wheel side.
280-07E8	**Error message** Chamfer width missing **Cause of error** Wheel side: Chamfer width missing. A chamfer width is expected but was not programmed. **Error correction** Check the parameters of the wheel side.

Error number	Description
280-07E9	**Error message** Chamfer greater than side len. X **Cause of error** Wheel side: Chamfer greater than side length X. **Error correction** Check the parameters of the wheel side.
280-07EA	**Error message** Angle of the relief is incorrect **Cause of error** Wheel side: Angle of the relief is incorrect. The angle of the relief has an invalid value. **Error correction** Check the parameters of the wheel side.
280-07EB	**Error message** FN14_2027 **Cause of error** FN14_2027 **Error correction** FN14_2027
280-07EC	**Error message** FN14_2028 **Cause of error** FN14_2028 **Error correction** FN14_2028
280-07ED	**Error message** FN14_2029 **Cause of error** FN14_2029 **Error correction** FN14_2029
280-07EE	**Error message** Dressing strategy: corner radius not permitted **Cause of error** If a corner radius (RV, RV1, RV2) is defined, then a dressing strategy must be selected that dresses the diameter and the side at the same time. **Error correction** Select a different dressing cycle, or set corner radius to 0

Error number	Description
280-07EE	**Error message** FN14_2030 **Cause of error** FN14_2030 **Error correction** FN14_2030
280-07EF	**Error message** Dressing strategy: wheel edge not supported **Cause of error** The combination of dressing cycle and active wheel edge is not allowed **Error correction** Activate a different wheel edge or select a different dressing cycle
280-07EF	**Error message** FN14_2031 **Cause of error** FN14_2031 **Error correction** FN14_2031
280-07F0	**Error message** Selected dressing strategy is not supported **Cause of error** A reciprocating strategy was programmed although this is not supported. A reciprocating strategy can be used only if the dressing movement consists of a straight line. A “Special grinding point” type of grinding wheel cannot be used with the “reciprocating” strategy. **Error correction** Select a different dressing strategy
280-07F0	**Error message** FN14_2032 **Cause of error** FN14_2032 **Error correction** FN14_2032

Error number	Description
280-07F1	**Error message** Dressing mode already active, tool not allowed **Cause of error** If dressing mode (FUNCTION DRESS BEGIN) is activated before the dressing cycle, then no tool may be programmed in the dressing cycle. **Error correction** - Clear the tool number/name - Remove FUNCTION DRESS BEGIN before the dressing cycle
280-07F1	**Error message** FN14_2033 **Cause of error** FN14_2033 **Error correction** FN14_2033
280-07F2	**Error message** Type of grinding wheel not allowed, not approved **Cause of error** The dressing cycle is not suitable for the selected type of grinding wheel, or has not been released yet. **Error correction** Select a different dressing cycle
280-07F2	**Error message** FN14_2034 **Cause of error** FN14_2034 **Error correction** FN14_2034
280-07F3	**Error message** Tool is not a dressing wheel or roll **Cause of error** A relationship between the cutting speeds was programmed even though the dressing tool is neither a dressing wheel nor a roll. **Error correction** - Change the type of dressing tool - Either do not program the relationship between the cutting speeds, or set it to 0

Error number	Description
280-07F3	**Error message** FN14_2035 **Cause of error** FN14_2035 **Error correction** FN14_2035
280-07F4	**Error message** FN14_2036 **Cause of error** FN14_2036 **Error correction** FN14_2036
280-07F5	**Error message** FN14_2037 **Cause of error** FN14_2037 **Error correction** FN14_2037

280-07FD	**Error message** FN14_2045 **Cause of error** FN14_2045 **Error correction** FN14_2045
280-07FE	**Error message** FN14_2046 **Cause of error** FN14_2046 **Error correction** FN14_2046

Error number	Description
280-07FF	**Error message** FN14_2047 **Cause of error** FN14_2047 **Error correction** FN14_2047
280-0800	**Error message** FN14_2048 **Cause of error** FN14_2048 **Error correction** FN14_2048
280-0801	**Error message** FN14_2049 **Cause of error** FN14_2049 **Error correction** FN14_2049
280-0834	**Error message** Infeed not defined **Cause of error** Infeed not defined. The definition command for this infeed was not programmed. **Error correction** Define/program the infeed.
280-0835	**Error message** Infeed direction not defined **Cause of error** Infeed direction not defined. The infeed direction is unknown. That means that the start position of the infeed is identical with the end position, and no infeed direction is known from a previous command. **Error correction** At least in the first infeed command, program an end position unequal to the starting position.

Error number	Description
280-0836	**Error message** Undersize **Cause of error** Undersize. During grinding with a dimensional control, the control has already responded at the start of the command. This means that the diameter to be ground already has a finishing dimension or undersize. If more than one cycle is programmed in sequence with a dimensional control, it can be normal for the rough size to be too small. However, at least the last cycle must be free of such error. **Error correction** Check the workpiece / Check the setting of the dimensional control.
280-0837	**Error message** FN14_2103 **Cause of error** FN14_2103 **Error correction** FN14_2103
280-0838	**Error message** Oversize **Cause of error** Oversize. During grinding with a dimensional control, the control has not responded. This means that the diameter to be ground was not reached. The workpiece has an oversize. **Error correction** Check the workpiece / Check the setting of the dimensional control.
280-0839	**Error message** FN14_2105 **Cause of error** FN14_2105 **Error correction** FN14_2105

Error number	Description
280-083A	**Error message** Signal already active at start **Cause of error** Signal already active at start. During grinding with an external signal (probe etc.) the signal responded before the movement was started. **Error correction** Compare the workpiece dimensions with the program and correct the program if necessary.
280-083B	**Error message** FN14_2107 **Cause of error** FN14_2107 **Error correction** FN14_2107
280-083C	**Error message** Signal has not responded **Cause of error** Signal has not responded. During grinding with an external signal (probe etc.) the signal did not respond during the movement. **Error correction** Compare the workpiece dimensions with the program and correct the program if necessary.
280-083D	**Error message** FN14_2109 **Cause of error** FN14_2109 **Error correction** FN14_2109
280-083E	**Error message** B axis in wrong position **Cause of error** B axis in wrong position. For a function, the B axis was expected to be in a defined position. The B axis is not in this position. **Error correction** Check the position of the B axis.

Error number	Description
280-083F	**Error message** No grinding wheel **Cause of error** Tool to be dressed is not a grinding wheel. Only grinding wheels can be dressed. **Error correction** Check the tool type.
280-0840	**Error message** Dressing location not released **Cause of error** Dressing location has not been not released. A selected dressing location has not been not released. **Error correction** Select another dresser location.
280-0841	**Error message** Wheel edges not released **Cause of error** Backward grinding (edges 4-6) not released. The edges 4 to 6 are not released for the selected location. This means that "backward" grinding is not allowed. **Error correction** Select a wheel edge in front (1 to 3).
280-0842	**Error message** Wheel location not occupied **Cause of error** Location on wheelhead not occupied. There is no tool at the desired location. **Error correction** Select another location or tool.
280-0843	**Error message** Wheel location not released **Cause of error** Location on wheelhead not released. No tool is allowed at the desired location. It is locked against occupation. **Error correction** Select another location, or release this one for occupation.

Error number	Description
280-0844	**Error message** Dressing location not occupied **Cause of error** Dresser location is not occupied. The desired dresser attachment location is not occupied. **Error correction** Select another location or place a dressing attachment in the location.
280-0845	**Error message** T-call parameter invalid **Cause of error** Parameter during tool call is out of valid range. **Error correction** Check the tool call.
280-0846	**Error message** Wheel settings not defined **Cause of error** The settings of the grinding wheel are not defined. For certain setup functions it is expected that for a grinding wheel the settings (position of the head) have been defined/ set up. **Error correction** Define / set up the settings.
280-0847	**Error message** Wheel data not defined **Cause of error** Wheel data not captured (diameter, width, etc.). For certain setup functions it is expected that for one grinding wheel the settings (position of the head) have been defined/set up. **Error correction** Capture/set up the grinding wheel data.
280-0848	**Error message** Wheel not inserted **Cause of error** The grinding wheel is not mounted. Either no grinding wheel was mounted (logical wheel location number = 0 or wheel number = 0) or you attempted to work with a wheel other than the one that was mounted. **Error correction** Use tool call to mount the wheel.

Error number	Description
280-0849	**Error message** Wheel location changed **Cause of error** Wheel pocket changed. When the dresser was captured, the grinding wheel was at another location. **Error correction** Repeat the capture/setup of the dressing attachment.
280-084A	**Error message** Dressing location changed **Cause of error** Dressing location changed. When the wheel was evaluated, the dressing attachment was at another location. **Error correction** Repeat the evaluation/setup of the dressing attachment.
280-084C	**Error message** Feed rate not programmed **Cause of error** Feed rate not programmed.No feed rate was programmed, or it was programmed as zero. **Error correction** Program the feed rate for a velocity other than zero.
280-084D	**Error message** Wheel missing **Cause of error** Wheel missing. You tried to work with a location that is not occupied by a grinding wheel. **Error correction** Occupy the location with a grinding wheel.
280-084E	**Error message** No valid tool selected **Cause of error** No valid tool selected. You tried to work with a tool that is not allowed for the current operation, or no tool is even selected. **Error correction** Select a valid tool.

Error number	Description
280-084F	**Error message** FN14_2127 **Cause of error** FN14_2127 **Error correction** FN14_2127
280-0850	**Error message** Not a valid dresser type **Cause of error** Not a valid dresser type. You tried to work with a dresser that is not allowed for the current operation, or the dresser type is not defined. **Error correction** Define/check the dresser type.
280-0852	**Error message** No event programmed **Cause of error** No event programmed. You tried to run a function for which an event (touch probe, dimensional control, etc.) has to be defined, but no event is defined. **Error correction** Define/program the event.
280-0853	**Error message** Invalid event programmed **Cause of error** Invalid event programmed.An event was program that is not or not yet supported, or the event does not match the function. **Error correction** Program another event.
280-0854	**Error message** FN14_2132 **Cause of error** FN14_2132 **Error correction** FN14_2132

Error number	Description
280-0855	**Error message** Event happened before movement **Cause of error** Event happened before movement. An event has already happened before the associated movement was started. **Error correction** Check the program. Depending on the event, however, this may be correct behavior.
280-0856	**Error message** FN14_2134 **Cause of error** FN14_2134 **Error correction** FN14_2134
280-0857	**Error message** FN14_2135 **Cause of error** FN14_2135 **Error correction** FN14_2135
280-0858	**Error message** Event did not happen **Cause of error** The event did not happen. A movement with an event was programmed and the movement was completed without the event occurring. **Error correction** Check the program. Depending on the event, however, this may be correct behavior.
280-0859	**Error message** FN14_2137 **Cause of error** FN14_2137 **Error correction** FN14_2137

Error number	Description
280-085A	**Error message** No swing stroke **Cause of error** No swing stroke programmed. In a swing grinding operation, no swing stroke was programmed, or the stroke was programmed as zero. **Error correction** Check the swing cycle.
280-085B	**Error message** Jig grinding, reciprocating stroke: tool axis not allowed **Cause of error** The current tool axis is not supported by reciprocation cycle 1000 **Error correction** Reciprocation cycle 1000 is possible only with X, Y, or Z as tool axis
280-085B	**Error message** FN14_2139 **Cause of error** FN14_2139 **Error correction** FN14_2139
280-085C	**Error message** Jig grinding: reciprocating stroke already stopped **Cause of error** A reciprocation stop (cycle 1002) was programmed even though the reciprocation movement has already stopped. **Error correction** Check the NC program Mid-program startup, a change of operating mode, and other actions stop an active reciprocation movement
280-085C	**Error message** FN14_2140 **Cause of error** FN14_2140 **Error correction** FN14_2140

Error number	Description
280-085D	**Error message** Jig grinding: reciprocating stroke already defined **Cause of error** A reciprocation cycle (cycle 1000) was defined even though a reciprocation cycle is already active. **Error correction** Clear the previous reciprocation cycle definition (cycle 1002) before defining a new reciprocation cycle.
280-085D	**Error message** FN14_2141 **Cause of error** FN14_2141 **Error correction** FN14_2141
280-085E	**Error message** Immediate stop only permitted if reciprocation def. gets deleted **Cause of error** The parameter combination "Immediate stop" and "Do not delete reciprocation definition" is not allowed. **Error correction** Check the combination of parameter values, and correct as necessary
280-085E	**Error message** FN14_2142 **Cause of error** FN14_2142 **Error correction** FN14_2142
280-085F	**Error message** FN14_2143 **Cause of error** FN14_2143 **Error correction** FN14_2143
280-0860	**Error message** FN14_2144 **Cause of error** FN14_2144 **Error correction** FN14_2144

Error number	Description
280-0861	**Error message** FN14_2145 **Cause of error** FN14_2145 **Error correction** FN14_2145
280-0862	**Error message** FN14_2146 **Cause of error** FN14_2146 **Error correction** FN14_2146
280-0863	**Error message** FN14_2147 **Cause of error** FN14_2147 **Error correction** FN14_2147
280-0864	**Error message** FN14_2148 **Cause of error** FN14_2148 **Error correction** FN14_2148
280-0865	**Error message** FN14_2149 **Cause of error** FN14_2149 **Error correction** FN14_2149
280-0866	**Error message** Wrong axis programmed **Cause of error** An axis was programmed that is not allowed for the present function. **Error correction** Check the program.

Error number	Description
280-0867	**Error message** No axis programmed **Cause of error** No axis programmed. In a function that needs at least one programmed axis, no axis was programmed. **Error correction** Check the program.
280-0868	**Error message** M command not allowed **Cause of error** M command not allowed. An M command was programmed that is invalid or is not allowed at this time. **Error correction** Check the program.
280-0869	**Error message** FN14_2153 **Cause of error** FN14_2153 **Error correction** FN14_2153
280-086A	**Error message** FN14_2154 **Cause of error** FN14_2154 **Error correction** FN14_2154
280-086B	**Error message** FN14_2155 **Cause of error** FN14_2155 **Error correction** FN14_2155
280-086C	**Error message** FN14_2156 **Cause of error** FN14_2156 **Error correction** FN14_2156

Error number	Description
280-086D	**Error message** FN14_2157 **Cause of error** FN14_2157 **Error correction** FN14_2157
280-086E	**Error message** FN14_2158 **Cause of error** FN14_2158 **Error correction** FN14_2158
280-086F	**Error message** FN14_2159 **Cause of error** FN14_2159 **Error correction** FN14_2159
280-0870	**Error message** Pitch <= 0 **Cause of error** Thread grinding: Pitch <= 0. For thread grinding, the pitch must be greater than 0. **Error correction** Correct the parameter.
280-0871	**Error message** Rotational speed = 0 **Cause of error** Thread grinding: Rotational speed = 0. For thread grinding, the rotational speed must not be 0. **Error correction** Correct the parameter.
280-0872	**Error message** Cutting length = 0 **Cause of error** Thread plunge grinding: Cutting length = 0. For thread plunging, the cutting length must not be 0. **Error correction** Correct the parameter.

Error number	Description
280-0873	**Error message** Velocity = 0 **Cause of error** Thread plunge grinding: Velocity Ve, Vm or Vk = 0. For thread plunging, none of the three velocities can be zero. **Error correction** Correct the parameter.
280-0874	**Error message** Signs differ **Cause of error** Thread plunge grinding: Different signs for E, M and K. For thread plunge grinding, the algebraic signs of the parameters E, M and K must be identical. **Error correction** Correct the parameter.
280-0875	**Error message** Pitch = 0 **Cause of error** Thread plunge grinding: Thread depth = 0. For thread plunging, the thread depth must not be 0. **Error correction** Correct the parameter.
280-0876	**Error message** FN14_2166 **Cause of error** FN14_2166 **Error correction** FN14_2166
280-0877	**Error message** FN14_2167 **Cause of error** FN14_2167 **Error correction** FN14_2167

280-0883	**Error message** FN14_2179 **Cause of error** FN14_2179 **Error correction** FN14_2179
280-0884	**Error message** Block scan over probe functions not allowed **Cause of error** Block scan over probe functions not allowed. A block scan was started over a block with a probe function. **Error correction** Run the block without block scan. Touch probe functions cannot be run in block scan.

Error number	Description
280-0885	**Error message** Command not allowed during block scan **Cause of error** Command not allowed during block scan. A command or cycle cannot be run in block scan. **Error correction** Run the block without block scan. Some commands cannot be run in block scan.
280-0886	**Error message** Command not executed due to block scan **Cause of error** Command not executed due to block scan. A command or cycle was not run due to in block scan. **Error correction** None
280-0887	**Error message** Measuring function not executed due to block scan **Cause of error** Measuring function not executed due to block scan. A command or cycle containing a measuring function was not run due to block scan. **Error correction** None
280-0888	**Error message** Elimination of air grinding was not executed due to block scan **Cause of error** Elimination of air grinding was not executed due to block scan. A command or cycle containing the "Eliminate air grinding" function was not run due to block scan. **Error correction** None
280-0889	**Error message** Block scan is not possible on this block **Cause of error** Block scan is not possible on this block. The control does not support a block scan on the selected block. **Error correction** Select a block scan on another block.

Error number	Description
280-088A	**Error message** FN14_2186 **Cause of error** FN14_2186 **Error correction** FN14_2186

280-0894	**Error message** FN14_2196 **Cause of error** FN14_2196 **Error correction** FN14_2196
280-0895	**Error message** FN14_2197 **Cause of error** FN14_2197 **Error correction** FN14_2197

Error number	Description
280-0896	**Error message** FN14_2198 **Cause of error** FN14_2198 **Error correction** FN14_2198
280-0897	**Error message** FN14_2199 **Cause of error** FN14_2199 **Error correction** FN14_2199
280-0898	**Error message** No safety clearance at diameter **Cause of error** No safety clearance at diameter. No safety clearance was programmed at the diameter of the grinding wheel. When the dresser approaches the grinding wheel, it moves toward the wheel edge up to a safety clearance. To ensure that the diamond does not touch the wheel at this position, the safety clearance must be at least as large as half the dresser width. **Error correction** Define a safety clearance at the diameter.
280-0899	**Error message** No safety clearance on the outside **Cause of error** No safety clearance on the outside. No safety clearance was programmed at the outer side of the grinding wheel. When the dresser approaches the grinding wheel, it moves toward the wheel edge up to a safety clearance. To ensure that the diamond does not touch the wheel at this position, the safety clearance must be at least as large as half the dresser width. **Error correction** Define a safety clearance on the outer side.

Error number	Description
280-089A	**Error message** No safety clearance on the inside **Cause of error** No safety clearance on the inner side. No safety clearance was programmed at the inner side of the grinding wheel. When the dresser approaches the grinding wheel, it moves toward the wheel edge up to a safety clearance. To ensure that the diamond does not touch the wheel at this position, the safety clearance must be at least as large as half the dresser width. **Error correction** Define a safety clearance on the inner side.
280-089B	**Error message** Dresser too wide **Cause of error** Dresser too wide (safety clearance too small). When the dresser approaches the grinding wheel, it moves toward the wheel edge up to a safety clearance. To ensure that the diamond does not touch the wheel at this position, the safety clearance must be at least as large as half the dresser width. **Error correction** Check the safety clearances.
280-089C	**Error message** Insufficient diameter **Cause of error** Wheel diameter is too small. The wheel has less than the minimum permissible diameter. The minimum diameter requirement might have been violated during dressing or in a corresponding entry during setup. **Error correction** Correct the entry or adjust the minimum wheel diameter. You might have to insert another wheel.
280-089D	**Error message** Insufficient width **Cause of error** Wheel width is too small. The wheel has less than the minimum permissible width. The minimum width requirement might have been violated during dressing or in a corresponding entry during setup. **Error correction** Correct the entry or adjust the minimum wheel width. You might have to insert another wheel.

Error number	Description
280-089E	**Error message** Outer side of wheel incorrect **Cause of error** Outer side of wheel incorrect. Incorrect values or incorrect combination of parameters that define the outer side of the wheel. **Error correction** Check the parameters of the outer side of the wheel.
280-089F	**Error message** Inner side of wheel incorrect **Cause of error** Inner side of wheel incorrect. Incorrect values or incorrect combination of parameters that define the inner side of the wheel. **Error correction** Check the parameters of the inner side of the wheel.
280-08A0	**Error message** Dressing roller violates retraction amounts **Cause of error** The cutter width of the dressing roller is greater than the width and retraction amounts AA and AI of the grinding wheel together. Cycle 1018: An edge of the dresser is outside of the retraction amounts AA or AI of the grinding wheel. **Error correction** - Check the retraction amounts of the grinding wheel - Cycle 1018: Also check the center offset
280-08A0	**Error message** FN14_2208 **Cause of error** FN14_2208 **Error correction** FN14_2208
280-08A1	**Error message** FN14_2209 **Cause of error** FN14_2209 **Error correction** FN14_2209

Error number	Description
280-08A2	**Error message** Intermed. dressing not allowed **Cause of error** Intermediate dressing not allowed. Intermediate dressing is not allowed in the present condition of the machine, or no dressing is defined in the running program. **Error correction** Define dressing in the program.
280-08A3	**Error message** FN14_2211 **Cause of error** FN14_2211 **Error correction** FN14_2211

280-0917	**Error message** Non-circular channel not active **Cause of error** Non-circular channel not active A command was programmed that expects an active non-circular channel (non-circular program). **Error correction** Check/correct the program

Error number	Description
280-0918	**Error message** Non-circ. channel still active **Cause of error** Non-circular channel still active A command was programmed that is not allowed with an active non-circular channel. This could be, for example, an M3, M4 or M5. **Error correction** Check/correct the program
280-0919	**Error message** Command only allowed in non-circular channel **Cause of error** Command only allowed in non-circular channel A command was programmed in a normal program that is allowed only in a contour program (non-circular program). A contour program (non-circular program) was started as a normal program. **Error correction** Check/correct the program Start the non-circular program by means of a cycle and not in full sequence/single block
280-091A	**Error message** Incorrect contour command **Cause of error** Incorrect contour command: The sequence of commands (Cycles 175, 178, 179) is not suited for running a contour program. For example, a contour program is started although none was loaded. **Error correction** Check the sequence of the commands 175, 178 and 179.
280-091B	**Error message** Error in contour machining **Cause of error** Error in contour machining. **Error correction**
280-091C	**Error message** Contour program faulty **Cause of error** Contour program error: A Cycle 176 was programmed at the beginning of a contour program (noncircular contour). There is an error in the combination of possible parameters. **Error correction** Check the parameters of Cycle 176 in the contour program.

Error number	Description
280-092F	**Error message** Tool axis X, Y, Z permitted **Cause of error** Only X, Y, and Z are possible as tool axes **Error correction**
280-0930	**Error message** Starting spindle angle missing **Cause of error** For the imaging of tools, at least the spindle angle of one tooth must be known. **Error correction** - Run TCH PROBE Cycle 624 in order to determine the tooth angles - Enter the spindle angle in the VTC-TOOLS.TAB table
280-0931	**Error message** Max. tilt angle exceeded **Cause of error** The maximum tilting angle of the probe contact was exceeded. **Error correction** Check the setup of the probe contact, and correct it if required. The tilting angle of the probe contact must be within the prescribed limits of both axes.
280-0932	**Error message** Spindle speed not possible **Cause of error** The spindle shaft speed cannot be set for the panorama image. **Error correction** - Please contact your machine tool builder
280-0933	**Error message** Spindle speed not possible **Cause of error** The spindle shaft speed cannot be set for the breakage control. **Error correction** - Please contact your machine tool builder

Error number	Description
280-0934	**Error message** Camera data faulty **Cause of error** Incorrect internal camera data. Caution: Collisions are possible when running the VTC cycles! **Error correction** - Please contact HEIDENHAIN
280-0935	**Error message** Spindle angle unknown **Cause of error** The spindle angles of the tool teeth have not been determined yet. **Error correction** - Run VTC Cycle 624 - Or enter the angles in the TNC:\table\VTC-TOOLS.TAB table
280-0936	**Error message** Option for panorama image is missing **Cause of error** The VTC option for panorama images is not enabled **Error correction** - Consult your contact person at HEIDENHAIN
280-0937	**Error message** Spindle name? **Cause of error** The spindle designation is missing or unknown. **Error correction** - Enter the spindle name in the table PLC:\VTC\VTC.TAB
280-0938	**Error message** Error in VTC.TAB **Cause of error** Entries in the table PLC:\VTC\VTC.TAB are incorrect: - An entry is missing from the feed rate fields - Both FMAX and a numerical value were entered for a feed rate - An incorrect string was entered instead of FMAX **Error correction** Check VTC.TAB and enter the values correctly

Error number	Description
280-093A	**Error message** Excessive number of teeth **Cause of error** The permissible quantity of tool teeth was exceeded. Tools with no more than 32 teeth can be inspected. **Error correction**
280-093B	**Error message** Incorrect VTC API version **Cause of error** The camera cycles do not match the programming interface of the VTC application **Error correction** - Inform your service agency
280-093C	**Error message** Impermissible character in job name **Cause of error** An impermissible character was entered for the job name in the Q string QS620. **Error correction** - Edit the NC program - Check whether any special characters, such as ?, ; , or a blank have been entered
292-0001	**Error message** Look-ahead: internal software error **Cause of error** **Error correction** Inform your service agency.
292-0002	**Error message** ProfilePool: internal software error **Cause of error** **Error correction** Inform your service agency.
292-0003	**Error message** ProfilePool: internal software error **Cause of error** **Error correction** Inform your service agency.

Error number	Description
292-0004	**Error message** ProfilePool: internal software error **Cause of error** **Error correction** Inform your service agency.
292-0005	**Error message** Look-ahead: internal software error **Cause of error** **Error correction** Inform your service agency.
292-0006	**Error message** Thread cutting: Spindle synchronized too late (distance, position controller) **Cause of error** During thread cutting with controlled spindle, the control could not synchronize the spindle soon enough. **Error correction** 1.) Increase the safety clearance 2.) Check the position control loop (kv factor and tolerance window)
292-0007	**Error message** Axes switched while in motion Axes switched while in motion **Cause of error** - Result of emergency stop during movement - Clamping operation was switched while the axis was in motion - Axis was switched off while in motion **Error correction** - If you suspect a PLC error, contact your machine tool builder.
292-0008	**Error message** Incorrect sequence of contour machining **Cause of error** You used an illegal combination of contour machining commands. **Error correction** Correct the NC program

Error number	Description
292-0009	**Error message** %1 **Cause of error** **Error correction**
292-000A	**Error message** Parameters for contour machining not allowed **Cause of error** Control commands for non cylindrical machining are not supported (FN22 FNR720). **Error correction** Inform your service agency
292-000B	**Error message** Clamping mode switched too early **Cause of error** - PLC program has reset PP_AxClampModeRequest (W1038) too early, even before the drives were switched back on. **Error correction** - Inform your machine tool builder.
292-000C	**Error message** System error: No feed rate **Cause of error** A movement without feed rate occurred for no apparent reason. **Error correction** Inform your machine tool builder.
292-000D	**Error message** No spindle available for feed per revolution! **Cause of error** No spindle is available for the tool. **Error correction** Correct the kinematic configuration / switch off M14
292-000E	**Error message** New start after immediate stop of noncylindr. contour not allowed **Cause of error** If the noncylindrical contour was stopped with G179 STOPP=1, a new start with G178 is not allowed. **Error correction** Delete the complete noncylindrical contour with G179 STOPP=3 and reload.

Error number	Description
292-000F	**Error message** Noncircular program too long for RAM **Cause of error** The current noncircular program is too long. Not enough free RAM is available to run the program. **Error correction** Correct or reduce the NC program.
292-0010	**Error message** CMO is not in the current kinematic description CMO is not in the current kinematic description **Cause of error** You tried to activate or deactivate a collision monitored object (CMO) for monitoring. The control cannot fine the CMO in the currently selected kinematics. **Error correction** Correct the name of the CMO to be activated or deactivated.
292-0011	**Error message** Tool is not monitored for collisions **Cause of error** The selected tool has the value zero or a negative value as the radius or length. There will be no monitoring for collisions. **Error correction**
292-0012	**Error message** Tool is not allowed for collision monitoring **Cause of error** You have inserted a tool that cannot be monitored for collision by DCM (e.g. a non-cylindrical tool). **Error correction** Please use another tool.
292-0013	**Error message** General system error in the collision monitoring **Cause of error** A general system error has occurred in the collision monitoring. **Error correction** Inform your service agency.

Error number	Description
292-0014	**Error message** DCM: %1 **Cause of error** Dynamic collision monitoring (DCM) stopped the program in order to avoid a collision. **Error correction**
292-0015	**Error message** Spindle turning too fast **Cause of error** The axis cannot follow because the spindle is turning too fast for the programmed thread. **Error correction** Decrease the spindle speed.
292-0016	**Error message** DCM inactive: Axis has not yet been homed **Cause of error** DCM is inactive because one or more axes have no reference. **Error correction** Do a reference run in the axes
292-0017	**Error message** DCM inactive: RTC (Real Time Coupling) activated **Cause of error** DCM is inactive because for one or more axes the real-time coupling function is active (RTC). **Error correction** Cancel the real-time couplings (RTC)
292-0019	**Error message** Axes have not been homed, although DCM is active **Cause of error** Axes were not yet moved over the reference marks and DCM is switched on. The NC program run was aborted. **Error correction** - Deactivate DCM if non-referenced axes are used

Error number	Description
292-001A	**Error message** Lagged axes with active DCM **Cause of error** In the current NC program, an axis is moved in the following error mode while the DCM collision monitoring is active. The collision monitoring of axes with following error is not supported. The NC program run was aborted. **Error correction** - Edit the NC program, use FUNCTION DCM to deactivate DCM, or - Use the soft key to switch DCM off
292-001B	**Error message** Thread cutting: Spindle synchronization aborted! **Cause of error** During tapping with servo-controlled spindle, the movement was interrupted during spindle synchronization. The tool axis did not come to a stop until after reaching the safety clearance, although the spindle is still turning. **Error correction** - Check the tool and workpiece for possible damage. - Generate the service file and inform your service agency
292-001D	**Error message** DCM inactive: Facing-slide kinematics are activated **Cause of error** DCM collision monitoring is inactive because a facing slide kinematic model was activated. **Error correction** - Deactivate the facing slide kinematics again.
292-001E	**Error message** Facing slide activated with active DCM **Cause of error** The facing slide was activated and collision monitoring (DCM) is switched on. The NC program run was aborted. **Error correction** - Deactivate DCM, if a facing slide is used.

Error number	Description
292-001F	**Error message** Deactivate handwheel for axis %1 Deactivate handwheel for axis %3 **Cause of error** The control waits for automatic clamping of this axis. The activated handwheel is preventing this clamping. **Error correction** Disable the handwheel for this axis
292-0020	**Error message** Configuration of CfgDCM/manualModeDistance is faulty **Cause of error** The value configured for CfgDCM/manualModeDistance is less than the minimum permissible value. **Error correction** Adapt the machine configuration
292-0021	**Error message** Machine configuration is incorrect **Cause of error** The configuration of the parameter profileType or profileTypeHi is faulty. If "advancedTrapezoidal" is to be configured, then this setting must be set in both the profileType parameter as well as in profileTypeHi. The settings currently do not match. **Error correction** Modify the configuration: Configure the value "advancedTrapezoidal" in profileType and in profileTypeHi
292-0022	**Error message** Look-ahead: internal software error. Code %1 **Cause of error** The control has detected an internal software error dealing with the motion control. **Error correction** Inform your service agency
293-0001	**Error message** Internal error in Look-Ahead Chain Module **Cause of error** **Error correction** Inform your service agency.

Error number	Description
293-0002	**Error message** Illegal filter type 2 **Cause of error** The second nominal value filter must not be of the cutter-location type. **Error correction** Adjust the configuration.
293-0003	**Error message** Axis %1 with 2 filters **Cause of error** Two filters are activated in the parameter set of one axis. **Error correction** Adjust the configuration.
293-0004	**Error message** Incorrect filter form in axis %1 **Cause of error** Only position filters with HSC form are allowed. **Error correction** Adjust the configuration
293-0005	**Error message** No cutter-location filter active **Cause of error** The tolerance for rotary axes with M128 was - configured or programmed, although no nominal-value filter of the cutter-location type is active. - configured or programmed, although none of the loaded axis parameters works with the 1st filter. **Error correction** Adjust the configuration or edit the program.
293-0006	**Error message** Tolerance for rotary axes inactive **Cause of error** The tolerance for rotary axes with M128 was deactivated because you switched to a set of axis parameters without cutter-location filter. Therefore the normal path tolerance is being again used for all axes. The tolerance for rotary axes with M128 stays active until the cutter-location filter is used again. **Error correction** A correction is not essential. The warning can be suppressed by deactivating the tolerance for rotary axes before the axis parameter switchover.

Error number	Description
293-0007	**Error message** Axis parameters for logical axis %1 were lost **Cause of error** Internal error The most recently programmed axis parameters of the axis named were lost in an abnormal program cancellation. Therefore the configured parameters will be used. **Error correction** The control continues operation without correction. If you still know the lost axis parameters, you can program them again.
293-0008	**Error message** Parameters from another axis were programmed %1 **Cause of error** The axis for which the axis parameters were programmed do not belong to the channel. **Error correction** Edit the program
293-0009	**Error message** Parameters from another axis were configured %1 **Cause of error** A logical axis is assigned to another, physical axis. The parameter of this physical axis cannot be overwritten by the values of the logical axis. **Error correction** Change the configuration
293-000A	**Error message** Missing axis parameters in CfgAxis of %1 **Cause of error** The configuration of an axis has no entries for the axis parameters used here. **Error correction** Change the configuration
293-000B	**Error message** Two cutter-location filters **Cause of error** Both position filters are of the cutter-location type. **Error correction** Change the configuration.

Error number	Description
293-000C	**Error message** Position filter is missing **Cause of error** With a position filter of the cutter-location type, the second filter must be of the position type. **Error correction** Change the configuration.
293-000D	**Error message** Two position filters in axis %1 **Cause of error** Two position filters of the position type are configured for the same axis. **Error correction** Change the configuration.
293-000E	**Error message** No position filter in axis %1 **Cause of error** For axes with cutter-location filters, the second filters must also be configured. **Error correction** Change the configuration.
293-000F	**Error message** The option for axis-specific jerk has not been enabled **Cause of error** Axis-specific jerk values were activated in the machine configuration, but the option was not yet enabled. Now the jerk that is valid in the channel was activated for the axis. **Error correction** - Delete the parameters MP_axPathJerk and MP_axPathJerkHi for axis-specific jerk from the machine configuration or enable the software option.
293-0010	**Error message** The option for the feed rate filter has not been enabled **Cause of error** A time constant for the feed rate filter was configured in the machine configuration, but the option was not yet enabled. The feed rate filter was deactivated by the NC software. **Error correction** - Delete the parameter MP_filterFeedTime for the time constant of the feed rate filter from the machine configuration or enable the software option.

Error number	Description
293-0011	**Error message** In Program Run it is not allowed to switch the filter on or off **Cause of error** A filter can be switched on or off by changing the filter form, filter order or the frequency. Filter switched on: Form is not "Off" and the order is greater than 1. Filter switched off: Form is "Off" and the order is less than 1. Only for HSC filters: Filter is switched off if frequency = 0. The programmed parameters for the filter were not adopted. **Error correction** - Edit the program or the cycle.
293-0012	**Error message** Faulty configuration of the nominal position value filters **Cause of error** The following filter parameters are no longer supported and must no longer be configured: - CfgFilter/typeFilter1, typeFilter2, orderFilter1, orderFilter2, - CfgPositionFilter/filter1Shape, filter2Shape, filter1LimitFreq, filter2LimitFreq **Error correction** The old parameters of the position nominal value filter are automatically deleted by a correctly run configuration update. The following conditions must be met in order to conduct the update: - The config object CfgFilter must completely match the old level (with no new parameters). - Either only new parameters or only old parameters are permitted for each CfgPositionFilter config object in the system.
293-0013	**Error message** Name of parameter set (%1) for axis (%2) already assigned **Cause of error** Two or more axes are using the same parameter set. The names of parameter sets must be unique for each axis. **Error correction** - Assign a unique name for each of the parameter sets.

Error number	Description
293-0014	**Error message** Option for limiting the radial acceleration not enabled **Cause of error** A maximum value for the radial acceleration was configured in the machine configuration, but the option was not yet enabled. The limit to the radial acceleration was deactivated by the NC software. **Error correction** - Delete the maxTransAcc and maxTransAccHi parameters for limiting the radial acceleration from the machine configuration or enable the software option.
293-0016	**Error message** Filter settings for virtual axis %1 not allowed **Cause of error** An individual filter setting was configured for a virtual axis. That is not allowed for virtual axes. The individual filter setting was deactivated by the NC. An axis is virtual if CfgAxis/axisMode has the value "Virtual". **Error correction** - Configuration: Delete the config object CfgPositionFilter for this axis and use CfgKeySynonym to connect it with the real axis - FN17: Use FN17 to delete filter settings from the NC program - Cycle 32: Delete HSC mode from Cycle 32
293-0017	**Error message** ADP must be active during use of DCM tolerances **Cause of error** The additional tolerances CfgDCM/maxLinearTolerance and CfgDCM/maxAngleTolerance are configured and ADP is not active. This is not allowed. **Error correction** Switch-on ADP by configuring CfgHardware/setupADP = Premium. Comply with the information on ADP in the Technical Manual.

Error number	Description
293-0018	**Error message** Excessive contour error (%1 mm) in thread (%2 mm permitted) **Cause of error** The adjusted tolerance for successive threads was exceeded **Error correction** - Edit the NC program If possible, reduce the spindle speed. - If a larger deviation is acceptable, increase the tolerance for threads. - Inform your service agency.
293-0019	**Error message** End of successive threads not reached **Cause of error** The programmed end point of the successive thread was not reached. **Error correction** - Check the NC program and edit it if necessary - Reduce the spindle speed, if possible
293-001A	**Error message** Invalid number programmed for FN17/18 No%1 **Cause of error** - Incorrect number of FN17/18 programmed during access to look-ahead parameters. - The is no look-ahead parameter under this number. **Error correction** - Correct the corresponding FN17 or FN18 command.
293-001B	**Error message** Invalid axis programmed in FN17/18 IDX%1 **Cause of error** - Incorrect axis/spindle was programmed through FN17 or FN 18 during access to look-ahead parameters. - There is no axis or spindle with this axis index. **Error correction** - Correct the corresponding FN17 or FN18 command.

Error number	Description
293-001C	**Error message** Vertical movement not allowed in the middle of successive threads **Cause of error** - A movement perpendicular to the threaded axis was programmed in the middle of the thread. - A perpendicular movement is allowed only in the form of lift-off at the end of the thread. **Error correction** - Check the NC program and adapt it if necessary
293-001E	**Error message** Programmed feed rate too small **Cause of error** The programmed feed rate is too small. **Error correction** Edit the NC program.
293-001F	**Error message** The NC program is longer than %1 **Cause of error** The total distance moved in the NC program is greater than permitted. **Error correction** Shorten the NC program. Remove infinite loops.
293-0020	**Error message** Internal error in LookAheadChain module. Code %1 **Cause of error** The control has detected an internal software error dealing with the motion control. **Error correction** Inform your service agency
293-0021	**Error message** Impermissible dynamic calculation of non-registered axis %1 **Cause of error** Look-ahead is supposed to calculate the dynamics of an axis that is not registered. The cause could be a deactivated axis that is used in the kinematics. That is not allowed. **Error correction** - Activate the deactivated axis, check the machine configuration, and correct it if required - Activate another machine kinematic configuration through the NC program - Edit the machine configuration or activate another machine kinematic configuration

Error number	Description
293-0022	**Error message** NC program contains more than %1 blocks **Cause of error** The NC program contains too many blocks. **Error correction** Shorten the NC program. Remove infinite loops.
2A0-0001	**Error message** Ext. in-/output not ready **Cause of error** - The interface is not connected. - The external device is either switched off or not ready. - The transmission cable is defective or incorrect. **Error correction** Check the data transfer line.
2A0-0002	**Error message** Error **Cause of error** This message indicates that there is an error message on the screen now in the background. **Error correction** Switch to the background mode and acknowledge the error message.
2A0-0003	**Error message** Interface already assigned **Cause of error** You attempted to assign an already occupied data interface. **Error correction** End the data transmission and restart it.
2A0-0004	**Error message** Baud rate not possible **Cause of error** The baud rates set at the two data interfaces do not permit simultaneous transmission over both interfaces. **Error correction** Select another baud rate.

Error number	Description
2A0-0005	**Error message** Data transfer erroneous **Cause of error** E During data transfer with BCC the <NAK> signal was received 15 times in succession. A to H Error code of the receiver module with one w/o E of the following causes: - The baud rate settings of the TNC and peripheral device do not match. - The parity bit is erroneous. - Erroneous data frame (e.g.: no stop-bit). - The receiver module of the interface is defective. K During transmission of an error to the TNC the <1> character was not transmitted after the <ESC> character. L After the error sequence <ESC><1> an incorrect error number was received (error numbers 0 to 7 are permitted). M During data transmission with BCC the <NAK> character was transmitted 15 times in succession. N An expected acknowledgment <ACK> or <NAK> was not transmitted after a certain time. **Error correction** Check the data transfer channel.
2A0-0006	**Error message** LSV2: Line interrupted **Cause of error** - DSR signal missing **Error correction** - Check the data transfer line
2A0-0007	**Error message** LSV2: Transmission error **Cause of error** - Character error in the telegram **Error correction** - Check the data transfer line
2A0-0008	**Error message** LSV2: Transmission error **Cause of error** - Checksum error in the received telegram **Error correction** - Check the data transfer line - If the error recurs, inform your service agency

Error number	Description
2A0-0009	**Error message** LSV2: Transmission error **Cause of error** - Checksum error in the transmitted telegram **Error correction** - Check the data transfer line - If the error recurs, inform your service agency
2A0-000A	**Error message** LSV2: Timeout error **Cause of error** - No reaction from distant terminal (T1) **Error correction** - If the error recurs, inform your service agency - Check the LSV2TIME1 entry in OEM.SYS
2A0-000B	**Error message** LSV2: Transmission error **Cause of error** - Distant terminal not ready **Error correction** - Check the communications software of distant terminal
2A0-000C	**Error message** LSV2: Timeout error **Cause of error** - Telegram incomplete, ETX missing (T0) **Error correction** - Check the communications software of distant terminal - If the error recurs, inform your service agency - Check the LSV2TIME0 entry in OEM.SYS
2A0-000D	**Error message** LSV2: Timeout error **Cause of error** - No reaction from distant terminal (T2) **Error correction** - Check the communications software of distant terminal - If the problem recurs, inform your service agency - Check the LSV2TIME2 entry in OEM.SYS

Error number	Description
2A0-000E	**Error message** LSV2: Outgoing transmiss. error **Cause of error** - Internal software error **Error correction** - If the problem recurs, inform your service agency - Check the software version
2A0-0010	**Error message** Illegal file name **Cause of error** Syntax error during file-name input. **Error correction** Use no more than 16 characters for file names.
2A0-0011	**Error message** Key is locked **Cause of error** You pressed a key that is locked at present by the NC software. **Error correction** If necessary, repeat the function at a later time.
2A0-0012	**Error message** Function not permitted **Cause of error** You tried to use a feature that is not enabled on your control by the Feature Content Level (FCL) management. **Error correction** By default, FCL functions are locked after a software update. By entering the code number 65535 in the SIK Menu, you can enable these functions for a certain period of time for test purposes. You can enable FCL functions permanently by purchasing and entering a code number. For more information, contact your machine tool builder or the service agency for the control.
2A0-0013	**Error message** Two rotary positions not allowed **Cause of error** In a pattern or a frame, you tried to define two rotary positions at once. **Error correction** Define only the rotary position of the reference axis or minor axis.

Error number	Description
2A0-0014	**Error message** File name already exists **Cause of error** You tried to assign a name to a new file, although that name already exists. **Error correction** Use another file name.
2A0-0015	**Error message** Function not enabled **Cause of error** You tried to use a software option that is not enabled on your control. **Error correction** Contact your machine tool builder or the service agency for the control to purchase the software option.
2A0-0016	**Error message** Caution: Prepos. height defined! **Cause of error** You have hidden or disabled a point for which a pre-positioning height is defined. In some cases this could lead to a collision. **Error correction** Check if the next points can be approached without danger.
2A0-0017	**Error message** Too little free memory on SYS: **Cause of error** There is not enough memory on the system partition SYS:. Proper function of the control can no longer be ensured. **Error correction** - Reboot the control. - Inform your service agency
2A0-0018	**Error message** Too little free memory on SYS: **Cause of error** There is not enough memory on the system partition SYS:. Proper function of the control can no longer be ensured. **Error correction** - Reboot the control. - Inform your service agency

Error number	Description
2A0-0019	**Error message** Too little free memory on SYS: **Cause of error** There is not enough memory on the system partition SYS:. Proper function of the control can no longer be ensured. **Error correction** - Reboot the control. - Inform your service agency
2A0-001A	**Error message** Too little free memory on SYS: **Cause of error** There is not enough memory on the system partition SYS:. Proper function of the control can no longer be ensured. **Error correction** - Reboot the control. - Inform your service agency
2A0-001B	**Error message** Too little free memory on SYS: **Cause of error** There is not enough memory on the system partition SYS:. Proper function of the control can no longer be ensured. **Error correction** - Reboot the control. - Inform your service agency
2A0-001C	**Error message** Too little free memory on PLC: **Cause of error** There is not enough memory on the PLC: partition. Proper function of the control can no longer be ensured. **Error correction** Inform your machine tool builder.
2A0-001D	**Error message** Too little free memory on PLC: **Cause of error** There is not enough memory on the PLC: partition. Proper function of the control can no longer be ensured. **Error correction** Inform your machine tool builder.

Error number	Description
2A0-001E	**Error message** Too little free memory on PLC: **Cause of error** There is not enough memory on the PLC: partition. Proper function of the control can no longer be ensured. **Error correction** Inform your machine tool builder.
2A0-001F	**Error message** Too little free memory on PLC: **Cause of error** There is not enough memory on the PLC: partition. Proper function of the control can no longer be ensured. **Error correction** Inform your machine tool builder.
2A0-0020	**Error message** Too little free memory on PLC: **Cause of error** There is not enough memory on the PLC: partition. Proper function of the control can no longer be ensured. **Error correction** Inform your machine tool builder.
2A0-0021	**Error message** Too little free memory on TNC: **Cause of error** You saved too many files or excessively large files on the TNC: partition of the control. If you save any more files you will prevent safe operation of the control. **Error correction** - Delete NC programs that are no longer required - Delete backup files of NC programs (*.bak) that are no longer required - Delete service files that are no longer required - If a machining process is now in progress, do not under any circumstance save any more files. It would endanger the success of the operation.

Error number	Description
2A0-0022	**Error message** Too little free memory on TNC: **Cause of error** You saved too many files or excessively large files on the TNC: partition of the control. If you save any more files you will prevent safe operation of the control. **Error correction** - Delete NC programs that are no longer required - Delete backup files of NC programs (*.bak) that are no longer required - Delete service files that are no longer required - If a machining process is now in progress, do not under any circumstance save any more files. It would endanger the success of the operation.
2A0-0023	**Error message** Too little free memory on TNC: **Cause of error** You saved too many files or excessively large files on the TNC: partition of the control. If you save any more files you will prevent safe operation of the control. **Error correction** - Delete NC programs that are no longer required - Delete backup files of NC programs (*.bak) that are no longer required - Delete service files that are no longer required - If a machining process is now in progress, do not under any circumstance save any more files. It would endanger the success of the operation.
2A0-0024	**Error message** Too little free memory on TNC: **Cause of error** You saved too many files or excessively large files on the TNC: partition of the control. If you save any more files you will prevent safe operation of the control. **Error correction** - Delete NC programs that are no longer required - Delete backup files of NC programs (*.bak) that are no longer required - Delete service files that are no longer required - If a machining process is now in progress, do not under any circumstance save any more files. It would endanger the success of the operation.

Error number	Description
2A0-0025	**Error message** Too little free memory on TNC: **Cause of error** You saved too many files or excessively large files on the TNC: partition of the control. If you save any more files you will prevent safe operation of the control. **Error correction** - Delete NC programs that are no longer required - Delete backup files of NC programs (*.bak) that are no longer required - Delete service files that are no longer required - If a machining process is now in progress, do not under any circumstance save any more files. It would endanger the success of the operation.
2A0-0026	**Error message** Not enough free RAM. **Cause of error** There is little free RAM available. If you use any more RAM you will prevent safe operation of the control. **Error correction** - Deactivate memory-intensive applications such as the editor graphics or the Test Run mode. - Reboot the control.
2A0-0027	**Error message** Not enough free RAM. **Cause of error** There is little free RAM available. If you use any more RAM you will prevent safe operation of the control. **Error correction** - Deactivate memory-intensive applications such as the editor graphics or the Test Run mode. - Reboot the control.
2A0-0028	**Error message** Not enough free RAM. **Cause of error** There is little free RAM available. If you use any more RAM you will prevent safe operation of the control. **Error correction** - Deactivate memory-intensive applications such as the editor graphics or the Test Run mode. - Reboot the control.

Error number	Description
2A0-0029	**Error message** Not enough free RAM. **Cause of error** There is little free RAM available. If you use any more RAM you will prevent safe operation of the control. **Error correction** - Deactivate memory-intensive applications such as the editor graphics or the Test Run mode. - Reboot the control.
2A0-002A	**Error message** Not enough free RAM. **Cause of error** There is little free RAM available. If you use any more RAM you will prevent safe operation of the control. **Error correction** - Deactivate memory-intensive applications such as the editor graphics or the Test Run mode. - Reboot the control.
2A0-002B	**Error message** Cannot switch modes of operation **Cause of error** You started the pattern generator or the contour programming while in a machining form and from there tried to switch to another operating mode. **Error correction** Close the pattern generator or contour programming and then close the form input mode (saving or discarding the data) before you switch to another operating mode.
2A0-002C	**Error message** Auto. keyboard lock was opened **Cause of error** The TNC locks keys during a status change, but the lock was opened because the status change was not completed within 15 seconds. **Error correction** Wait until the status change is complete.

Error number	Description
2A0-002D	**Error message** Tree view buildup canceled **Cause of error** After selecting a long smarT.NC program, you canceled the buildup of the tree view. The TNC therefore cannot show the complete tree structure of the program within smarT.NC, nor can you test or run the program. **Error correction** Select the program again and this time wait until the TNC has finished building the tree view.
2A0-002E	**Error message** PGM being edited in parallel **Cause of error** You tried to edit form data that are being edited in the Programming and Editing mode. **Error correction** Cancel your editing in the Programming and Editing mode and make the desired changes in the smarT.NC mode.
2A0-002F	**Error message** Program header already exists **Cause of error** You tried to insert the UNIT 700 (program header), although it already exists. **Error correction** Make changes in the existing program header.
2A0-0030	**Error message** Clipboard is empty! **Cause of error** You tried to insert a block from the clipboard, but the clipboard is empty. **Error correction** First fill the clipboard with the COPY BLOCK or CUT BLOCK.
2A0-0031	**Error message** System memory overflow **Cause of error** This error occurs when the TNC does not have enough buffer memory for calculations, e.g. for generating complex FK graphics while machining a complex part. **Error correction** Acknowledge the error message by pressing CE and repeat the function.

Error number	Description
2A0-0032	**Error message** Function not permitted! **Cause of error** You tried to use a workpiece blank definition from an .hu program, but you did not select the current contour program from an .hu program. **Error correction** Use the function only when you have started the contour program from a UNIT program.
2A0-0033	**Error message** File does not exist **Cause of error** You tried to use the "Recent Files" function to open a file that was moved or no longer exists. **Error correction** Select a different file or open a new file.
2A0-0034	**Error message** File format has changed **Cause of error** This error message will be displayed upon opening a binary file (*.H,*.T...) if the binary format has changed since the previous output version. **Error correction** Delete the file.
2A0-0035	**Error message** smarT.NC: Programming smarT.NC: Programming **Cause of error** **Error correction**
2A0-0036	**Error message** smarT.NC: Defining contours smarT.NC: Contour def. **Cause of error** **Error correction**

Error number	Description
2A0-0037	**Error message** smarT.NC: Defining positions smarT.NC: Position def. **Cause of error** **Error correction**
2A0-0038	**Error message** Application %1 cannot be started **Cause of error** - Due to a lack of system resources (e.g. during memory-intensive HSC machining), a part of the system software cannot be loaded. - The TNC cannot interpret the format of a DXF file. - The DXF file is destroyed. **Error correction** - Call the desired function again at a later time. - Ensure that the DXF file is available in R12 (ASCII) format. - If required, recreate the DXF file.
2A0-0039	**Error message** %1 **Cause of error** **Error correction**
2A0-003A	**Error message** Programming graphics impossible **Cause of error** Programming graphics generation had to be terminated due to an internal error. **Error correction** Select the NC program again and restart generation of a new programming graphic (RESET+START soft key)
2A0-003B	**Error message** smarT.NC: Select DXF elements smarT.NC: Select elements **Cause of error** **Error correction**

Error number	Description
2A0-003C	**Error message** Erroneous DXF file Use of DXF_CONVERTER not possible **Cause of error** You tried to open a DXF file that cannot be edited by the TNC. **Error correction** - Check whether the DXF file is available in ASCII format. - Have the DXF file read out in AutoCAD R12 (AC1009€) format. If the problem recurs, try to make the DXF file with another CAD system. - If necessary, inform your service agency.
2A0-003E	**Error message** Program-run graphics impossible! **Cause of error** The TNC is being so heavily utilized to machine the current workpiece that there is no more capacity available for the program-run graphics. **Error correction** No corrective action possible.
2A0-003F	**Error message** Global PGM settings deactivated **Cause of error** In the smarT.NC operating mode you selected the Program Run submode although global program settings were active. **Error correction** The TNC automatically deactivates all active global program settings. Reactivate the settings, if necessary, when you continue working in the Program Run, Single Block or Program Run, Full Sequence operating mode.
2A0-0040	**Error message** smarT.NC: Program run smarT.NC: Program run **Cause of error** **Error correction**
2A0-0041	**Error message** To retract: NC start **Cause of error** **Error correction**

Error number	Description
2A0-0042	**Error message** Selected block not addressed **Cause of error** After an interruption of the program run the TNC can no longer resume the program run from the cursor's present location. **Error correction** Press GOTO and enter a block number to select the desired location for returning to the program, or select the mid-program startup function.
2A0-0043	**Error message** Test graphic not possible **Cause of error** At present, the system is preventing use of the test graphic. **Error correction** Use the test graphic at a later time.
2A0-0044	**Error message** smarT.NC: Testing smarT.NC: Testing **Cause of error** **Error correction**
2A0-0045	**Error message** Tool file? **Cause of error** There are several tool tables in the NC memory and no table is activated in the Test Run operating mode. **Error correction** Activate the tool table in the Test Run operating mode (status "S").
2A0-0047	**Error message** GOTO table line **Cause of error** **Error correction**

Error number	Description
2A0-0048	**Error message** Locked axis was programmed **Cause of error** - You programmed a locked axis in a part program block. - A traverse was calculated for a locked axis (e.g. due to an active rotation). - A programmed axis is a freely traversing rotary axis. **Error correction** - If necessary, activate the axis. - Delete the axis from the part program block.
2A0-0049	**Error message** Spindle must be turning Spindle must be turning **Cause of error** You called a fixed cycle without first switching on the spindle. **Error correction** Edit the part program.
2A0-004A	**Error message** Tool axis is missing **Cause of error** You called a fixed cycle without first activating a tool. **Error correction** Edit the part program.
2A0-004B	**Error message** Tool radius too small Tool radius too small **Cause of error** - The tool radius is too small for the selected operation. - Cycle 3 "Slot": You defined a width greater than four times the tool radius. - Cycle 240: You entered a centering diameter greater than the tool diameter. - Cycle 210 "Slot" or Cycle 211 "Circular Slot": The slot width is six times greater than the tool radius. **Error correction** - Use a tool with a larger radius. - Cycle 3 "Slot": Define the slot width to be greater than the tool diameter and smaller than four times the tool radius. - Cycle 240: Use a larger tool. - Cycle 210 "Slot" or Cycle 211 "Circular Slot": Define the slot width to be greater than the tool diameter and smaller than six times the tool radius.

Error number	Description
2A0-004C	**Error message** Tool radius too large Tool radius too large **Cause of error** - Contour milling: The radius of an arc block at an inside corner is smaller than the tool radius. - Thread milling: The thread core diameter is smaller than the tool diameter. - Slot milling: The slot width for roughing is smaller than the tool diameter. - Cycle 251, rectangular pocket: The rounding radius Q220 is smaller than the tool radius. - Cycle 214: The given workpiece-blank diameter is smaller than the tool diameter **Error correction** - Use a smaller tool - Slot milling: If necessary, use a smaller oversize (Q368) - Cycle 214: Use a smaller tool; correct the workpiece-blank diameter
2A0-004D	**Error message** Range exceeded Range exceeded **Cause of error** During digitizing the stylus went out of the defined digitizing range. **Error correction** Check the data in the Range cycle, especially the entry for the touch probe axis.
2A0-004E	**Error message** Start position incorrect Start position incorrect **Cause of error** Digitizing with contour lines: Incorrect starting position selected. **Error correction** Check the axes defined in the Contour Lines cycle.

Error number	Description
2A0-004F	**Error message** Rotation not permitted **Cause of error** - Rotation not permitted during digitizing. - Rotation not permitted during automatic measuring (measuring cycles 400 to 418) together with 3-D rotation. - 3-D rotation not permitted together with Cycle 247. **Error correction** - Delete the Rotation cycle. - Reset the rotation (manual mode). - Reset 3-D rotation.
2A0-0050	**Error message** Scaling factor not permitted **Cause of error** You programmed a scaling factor before the TCH PROBE 0 cycle (ISO: G55) or before the digitizing cycles. **Error correction** Delete the Scaling Factor or the Axis-Specific Scaling
2A0-0051	**Error message** Mirroring not permitted **Cause of error** You programmed a mirror image before the TCH PROBE 0 cycle (ISO: G55) or before the digitizing cycles. **Error correction** Delete the Mirror Image cycle.
2A0-0052	**Error message** Datum shift not permitted **Cause of error** Digitizing with contour lines: Datum shift is active. **Error correction** Delete the datum shift.
2A0-0053	**Error message** Feed rate is missing Feed rate is missing **Cause of error** You did not program a feed rate. **Error correction** Edit the NC program. FMAX is effective only for the block in which it is programmed.

Error number	Description
2A0-0055	**Error message** Contradictory signs in cycle **Cause of error** The algebraic signs of the setup clearance, total hole depth and plunging depth do not match. **Error correction** Enter identical signs.
2A0-0056	**Error message** Entered angle not permitted Entered angle not permitted Entered angle not permitted **Cause of error** - The solid angles programmed in Cycle 19 Tilt Working Plane (DIN/ISO: G80) cannot be realized with the current attachment (e.g. universal head where only one hemisphere is accessible). - Run probing cycle only with paraxial angular position. - The point angle (T-ANGLE) defined for the active tool is 180°. **Error correction** - Edit the solid angle entered. - Run probing cycle only with paraxial angular position. - Use angular values greater than 0 and less than 180°.
2A0-0057	**Error message** Touch point inaccessible **Cause of error** In the TCH PROBE 0 (ISO: G55) cycle or during use of the manual probe cycles no touch point was reached within the traverse defined in machine parameter MP6130. **Error correction** - Pre-position the touch probe to the workpiece. - Increase the value in MP6130.
2A0-0058	**Error message** Too many points Too many points **Cause of error** Automatic establishment of points for the digitizing range in the Positioning with Manual Data Input operating mode: Number of stored points (max. 893) exceeded. **Error correction** Re-record digitizing range after increasing the point spacing.

Error number	Description
2A0-005A	**Error message** CYCL DEF incomplete CYCL DEF incomplete **Cause of error** - You deleted part of a cycle. - You have inserted other part program blocks within a cycle. **Error correction** - Redefine the complete cycle again - Delete part program blocks programmed within a cycle.
2A0-005B	**Error message** Height axis not permitted here Plane wrongly defined **Cause of error** While defining the Contour Lines cycle (TCH PROBE 7) you programmed a height axis in the starting point. **Error correction** Edit the part program.
2A0-005C	**Error message** Wrong axis programmed Wrong axis programmed **Cause of error** - An incorrect axis is programmed in the highlighted block. - Touch Probe Cycle 403: You programmed in incorrect compensation axis (Q312). **Error correction** - Check whether you have programmed an axis twice. - Touch Probe Cycle 403: In parameter Q312, select only compensation axes that are present in the kinematic description.
2A0-005D	**Error message** Wrong rpm **Cause of error** You entered an invalid spindle speed. **Error correction** Enter the correct speed, refer to the machine manual.

Error number	Description
2A0-005E	**Error message** Radius comp. undefined **Cause of error** - In the definition of a contour, a contour pocket or a contour train you neglected to program radius compensation. - You have called a machining cycle with the tool radius 0. **Error correction** - Set a tool radius compensation in the contour subprogram to define whether the contour is for a pocket or island. - Define a tool radius other than 0.
2A0-005F	**Error message** Rounding-off undefined **Cause of error** You programmed in sequence a positioning block without radius compensation, a rounding arc (RND, ISO: G25), and a circle block with radius compensation. **Error correction** Edit the part program.
2A0-0060	**Error message** Rounding radius too large Rounding radius too large **Cause of error** - In the definition of a contour, a contour pocket or a contour train, you programmed a rounding arc (RND, ISO: G25) with so large a radius that it does not fit between the adjoining elements. - In a fixed cycle (rectangular pocket/rectangular stud), you defined a rounding arc that cannot be inserted. **Error correction** - Define a smaller rounding radius in the contour subprogram - Check the cycle definition and correct the input values
2A0-0061	**Error message** Program start undefined **Cause of error** The TNC cannot exactly calculate the geometry from the present position (e.g., the programmed coordinates of the first positioning block are the same as the compensated actual position). **Error correction** - Restart the part program. - Use mid-program startup to return to the point of interruption.

Error number	Description
2A0-0062	**Error message** Excessive subprogramming **Cause of error** In a Contour Pocket cycle or a Contour Train cycle you called more than 6 programs (PGM CALL, ISO: %..). A program call can also be: - Cycle 12 (PGM CALL, ISO: G39) - Calling an OEM cycle **Error correction** Edit the part program.
2A0-0063	**Error message** Angle reference missing Angle reference missing Angle reference missing **Cause of error** In an LP/CP block (ISO: G10, G11, G12, G13) no polar angle or incremental polar angle is defined, i.e.: - The distance between the last programmed position and the pole is less than or equal to 0.1 µm. - No rotation is programmed between pole assumption and an LP/CP block. **Error correction** - Program the absolute polar angle. - Check the position of the pole. - If necessary, reset the rotation.
2A0-0064	**Error message** No fixed cycle defined No fixed cycle defined **Cause of error** There is no fixed cycle defined before Cycle 220/221 (circular/linear point pattern). **Error correction** Define a fixed cycle before Cycle 220/221.
2A0-0065	**Error message** Insufficient slot width Insufficient slot width **Cause of error** The width defined in the slot cycle cannot be machined with the active tool. **Error correction** Use a smaller tool.

Error number	Description
2A0-0066	**Error message** Pocket too small Pocket too small **Cause of error** The side lengths defined in the Pocket Milling cycle are too small. **Error correction** Use a smaller tool.
2A0-0067	**Error message** Q202 not defined Q202 not defined **Cause of error** There is no plunging depth (Q202) defined in the fixed cycles 200 to 215. **Error correction** Enter a plunging depth in the fixed cycle.
2A0-0068	**Error message** Q205 not defined Q205 not defined **Cause of error** In the Universal Drilling cycle, you have not defined the minimum plunging depth. **Error correction** Enter a minimum plunging depth in the fixed cycle.
2A0-0069	**Error message** Q218 must be greater than Q219 Q218 must be greater than Q219 **Cause of error** Pocket milling cycle: Q218 must be greater than Q219. **Error correction** Correct the values in the fixed cycle.
2A0-006A	**Error message** CYCL 210 not permitted Fixed cycle not allowed **Cause of error** Fixed cycle cannot be run in the CIRCULAR PATTERN or LINEAR PATTERN cycle. **Error correction** Use another fixed cycle.

Error number	Description
2A0-006B	**Error message** CYCL 211 not permitted CYCL 211 not permitted **Cause of error** Cycle 211 cannot be run in the CIRCULAR PATTERN or LINEAR PATTERN cycle. **Error correction** Use another fixed cycle.
2A0-006C	**Error message** Q220 too large Q220 too large **Cause of error** Pocket finishing or stud finishing cycle: Rounding radius Q220 is too large. **Error correction** Correct the rounding radius in the fixed cycle.
2A0-006D	**Error message** Q222 must be greater than Q223 Q222 must be greater than Q223 **Cause of error** Stud finishing cycle: Workpiece blank diameter Q222 must be greater than the finished part diameter Q223. **Error correction** Correct the workpiece blank diameter in the fixed cycle.
2A0-006E	**Error message** Q244 must be greater than 0 Q244 must be greater than 0 **Cause of error** Circular Pattern cycle: You entered a pitch circle diameter of zero. **Error correction** Correct the pitch circle diameter in the cycle.
2A0-006F	**Error message** Q245 must not equal Q246 Q245 must not equal Q246 **Cause of error** Circular Pattern cycle: Enter a stopping angle equal to the starting angle. **Error correction** Correct the starting or stopping angle in the cycle.

Error number	Description
2A0-0070	**Error message** Angle range must be under 360° Angle range must be under 360° **Cause of error** Circular Pattern cycle: You entered an angle range greater than 360°. **Error correction** Correct the starting or stopping angle in the cycle.
2A0-0071	**Error message** Q223 must be greater than Q222 Q223 must be greater than Q222 **Cause of error** In the Circular Pocket Finishing cycle, you entered a finished-part diameter (Q223) smaller than the workpiece-blank diameter (Q222). **Error correction** Edit Q222 in the cycle definition.
2A0-0072	**Error message** Q214: 0 not permitted Q214: 0 not permitted **Cause of error** In the definition of Cycle 204 you have entered the disengaging direction 0. **Error correction** In Q214, enter a value from 1 to 4.
2A0-0089	**Error message** No measuring axis defined No measuring axis defined **Cause of error** You failed to define the measuring axis in one of the measuring cycles 400, 402, 420, 425, 426 or 427. **Error correction** Check Q272 in the corresponding cycle. Permissible input values: 1 or 2; for Cycle 427: 1, 2 or 3.
2A0-008A	**Error message** Tool breakage tolerance exceeded Tool breakage tolerance exceeded **Cause of error** During workpiece inspection using a measuring cycle, the tool breakage tolerance RBREAK given in the tool table was exceeded. **Error correction** Check whether the tool is damaged.

Error number	Description
2A0-008B	**Error message** Enter Q247 unequal 0 Enter Q247 unequal 0 **Cause of error** In a measuring cycle you entered in parameter Q247 an angular step of 0. **Error correction** Enter an angular step (Q247) other than 0.
2A0-008C	**Error message** Enter Q247 greater than 5 Enter Q247 greater than 5 **Cause of error** In a measuring cycle, you entered in parameter Q247 an angular step smaller than 5 degrees. **Error correction** To ensure sufficient measuring accuracy, enter an angular step (Q247) greater than 5 degrees.
2A0-008D	**Error message** Datum table? **Cause of error** A datum table is required to machine a part program. Either there is no table in the control's NC memory, or several tables have be saved and none activated. **Error correction** Activate the datum table in the Program Run, Full Sequence mode (status M).
2A0-008E	**Error message** Enter direction Q351 unequal 0 Enter direction Q351 unequal 0 **Cause of error** In a fixed cycle you did not define the cutting direction (climb or up-cut). **Error correction** Define the cutting direction as climb milling (= 1) or up-cut milling (= -1).
2A0-008F	**Error message** Thread depth too large Thread depth too large **Cause of error** The programmed thread depth plus 1/3 of the pitch is greater than the drilling or sinking depth. **Error correction** Program the total hole depth to be at least 1/3 of a thread pitch smaller that the total hole depth.

Error number	Description
2A0-0090	**Error message** Missing calibration data Missing calibration data **Cause of error** You have attempted to perform a measurement with Cycle 440 without first performing a calibration. **Error correction** Repeat Cycle 440, but with Q363 = 0 (calibrate).
2A0-0093	**Error message** ORIENTATION not permitted **Cause of error** - Your machine does not offer spindle orientation - Spindle orientation not possible **Error correction** - Refer to your machine manual! - Check machine parameter 7442 and enter the numerical designation of the M function or -1 for spindle orientation by the NC. Refer to your machine manual!
2A0-0096	**Error message** Check the depth sign **Cause of error** **Error correction**
2A0-00A4	**Error message** Switchover of Q399 not allowed **Cause of error** You tried to switch on the touch probe cycle 441 to switch on the angle tracking, although this function is deactivated by machine parameter 6165. **Error correction** Set the machine parameter 6165 = 1 (MOD function, code number 123) and then recalibrate the touch probe.
2A0-00A5	**Error message** Tool not defined Tool not defined Tool not defined Tool not defined Tool not defined **Cause of error** You have called a tool that is not defined in the tool table. **Error correction**

Error number	Description
2A0-00A6	**Error message** Tool number not allowed Tool number not allowed **Cause of error** In a TOOL CALL or TOOL DEF block you tried to define a tool number although it is prohibited by machine parameter. **Error correction** - Use the tool name. - Adapt machine parameter 7483. If required, contact your machine manufacturer.
2A0-00A7	**Error message** Tool name not allowed Tool name not allowed **Cause of error** In a TOOL CALL or TOOL DEF block you tried to define a tool name although it is prohibited by machine parameter. **Error correction** - Use the tool number. - If required, contact your machine tool builder
2A0-00AD	**Error message** Handwheel inactive **Cause of error** **Error correction**
2A0-00AE	**Error message** HR not allowed **Cause of error** **Error correction**
2A0-00AF	**Error message** Wrong operating mode for handwheel **Cause of error** **Error correction**
2A0-00B0	**Error message** Manual **Cause of error** **Error correction**

Error number	Description
2A0-00B1	**Error message** Handwheel **Cause of error** **Error correction**
2A0-00B2	**Error message** Manual input **Cause of error** **Error correction**
2A0-00B3	**Error message** Single Block **Cause of error** **Error correction**
2A0-00B4	**Error message** Full Sequence **Cause of error** **Error correction**
2A0-00B5	**Error message** Edit table **Cause of error** **Error correction**
2A0-00B6	**Error message** T%s: Remaining tool life too short **Cause of error** The remaining tool life (TIME2 column in the tool table) of the tool indicated in the error text has been exceeded. **Error correction** - Use a new tool. - Correct the current tool life (CUR.TIME column in the tool table). A complete list of the tools whose tool life has expired is contained in the TOOLLIST.ERR file stored in the TNC:\ directory.

Error number	Description
2A0-00B8	**Error message** FN 14: error code %-3u FN 14: Error code %s **Cause of error** Forced error through function FN14 (ISO: D14). With this function the TNC calls the preprogrammed messages of the machine manufacturer (e.g. from an OEM cycle). If during a program run or test run the TNC comes to a block with FN14 (D14), it stops operation and displays a message. You must then restart the program. **Error correction** Refer to the User's Manual for a description of the error. Correct the error and restart the program.
2A0-00B9	**Error message** Calculated error no. too large **Cause of error** Calculation of an error number for the FN14 function (ISO: D14) from a Q parameter resulted in a value outside the permissible range of 0 to 499. **Error correction** Edit the part program.
2A0-00BA	**Error message** Tool %s not defined **Cause of error** You called a tool that is not contained in the tool magazine. **Error correction** Check the pocket table and add the tool if required. A complete list of the tools that are not contained in the tool magazine can be found in the the TOOLLIST.ERR file stored in the TNC:\ directory.
2A0-00BB	**Error message** block scan inconsistent %s **Cause of error** During restoration of the machine status after a block scan (mid-program startup), the conditions on the machine regarding spindle speed (S), traverse range (R) or preset (P) were not the same as calculated in the block scan. **Error correction** - Shut down the control and restart it. - Inform your machine tool builder.

Error number	Description
2A0-00BC	**Error message** Limit switch %.2s- **Cause of error** The calculated path of the tool exceeds the traversing range (software limit switch) of the machine - Software limit switch was reached in a manual operating mode **Error correction** - Check the programmed coordinates. If required, edit the program. - Check the reference point. If required, set a new reference point. - Move the tool in the opposite direction.
2A0-00BD	**Error message** Limit switch %.2s- **Cause of error** The calculated tool path exceeds the machine's traverse limits. Negative traverse range is defined with MP92x.x. **Error correction** - Check the programmed coordinates. If required, edit the program. - Check the reference point. If required, set a new reference point.
2A0-00BE	**Error message** Limit switch %.2s+ **Cause of error** - The calculated path of the tool exceeds the traversing range (software limit switch) of the machine - Software limit switch was reached in a manual operating mode **Error correction** - Check the programmed coordinates. If required, edit the program. - Check the reference point. If required, set a new reference point. - Move the tool in the opposite direction.

Error number	Description
2A0-00BF	**Error message** Limit switch %.2s+ **Cause of error** The calculated tool path exceeds the machine's positive traverse limits. Positive traverse range is defined with MP91x.x. **Error correction** - Check the programmed coordinates. If required, edit the program. - Check the reference point. If required, set a new reference point.
2A0-00C1	**Error message** File does not exist **Cause of error** - The given file does not exist. - The given file has been deleted since last used. - You tried to select a file whose name exceeds the permitted length. - smarT.NC: You selected an .HU program that uses a point table that does not exist on the TNC hard disk. - You entered an incorrect path under >MOD >Print (print test). - You tried to open and edit a file protected by SELinux (access check). **Error correction** - Use an existing file for the selected file operation. - Pay attention to the maximum permissible length of the file name. - Check the .HU program for missing point tables and restore or read-in the missing files - Correct the path entry. - Deactivate SELinux temporarily.
2A0-00C2	**Error message** File type missing or incorrect **Cause of error** You tried to create a new file without first defining the appropriate file type. **Error correction** Enter the correct file type.

Error number	Description
2A0-00C3	**Error message** No datum table selected **Cause of error** You tried to select a datum number by soft key although no datum table is selected in the program header. **Error correction** - Under options in the program header (UNIT 700), enter a datum table from which the datums can be selected. - Make sure that you have entered the correct path name in the UNIT 141 or in the program header (UNIT 700).
2A0-00C7	**Error message** MC: System error in SPLC-RTS **Cause of error** - Internal software error in the run-time system (RTS) of the SPLC on the MC **Error correction** Inform your service agency
2A0-00C8	**Error message** Faulty recognition of PL/MB hardware **Cause of error** An error occurred during detection and evaluation of the safety-related PL and MB hardware. **Error correction** - Check the connection and function of HSCI-PLs and MB - Inform your service agency
2A0-00C9	**Error message** I/O assembly %1 reports an error **Cause of error** A safety-related HSCI-PL or the MB supplies invalid data. **Error correction** - Find and exchange the faulty device - Inform your service agency
2A0-00CA	**Error message** I/O assembly %1 reports an error **Cause of error** A safety-related HSCI-PL or the MB reports an error. **Error correction** - Check the wiring and condition of the PLs or the MB. - Inform your service agency

Error number	Description
2A0-00CB	**Error message** MC: System error in SPLC-RTS **Cause of error** - Internal software error in the run-time system (RTS) of the SPLC by the MC **Error correction** Inform your service agency
2A0-00CC	**Error message** MC: System error in SPLC-RTS **Cause of error** - Internal software error in the run-time system (RTS) of the SPLC by the MC **Error correction** Inform your service agency
2A0-00CD	**Error message** Run-time error in SPLC program **Cause of error** - Run-time error in the SPLC program **Error correction** Inform your service agency
2A0-00CE	**Error message** SPLC cannot load program **Cause of error** The SPLC program cannot be loaded. **Error correction** Inform your service agency
2A0-00CF	**Error message** SPLC program has changed **Cause of error** The SPLC program or the NC software was changed after the machine safety acceptance. **Error correction** Restore the original SPLC program or perform the safety acceptance again.
2A0-00D0	**Error message** SPLC program cannot run **Cause of error** SPLC program cannot be started **Error correction** - Note further error messages. - Inform your service agency

Error number	Description
2A0-00D1	**Error message** Machine not in safe operation **Cause of error** The control commissioning is not yet concluded. The functional safety of the machine is not ensured. **Error correction**
2A0-00D2	**Error message** Configuration of SPLC inputs **Cause of error** The configuration of the SPLC inputs with inverse logic is faulty. **Error correction** - Check configuration in safety-related machine parameters inpNoInverseA and inpNoInverseB. - Inform your service agency
2A0-00D3	**Error message** Configuration of SPLC inputs **Cause of error** The configuration of the SPLC inputs that are participating in the minute test is faulty. **Error correction** - Check configuration in safety-related machine parameter inpNoDynTest. - Inform your service agency
2A0-00D4	**Error message** Configuration of SPLC cycle time **Cause of error** Configured cycle time for SPLC is too long or too short. **Error correction** - Check configuration in machine parameter plcCount. - Inform your service agency
2A0-00D5	**Error message** Functional Safety (FS) not ensured! **Cause of error** This installation of the control software is a test version: - This control software may be used only for test purposes! - The functional safety of the machine is not guaranteed! - Therefore be careful when running the machine, particularly when the guard doors are open! **Error correction**

Error number	Description
2A0-00D6	**Error message** ACCESSLEVEL: Function locked **Cause of error** - Desired function in the active ACCESSLEVEL is locked **Error correction** - Enable the function through ACCESSLEVEL
2A0-00D8	**Error message** smarT.NC: Copy/Cut smarT.NC: Copy **Cause of error** **Error correction**
2A0-00D9	**Error message** Changed NC software version **Cause of error** - The NC software version was changed after the machine safety acceptance. - NC software version and version of the file used, SplcApi-Marker.def, do not match. **Error correction** - Transfer the SplcApiMarker.def file appropriate to the installed NC software version into the SPLC project. - Enter the value of the constant SPLC_API_VERSION from this file into the safety-related machine parameter splcApiVersion in CfgSafety - Repeat the safety inspection and approval of the machine with the appropriate comprehensiveness. - Inform your service agency
2A0-00DA	**Error message** Error in SPLC configuration data **Cause of error** - The configuration data for the SPLC are incorrect. It is not possible to translate the PLC program until these data are corrected. **Error correction** - Correct the configuration data for SPLC Note further error messages regarding this. - Inform your service agency

Error number	Description
2A0-00DB	**Error message** Incorrect condition of safe output %1 **Cause of error** - Indicated SPLC output is logical 1 (+24 V), although SPLC specifies logical 0 (0 V) for the output. - Faulty wiring (short circuit to +24 V) - PLD module defective **Error correction** - Check the wiring - Exchange the defective PLD module - Inform your service agency
2A0-00DC	**Error message** AFC: No reference power recorded **Cause of error** Adaptive Feed Control (AFC), learning mode: The TNC could not find any reference power. Possible cause: Test cut in the air **Error correction** Repeat the teach-in cut.
2A0-00DD	**Error message** Faulty assignment of tool/cut no. **Cause of error** AFC: In the AFC settings the assignment of the current cut number to the current tool is faulty. **Error correction** Repeat the teaching process. The TNC automatically resets the current cut to "Teach".
2A0-00DE	**Error message** Wiring of SPLC input %1 **Cause of error** According to the configuration (CfgSafety / inpNoDynTest), the SPLC input named in the text participates in the dynamic test but does not drop out although the corresponding test output was switched off. **Error correction** - Check the wiring - Check the configuration

Error number	Description
2A0-00DF	**Error message** Wiring of emergency stop **Cause of error** An emergency stop input does not drop out, although the associated test output was switched off. **Error correction** Check the wiring. All emergency stop circuits must be supplied with current over the corresponding test outputs.
2A0-00E0	**Error message** Wrong input %1 for dynamic test **Cause of error** The indicated SPLC input cannot be tested with the minute test (dynamic test) - No physical PLC input with the indicated number exists - The PLC input is neither on a system PL (PLB 62xxFS) nor on a safe machine operating panel (MB 6xxFS) even though there is more than one system PL in the HSCI system. **Error correction** - Check machine parameter inpNoDynTest in CfgSafety. - Inform your service agency.
2A0-00E1	**Error message** MC error during cross comparison at input %1 **Cause of error** The two terminals of a dual-channel FS input have differing logical conditions. Possible causes: - Key on the machine operating panel was pressed on a slant - Breakage in the wiring of an FS input - Short circuit on 0 V or 24 V in the wiring of an FS input - Incorrect configuration (SMP) of inverse FS inputs (e.g. with antivalent or inverted signal) **Error correction** - Check the keys on the machine operating panel. If one of the keys had been pressed at an incorrect angle, then no further measures are necessary - Check the wiring of the affected dual-channel input - Inform your service agency Note that the input cannot be put back into the trigger state until both input terminals are in the idle state.

Error number	Description
2A0-00E2	**Error message** Unexpected condition of SPLC input %1 **Cause of error** According to the machine parameter configuration, the given SPLC input in the idle state should be providing 0 V and another channel 24 V. This is not the case. Possible causes: - Configuration of the SPLC input is faulty - Input is not in the idle state during the self-test - Wiring is faulty. - The connected handwheel is not suitable for functional safety (FS) - The handwheel has been replaced by an unsuitable dummy plug (not suitable for FS) **Error correction** - Check the wiring - Check the configuration - Check connected handwheel and exchange it if necessary - Check the dummy plug and exchange it if necessary - Inform your service agency
2A0-00E3	**Error message** Select override: Handw./ Op. panel CAUTION F/S values **Cause of error** **Error correction**
2A0-00E4	**Error message** Control strategy not found in AFC.TAB. Default will be used. **Cause of error** The control could not find the control strategy assigned to the active workpiece in the table AFC.TAB. **Error correction** Correct the entries in the AFC column of the tool table or in the AFC.TAB table.
2A0-00E5	**Error message** Input marker %1 set by SPLC program **Cause of error** - The SPLC program has an input marker set to the value TRUE (= 1). This is not allowed. - Input markers can be deleted by the SPLC program (= 0), but they cannot be set (= 1) **Error correction** - Check the SPLC program and correct it if necessary - Inform your service agency

Error number	Description
2A0-00EC	**Error message** AFC parameters not allowed in turning mode **Cause of error** An AFC parameter was programmed that is not permitted in turning mode, e.g. TIME or DIST. **Error correction** Check the NC program and adapt it if necessary
2A0-00ED	**Error message** Program-run graphics: Incomplete display **Cause of error** The TNC is so busy machining the current workpiece that the program-run graphics are sometimes not being updated, and can therefore be incomplete. **Error correction** No corrective action possible
2A0-00EE	**Error message** AFC: No idle power recorded **Cause of error** The acceleration phase to the starting speed could not be concluded before the first cutting block was reached; therefore the idle power could not be determined. **Error correction** Only perform the first cutting block once it is ensured that the starting speed has been reached.
2A0-00EF	**Error message** AFC: function is not in effect; inconsistent input values **Cause of error** A FUNCTION MODE ... command was executed after the TOOL CALL. That is not allowed. **Error correction** Edit the NC program
2A8-0003	**Error message** Place handwheel in charger **Cause of error** The wireless handwheel is not located in the charging station although the handwheel mode is not active. If the rechargeable battery of the handwheel is emptied or there is interference in the radio connection, the TNC releases an emergency stop. In this case the program run is canceled. **Error correction** Always place the handwheel in the loading station when you are not working with it.

Error number	Description
2A8-0004	**Error message** Configuration error in OEM handwheel menu or soft key **Cause of error** The configuration of an OEM handwheel menu or an OEM handwheel soft key is incomplete or faulty. **Error correction** Inform your service agency.
2A8-0007	**Error message** Battery almost empty. Place handwheel into the charging station **Cause of error** The wireless handwheel's rechargeable battery is almost empty. If the rechargeable battery loses charge, it interrupts the connection to the handwheel. This results in an emergency stop and the program run is aborted! **Error correction** - Now place the handwheel onto the charging station to restore its charge. - Recommendation: Always keep the handwheel in the charging when not in use.
2A9-0001	**Error message** Faulty BLK FORM **Cause of error** The given workpiece blank definition is faulty and could not be interpreted by the control. **Error correction** - Correct the BLK FORM in the NC program.
2A9-0002	**Error message** Incorrect tool data **Cause of error** The 3-D simulation graphic cannot process the tool data. **Error correction** Adapt the tool data
2A9-0009	**Error message** Rapid-traverse cut near block %1 **Cause of error** The simulation detected possible cutting of material at rapid traverse near the indicated block number. **Error correction** - Check the position and size of the BLK FORM - Increase the quality of the simulation - Edit the NC program

Error number	Description
2A9-000B	**Error message** System error when calculating the graphics **Cause of error** System error during internal calculation of the 3-D graphical representation during program run or a test run. **Error correction** Inform your service agency
2A9-000C	**Error message** Violation of the workpiece near block %1 **Cause of error** The simulation detected a possible violation of the workpiece by a non-cutting part of the tool (holder or shank) near the indicated block number. **Error correction** Check the position and size of the BLK FORM, as well as the tool data, and edit the NC program if necessary
2A9-000D	**Error message** %2 3-D model not loaded %1 **Cause of error** Error while reading the 3-D model: the file could not be opened or is not a supported 3-D data format. **Error correction** - Check the path and correct it if necessary - Reload the file
2A9-000E	**Error message** %2 3-D model not loaded %1 **Cause of error** Could not load the 3-D model because it does not fulfill the quality requirements. The following requirements are in place for 3-D models: - All dimensions in mm - No gaps between triangles ("waterproof") - No overlapping - No degenerated triangles **Error correction** Regenerate the 3-D model and transfer it to the control.

Error number	Description
2A9-000F	**Error message** %2 3-D model not loaded %1 **Cause of error** Error while reading the 3-D model: the file contains too many triangles. **Error correction** - Use a rougher 3-D model - Generate the 3-D model with the CAD program again and transfer it to the control. In many CAD programs the level of detail can be set when exporting.
2A9-0010	**Error message** Workpiece could not be exported **Cause of error** Could not write the file. **Error correction** - Check the path and correct it if necessary - Check the available memory
2A9-0011	**Error message** Ext. workpiece monitoring temporarily deactivated **Cause of error** Too many blocks with violations of the workpiece were found. Extended workpiece monitoring will be deactivated until the next BLK FORM. **Error correction** Check and correct as necessary: - Tool data - Position and shape of the workpiece - Cuts at FMAX
2A9-0012	**Error message** Workpiece could not be exported **Cause of error** There is no workpiece present. **Error correction**
2AA-0005	**Error message** Database error **Cause of error** Access to the table was not possible for the following reasons: - The table is write-protected - The table is corrupted - The table does not exist **Error correction** Check the table

Error number	Description
2D4-0000	**Error message** Start of Python script "%1" failed **Cause of error** Communication with the PLC necessary for starting the Python script has failed. **Error correction** - Compile the PLC program - Restart the Python script
2D4-0001	**Error message** Start of Python script "%1" failed **Cause of error** The exact cause of the error is unknown. **Error correction** Inform your service agency.
2D4-0002	**Error message** Start of Python script "%1" failed **Cause of error** The Python option is not enabled For Python applications to be run on the control, the "Python OEM Process" software option must be enabled in the SIK. **Error correction** - "Python OEM process" software option was not enabled in the SIK
2D4-0003	**Error message** Start of Python script "%1" failed **Cause of error** Too little free working memory available to run the Python script. **Error correction** - Assign less memory requirement to the Python script over the machine configuration ("memLimit" machine parameter) - Close running Python processes to free memory.
2D4-0004	**Error message** Start of Python script "%1" failed **Cause of error** The value of the machine parameter "memLimit" (maximum process memory) is invalid. **Error correction** - Check the machine parameter "memLimit" and correct it

Error number	Description
2D4-0005	**Error message** Start of Python script "%1" failed **Cause of error** The path entered in the machine configuration for the Python script is invalid. **Error correction** - Correct the machine parameter in the CfgSoftkeyOverlay config object.
2D4-0006	**Error message** Start of Python script "%1" failed **Cause of error** The name entered in the machine configuration for the Python process is invalid. **Error correction** - Correct the machine parameter "jobName" in the CfgSoftkeyOverlay config object.
2D4-0007	**Error message** Start of Python script "%1" failed **Cause of error** A Python process with the same name is already running. **Error correction** - If desired, terminate the running Python process
2D4-0008	**Error message** Start of Python script "%1" failed **Cause of error** In the machine configuration there are invalid parameters defined for the Python script. **Error correction** - Correct the machine parameter "parameter" in the CfgSoftkeyOverlay config object.
303-0001	**Error message** Referenced OPC UA namespace %1 does not exist **Cause of error** The entities CfgOpcUaObject and CfgOpcUaPlcVar with the following keys do not refer to an existing OPC UA namespace configuration: %1 The nodes stated and all child elements will not be created. **Error correction** Check the withinNamespace attribute

Error number	Description
303-0002	**Error message** Referenced OPC UA parent node %1 does not exist **Cause of error** The entities CfgOpcUaObject and CfgOpcUaPlcVar with the following keys use the attribute parentNode to refer to a parent node that does not exist: %1 The nodes and all child elements will not be created. **Error correction** Check the parentNode attribute
303-0003	**Error message** Invalid value for nodeIdIdentifier %1 **Cause of error** nodeIdType was set to Numeric in the configuration datum %1. However, the value entered for nodeIdIdentifier is not a numeric value. The node and all child elements will not be created. **Error correction** Check the nodeIdType and nodeIdIdentifier attributes in the indicated configuration datum
303-0004	**Error message** Invalid value for publicationDate %1 **Cause of error** The publication date entered in the configuration datum %1 does not match the format YYYY-MM-DDThh:m-m:ss.sssTZD. **Error correction** Check the configuration datum
303-0005	**Error message** Multiple definitions of the namespace URI %1 **Cause of error** The namespace URI of an OPC UA namespace must be unique. The namespaceUri in the CfgOpcUaNamespace entities with the following keys is identical: %1 (%2 entities) Only the first namespace configuration stated is active. **Error correction** Check the configuration of the namespaceUri

Error number	Description
303-0006	**Error message** Value not permitted for namespaceUri %1 **Cause of error** The OPC UA namespace URI entered in the configuration datum %1 is not permitted, since it is too similar to other names or namespace URIs that have already been assigned. The namespace and all nodes it contains will not be created. **Error correction** Select a different URI for the OPC UA namespace
303-0007	**Error message** Multiple use of NodeId %1 **Cause of error** The same NodeId was configured for the entities CfgOpcUaObject and CfgOpcUaPlcVar with the following keys: %1 (%2 entities) Only the first node stated will be created. **Error correction** Check the configuration of the withinNamespace, nodeId-Type, and nodeIdIdentifier attributes
303-0008	**Error message** Attribute %1 was not configured **Cause of error** No value was entered in the configuration datum %1. It is absolutely essential. The node and all child elements will not be created. **Error correction** Check the configuration datum
303-0009	**Error message** Cyclic parent-child relationship **Cause of error** The entities CfgOpcUaObject and CfgOpcUaPlcVar with the following keys form a cyclic reference though their parentN-ode attributes: %1 This is not permitted. The nodes stated and all child elements will not be created. **Error correction** Check the respective parentNode attributes

Error number	Description
303-000A	**Error message** Invalid namespace URI %1 **Cause of error** An invalid namespace URI was entered in the namespaceUri attribute in the configuration datum %1. The node and all child elements will not be created. **Error correction** Enter a correct namespace URI
303-000B	**Error message** Invalid parent node: %1 **Cause of error** The entity CfgOpcUaObject %1 references an CfgOpcUaPlcVar entity as parent node. This is not allowed. The node and all child elements will not be created. **Error correction** Check the parentNode attribute
303-000C	**Error message** Impermissible multiple use of browseName %1 **Cause of error** The same browseName is used below the same parent node in the entities CfgOpcUaObject and CfgOpcUaPlcVar with the following keys: %1 (%2 entities) Only the first node stated will be created. **Error correction** Check the configuration of the browseName attribute
303-000D	**Error message** More than %1 variables are configured **Cause of error** The machine manufacturer configured many variables for access through OPC UA NC Server. If OPC UA clients order subscriptions to all of these variables, a system overload can occur. %2 variables are configured. **Error correction** Reduce the number of variables

Error number	Description
303-000E	**Error message** The configuration of the OPC UA NC Server has changed **Cause of error** The OEM-specific configuration of OPC UA NC Server was changed. The changes will take effect the next time the server is restarted. **Error correction** Restart the server to activate the changes. Active connections will be disconnected.
303-0012	**Error message** Invalid range specified %1 **Cause of error** The range specified in the configuration datum %1 is not valid. The minimum value is greater than the maximum value. The variable node will not be created. **Error correction** Check the configuration datum
303-0013	**Error message** Incomplete range specified %1 **Cause of error** The range specified in the configuration datum %1 is not complete. Either the minimum value or the maximum value is missing. The variable node will not be created. **Error correction** Check the configuration datum
303-0014	**Error message** EURange outside of InstrumentRange **Cause of error** The range specified for EURange in the configuration datum %1 exceeds the range specified for InstrumentRange in the configuration datum %2 InstrumentRange indicates the maximum permissible range of values, and therefore must not be exceeded by EURange. The variable node will not be created. **Error correction** Check the configuration datum

Error number	Description
303-0015	**Error message** Unknown UnitCode %1 **Cause of error** The UnitCode entered in the configuration datum %1 is unknown to the control. The variable node will not be created. **Error correction** Check the configuration datum
303-0016	**Error message** Unknown PLC symbol %1 **Cause of error** Im Konfigurationsdatum %1 wurde ein PLC-Symbolname angegeben, der im PLC-Programm nicht definiert ist. **Error correction** Konfigurationsdatum prüfen
303-0017	**Error message** Meta-information does not match the PLC operand **Cause of error** In Konfigurationsdatum %1 wurden Meta-Informationen für numerische Werte konfiguriert. Der Datentyp des angegebenen PLC-Operanden ist jedoch nicht numerisch. Die Meta-Informationen werden ignoriert. **Error correction** Meta-Informationen löschen oder korrekten PLC-Operanden angeben
303-0018	**Error message** Meta-information does not match the PLC operand **Cause of error** A valuePrecision was entered in the configuration datum %1. However, this is supported only for the data types Word and DWord. The indicated valuePrecision will be ignored. **Error correction** Delete the value for valuePrecision or enter a correct PLC operand

Error number	Description
303-0019	**Error message** Invalid index for PLC symbol %1 **Cause of error** Im Konfigurationsdatum %1 wurde ein PLC-Symbol mit einem ungültigen Index adressiert. **Error correction** Konfigurationsdatum prüfen
303-001A	**Error message** PLC symbol %1 has no valid data value **Cause of error** Im Konfigurationsdatum %1 wurde ein PLC-Symbolname angegeben, der keinen gültigen Datenwert beschreibt (z.B. eine PLC-Struktur). **Error correction** Konfigurationsdatum prüfen. (Bei PLC-Strukturen können deren Elemente als separate Variablen konfiguriert werden.)
303-001B	**Error message** Write-access configured for PLC constant **Cause of error** In Konfigurationsdatum %1 wurde der PLC-Operand über valueWritable als schreibbar konfiguriert. Der angegebene PLC-Operand ist jedoch eine Konstante und kann somit nicht geändert werden. Das Attribut valueWritable wird ignoriert. **Error correction** Konfigurationsdatum prüfen
320-0001	**Error message** Error while sending message to PLC **Cause of error** **Error correction**
320-0002	**Error message** PLC program not successfully compiled **Cause of error** **Error correction**

Error number	Description
320-0003	**Error message** Argument out of range **Cause of error** **Error correction**
320-0004	**Error message** PLC is running in simulation mode **Cause of error** **Error correction**
320-0005	**Error message** PLC compiler argument (%1) missing **Cause of error** **Error correction**
320-0006	**Error message** Invalid PLC call parameter **Cause of error** **Error correction**
320-000A	**Error message** Programmed spindle speed is too low **Cause of error** The spindle speed that programmed is too low. **Error correction** Program a faster shaft speed or check the configuration datum Axes->ParameterSets->????->CfgFeedLimits->minFeed. "????" designates the current name of the data record from the configuration.
320-000B	**Error message** Rotational speed programmed for spindle too high **Cause of error** The shaft speed that you programmed for this axis is too low. **Error correction** Program a faster shaft speed or check the configuration datum Axes->ParameterSets->????->CfgFeedLimits->minFeed. "????" designates the current name of the configuration set.

Error number	Description
320-000C	**Error message** %1 %1 **Cause of error** siehe Maschinenhandbuch **Error correction** siehe Maschinenhandbuch
320-000D	**Error message** The PLC program has been stopped **Cause of error** The PLC program was stopped because of a system error in the PLC. **Error correction** Inform your machine tool builder.
320-000E	**Error message** Error in PLC program **Cause of error** An error occurred during execution of the PLC program. **Error correction** Inform your machine tool builder.
320-000F	**Error message** System error in the PLC System error in the PLC **Cause of error** Internal software error **Error correction** Inform your service agency.
320-0010	**Error message** General system error **Cause of error** Internal software error **Error correction** Inform your service agency.
320-0011	**Error message** Spindle speed programmed without configured spindle **Cause of error** No spindle available, but speed has been programmed. **Error correction** Configure the spindle (CfgAxes->spindleIndices) or do not program a spindle speed.

Error number	Description
320-0012	**Error message** Configuration datum %1/%2 contains errors Configuration datum %1 - %2 contains errors **Cause of error** The given configuration datum contains errors and was not accepted for control operation. **Error correction** Correct the given configuration data or inform your machine tool builder.
320-0013	**Error message** Configuration datum %1 for channel %2 missing **Cause of error** The given configuration datum was not found. **Error correction** Add the given configuration datum or inform your machine tool builder.
320-0014	**Error message** Configuration datum %1 for channel %2 already defined **Cause of error** The given configuration datum causes a multiple definition of an output to the PLC. **Error correction** Correct the given configuration data or inform your machine manufacturer.
320-0015	**Error message** Operand %1 for configuration datum %2 not found **Cause of error** The operand described in the given configuration data was not defined in the PLC. **Error correction** Correct the given configuration data, select another PLC program and/or inform your machine manufacturer.

Error number	Description
320-0016	**Error message** Data of PLC strobe for channel %1 could not be transferred **Cause of error** The data belonging to the given output to the PLC could not be saved in PLC markers. **Error correction** Correct the associated configuration datum or inform your machine tool builder.
320-0017	**Error message** Configuration and PLC program incompatible **Cause of error** A PLC program has been selected that is not compatible with the configuration of the machine. Necessary prerequisites for the successful operation of the PLC program: - PLC programs that operate with the numerical memory interface API 1.0 (TNC flag interface) can only control one operating mode group, one NC channel, and one spindle. - PLC programs that use the symbolic memory interface API 3 must create the API data structures in the number suitable for the configuration. - The correct values for the system parameters AXIS_COUNT and SPINDLE_COUNT must be defined in the configuration file of the PLC compiler. - PLC programs must define a sufficiently large memory image. All permanently assigned, non-volatile, or absolutely addressed flags must fall within the memory image. - PLC programs have to define all markers to which configuration data are to be assigned at the start of the PLC program. - Pay attention to any other, previously issued warnings. **Error correction** - Check the machine configuration - Check the configuration file of the PLC compiler for correct values - Use a suitable PLC program - Inform your service agency
320-0018	**Error message** Inconsistent PLC program **Cause of error** The API version in the selectable PLC program is not compatible with the control software or the definition of the API version in the PLC program is faulty. **Error correction** Update the ApiMarker.DEF file from the PLC project of the machine, or correct the PLC program.

Error number	Description
320-0019	**Error message** Error in PLC program: Input was changed **Cause of error** The PLC program tried to change an input marker (e.g. I3). **Error correction** Correct the PLC program. Input markers can only be read, never written.
320-001A	**Error message** PLC error table cannot be read (%1) **Cause of error** The PLC cannot read your error table. It could be that the path configured for the table is incorrect or the table has an incorrect format. **Error correction** Check the configuration and PLC error table.
320-001B	**Error message** PLC error table erroneous (%1) **Cause of error** An invalid error marker was given in the PLC error table.It could be that a symbolic name is written incorrectly. **Error correction** Correct the PLC error table.
320-001C	**Error message** Control cannot read operating times **Cause of error** The control cannot read one or more operating time values that are saved in a file. The file was presumably destroyed. **Error correction** If the error message appears repeatedly, inform your service agency.
320-001D	**Error message** System error in the PLC **Cause of error** Internal software error: The persistent storage of operating times in a file has failed, presumably because of an error in the file system. **Error correction** Inform your service agency.

Error number	Description
320-0023	**Error message** Invalid configuration for fast inputs Number %1 - Operand %2 **Cause of error** The configuration of the fast inputs is incorrect. **Error correction** Correct the configuration under consideration of the following constraints: - PLC programs that use the TNC marker can only use the markers M4590-4593 - The data type D (DWORD) is required to record all edges - Symbolic operands must be defined in the PLC program
320-0024	**Error message** Configuration datum %1/%2 missing **Cause of error** The given configuration datum was not found. **Error correction** Add the given configuration datum or inform your machine tool builder.
320-0025	**Error message** The PLC program has been stopped **Cause of error** Due to a change of the configuration data, the PLC was stopped and will be restarted. **Error correction** No correction necessary.
320-0026	**Error message** PLC: Division by 0/ Modulo error **Cause of error** Run-time error in the PLC program: - Division by 0 was caused. - A modulo calculation was incorrectly executed. **Error correction** Edit the PLC program. Change the PLC compiler setting DIVERROR/MODERROR.
320-0027	**Error message** PLC: Overflow when multiplying **Cause of error** Run-time error in PLC program: - Overflow during multiplication **Error correction** Edit the PLC program. Change the PLC compiler setting MULERROR.

Error number	Description
320-0028	**Error message** Invalid configuation for PLC arithmetic error operand %1 **Cause of error** The configuration for treatment of PLC arithmetic errors is illegal. **Error correction** Correct the configuration under consideration of the following constraints: - Examine the MULERROR, DIVERROR, and MODERROR entries in the configuration file for the PLC compiler (see entry under CfgPlcPath) - PLC programs that use the TNC marker interface can use only the markers M4200 to M4202 - Symbolic operands must be defined in the PLC program
320-0029	**Error message** System error in the PLC **Cause of error** A PLC server function that has not yet been implemented was called. **Error correction** Inform your service agency
320-002A	**Error message** System error in the PLC **Cause of error** The PLC server cannot find the sender of a message. **Error correction** Inform your service agency
320-002B	**Error message** System error in the PLC **Cause of error** The PLC server cannot reach the sender of a message. **Error correction** Inform your service agency
320-002C	**Error message** System error in the PLC **Cause of error** A software error has occurred in the PLC. **Error correction** Inform your service agency

Error number	Description
320-002D	**Error message** Cannot read the PLC MAIN file (%1) **Cause of error** The PLC cannot read its program file. **Error correction** Check the configuration and PLC program file.
320-002E	**Error message** Cannot read the PLC compiler file (%1) **Cause of error** The PLC cannot read a given compiler file. **Error correction** Check the PLC compiler configuration file (.cfg).Check the PLC compiler error text file (.err).
320-002F	**Error message** Operand field %1 in datum %2 too large **Cause of error** The given symbolic name refers to a field of PLC operands. The field size is too large for the given configuration data item. **Error correction** Correct the given configuration item, or contact your machine tool builder.
320-0030	**Error message** Operand field %1 in datum %2 too small **Cause of error** The given symbolic name refers to a field of PLC operands. The field size is too small for the given configuration data item. **Error correction** Correct the given configuration item, or contact your machine tool builder.
320-0031	**Error message** Invalid text source **Cause of error** A text source configured for dialog and error texts cannot be loaded. **Error correction** Configure another language or contact your machine tool builder.

Error number	Description
320-0032	**Error message** PL510 fault in cyclic operation **Cause of error** An EMC disturbance has occurred in the cyclical PL 510 mode. The periphery cannot be used. **Error correction** Inform your machine tool builder
320-0034	**Error message** Strobe was not realized **Cause of error** A strobe output was not realised after the block scan **Error correction**
320-0035	**Error message** System-management-bus initialization failed **Cause of error** No support for system management bus, or version of operating system is too old. **Error correction** Inform your service agency.
320-0036	**Error message** Error in PLC Python script **Cause of error** The given PLC Python script has an error. **Error correction** Inform your machine tool builder.
320-0037	**Error message** Error in PLC program **Cause of error** PLC run-time error: An error occurred when an API was called in the PLC program. **Error correction** Edit the PLC program.

Error number	Description
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The programmed parameter is outside the valid range **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The programmed parameter is invalid/does not exist **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The programmed address is outside the valid value range **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - Sum of address and block length outside valid value range **Error correction** - Check the PLC program and correct it - Inform your service agency

Error number	Description
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The programmed address is not a word or double word address **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The programmed value can/must not be changed **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - Programmed file is faulty **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - Wrong NC operating mode is active **Error correction** - Check the PLC program and correct it - Inform your service agency

Error number	Description
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - A position command or another job is already being executed **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - No tool changer defined **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - String cannot be converted or contains illegal characters in the string **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - No end of string detected, or string incomplete **Error correction** - Check the PLC program and correct it - Inform your service agency

Error number	Description
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - No connection over interface or to a server **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - RS-232 interface busy or not assigned **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - RS-232 transmit buffer not empty **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - RS-232 receiving buffer empty **Error correction** - Check the PLC program and correct it - Inform your service agency

Error number	Description
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - RS-232 baud rate not possible **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - Transmission error of RS-232 interface **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - No current controller found **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The PLC module was not called as a submit or spawn job **Error correction** - Check the PLC program and correct it - Inform your service agency

Error number	Description
320-0037	**Error message** Error in PLC program **Cause of error** An error occurred when a PLC module was called in the PLC program. The PLC module was called during program run without a strobe. **Error correction** - Check and correct the PLC program - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - Overflow of key queue **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - Overflow of PLC error message queue **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The PLC module was called from a submit or spawn job **Error correction** - Check the PLC program and correct it - Inform your service agency

Error number	Description
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - Too many elements in a constants field **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - Illegal elements programmed in a constants field **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - Oriented spindle stop already active **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - Module function is already active **Error correction** - Check the PLC program and correct it - Inform your service agency

Error number	Description
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The entered file name is invalid! **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The programmed field name does not exist **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - Syntax error of the query statement **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - No fitting data record available for the inquiry **Error correction** - Check the PLC program and correct it - Inform your service agency

Error number	Description
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The programmed axis has not yet been referenced **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The reset of a connected external device is faulty **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The editor is not active **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - A general error occurred during a data access **Error correction** - Check the PLC program and correct it - Inform your service agency

Error number	Description
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The control's system memory is too small **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - Error occurred during parsing **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - Fast PLC input set when drives are to be switched on **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The drives cannot be switched on **Error correction** - Check the PLC program and correct it - Inform your service agency

Error number	Description
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The inspection of the number type was interrupted during entry in the tool table **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The powerfail monitoring cannot be switched off **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The control is a system without functional safety (FS) **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - Error occurred in the evaluation of the soft-key resource file **Error correction** - Check the PLC program and correct it - Inform your service agency

Error number	Description
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The PLC module execution was canceled **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - There has been an Profibus error **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program **Error correction** - Check and correct the PLC program - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program **Error correction** - Check the PLC program and correct it - Inform your service agency

Error number	Description
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The programmed function is not supported by the PLC module **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The programmed function is supported only by a dual-processor control. **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The control hardware does not have a serial interface **Error correction** - Check the PLC program and correct it - Inform your service agency

Error number	Description
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The programmed function is not supported by a dual-processor control **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - File could not be disabled **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - Entered file not found **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The function (software option or FCL) has not not been released **Error correction** - Check the PLC program and correct it - Inform your service agency

Error number	Description
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The function not available when there is more than one configured NC channel **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - Could not start the programmed process (Python) **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - This hardware does not support the programmed analog output at X8/X9 **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The PLC module could not be run **Error correction** - Check the PLC program and correct it - Inform your service agency

Error number	Description
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The transferred symbol/designator does not exist **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - Could not create the handle **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - The transferred handle is invalid **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - Wrong data direction for transmission **Error correction** - Check the PLC program and correct it - Inform your service agency

Error number	Description
320-0037	**Error message** Error in PLC program **Cause of error** - An error occurred when an PLC module was called in the PLC program - A control with functional safety (FS) does not support the function called **Error correction** - Check the PLC program and correct it - Inform your service agency
320-0038	**Error message** Operand %1 for configuration datum %2 illegal **Cause of error** The operand defined in the given configuration datum is not allowed at this location. In most cases, configuration data can refer only to ordinary logical PLC markers (type M) or ordinary arithmetic PLC operands (types B,W,D). **Error correction** Correct the given configuration datum, and select another PLC program or inform your machine manufacturer
320-0039	**Error message** Configuration datum %1 **Cause of error** Correct the given configuration datum or inform your machine manufacturer **Error correction** Too many configuration data of the given type were defined.
320-003A	**Error message** PLC: Error in magazine rules file **Cause of error** The selected magazine rules file is missing or contains errors. **Error correction** Restore or correct the magazine rules file.

Error number	Description
320-003B	**Error message** Default setting of IOC hardware is incomplete **Cause of error** The default setting for the use of the IOC hardware and the IOC configuration file is incomplete: (see also the machine parameter iocProject under CfgPlcPeriphery) - IOC file not found - Hardware is configured in the IOC file, but the file is not available - IOC hardware is available, but the IOC file is not configured **Error correction** - Match the configuration file and hardware. - You can find more information in the diagnostics menu
320-003C	**Error message** Profibus initialization incorrect **Cause of error** An error occurred during initialization of the Profibus hardware. **Error correction** - Inform your service agency - You can find more diagnostic information in the diagnostics menu.
320-003D	**Error message** Profibus error in cyclic operation **Cause of error** An error occurred during access to the Profibus hardware. **Error correction** - Inform your service agency - You can find more diagnostic information in the diagnostics menu.
320-003E	**Error message** Faulty initialization of IOC hardware **Cause of error** Errors occurred while initializing the IOC hardware and the IOC configuration file (see the attribute iocProject under CfgPlcPeriphery). **Error correction** - Inform your service agency. - You can find more information in the diagnostics menu.

Error number	Description
320-003F	**Error message** Faulty HSCI initialization **Cause of error** An error occurred during initialization of the HSCI hardware. **Error correction** - Inform your service agency - You can find more diagnostic information in the diagnostics menu.
320-0040	**Error message** Error from PL/MB in cyclic operation **Cause of error** A PL component (PLB), a machine operating panel (MB, TE), or a PL part of a compact inverter (UEC, UMC) reported an error. **Error correction** - Inform your service agency - For more diagnostics information about the affected device and the cause, see the bus diagnosis under HSCI
320-0041	**Error message** SPLC MAIN file cannot be read (%1) **Cause of error** The PLC cannot read the program file for the SPLC program. **Error correction** Check configuration and SPLC program file.
320-0042	**Error message** Inconsistent SPLC program **Cause of error** The API version in the selectable SPLC program is not compatible with the control software or the definition of the API version in the SPLC program is faulty. **Error correction** Update the file SplcApiMarker.DEF or correct the SPLC program. The file SplcApiMarker.def must be included in the SPLC program before all other definition files.
320-0043	**Error message** Inconsistent SPLC program **Cause of error** The definition of the markers that are transferred between the PLC program and SPLC program is faulty. **Error correction** Correct the SPLC program

Error number	Description
320-0044	**Error message** SPLC program has changed **Cause of error** The SPLC program has been edited. A partial acceptance test must be conducted before the machine can be operated with this edited SPLC program. **Error correction** Intended change: Delete the error message, then restart the control and run the required partial acceptance test. Unintended change: Undo the change of the SPLC program and recompile the SPLC program.
320-0045	**Error message** SPLC program binary code has changed **Cause of error** The binary code of the SPLC program has been changed, although the source code has remained unchanged. Possible causes: - New SPLC compiler through software update - Corrupted binary file of the SPLC program on MC or CC (without software update) **Error correction** Message appears after a software update: Delete the error message, then restart the control and run the required partial acceptance test. Then take the new CRC sum into the corresponding safe machine parameters. Message appears, although no software update has been conducted: Inform your service agency
320-0047	**Error message** Configuration PLC compiler: Enter %1 **Cause of error** A value inappropriate for the control model is defined for a constant in the configuration file for the PLC compiler. The values of the constants OMG_COUNT, CHANNEL_COUNT, AXIS_COUNT and SPINDLE_COUNT must be entered correctly. **Error correction** - Check the configuration file of the PLC compiler and correct it if necessary

Error number	Description
320-0048	**Error message** PLC program source code required **Cause of error** Because of a reconfiguration, the PLC program is no longer suitable on the control. The PLC program must be regenerated from the source code. **Error correction** - Undo the configuration change (ignore the repeated error message). - Copy the source code of the PLC program to the control and compile it.
320-004C	**Error message** Error: Process %1 could not be started **Cause of error** The hardware used does not have enough main memory. **Error correction** Inform your service agency.
320-004D	**Error message** Error: Process %1 could not be started **Cause of error** The command line transferred to the process is too long. **Error correction** Ensure that the command line has fewer than 127 characters.
320-004E	**Error message** Error: Process %1 could not be started **Cause of error** The name selected for the process is ambiguous. **Error correction** Select another unique name for the process.

Error number	Description
320-004F	**Error message** Error: Process %1 could not be started **Cause of error** Possible causes: - The given path does not lead to a valid Python script. - Fatal errors occurred during initialization of the Python script. - The assigned memory was exhausted during initialization of the Python script. - Other system resources were exhausted during initialization of the Python script. **Error correction** - Check the path of the Python script and correct it if necessary. - Ensure that all required libraries are installed in the required versions. - Increase the memory reserved for the script.
320-0050	**Error message** Error: Process %1 could not be started **Cause of error** An excessively long name was entered for the Python process. **Error correction** - Edit the Python script. The name of the Python process must be shorter than 17 characters.
320-0051	**Error message** Error: Process %1 could not be started **Cause of error** Possible causes: - The path given for the Python script is too long. - No file was found in the path given for the Python script. **Error correction** - Ensure that a Python script has been saved in the given path. - Check the path information. The path must have fewer than 260 characters.

Error number	Description
320-0052	**Error message** Error: Process %1 could not be started **Cause of error** Possible causes: - You have assigned too much memory to the Python script. - You have assigned more memory to the script than is available in total for all Python processes. - You have assigned a negative value to the Python script. - You have not assigned any memory to the Python script. **Error correction** - Adapt the Python script so that it is assigned a correct memory size.
320-0053	**Error message** Error: Process %1 could not be started **Cause of error** The maximum memory available for Python processes is in use. **Error correction** - Edit the Python scripts so that fewer processes are started at the same time. - Assign less memory for the individual processes.
320-0054	**Error message** Error: Process %1 could not be started **Cause of error** Could not start the Python process because it would exceed the maximum number of simultaneous Python processes. **Error correction** - Edit the Python scripts so that fewer processes are active at the same time.
320-0055	**Error message** Error: Process %1 could not be started **Cause of error** The software option #46 (Python OEM Process) required for execution of Python processes is not enabled. **Error correction** - Order the software option from your service agency.
320-0056	**Error message** Initialization of IOC hardware with warnings **Cause of error** Warning occurred during the initialization of IOC hardware and the IOC configuration file (see the parameter iocProject under CfgPlcPeriphery). **Error correction** You can find more information in the diagnostics menu.

Error number	Description
320-0057	**Error message** ProfiNET: Initialization faulty **Cause of error** An error occurred during initialization of the ProfiNET hardware. **Error correction** - Inform your service agency. - You can find more information in the diagnostics menu.
320-0058	**Error message** ProfiNET: Error in cyclic operation **Cause of error** An error occurred during access to the ProfiNET hardware. **Error correction** - Inform your service agency. - You can find more information in the diagnostics menu.
320-0059	**Error message** IOC configuration has invalid PLC operand addresses **Cause of error** The IOC configuration contains PLC operand addresses, that exceed the permissible PLC memory area. Possible causes: - IOC configuration and PLC configuration file do not fit together - Initial servicing or new installation - Importing a backup The BUS diagnosis shows which operand range is affected. **Error correction** Confirm the error message and current interruption, and note the further error messages: - Either the areas for the affected operands must be enlarged in the configuration file for the PLC compiler, or - a restart is necessary in order to activate a new or changed configuration. - Inform your service agency
320-005A	**Error message** IOC configuration requires too much memory **Cause of error** - The IOC configuration requires for at least one bus system (e.g. HSCI) too much memory on the field bus hardware. - The BUS diagnosis has more information. **Error correction** - Check the IOC configuration. - Reduce the number of configured system components. - Create a service file. - Inform your service agency.

Error number	Description
320-005B	**Error message** HSCI warning in cyclic operation **Cause of error** An warning appeared during access to the HSCI hardware. **Error correction** - You can find more diagnostic information in the HSCI-bus diagnostics.
320-005C	**Error message** Change of %1/%2 requires a compilation of the PLC program **Cause of error** The changed configuration datum goes into the definition of symbols for the PLC program. The PLC program must be recompiled so that the change becomes effective. **Error correction** Recompile the PLC program
320-005D	**Error message** Internal inputs/outputs: Faulty initialization **Cause of error** An error occurred during initialization of the internal I/O hardware (PL/PL510/SPI). **Error correction** - Inform your service agency. - You can find more information in the diagnostics menu
320-005E	**Error message** Internal inputs/outputs: Error in cyclic operation **Cause of error** An error occurred upon access to the internal I/O hardware (SPI modules). **Error correction** - Inform your service agency. - You can find more information in the diagnostics menu.
320-005F	**Error message** Spindle not available **Cause of error** An NC function is trying to control a spindle that is not available at the moment: - At present the spindle is functioning as an NC axis - The spindle is occupied by another channel - A spindle is to be switched to the NC axis while it is occupied by the NC **Error correction** Edit the NC program or contact your machine tool builder

Error number	Description
320-0060	**Error message** IOC configuration has invalid PLC operands **Cause of error** The IOC configuration includes PLC operands that have already been assigned. The BUS diagnosis shows which operands are affected. Possible causes: - Use of operands that are occupied by an internal PL board. - Use of operands that are occupied by a handwheel. **Error correction** Correct the operand addresses in the IOC file: - If an internal PL board is active, then the operands I0-I32 and O0-O31 must not be used. - If the default data of a handwheel are active, then the operands I160-I175 and O96-O111 must not be used. - Inform your service agency.
320-0061	**Error message** Invalid IOC configuration for PLC operand Operand %1 not found **Cause of error** The operand designated in the IOC file was not defined in the PLC program. **Error correction** - Correct the PLC program or the IOC project. - Inform your service agency.
320-0062	**Error message** Invalid IOC configuration for PLC operand Operand %1 not appropriate for terminal (%2) **Cause of error** The operand designated in the IOC file is not suitable for the terminal: - The data size is incorrect. - The terminal cannot be mapped to the operand type. - Mixture of logical and arithmetical data types. **Error correction** - Correct the PLC program or the IOC project. - Inform your service agency.
320-0063	**Error message** Invalid configuration for PLC log files **Cause of error** The configuration under CfgPlcLogging is invalid. **Error correction** Inform your service agency

Error number	Description
320-0064	**Error message** Strobe %1 was canceled **Cause of error** Execution of the NC program was canceled in the output of an M, S, or T strobe to the PLC program. **Error correction** - Your system might be in an inconsistent condition. Check whether the status shown for the machine and for the active tool reflect the actual situation. - Inform your service agency.
320-041A	**Error message** PLC: excessive nesting **Cause of error** PLC runtime error: - You attempted to nest more than 32 module calls within each other. - You programmed a recursive module call that exceeds the limit of 32 levels. **Error correction** Edit PLC program.
320-041B	**Error message** PLC: stack underflow **Cause of error** PLC runtime error: You attempted to retrieve data from the stack, although it had not been written there. **Error correction** Edit PLC program.
320-041C	**Error message** PLC: stack overflow **Cause of error** PLC runtime error: You attempted to write more than 128 bytes of data to the stack. Word operands (B/W/D/K) each occupy 4 bytes, Logic operands (M/I/O/T/C) occupy 2 bytes. **Error correction** Edit PLC program.

Error number	Description
320-041D	**Error message** PLC: timeout PLC: timeout **Cause of error** PLC runtime error: - The processing of the cyclically executed program section takes too long. Check the subprogram structure for very calculation-intensive sections that you can start as SUBMIT jobs. - The displayed processing time will be increased during data transfer and in handwheel mode. In case of doubt, select handwheel mode and simultaneously start the data transfer at max. baud rate. At the same time, check "MAXIMUM PROCESSING TIME" in the PLC programming. Values should not exceed 150% (safety reserve in the event of unfavorable operating conditions!). **Error correction** Edit the PLC program.
320-041E	**Error message** PLC: CASE out of range **Cause of error** PLC runtime error: The operand for the CASE statement contains a value that cannot be interpreted as an offset in the CM table (smaller than 0, or greater than or equal to the table length). **Error correction** - Have the PLC program checked - Inform your service agency
320-041F	**Error message** PLC: subprogram not defined **Cause of error** PLC runtime error: Subprogram not defined. **Error correction** Edit the PLC program.

Error number	Description
320-0420	**Error message** PLC: index range incorrect **Cause of error** PLC runtime error: - The address for a writing access to data types B/W/D/M/I/O/T/C is, through the inclusion of the index register, in an invalid region for these operand types. - The index register contains a value, due to accessing a constant field, which is not possible for this field (less than 0, or greater than or equal to field length). - The address of a string leads through the inclusion of the index register to an invalid value. - The number of a dialog (S#Dn[X]) or an error message (S#En[X]) leads through the inclusion of the index register to an invalid value (less than 0 or greater than 999). - During the addressing of a component string. **Error correction** Edit the PLC program.
320-0421	**Error message** PLC: error table missing **Cause of error** There is no PLC error table. - A PLC error module 9085/9086 was called although no error table was compiled, or there were no entries in the table. - A PLC error module 9085/9086 was called or an error marker was set, although the error table was edited or erased after compilation. **Error correction** - Compile the PLC error table. - Check the entries in the PLC error table.
320-0422	**Error message** PLC: error in module call **Cause of error** Fatal error during PLC module call (e.g. Module 9031: error converting MP). **Error correction** Edit the PLC program.
320-0423	**Error message** PLC: Event file not found **Cause of error** In the system file plc.cfg the file defined with PLCEVENTS= was not found. **Error correction** Contact your service agency.

Error number	Description
320-0424	**Error message** PLC: Too many events **Cause of error** More than 15 events were defined for the current SPAWN process (cooperative multitasking). **Error correction** Contact your service agency.
320-0442	**Error message** PLC: error table not .PET **Cause of error** The PLC error table selected in plc.cfg is not a PET file. **Error correction** Check the format of the PLC error table.
320-0443	**Error message** PLC: error table not found **Cause of error** The PLC error table in the plc.cfg file was not found. **Error correction** Check the file name or the path name.
320-0444	**Error message** PLC: err. table format incorrect **Cause of error** PLC error table: The error table selected in the plc.cfg file does not have an up-to-date binary format (e.g. after a software exchange). **Error correction** Delete the PLC error table and download a new PLC error table through the data interface.
320-0445	**Error message** PET table: Too many lines **Cause of error** There are too many error messages defined in the PET table. **Error correction** Only a limited number of lines in a PET table can be evaluated. All subsequent lines are ignored.
320-07D0	**Error message** PLC: Checksum error **Cause of error** **Error correction**

Error number	Description
320-07D1	**Error message** PLC: M4005/M4006/M4006 incorrect **Cause of error** PLC runtime error: More than one of the markers M4005 (M03), M4006, (M04), M4007 (M05) is set. **Error correction** Edit the PLC program.
320-07D2	**Error message** PLC: more than one strobe active **Cause of error** PLC runtime error: More than one of the functions "PLC positioning," "datum shift," or "spindle orientation" has been activated. **Error correction** Edit the PLC program.
320-07D3	**Error message** PLC: undefined run-time error **Cause of error** Undefined run-time error **Error correction** Inform your service agency.
320-07D4	**Error message** Supply voltage missing at X44 **Cause of error** No supply voltage is applied at connector X44 of the control (= Relay external DC voltage missing). Possible causes: - PLC fuses defective - 24V power supply unit in the electrical cabinet defective - Faulting wiring of 24 V supply - Lines interrupted **Error correction** - Check the PLC fuses - Check the 24 V power supply unit in the electrical cabinet - Check the wiring of the 24 V supply - Check the lines for interruption
320-07D5	**Error message** Incorrect wiring of EMERGENCY STOP **Cause of error** - The wiring of the emergency stop circuit is faulty. **Error correction** - Inform your service agency - Check the wiring

Error number	Description
320-07D6	**Error message** STOP through PLC **Cause of error** The system was stopped by the PLC program **Error correction** Note any further messages. If necessary, inform your machine tool builder. The control must be shut down and restarted.
320-07D7	**Error message** M0-999 and B0-127 deleted **Cause of error** You called the function for deleting the non-volatile data. The system has been stopped. **Error correction** Restart the control
320-07D8	**Error message** Exchange buffer battery **Cause of error** The voltage of the buffer battery has dropped below the minimum permissible value. **Error correction** Refer to your machine manual or contact your machine tool builder.
320-07D9	**Error message** Temperature too high (CPU%1 := %2°C) Temperature of MC main computer too high := %1°C Temperature of the MC main computer too high: %1°C (warning) **Cause of error** Temperature sensor detects an excessively high temperature within the main computer's housing. - Insufficient heat dissipation for the MC main computer - Contaminated filter pads - Defective climate control unit in the electrical cabinet or operating panel (where MC is installed) - Defective fan - Defective temperature sensor - Unfavorable mounting of components **Error correction** - Clean the filter pads - Check the climate control unit and repair it if necessary - Replace the fan - Inform your service agency

Error number	Description
320-07DB	**Error message** MC housing fan defective **Cause of error** Rotational speed of the housing fan is too low. **Error correction** - Exchange the fan - inform your service agency
320-0BB8	**Error message** %1 **Cause of error** **Error correction**
320-0FA1	**Error message** M **Cause of error** **Error correction**
320-0FA2	**Error message** S **Cause of error** **Error correction**
320-0FA3	**Error message** T0 **Cause of error** **Error correction**
320-0FA4	**Error message** TOOL CALL **Cause of error** **Error correction**
320-0FA5	**Error message** TOOL DEF **Cause of error** **Error correction**
320-0FA6	**Error message** Strobe **Cause of error** **Error correction**

Error number	Description
320-0FA7	**Error message** Acknowledgment **Cause of error** **Error correction**
320-0FA8	**Error message** Parameter **Cause of error** **Error correction**
320-0FA9	**Error message** Rotational speed **Cause of error** **Error correction**
320-0FAA	**Error message** Mode **Cause of error** **Error correction**
320-0FAB	**Error message** Gear range **Cause of error** **Error correction**
320-0FAC	**Error message** Index **Cause of error** **Error correction**
320-0FAD	**Error message** Magazine **Cause of error** **Error correction**
320-0FAE	**Error message** Pocket **Cause of error** **Error correction**

Error number	Description
320-0FAF	**Error message** Channel **Cause of error** **Error correction**
320-0FB0	**Error message** Status **Cause of error** **Error correction**
320-0FB1	**Error message** Manual **Cause of error** **Error correction**
320-0FB2	**Error message** Incremental **Cause of error** **Error correction**
320-0FB3	**Error message** Referencing **Cause of error** **Error correction**
320-0FB4	**Error message** Probing **Cause of error** **Error correction**
320-0FB5	**Error message** Negative direction **Cause of error** **Error correction**
320-0FB6	**Error message** Position **Cause of error** **Error correction**

Error number	Description
320-0FB7	**Error message** Feed rate **Cause of error** **Error correction**
320-0FB8	**Error message** W/o limit switches **Cause of error** **Error correction**
320-0FB9	**Error message** Without NC stop **Cause of error** **Error correction**
320-0FBB	**Error message** Supply voltage missing for HSCI device **Cause of error** It was detected that the +24 V supply voltage was missing on an HSCI bus device. The -PF.BOARD is pending in the S status. **Error correction** - Open the bus diagnosis and check the status messages of the devices connected to the HSCI bus system. - Provide all devices connected to the HSCI bus system with the correct +24 V NC and +24 V PLC voltage. - Restart the control.
320-0FBC	**Error message** The TNC will be shut down and machine functions will be performed **Cause of error** The PLC program is delaying shutdown of the control **Error correction** Run the machine functions requested by the PLC program.
320-0FBF	**Error message** More than one error class was defined for a PET error **Cause of error** - More than one error class was defined for an error in an error table (.PET). **Error correction** - Define only one error class for the relevant error. - You will find more informationen (table name, error number) in the error list through the "Internal info" soft key. - Inform your service agency.

Error number	Description
320-0FC0	**Error message** Fast PLC input has incorrect parameters **Cause of error** A fast PLC input is not in the IOC file, or the parameters are incorrect. **Error correction** - Check the IO configuration. - Inform your service agency
320-0FC2	**Error message** JHIOSim installation incomplete **Cause of error** Windows: JHIOSim DLL not available Virtual Box: Installation incomplete Virtual Box: Common folder /mnt/sf/IOsim does not exist **Error correction** Check the installation of virtual box and Windows
320-0FC3	**Error message** Start of an NC program not permitted at this time **Cause of error** Starting the NC program is not permitted at this time, since axes are currently executing positioning tasks. **Error correction** Try to start the NC program at a later time
320-0FC4	**Error message** System overload – message buffer is full **Cause of error** Very many small jobs were sent in a short time to the PLC run-time system. As a result, the associated messages could no longer be delivered in the system. These jobs result from calling PLC modules or calling the Python function library for OEM applications. The capacity for buffering the messages in the system has been exhausted; the PLC program has been stopped. **Error correction** Change the PLC program or the OEM application Distribute the calls from PLC modules or functions of the JH function library in Python OEM applications more evenly over time.

Error number	Description
320-0FC7	**Error message** Temperature of the MC main computer too low: %1°C (warning) Temperature of the MC main computer too low: %1°C **Cause of error** Temperature sensor detects an excessively low temperature within the main computer's housing. - Defective climate control unit in the electrical cabinet or operating panel (where MC is installed) - Defective temperature sensor - Unfavorable mounting of components **Error correction** - Check the temperature conditions in the electrical cabinet - Check the climate control unit, and repair it if necessary - Inform your service agency
322-0002	**Error message** Incorrect tool location at start of block scan (%1) **Cause of error** Mid-program startup started with incorrect tool. **Error correction** Change to the correct tool and start again.
322-0003	**Error message** Configuration datum %1 - %2 contains errors **Cause of error** The file entered in the configuration data for the description of a tool-change sequence contains errors, and was not loaded onto the control for operation. **Error correction** Inform your machine tool builder.
322-0004	**Error message** Tool call unclear **Cause of error** Two tools are to be inserted or exchanged at the same time. **Error correction** Correct the NC program.
322-0005	**Error message** File not found **Cause of error** The file entered in the configuration data for describing a tool-change sequence does not exist. **Error correction** Inform your machine tool builder.

Error number	Description
322-0006	**Error message** Pocket table faulty **Cause of error** No primary key (TOOL_P.P, magazine number and pocket number) is defined for the pocket table TOOL_P. **Error correction** Inform your machine tool builder.
322-0007	**Error message** Pocket table faulty **Cause of error** The wrong column (not TOOL_P.P, magazine number and pocket number) was defined as primary key for the pocket table TOOL_P. **Error correction** Inform your machine tool builder.
322-0008	**Error message** Pocket table faulty **Cause of error** An invalid value was read in column P of the pocket table. **Error correction** Inform your machine tool builder.
322-0009	**Error message** Pocket table faulty **Cause of error** An invalid value was read in column ST of the pocket table. **Error correction** Inform your machine tool builder.
322-000A	**Error message** Pocket table faulty **Cause of error** An invalid value was read in column F of the pocket table. **Error correction** Inform your machine tool builder.
322-000B	**Error message** Pocket table faulty **Cause of error** An invalid value was read in column PTYP of the pocket table. **Error correction** Inform your machine tool builder.

Error number	Description
322-000C	**Error message** Pocket table faulty **Cause of error** A tool was found more than once in the pocket table. **Error correction** Correct the pocket table. Delete the tool from the pockets that it is not in, or mark these pockets as reserved.
322-000D	**Error message** Pocket table might be inconsistent **Cause of error** The internal data of the control on the loaded tool do not correspond with the content of the pocket table. This can happen after the pocket table is edited or overwritten, or after a tool change was canceled. The contents of the pocket table might no longer correspond to the tool configuration in the tool memory. **Error correction** Check the contents of the pocket table and correct them if required.
322-000E	**Error message** Pocket table faulty **Cause of error** A required column (P, Tor RSV) is not defined for the pocket table TOOL_P. **Error correction** Inform your machine tool builder.
322-000F	**Error message** File not found **Cause of error** The file with the pocket table was not found in the path configured. **Error correction** Restore the file to the original path, or create a new file with the original path, or contact your machine tool builder.
322-0011	**Error message** Access to pocket table denied **Cause of error** The tool call cannot proceed because write-access to the pocket table was denied. The PLC program or editing of the pocket table can be the cause of such a lock. **Error correction** Conclude editing of the pocket table, or contact your machine tool builder.

Error number	Description
322-0012	**Error message** Pocket table faulty **Cause of error** The configuration data for a column in the pocket table are missing or faulty. **Error correction** Inform your machine tool builder
322-0013	**Error message** File access not possible **Cause of error** The file with the pocket table is missing, or access to this file was denied. **Error correction** Restore the file, or check the access rights to the file. Rescind any active write-protection.
322-0014	**Error message** Pocket table faulty **Cause of error** The file with the pocket table is incomplete, or contains lines of differing lengths, syntactical errors or unknown columns. **Error correction** Correct the file, or restore the file, or contact your machine tool builder.
322-0015	**Error message** Pocket table faulty **Cause of error** An invalid value was read in column T of the pocket table. **Error correction** Correct the file, or restore the file, or contact your machine tool builder.
322-0016	**Error message** System error in the PLC **Cause of error** Internal software error **Error correction** Inform your service agency

Error number	Description
322-0017	**Error message** Access to pocket table denied **Cause of error** Access to the pocket table is locked by another application. The control could therefore no longer update the pocket table after tool change. The contents of the pocket table might no longer correspond to the tool configuration in the tool memory. **Error correction** Check the contents of the pocket table and correct them if required. Conclude editing of the pocket table, or contact your machine tool builder.
322-0018	**Error message** System error in the PLC **Cause of error** Internal software error **Error correction** Inform your service agency
322-0019	**Error message** Pocket table faulty **Cause of error** An invalid value was read in column RSV of the pocket table. **Error correction** Correct the file, or restore the file, or contact your machine tool builder.
322-001A	**Error message** Tool change without configured spindle required **Cause of error** No spindle was configured for channel %1 or (only channel 0). It was not possible to implicitly assign a spindle. **Error correction** Edit the NC program or contact your machine tool builder

Error number	Description
322-001B	**Error message** PLC datum %1 cannot be changed **Cause of error** An attempt was made to change the PLC datum with the given designation. The datum does not exist, or cannot be changed, or the new value is not permissible. **Error correction** Check whether the datum with the given designation exists and is free for changes. Check whether the new value is permissible for this datum. Edit your NC program so that a correct designation and a permissible value are used.
322-001C	**Error message** System error in the PLC System error in the PLC **Cause of error** Internal software error **Error correction** Inform your service agency
322-001D	**Error message** Pocket table faulty **Cause of error** An invalid value was read in column L of the pocket table. **Error correction** Inform your machine tool builder
322-001E	**Error message** Pocket in tool magazine is locked **Cause of error** The tool call cannot be executed because the pocket in the tool magazine is locked. Such a lock can be caused by editing the pocket table or by the PLC program. **Error correction** Correct the pocket datum or inform your machine manufacturer.
330-0002	**Error message** Safe Torque Off (-STO.B.x) is active **Cause of error** - Error in program run - Safety function Safe Torque Off (STO) is active **Error correction** - Inform your service agency.

Error number	Description
330-0004	**Error message** Switch off external dc voltage **Cause of error** The machine control voltage is still switched on. **Error correction** Switch off the machine control voltage.
330-0005	**Error message** Normally closed relay open? **Cause of error** In the relay chain the normally closed contact of one or more relays is open. **Error correction** - Check the relay for proper function. - If necessary, contact your service agency.
330-0006	**Error message** Switch on external dc voltage **Cause of error** The machine control voltage is switched off. **Error correction** Switch off the machine control voltage.
330-0008	**Error message** Inverter not ready **Cause of error** - Power-on of the drive not possible, because an inverter is not ready (RDY signal). - On interface PCBs for Siemens inverters, the second axis is not enabled - No switch signals to the inverter contacts or relays - Compact inverter, inverter supply unit or power module is defective - Interruption at inverter bus cable (supply bus, unit bus, PWM bus) - Defective PWM interface on the control **Error correction** - Remove interruption in the electrical cabinet - Replace the defective compact inverter, supply unit or power module - Replace the defective cable - Inform your service agency

Error number	Description
330-0012	**Error message** MC machine key depressed **Cause of error** Contact of a machine key does not open. **Error correction** Release the key if pressed, otherwise inform your service agency.
330-0013	**Error message** Relay: n.c. contact closed? **Cause of error** In the relay chain, the normally closed contact of all relays is closed. **Error correction** Check the relays for proper function. If required, inform your service agency.
330-0014	**Error message** CC%2 inverter for spindle RDY=0 **Cause of error** The power module of the spindle could not be switched to ready condition. - Safety relay not on (e.g. connector X71 of the UE/UV/UVR, X73 of the HEIDENHAIN expansion board for Simodrive) - Defective power module - PWM bus cable interrupted **Error correction** Check the wiring and inform your service agency.
330-0015	**Error message** CC%2 inverter for axis RDY=0 **Cause of error** The power module of an axis could not be switched to ready condition. - Safety relay not on (e.g. connector X72 of the UV, X73 of the HEIDENHAIN expansion board for Simodrive) - Defective power module - PWM bus cable interrupted **Error correction** Check the wiring and inform your service agency.
330-0016	**Error message** CC%2 inverter for spindle RDY=1 **Cause of error** The spindle power supply is ready for operation although it ought to be switched off. **Error correction** Inform your service agency.

Error number	Description
330-0017	**Error message** CC%2 inverter for axis RDY=1 **Cause of error** The power module of an axis is ready for operation although it should actually be switched off. **Error correction** Inform your service agency.
330-001A	**Error message** Input (ES.B) not equal to 0 **Cause of error** 24 V at input ES.B. During the dynamic test, the voltage is expected to be 0 V. **Error correction** Inform your service agency.
330-001B	**Error message** Test of cutout channels inactive **Cause of error** The MC (Main Computer Unit) failed to test the cutoff channels. **Error correction** Inform your service agency.
330-0020	**Error message** Command buffer overflow **Cause of error** The CC could not run so many commands from the MC. **Error correction** Inform your service agency.
330-0021	**Error message** Commands do not agree **Cause of error** The command confirmed from the CC as an echo is not the command sent from the MC. **Error correction** Inform your service agency.
330-0022	**Error message** CC%2 command not acknowledged **Cause of error** Command was not acknowledged by the Computer Control Unit (CC) within 200 ms. **Error correction** Inform your service agency.

Error number	Description
330-0023	**Error message** FS function not performed **Cause of error** One or more FS functions within a cycle were not performed. **Error correction** Inform your service agency.
330-0024	**Error message** MC handwheel permissive key pressed **Cause of error** The permissive button of the handwheel was pressed. An incorrect handwheel was selected by CfgHandwheel–>type. **Error correction** - Check the permissive button - Set the configuration datum properly; - Inform your service agency.
330-0025	**Error message** Faulty data from CC%2 **Cause of error** Faulty software **Error correction** Inform your service agency.
330-0027	**Error message** MC pos. deviation too large %2 **Cause of error** The calculated position deviation between the speed encoder and the position encoder is greater than the value from the parameter CfgAxisSafety->positionDiffRef or CfgAxisSafety->positionDiffRun. - Excessive difference between the positions calculated from the position encoder pulses and the speed encoder pulses - During initial operation: Incorrect standardization of speed encoder pulses (e.g. incorrect screw pitch entered) - Excessive backlash - Defective coupling, gear, etc. - Belt torn **Error correction** - Switch the control off and on again - Check CfgAxisSafety->positionDiffRef, CfgAxisSafety->positionDiffRun - During initial operation: Check the standardization of speed encoder pulses (enter the correct screw pitch) - Check the backlash - Repair the defective coupling, gear, etc. - Replace the belt - Inform your service agency

Error number	Description
330-0028	**Error message** No pos. values from the CC%2 **Cause of error** For a certain time the CC has not sent any position values to the MC. **Error correction** - Switch the control off and back on again - Inform your service agency
330-0029	**Error message** CC%2 no pos. values from the MC **Cause of error** - The MC must not send any position values to the CC. - Internal software error **Error correction** - Switch the control off and on again - Inform your service agency
330-002A	**Error message** MC/CC%2 checked axes unequal **Cause of error** - Contradictory status of checked position values in the MC and CC. - Internal software error **Error correction** - Switch the control off and on again - Inform your service agency
330-002B	**Error message** CC%2 wrong include-file version **Cause of error** - The version number of one of the called Include files are different in the MC and CC - Internal software error **Error correction** - Check the software version - Inform your service agency
330-002D	**Error message** Switch on spindle **Cause of error** The spindle start key was pressed but not the permissive key while the protective door A/S was open. **Error correction** Press the spindle start key and the permissive key

Error number	Description
330-002E	**Error message** SMP or checksum erroneous **Cause of error** - Safety-related machine parameter (SMP) was changed. - Checksum over safety-related machine parameter was changed. **Error correction** - Check the safety-related machine parameter and the checksum. - Change must be conducted only by the machine manufacturer using a manufacturer's password. - If there are changes, it may be necessary to conduct acceptance tests on the machine. - Inform your service agency
330-002F	**Error message** SMP or checksum calculation erroneous **Cause of error** - Safety-related machine parameter (SMP) was changed. - Checksum over safety-related machine parameter was changed. - Machine parameter file could not be opened or does not exist. **Error correction** - Check the safety-related machine parameter and the checksum. - Change must be conducted only by the machine manufacturer using a manufacturer's password. - If there are changes, it may be necessary to conduct acceptance tests on the machine. - Inform your service agency
330-0030	**Error message** Safe axes must have sinusoidal inputs **Cause of error** - Safety orientation (SG) error **Error correction**
330-0031	**Error message** Axis status cannot be determined **Cause of error** - Safety orientation (SG) error **Error correction**

Error number	Description
330-0033	**Error message** Not in the REF operating mode **Cause of error** - The axes can be tested only in the Reference Run REF operating mode. **Error correction** - Press CE to acknowledge the error message and switch to the REF mode. - Then home the axes. - Inform your service agency
330-0034	**Error message** Invalid axis **Cause of error** - The axis to be tested is not a safe axis. - The axis to be tested is a spindle. - The given axis number is invalid. **Error correction** - Check the configuration of the axis and, if necessary, correct it (spindles cannot be referenced). - Inform your service agency.
330-0035	**Error message** Axis has already been checked **Cause of error** - Axis to be tested has already been checked. - The given axis number is invalid. **Error correction** - Internal software error. - Inform your service agency
330-0036	**Error message** Axis is not referenced **Cause of error** - The axis to be tested has not yet been homed. **Error correction** - Internal software error. - Inform your service agency
330-0037	**Error message** Axis in motion **Cause of error** - The axis to be tested is not yet stationary. **Error correction** - Press CE to acknowledge the error message and bring the axis to a standstill. - Then test the axis. - Inform your service agency

Error number	Description
330-0038	**Error message** Axis not at test position **Cause of error** - The axis to be tested is not located at the test position (safe machine parameter positionMatch in CfgAxisSafety). - The axis to be tested is not located at the test position (safe machine parameter positionDiffRef in CfgAxisSafety). - Axis traverse direction is not correctly configured (machine parameter MP_signCorrActualVal, MP_signCorrNominalVal or entry in the DIR column of the motor table). **Error correction** - Press CE to acknowledge the error message and move the axis to the test position. - Then test the axis. - If the message appears although the axis is at the correct test position, check the configuration of the axis traverse direction and correct it if necessary. - Inform your service agency
330-0039	**Error message** Missing permission **Cause of error** - When testing the axis (message: "Confirm with permissive key") control receives no permission through a permissive key. - Permissive key(s) defective. - Test of the axes cannot be concluded without permission. **Error correction** - Check the hardware of the permissive keys. - Inform your service agency
330-003A	**Error message** No authorization for testing **Cause of error** - The axis(or axes) cannot be tested in the safety-related operating mode SOM_1. **Error correction** - Select another safety-related operating mode (e.g. SOM_2, SOM_3). - To acknowledge any pending error message, use the CE key. - Then test the axis. - Inform your service agency if the error message recurs.

Error number	Description
330-003C	**Error message** MC S input signals %2 not equal **Cause of error** Safety-oriented input of SPLC-MC is not equal to input of SPLC-CC. e.g. FB_NCC.x, KSW.x, ES.x **Error correction** Inform your service agency.
330-003E	**Error message** MC limit switch %2 + **Cause of error** - Violation of the absolute positive limit position value (in the positive traverse direction) of the safety function SLP. - The calculated path of the tool exceeds the defined traversing range (software limit switch) of the machine. - The software limit switch (absolute position limit value) was reached in a manual operating mode. **Error correction** - Check the programmed coordinates. If required, edit the program. - Check the reference point. If required, set a new reference point. - Move the tool in the opposite direction. - Inform your service agency.
330-0040	**Error message** MC limit switch %2 - **Cause of error** - Violation of the absolute negative limit position value (in the negative traverse direction) of the safety function SLP. - The calculated path of the tool exceeds the defined traversing range (software limit switch) of the machine. - The software limit switch (absolute position limit value) was reached in a manual operating mode. **Error correction** - Check the programmed coordinates. If required, edit the program. - Check the reference point. If required, set a new reference point. - Move the tool in the opposite direction. - Inform your service agency.

Error number	Description
330-0042	**Error message** MC standstill monitoring %2 **Cause of error** - The position error in an active safe operating stop (SOS) is greater than the value specified in the configuration parameter CfgAxisSafety->positionRangeVmin. - If during an emergency stop the axes and spindle are decelerated, and the axes come to a stop earlier than the spindle, then the axes are standstill-monitored for the value from CfgAxisSafety->positionRangeVmin until the spindle comes to a stop. - If the protective door is closed in the automatic mode (SOM 1), axes whose drives are switched off (e g. clamped axes) are standstill-monitored for the value from CfgAxisSafety->positionRangeVmin. - After the permissive button is released, the tool magazine axis continues to move for more than 3 seconds. - During the braking test, the axis exceeds the maximum permissible path in CfgAxisSafety->positionRangeVmin. It must be assumed that a holding brake for the axis is defective! - After triggering of an SS2 stop reaction and expiration of the SS2 stopping time, a position error greater than the value in the configuration parameter CfgAxisSafety->positionRangeVmin was detected. **Error correction** - If the error occurs during the brake test, the axis remains in the servo loop. The axis has to be moved to a safe position before you switch the machine off. It must be assumed that a holding brake is defective. - Inform your service agency.
330-0044	**Error message** MC feed rate greater SLS %2 **Cause of error** The feed rate exceeds the permissible limit value for the active safety-related operating mode (SOM). **Error correction** Inform your service agency.
330-0045	**Error message** CC feed rate greater SLS %2 **Cause of error** The feed rate exceeds the permissible limit value for the active safety-related operating mode (SOM). **Error correction** Inform your service agency.

Error number	Description
330-0046	**Error message** MC S input %2 not equal 0 CC%1 S input %2 not equal 0 **Cause of error** The safety-oriented inputs for detachable-key switches, door contacts and emergency stop were not set to 0 during the cyclic test. **Error correction** Inform your service agency!
330-0048	**Error message** MC NC temperature out of tol. CC%2 NC temperature out of tol. **Cause of error** The temperature inside the control is outside the permissible tolerance range. - Clogged filter pads in the electrical cabinet - Defective climate control unit in the electrical cabinet - Defective fan in the control housing - Defective control **Error correction** - Clean the filter pads - Repair the air conditioner - Exchange the fan in the control housing / if necessary, exchange the complete control Improve the ventilation in the electrical cabinet.
330-004A	**Error message** MC +5V out of tolerance **Cause of error** - The internal +5-V power supply of the MC is outside the permissible tolerance range. **Error correction** - Exchange defective hardware (MC) - Inform your service agency
330-004B	**Error message** CC%2 +5V out of tolerance **Cause of error** The 5V power supply of the control is outside the permissible tolerance range. **Error correction** Inform your service agency

Error number	Description
330-004C	**Error message** Op. state of MC not equal CC **Cause of error** The automatic SLS, SOS, STO operating states of the MC and CC are compared cyclically. If the values remain unequal for longer than 500 ms, a Safe Stop 1 (SS1) is released. **Error correction** - Press CE to acknowledge the error message - Switch the machine off and on - Inform your service agency. - Check the software version
330-004D	**Error message** CC%2 operating state not equal MC **Cause of error** - The automatic SLS, SOS, STO operating states of the MC and CC are compared cyclically. If the values remain unequal for longer than 500 ms, a Safe Stop 1 (SS1) is released. **Error correction** - Press CE to acknowledge the error message - Switch the machine off and on - Inform your service agency. - Check the software version
330-004E	**Error message** MC amplitude too high %2 **Cause of error** The amplitude of the encoder signal is too high or the signal for contamination is active. - Incorrect adjustment between head and encoder, air gap too small (exposed encoders) - Excessive supply voltage **Error correction** - Check the amplitude of the encoder signal - Inform your service agency

Error number	Description
330-0050	**Error message** MC amplitude too low %2 CC amplitude too low %2 Disturbance of handwheel for %2 (handwheel on encoder connection) **Cause of error** The amplitude of the encoder signal is too small or the signal for contamination is active. - Encoder contaminated - Encoder defective - Penetration of humidity - Scanning head misaligned (distance, parallelism, etc.) - Encoder cabling defective - Encoder input defective on the control - Vibration - Interfering signals **Error correction** - Inform your service agency
330-0052	**Error message** MC frequency too high %2 **Cause of error** The maximum input frequency was exceeded at an encoder input. - Fault on signal of the speed encoder - Vibrations on the machine **Error correction** - Check the speed encoder connection (ground connection) - Check the speed encoder - Check the encoder signal input frequency. - Eliminate the vibrations - Inform your service agency
330-0054	**Error message** MC speed greater than SLS %2 **Cause of error** The rotational speed exceeds the permissible limit value for the active safety-related operating mode (SOM_2, SOM_3, SOM_4 or SLI_S). **Error correction** Inform your service agency.
330-0055	**Error message** CC speed greater than SLS %2 **Cause of error** The feed rate exceeds the permissible limit value for the active safety-related operating mode (SOM). **Error correction** Inform your service agency.

Error number	Description
330-0056	**Error message** MC: Machine permissive button depressed **Cause of error** The permissive button of the tool changer was pressed. **Error correction** - Check the permissive buttons. - Contact your service agency.
330-0057	**Error message** CC%2 SH1=0 MC -SMC.A.WD=0 **Cause of error** Internal software error **Error correction** Inform your service agency
330-0058	**Error message** CC%2 SH1=1 **Cause of error** - Hardware error - Internal software error **Error correction** Inform your service agency
330-0059	**Error message** No hardware for functional safety **Cause of error** Hardware components not compatible with safety software. **Error correction** Inform your service agency.
330-005A	**Error message** MC no memory available **Cause of error** Internal software error **Error correction** Inform your service agency

Error number	Description
330-005B	**Error message** MC safety doors are open **Cause of error** Guard doors are open The guard doors have to be closed in order to conduct the safety self-test or the brake test of an axis. Further possible causes: - Faulty wiring of guard doors - Guard door contact is defective - SPLC interface signal PP_AxGrpStateReq unequal to S_S-TATE_AUTO [10] **Error correction** - Close the guard doors in order to conduct the safety self-test or the brake test Further possible measures: - Check the wiring of the guard door contacts - Check the guard door contact. - Check the SPLC program. - Inform your service agency
330-005C	**Error message** Axis %2 started w/o test by MC **Cause of error** The axis was not yet tested. **Error correction** Test the axis.
330-005E	**Error message** Internal software error Internal software error **Cause of error** Internal software error **Error correction** Inform your service agency.
330-005F	**Error message** FS hardware used without FS software! **Cause of error** The safety hardware cannot be installed without safety software! **Error correction** Inform your service agency.

Error number	Description
330-0060	**Error message** FS error in configuration **Cause of error** - The machine parameter or config object is erroneous, incomplete, or the like (datum was read as additional info). - Axis group from config object CfgAxisSafety is not configured. - Safe spindle not in the axis group for spindles - Maximum velocity for SOM 2 is missing or incorrect - Safe feed axis not in the axis group for spindles - The encoder input (position or motor) was configured incorrectly or not at all - PWM output was configured incorrectly - Safe axis not controlled through CC (analog, simulation, PLC spindle, etc.) - Safe axis configured for “referencing on the fly"; check machine parameter MP_refType (400401) - Differing line counts for motor encoder in various parameter sets of one axis - Several axis groups assigned with identical ID - Invalid index number assigned for axis group (negative, too large) **Error correction** - Correct the machine configuration - Inform your service agency
330-0064	**Error message** MC brake test not completed **Cause of error** The brake test was started, but no end was received within 10 seconds from the CC. **Error correction** - Internal software error - Inform your service agency
330-0065	**Error message** MC command %1 not acknowledged **Cause of error** Command was not acknowledged by the Main Computing Unit (MC) within 400 ms. **Error correction** Inform your service agency.
330-0066	**Error message** MC PWM output is not present **Cause of error** Internal software error **Error correction** Inform your service agency

Error number	Description
330-0067	**Error message** CC%2 timeout version comparison **Cause of error** The CC does not send a version number (safe stop 0) within 2 s. **Error correction** Inform your service agency.
330-0068	**Error message** MC wrong quantity FS-CC **Cause of error** Internal software error **Error correction** - Inform your service agency - Exchange the software
330-0069	**Error message** MC S checksum error CC%2 FS checksum error **Cause of error** - Checksum error due to faulty data - Internal software error **Error correction** Inform your service agency.
330-006A	**Error message** CC%2 timeout SMP check sum **Cause of error** The CC does not find an SMP checksum (safe stop 0) within 2 s. - Internal software error **Error correction** Inform your service agency.
330-006B	**Error message** MC SOM 2 only one axis allowed **Cause of error** Two or more axes are to be moved simultaneously in the SOM 2 operating mode. **Error correction** Only one axis may be moved at a time in SOM 2.

Error number	Description
330-006C	**Error message** +24 V MC short on brake line **Cause of error** There is a short circuit with 24 V on the brake line A of the MC. **Error correction** - Check brake channel A - Inform your service agency
330-006D	**Error message** MC 0 V short on brake line %2 **Cause of error** There is a short circuit with 0 V on the brake line A of the MC. **Error correction** - Check brake channel A - Inform your service agency
330-006E	**Error message** MC SOM 4 Press the permissive key **Cause of error** In the SOM 4 mode of operation, the permissive key was not pressed within the time defined in MP529. **Error correction** Press the permissive key.
330-006F	**Error message** MC SOM 4 not released **Cause of error** The operating mode BA4 is addressed through the keylock switch and is still not enabled over the configuration datum "permitSom4". **Error correction** - Inform your service agency - Enable the operating mode through the configuration datum "permitSom4"
330-0070	**Error message** MC SOM 4 not possible **Cause of error** 1. Key switch is not on SOM 1. **Error correction** 1. Turn the key switch to SOM 1.

Error number	Description
330-0071	**Error message** MC operating mode not possible **Cause of error** Wiring error at the SG inputs BA2.x, BA3.x and BA4.x. **Error correction** - Inform your service agency. - Check the wiring.
330-0073	**Error message** CC%2 current measurement timeout **Cause of error** Current measurement of the controller unit in the cut-out test could not be performed because the standby signal RDY of a power stage (inverter) is missing. **Error correction** - Check the switch setting of "AXIS/SPINDLE (X110)" on the inverter. - Inform your service agency
330-0074	**Error message** MC: Incorrect safe axis group **Cause of error** - The axis-group definition is not allowed in the safe machine parameter axisGroup in CfgAxisSafety. **Error correction** - Correct the machine parameter axisGroup in CfgAxisSafety. - Changes in this safe machine parameter may be performed solely by the machine tool builder. - Inform your service agency.
330-0075	**Error message** MC braking test not activated **Cause of error** - Move the axis to a safe position before power-off - Brake test was not commanded by the MC **Error correction** - Software error - Inform your service agency

Error number	Description
330-0076	**Error message** CC: Guard doors are open **Cause of error** - One or more guide doors are open The guard doors have to be closed in order to conduct the safety self-test or the brake test of an axis. Further possible causes: - Faulty wiring of guard doors - Guard door contact is defective **Error correction** - Close the guard doors in order to conduct the safety self-test or the brake test Further possible measures: - Check the wiring of the guard door contacts - Check the guard door contact - Check the SPLC program - Inform your service agency
330-0077	**Error message** Checksum error A **Cause of error** The CRC sum of the EPROMs IC-P1 and IC-P2 is incorrect. **Error correction** - Switch the control off and on again (reboot) - Inform your service agency.
330-0078	**Error message** MC movement monitoring %2 **Cause of error** - Defective hardware - Spindle cannot be controlled **Error correction** - Adjust the spindle - Exchange the hardware - Inform your service agency
330-0079	**Error message** MC error in braking process %2 **Cause of error** The axes cannot be servo-controlled. dv/dt monitoring has responded. **Error correction** - Check machine parameter CfgAxParSafety/timeTolerанceDvDt - Adjust the axes - Exchange the hardware - Inform your service agency

Error number	Description
330-007A	**Error message** CC: Machine key depressed **Cause of error** One or more machine keys of an operating station are active on the CC side. Machine keys are keys, e.g. on the machine operating panel or the handwheel, that can release a movement of the machine (permissive keys, axis-direction keys, chip conveyors, etc.) **Error correction** - Release the key(s) or check the wiring - Inform your service agency
330-007B	**Error message** MC: Mach. permiss. button depressed **Cause of error** Machine-key permissive key is depressed on the MC side. **Error correction** - Release the key or check the wiring - Inform your service agency
330-007C	**Error message** CC panel permissive button pressed **Cause of error** Machine-key permissive key is depressed on the CC side. **Error correction** - Release the key or check the wiring - Inform your service agency
330-007D	**Error message** CC: Machine permissive button pressed **Cause of error** Tool changer permissive key is active on CC side. **Error correction** - Release the key or check the wiring - Inform your service agency
330-007E	**Error message** MC inverter RDY=0 %2 **Cause of error** Although SH1B.x=1, RDY.x=0 **Error correction** - Hardware error - Inform your service agency

Error number	Description
330-007F	**Error message** MC inverter RDY=1 %2 **Cause of error** Although SH1B.x=0, RDY.x=1 **Error correction** - Hardware error - Inform your service agency
330-0080	**Error message** MC 1st violation of limit switch %2+ **Cause of error** The safety limit switch was tripped for the first time. **Error correction** - Press "machine on" to cancel the error message and move to the limit switch range.
330-0081	**Error message** MC 1st violation of limit switch %2- **Cause of error** The safety limit switch was tripped for the first time. **Error correction** - Press "machine on" to cancel the error message and move to the limit switch range.
330-0082	**Error message** MC nominal-to-actual position error too large %2 **Cause of error** The following error of a moving axis is greater than the value specified in the safe machine parameter positionDiffNom. **Error correction** - Reduce the contouring feed rate, increase the rotational speed. - Remove any possible sources of vibration. - Inform your service agency if the error occurs frequently.
330-0083	**Error message** MC S software error %1 **Cause of error** - Software error **Error correction** - Inform your service agency

Error number	Description
330-0084	**Error message** MC start test of the cut-out channels not possible **Cause of error** The start test of the cutout channels was commanded through the PLC, although the machine-on input is inactive. **Error correction** - Error in PLC program - Inform your service agency
330-0085	**Error message** CC: Handwheel permissive button depressed **Cause of error** The permissive button of the handwheel on the CC side was pressed. An incorrect handwheel was selected by CfgHandwheel->type. **Error correction** - Check the permissive button - Set the configuration datum properly - Inform your service agency
330-0086	**Error message** Emergency stop from SPLC **Cause of error** - Stop reaction for emergency stop (SS1) released by the SPLC program **Error correction** - Inform your service agency
330-0087	**Error message** Fatal error from SPLC **Cause of error** - Stop reaction for fatal error (SS1) released by the SPLC program **Error correction** - Inform your service agency
330-0088	**Error message** MC: Permissive button depressed **Cause of error** Permissive button of machine operating panel or handwheel is depressed. **Error correction** - Release permissive button - Check inputs

Error number	Description
330-0089	**Error message** CC permissive button pressed **Cause of error** Permissive button of machine operating panel or handwheel is depressed. **Error correction** - Release permissive button - Check inputs
330-008A	**Error message** CC%2 inverter for axis RDY=0 (safety relay) **Cause of error** RDY of the inverter remains 0, although 1 is expected after a beginning a test. Possible causes: - Safety relay for axes (K1) has a short circuit to 0 V - Wiring of the enabling relays (X72) or the axis release module is faulty - Wiring of the STO.A.G or MC.RDY signal is faulty - Inverter is not configured for axes **Error correction** - Check the hardware - Check the wiring - Inform your service agency
330-008B	**Error message** CC%2 inverter for axes RDY=1 (safety relay) **Cause of error** RDY of the inverter remains 1, although 0 is expected after a beginning a test. Possible causes: - Safety relay for axes (K1) has a short circuit to +24 V. - Wiring of the enabling relays (X72) or the axis release module is faulty - Wiring of the STO.A.G or MC.RDY signal is faulty - Inverter is not configured for axes **Error correction** - Check the hardware - Check the wiring - Inform your service agency
330-008C	**Error message** MC timeout during braking (SS1) %2 **Cause of error** - The maximum permissible time for braking at the current limit (SS1 reaction) was exceeded. **Error correction** - Check the parameter values: timeLimitStop1: Default time for stopping the axes/spindle at the emergency braking ramp for SS1 reaction - Inform your service agency.

Error number	Description
330-008D	**Error message** MC traverse range exceeded at SS2 %2 **Cause of error** When braking at a contour (SS2), a spindle or axis exceeded the maximum permissible path. The maximum permissible path for axes is the entry in the safety-related machine parameter distLimitStop2. A maximum of 2 revolutions are permissible for spindles during an SS2 reaction in SOM_2, and 5 revolutions are permissible in SOM_3, SOM_4. **Error correction** - Check the machine parameters for the braking process during an SS2 reaction. - Check the entry in distLimitStop2 - Inform your service agency.
330-008E	**Error message** MC change from SOM_2/SOM_3 to SOM_4 not possible MC change from SOM_4 to SOM_2/SOM_3 not possible **Cause of error** - Safety-related mode of operation SOM_1 not selected - E.g. keylock switch 1 not in SOM_1 position **Error correction** - Select safety-related mode of operation SOM_1 - E.g. keylock switch 1 in SOM_1 position
330-0090	**Error message** MC SPLC requests invalid stop reaction **Cause of error** - SPLC demands an invalid stop reaction (SS0, SS1, SS1F or SS2) for an axis/spindle group - Error in SPLC program **Error correction** - Check the SPLC program - Inform your service agency
330-0091	**Error message** MC SPLC requests invalid safety function **Cause of error** - SPLC demands an invalid safety function (SLI, SLS, STO, SOS or AUTO) for an axis/spindle group - Error in SPLC program **Error correction** - Check the SPLC program - Inform your service agency

Error number	Description
330-0092	**Error message** MC brake cannot be deactivated %2 **Cause of error** - Drive was switched on although the STO (Safe Torque Off) safety function for the axis or spindle is still active. **Error correction** - Internal software error - Inform your service agency
330-0093	**Error message** MC System clock MC is not equal to SKERN MC **Cause of error** - MC does not increase the internal watchdog counter value - There is an MC hardware defect or internal software error **Error correction** - Restart the control - Inform your service agency
330-0094	**Error message** MC System clock MC is not equal to SPLC MC **Cause of error** - MC does not get any messages from the SPLC MC - There is an SPLC MC hardware defect or internal software error **Error correction** - Restart the control - Inform your service agency
330-0095	**Error message** MC System clock MC is not equal to SPLC CC **Cause of error** - MC does not get any messages from the SPLC CC - There is an SPLC CC hardware defect or internal software error **Error correction** - Restart the control - Inform your service agency

Error number	Description
330-0096	**Error message** MC error during cross comparison: %1 **Cause of error** - A cross comparison between safety-related data of the MC and the CC reports errors - Data of the programming interface SPlcApiFromSaftey (NN_xxx) are different on the MC and CC - Data of the programming interface SPlcApiToSaftey (PP_xxx) are different on the MC and CC - Hardware defective- Internal software error **Error correction** - Inform your service agency
330-0097	**Error message** MC Safe output is not equal: %1 **Cause of error** Cross comparison of a back-readable output reports an error. Possible causes: - Power supply of the outputs - Wiring of the outputs - Hardware defective (PL module) - Internal software error **Error correction** - Check the power supply of both channels or all outputs - Check the wiring - Exchange the defective PL module - Inform your service agency
330-0098	**Error message** MC +3.3 V out of tolerance **Cause of error** - The internal +3.3-V power supply of the MC is outside the permissible tolerance range. **Error correction** - Exchange defective hardware (MC) - Inform your service agency
330-0099	**Error message** MC +3.3 V PIC out of tolerance **Cause of error** - The internal +3.3 V PIC power supply of the MC is outside the permissible tolerance range. **Error correction** - Exchange defective hardware (MC) - Inform your service agency

Error number	Description
330-009A	**Error message** MC +12 V out of tolerance **Cause of error** - The internal +12-V power supply of the MC is outside the permissible tolerance range. **Error correction** - Exchange defective hardware (MC) - Inform your service agency
330-009B	**Error message** MC speed of fan 1 too slow **Cause of error** - Internal fan 1 of the MC is below the permissible tolerance range (too slow). **Error correction** - Exchange defective hardware (MC) - Inform your service agency
330-009C	**Error message** MC Speed of fan 2 too slow **Cause of error** - Internal fan 2 of the MC is below the permissible tolerance range (too slow). **Error correction** - Exchange defective hardware (MC) - Inform your service agency
330-009D	**Error message** MC fan not recognized **Cause of error** - Hardware (MC) defective **Error correction** - Exchange defective hardware (MC) - Inform your service agency
330-009E	**Error message** MC error in actual-value measurement %2 %1 **Cause of error** The encoder reports an internal error in the actual value acquisition **Error correction** Inform your service agency

Error number	Description
330-00A0	**Error message** MC axis %2 in servo control **Cause of error** - The SPLC program requests the STO safety function, although the axis is still in servo control - Internal software error **Error correction** Inform your service agency
330-00A1	**Error message** MC spindle %2 in servo control **Cause of error** - The SPLC program requests the STO safety function, although the spindle is still in servo control - Internal software error **Error correction** Inform your service agency
330-00A2	**Error message** MC excessive deviation of actual from nominal speed %2 **Cause of error** - The safety function "comparison of actual to nominal speed values" reports an error - The maximum permissible deviation between the actual and nominal speed value (speedDiffNom) exceeded the permissible time in the safety related machine parameter timeToleranceSpeed **Error correction** - Check the entries in the safety-related machine parameters speedDiffNom and timeToleranceSpeed in CfgAxisSafety - Inform your service agency
330-00A3	**Error message** MC: Erroneous data from SPLC %1 **Cause of error** - Data transfer error - CRC checksum error **Error correction** - Inform your service agency.

Error number	Description
330-00A4	**Error message** MC S status reaction is active: %1 **Cause of error** - An error bit was set in the S status by an internal hardware or software error: -STO.B.CC.WD: Watchdog WD.B.CC of a CC controller unit has timed out -SMOP.WD: Watchdog WD.A.SMOP or WD.B.SMOP of an MB machine operating panel has timed out -SPL.WD: Watchdog WD.A.SPL or WD.B.SPL of a PLB has timed out -PF.BOARD: The internal voltage monitoring of the HSCI components has detected a faulty operating voltage -REQ.SS2: The internal temperature or fan monitoring of the HSCI components has detected a fault **Error correction** - Inform your service agency.
330-00A6	**Error message** MC SMC autotest software loaded **Cause of error** - Unsafe test software loaded for acceptance tests - Caution: Safety functions have been partly deactivated! **Error correction** - Inform your service agency.
330-00A8	**Error message** Checksum of safe machine parameters are invalid **Cause of error** No checksum has been saved or a checksum is invalid for at least one of the following configurations: - Safe configuration data - Hardware configuration - Configuration of the encoders **Error correction** - Check the entries of the safe machine parameters and correct them if necessary - If the values of the machine parameters have been changed, they are to be loaded by entering the manufacturer's password. Then a corresponding acceptance test must be run. - Inform your service agency.

Error number	Description
330-00A9	**Error message** Checksum of safe machine parameters have been changed **Cause of error** - The internally saved checksum of the safe machine parameters does not match the new calculated checksum. - One or more safe machine parameters were changed. **Error correction** - Check the entries of the safe machine parameters - If the values of the machine parameters have been changed, they are to be loaded by entering the manufacturer's password. Then a corresponding acceptance test must be run. - Inform your service agency.
330-00AA	**Error message** Checksum was changed through the hardware configuration **Cause of error** - The internally saved checksum of the HSCI system hardware configuration does not match the new calculated checksum. - HSCI components were exchanged, removed, or new ones inserted **Error correction** - Check the hardware configuration and correct it if required. - If the configuration has been changed, they are to be loaded by entering the manufacturer's password. Then a corresponding acceptance test must be run. - Inform your service agency.
330-00AB	**Error message** Checksum was changed through the encoder configuration **Cause of error** - The internally saved checksum of the encoders' configuration does not match the new calculated checksum. - Encoders were exchanged, removed, or new ones inserted **Error correction** - Check the encoder configuration and correct it if required. - If the configuration has been changed, they are to be loaded by entering the manufacturer's password. Then a corresponding acceptance test must be run. - Inform your service agency.

Error number	Description
330-00AC	**Error message** Checksum of safe machine parameters have been changed **Cause of error** Entries in safe machine parameters have been changed. **Error correction** - Check the entries of the safe machine parameters - Switch the control off and on again - If the values of the machine parameters have been changed, they are to be loaded by entering the manufacturer's password. Then a corresponding acceptance test must be run. - Inform your service agency.
330-00AD	**Error message** Impermissible deviation of safe machine parameters Deviations in safe machine parameter **Cause of error** Safe machine parameters deviate between the individual parameter blocks of a safe axis. This is not allowed. The values have to match in all parameter blocks of an axis: - Encoder input - PWM output - Encoder resolution per path - Counting direction - Line count **Error correction** - Check the entries of the safe machine parameters and correct them if necessary - Switch the control off and on again - If the values of the machine parameters have been changed, they are to be loaded by entering the manufacturer's password. Then a corresponding acceptance test must be run. - Inform your service agency.

Error number	Description
330-00AE	**Error message** Invalid entry in safe machine parameter **Cause of error** The configuration datum CfgAxisSafety contains invalid values in one of the following safe machine parameters: - positionMatch Entered position or value is invalid - positionDiffRef Entered deviation or value is invalid - speedLimitSom2 Entered velocity or value is invalid - axisGroup Invalid axis group, too many spindles, too many axes or axis configured as spindle. **Error correction** - Check the entries of the safe machine parameters and correct them if necessary - Switch the control off and on again - If the values of the machine parameters have been changed, they are to be loaded by entering the manufacturer's password. Then a corresponding acceptance test must be run. - Inform your service agency.
330-00AF	**Error message** Invalid entry in safe machine parameter **Cause of error** The configuration datum CfgAxGroupSafety contains an invalid value in a safe machine parameter. - The number of the axis group in the safe machine parameter “id”invalid. - The axis group is not of the “SPINDLE” type, but in the safe machine parameter “brakeAfter” there is a dependency on at least one other axis group. - The axis group is not of the “SPINDLE” type, but the value “STO” is set in the safe machine parameter “idleState”. **Error correction** - Check the entries of the safe machine parameter and correct if necessary - Switch the control off and on again - If the values of the machine parameters have been changed, they are to be loaded by entering the manufacturer’s password. Then a corresponding acceptance test must be run. - Inform your service agency

Error number	Description
330-00B0	**Error message** Invalid entry in safe machine parameter **Cause of error** The safe machine parameter cfgSafety contains invalid values. **Error correction** - Check the entries of the safe machine parameter and correct them if necessary - Switch the control off and on again - If the values of the machine parameters have been changed, they are to be loaded by entering the manufacturer's password. Then a corresponding acceptance test must be run. - Inform your service agency.
330-00B1	**Error message** Invalid entry in safe machine parameter **Cause of error** The configuration of the safe machine parameters is invalid. The following causes are possible: - Invalid encoder input was configured or none and all (speed or position encoder) - Invalid PWM output was configured or none at all - Invalid assignment of axes/spindles to controller main boards - Invalid assignment of PWM output and encoder input (speed or position encoder) to the controller main board - Configuration between PWM output and encoder input (speed or position encoder) is invalid **Error correction** - Check the configuration in the safe machine parameters and correct them if necessary - Switch the control off and on again - If the values of the machine parameters have been changed, they are to be loaded by entering the manufacturer's password. Then a corresponding acceptance test must be run. - Inform your service agency.

Error number	Description
330-00B3	**Error message** MC self test %1 not started **Cause of error** The self-test for safety detected an error. A certain signal must be set for test purposes. This signal was not released by the indicated HSCI component. The error message contains the following information: MC self test STEST_<signal>, STESTDEV_<HSCI component>, <HSCI address> - The signal to be set is indicated under STEST_. - The HSCI component that did not set the signal is indicated under STESTDEV_. - The given number in the error message matches the HSCI address of the HSCI component concerned. Possible causes: - HSCI component is defective. - Wiring is faulty. **Error correction** - Exchange the HSCI component. - Check the wiring - Inform your service agency
330-00B4	**Error message** MC self test %1 not detected **Cause of error** The self-test for safety detected an error. A certain signal was set and was not recognized by the indicated HSCI component. The error message contains the following information: MC self test STEST_<signal>, STESTDEV_<HSCI component>, <HSCI address> - The set signal is indicated under STEST_. - The HSCI component that did not recognize the set signal is indicated under STESTDEV_. - The given number in the error message matches the HSCI address of the HSCI component concerned. Possible causes: - HSCI component is defective. - Wiring is faulty. **Error correction** - Exchange the HSCI component. - Check the wiring - Inform your service agency.
330-00B5	**Error message** MC Incorrect command from the MC **Cause of error** - Internal software error **Error correction** - Inform your service agency

Error number	Description
330-00B6	**Error message** MC Invalid SPLC operating mode **Cause of error** - Error in SPLC program - SPLC requests an invalid operating mode The valid modes are SOM_1, SOM_2, SOM_3, SOM_4 - Internal software error **Error correction** - Check the SPLC program - Inform your service agency
330-00B7	**Error message** MC brake control is defective %2 **Cause of error** - Brake output of the inverter is defective - PL output for controlling the brake is defective - Incorrect wiring of the braking control (e.g. short circuit to 0 V, short circuit to 24 V) **Error correction** - Check the wiring of the brake control - Check the wiring for short circuits to 0 V or 24 V - Check the supply voltage of the outputs to the brake control (PL module, inverter) - Inform your service agency.
330-00B8	**Error message** MC brake control is defective **Cause of error** - Brake output of the inverter is defective - PL output for controlling the brake is defective - Incorrect wiring of the braking control (e.g. short circuit to 0 V, short circuit to 24 V) **Error correction** - Check the wiring of the brake control - Check the wiring for short circuits to 0 V or 24 V - Check the supply voltage of the outputs to the brake control (PL module, inverter) - Inform your service agency.

Error number	Description
330-00B9	**Error message** MC error in the cutout channel STO.A.x (-STO.A.P.x=0) %2 **Cause of error** The cutout channel test detected a fault: The axis-specific pulse deletion for the power stage over the A channel is defective. Switch-off signal: STO.A.P.x Switch-off signal: STO.A.x The acknowledgment signal for this cutout channel has the wrong condition, i.e. when - JH inverter: Power stage reports "readiness" (RDY.x=1), although "No readiness" (RDY.x=0) is expected. - DRIVE-CLiQ inverter: Associated diagnostic signal is "1", although "0" is expected. **Error correction** - Check the wiring (PWM cable) - Hardware error (power module, controller unit) - Inform your service agency.
330-00BA	**Error message** MC error in the cut-out channel STO.A.x (-STO.A.P.x=1) %2 **Cause of error** The cutout channel test detected a fault: The axis-specific pulse release for the power stage over the A channel is defective. Switch-off signal: STO.A.P.x Switch-off signal: STO.A.x The acknowledgment signal for this cutout channel has the wrong condition, i.e. when - JH inverter: Power stage reports "no readiness" (RDY.x=0), although "readiness" (RDY.x=1) is expected. - DRIVE-CLiQ inverter: Associated diagnostic signal is "0", although "1" is expected. **Error correction** - Check the wiring (PWM cable) - Hardware error (power module, controller unit) - Inform your service agency.

Error number	Description
330-00BB	**Error message** CC%2 error in cut-out channel STO.A.x (-STO.A.MC.WD=0) ax-grp A **Cause of error** The cutout channel test detected a fault: The CC-specific pulse deletion for the corresponding power modules of the NC axis group (A) over the A channel is defective. Switch-off signal: STO.A.MC.WD Switch-off signal: STO.A.x At least one of the acknowledgment signals for this cutout channel has the wrong condition, i.e. when - JH inverter: At least one power module reports "readiness" (RDY.x=1), although for all power modules of the axis group A of the CC, "No readiness" (RDY.x=0) is expected. - DRIVE-CLiQ inverter: At least on of the associated diagnostic signal is "1", although "0" is expected. **Error correction** - Check the wiring (PWM cable) - Hardware error (power module, controller unit) - Inform your service agency.
330-00BC	**Error message** CC%2 error in cut-out channel STO.A.x (-STO.A.MC.WD=0) ax-grp. S **Cause of error** The cutout channel test detected a fault: The CC-specific pulse deletion for the corresponding power modules of the spindle axis group (S) over the A channel is defective. Switch-off signal: STO.A.MC.WD Switch-off signal: STO.A.x At least one of the acknowledgment signals for this cutout channel has the wrong condition, i.e. when - JH inverter: At least one power module reports "readiness" (RDY.x=1), although for all power modules of the axis group S of the CC, "No readiness" (RDY.x=0) is expected. - DRIVE-CLiQ inverter: At least on of the associated diagnostic signal is "1", although "0" is expected. **Error correction** - Check the wiring (PWM cable) - Hardware error (power module, controller unit) - Inform your service agency.

Error number	Description
330-00BD	**Error message** CC%2 error in cut-out channel STO.A.x (-STO.B.P.x) axis group A **Cause of error** The cutout channel test detected a fault: The CC-specific pulse release for the corresponding power modules of the NC axis group (A) over the A channel is defective. The ready signal RDY for one axis group is missing. The cutout channel STO.A.x was switched to inactive for the test of the cutout channel STO.B.x for all power modules. At least one of the acknowledgment signals for this cutout channel has the wrong condition, i.e. when - At least one power module reports "No readiness" (RDY.x=0), although "Readiness" (RDY.x=1) is expected for all power modules of the axis group of the CC. **Error correction** - Check the wiring (e.g. pulse release X72 of the supply module, X73 Heidenhain interface PCB, PWM cable is defective) - Exchange defective hardware (power module) - Inform your service agency
330-00BE	**Error message** CC%2 error in cut-out channel STO.A.x, RDY signal missing **Cause of error** The cutout channel test detected a fault: The CC-specific pulse release for the corresponding power modules of the spindle (S) over the A channel is defective. The ready signal RDY for one axis group is missing. The cutout channel STO.A.x was switched to inactive for the test of the cutout channel STO.B.x for all power modules of the axis group S. At least one of the acknowledgment signals for this cutout channel has the wrong condition, i.e. when - At least one power module reports "No readiness" (RDY.x=0), although "Readiness" (RDY.x=1) is expected for all power modules of the axis group of the CC. **Error correction** - Check the wiring (e.g. pulse release X71 of the supply module, X73 Heidenhain interface PCB, PWM cable is defective) - Exchange defective hardware (power module) - Inform your service agency

Error number	Description
330-00C0	**Error message** Self-test required **Cause of error** - Maximum permissible time interval for the self-test has been exceeded - For further operation of the machine with open guard doors, the self-test must be conducted **Error correction** - Start the self-test - If the guard doors are closed, the error message can be acknowledged and machine operation continued - With open guard doors, or before the guard doors are opened, the self-test must be conducted in order to continue operating the machine - Inform your service agency
330-00C1	**Error message** MC drives cannot be switched on: NN_GenSafe = 0 **Cause of error** - SPLC interface signal NN_GenSafe = 0. It is therefore impossible to switch on the drives. - SPLC program does not set the interface signal. **Error correction** - Check the SPLC program. - Inform your service agency.
330-00C2	**Error message** Error during activation of an FS configuration **Cause of error** The activation of another FS configuration was canceled because the CRC checksums of the FS data records differ. **Error correction** - Reset the "accepted" status of the most recently changed FS data records - Manually undo your most recently made changes - Copy a valid backup onto the machine - Inform your service agency
330-00C3	**Error message** FS configuration error: machine IDs do not match **Cause of error** The activation of another FS configuration was canceled because the entered machine IDs of the FS configurations differ. **Error correction** – Check the machine IDs of the FS configurations - Inform your service agency

Error number	Description
330-00C4	**Error message** Maximum number of FS data records has been reached **Cause of error** The activation of another FS configuration was canceled because the maximum permissible number of different FS data records was exceeded. **Error correction** - Delete any unneeded FS data records - Inform your service agency
330-00C5	**Error message** Maximum number of FS configurations has been reached **Cause of error** The activation of another FS configuration was canceled because the maximum permissible number of different FS configurations was exceeded. **Error correction** - Delete any unneeded FS configurations - Inform your service agency
330-00C6	**Error message** MC manual operation. Only one axis allowed. **Cause of error** — Two or more axes are being moved in the "Electronic Handwheel" operating mode. - Simultaneous movement of multiple axes is not allowed. **Error correction** - Move only one axis in the Handwheel operating mode. - Check the entry in the appropriate safe machine parameter and correct it if necessary. - Inform your service agency.
330-00C7	**Error message** A fatal reconfiguration error was triggered **Cause of error** - The reconfiguration process for functional safety (FS) has failed. **Error correction** - The status "accepted" will be reset for all configurations and data records for functional safety. - The comparison data records will be deleted. - Install a complete backup of the machine. - Inform your service agency.

Error number	Description
330-00C8	**Error message** Acceptance not allowed during configuration process **Cause of error** - Acceptance testing of data records configurations was conducted during an FS configuration process. This is not allowed. **Error correction** - Conduct the acceptance testing when the configuration process is completed. - Inform your service agency.
330-00C9	**Error message** Error during activation of an FS configuration **Cause of error** One of the following safe machine parameters was changed after the self-test began: - Time to next self-test - Time monitoring for brake test These machine parameters can be changed only before starting the safety self-test. **Error correction** - Undo the change in the affected machine parameters. - Restart the control. - Inform your service agency.
330-00CA	**Error message** Axis-group-specific guard door is open (MC) %1 **Cause of error** - Guard door of the axis group is opened The guard door has to be closed in order to conduct the safety self-test or the brake test of a respective axis group Further possible causes: - Faulty wiring of guard doors - Guard door contact is defective - SPLC interface signal PP_AxGrpStateReq unequal to S_S-TATE_AUTO [10] **Error correction** - Close the axis-group-specific guard doors in order to conduct the safety self-test or the brake test Further possible measures: - Check the wiring of the guard door contacts - Check the guard door contact - Check the SPLC program - Inform your service agency

Error number	Description
330-00CB	**Error message** Axis-group-specific guard door is open (CC) %1 **Cause of error** - The guard door is open The guard door(s) has to be closed in order to conduct the safety self-test or the brake test of an axis Further possible causes: - Faulting wiring of the guard door - Guard door contact is defective **Error correction** - Close the guard door(s) in order to conduct the safety self-test or the brake test Further possible measures: - Check the wiring of the guard door contacts - Check the guard door contact - Check the SPLC program - Inform your service agency
330-00CC	**Error message** The time until the next brake test is invalid for one axis %1 **Cause of error** - A time greater than 0 is configured for a non-safe axis **Error correction** - For an axis that is not monitored by functional safety (FS) , only 0 is allowed as the time value.
330-00DE	**Error message** Commissioning function for FS is active **Cause of error** Commissioning support for functional safety (FS) functions are active: - The NC software does not limit velocity - Unexpected movements or dangerous situations might occur **Error correction** - The machine must be operated only by trained personnel. - Operate the machine only with great caution - This function must be activated only for commissioning purposes - Deactivate this function before shipping the machine

Error number	Description
330-00E7	**Error message** FS data record cannot be accepted **Cause of error** - There are at least two FS data records with identical ID in different parameter sets and at least one safe parameter SMP has a different value in both parameter set. **Error correction** - Compare and adjust the values of the safe parameters SMP of the same data record between the parameter sets. - To avoid such errors, HEIDENHAIN recommends using the "KeySynonym" function. - Inform your service agency.
330-00E8	**Error message** Self-test required **Cause of error** - Maximum permissible interval time for the self-test has been exceeded - The self-test must be conducted for further operation of the machine with open guard doors **Error correction** - Start the self-test - When the guard doors are open, or before opening the guard doors, the self-test must be started in order to continue operating the machine
330-00EA	**Error message** Activation of the automatic change mode not possible **Cause of error** An FS reconfiguration has not yet concluded. **Error correction** Wait until the FS reconfiguration process is completed and then retry.

Error number	Description
330-00EC	**Error message** MC: S status reaction is active: %1 **Cause of error** An error bit was set in the S status by an internal hardware or software error: -SCC.B.WD: Watchdog WD.B.CC of a CC controller unit has timed out -SMOP.WD: Watchdog WD.A.SMOP or WD.B.SMOP of an MB or TE machine operating panel has timed out -SPL.WD: Watchdog WD.A.SPL or WD.B.SPL of a PLB has timed out -PF.BOARD: The internal voltage monitoring of an HSCI component has detected a faulty supply voltage -REQ.SS2: The internal temperature or fan monitoring of an HSCI component has detected a fault **Error correction** - Generate the service file - Inform your service agency
330-00ED	**Error message** MC error, device-specific evaluation CC %2 / %3, error %1 **Cause of error** The CC controller unit reports a device-specific error. **Error correction** Inform your service agency
330-00EF	**Error message** SMC error in the configuration data %1 **Cause of error** The configuration parameters do not match the expected values. **Error correction** Check the machine parameters and correct as needed
330-00F0	**Error message** Checking of axes of various axis groups **Cause of error** You attempted to check axes of different axis groups simultaneously. **Error correction** - Check the configuration: axes that are coupled in a rigid gantry combination must belong to the same axis group - Uncouple a dynamic gantry combination if you want to check it - If necessary, inform your machine manufacturer

Error number	Description
330-00F1	**Error message** Reconfiguration while checking the axes **Cause of error** Safe machine parameters were reconfigured while the axes were being checked. Checking was therefore aborted. **Error correction** - Re-check the axes - If the problem persists, inform your machine manufacturer
330-00F2	**Error message** Checking of an externally monitored axis **Cause of error** You attempted to check an externally monitored axis. The control can check only internally monitored axes. **Error correction** - Check the parameter CfgAxParSafety/encoderForSafety - Inform your service agency
330-00F3	**Error message** Permissive button missing while checking **Cause of error** While checking an axis, you failed to press the permissive button within the time prescribed by the control. **Error correction** Re-check the axis.
330-00F4	**Error message** Checking during a fatal error **Cause of error** You attempted to check an axis while the functional safety was in a fatal error state. **Error correction** - Restart the control - If necessary, inform your service agency

Error number	Description
330-00F5	**Error message** Axis not at test position **Cause of error** - The axis to be checked is not located at the test position (safe machine parameter positionMatch in CfgAxisSafety) - Axis is too far from the test position (safe machine parameter positionDiffRef in CfgAxisSafety) **Error correction** - Press CE to acknowledge the error message and move the axis to the test position - Then check the axis If the message appears although the axis is at the correct test position: - For gantry combinations, an axis other than the one being checked might not be in the correct position. If necessary, uncouple the gantry combination for checking. - Check the configuration of the axis traverse direction and correct it if necessary (machine parameter signCorrActualVal, signCorrNominalVal, or entry in the DIR column of the motor table) - Inform your machine manufacturer
330-00F6	**Error message** FS configuration with a parameter whose value cannot be accepted **Cause of error** Acceptance of CfgSafety/CfgAxParSafety > speedPosComp-type with the value noComp is not allowed. **Error correction** - Reset the acceptance status - Reset the parameter value
330-00F7	**Error message** Axis in motion **Cause of error** Possible causes: - The axis to be checked is still in motion - Another axis that belongs to the same axis group as the axis to be checked is still in motion **Error correction** - Press CE to acknowledge the error message and bring the axis to a standstill - Then check the axis - Inform your service agency

Error number	Description
330-00F8	**Error message** Internal software error **Cause of error** You checked an axis while another axis was still being checked **Error correction** - Conclude checking of the first axis before checking another axis - Inform your service agency
330-00F9	**Error message** Checking of axes of different axis groups **Cause of error** You checked two or more axes at the same time even though they belong to different axis groups **Error correction** - Make sure that all internally monitored axes of a gantry combination belong to the same axis group - Inform your machine manufacturer - Inform your service agency
400-0720	**Error message** Selected block not addressed Current block (%1) not selected **Cause of error** After an interruption in the program run, the control cannot resume program run from the present cursor location. **Error correction** Select the desired location for resuming the program with "GOTO" + block number, or with the mid-program startup function.
400-073E	**Error message** Parameter not found %1 **Cause of error** A value could not be read from the configuration data. **Error correction** Check the configuration data.
400-075F	**Error message** Error while reading the model data from %1 **Cause of error** Error while reading the model data. **Error correction** Delete the faulty file and make a new one.

Error number	Description
400-0760	**Error message** Error while writing the model data to %1 **Cause of error** Error while writing the model data. **Error correction** Check the memory capacity. Error in file system.
400-0761	**Error message** Directory '%1' could not be created. **Cause of error** Directory could not be created. **Error correction** Check the memory capacity. Error in file system.
400-0768	**Error message** Selection of %1 not allowed **Cause of error** The tool table tool.t is meant only for program run. **Error correction** Select another tool table.
400-0773	**Error message** Unable to write parameter **Cause of error** A configuration file might be write protected. **Error correction**
400-0775	**Error message** Incomplete graphic model **Cause of error** **Error correction**
400-077F	**Error message** File is being saved and cannot yet be opened **Cause of error** The file is now being saved in the editor. **Error correction** - After the saving process is complete, reselect the file. - The condition is indicated by the “Please wait” icon.

Error number	Description
401-0001	**Error message** Message %1 cannot be transmitted **Cause of error** Internal software error **Error correction** Inform your service agency.
401-0002	**Error message** The application could not be initialized **Cause of error** Logon with the confiration server is not possible. Configuration of the programmable axes is contradictory. **Error correction** Check the configuration data and edit.
401-0003	**Error message** Bad option %1 specified **Cause of error** Internal software error **Error correction** Inform your service agency.
401-0004	**Error message** The file %1 already contains a binary coded NC program **Cause of error** **Error correction**
401-0005	**Error message** The file %1 does not contain an NC program **Cause of error** **Error correction**
401-0006	**Error message** The file %1 already contains an encrypted NC program **Cause of error** **Error correction**
401-0007	**Error message** The file %1 contains data in an unknown format **Cause of error** **Error correction**

Error number	Description
401-0008	**Error message** The file %2 will be overwritten by file %1 **Cause of error** **Error correction**
401-0009	**Error message** Specified drive %2 of the file %1 cannot be substituted **Cause of error** An NC program is to be installed on a drive other that 0:, R: or V:. **Error correction** Check and edit the configuration data for cycles and NC macros.
401-000A	**Error message** %2 file was converted (%1) **Cause of error** **Error correction**
401-000B	**Error message** File %1 could not be converted to file %2 **Cause of error** Error during conversion of an NC program. The file could not be saved. **Error correction** Check the path name and write protection of the target file.
401-000C	**Error message** File %2 was encrypted **Cause of error** **Error correction**
401-000D	**Error message** Installation of cycles complete **Cause of error** **Error correction**
401-000E	**Error message** Error: **Cause of error** **Error correction**

Error number	Description
401-000F	**Error message** %2 file was converted **Cause of error** **Error correction**
401-0010	**Error message** %1 file contains data in an illegible format **Cause of error** At an earlier time the program was converted to an unreadable format. No backup copy was made from which another conversion would be possible. **Error correction** Recopy the file with the source text of the program to the control and start the conversion again.
401-0011	**Error message** The file %1 contains syntactically incorrect NC block %2. **Cause of error** The program uses an unknown cycle or axis, or contains other syntax errors. **Error correction** Copy the file with the corrected program source text to the control again and restart the conversion.
402-0001	**Error message** FK programming: Contradictory input **Cause of error** You programmed contradictory data within a contour element or in different contour elements. **Error correction** Check the entered data and modify it.
402-0002	**Error message** FK programming: Undefined starting position **Cause of error** You did not define an unambiguous tool position before beginning an FK sequence. **Error correction** Before beginning an FK sequence, program a positioning block with both coordinates of the working plane.

Error number	Description
402-0003	**Error message** FK programming: No FPOL defined **Cause of error** You programmed polar coordinates within an FK sequence without first defining the pole. **Error correction** Use the FPOL function to program a pole.
402-0004	**Error message** FK programming: FSELECT not allowed. **Cause of error** An FK sequence contains an FSELECT block although the contour is already clearly defined. **Error correction** Edit the NC program: delete the corresponding FSELECT block.
402-0005	**Error message** FK programming: Contour too complex **Cause of error** The number of unresolvable FK blocks or the number of selectable alternative contours exceeds the permissible maximum value of 32 each. **Error correction** Use FSELECT to resolve the FK sequence earlier, or enter additional data.
402-0006	**Error message** FK programming: Internal software error **Cause of error** The control software could not calculate the programmed contour, although it satisfies all formal requirements tested. **Error correction** Try to program the desired contour in another way. If necessary, inform the service agency for you control.
402-0007	**Error message** FK programming: Illegal coordinate **Cause of error** You programmed an illegal axis within an FK sequence. **Error correction** Program only coordinates in the working plane that you defined using FPOL (default: XY plane).

Error number	Description
402-0008	**Error message** FK programming: Incomplete input **Cause of error** You did not program all required data within an FK sequence. The following are illegal: only one coordinate in the FPOL block, only one coordinate of a auxiliary point (PD, P1, P2 or P3), PD auxiliary point without the distance DP or vice versa, FC/FCT circular arc without definition of a rotational direction (DR), the distance of a contour to a parallel line (DP) without the parallel line (PAR) or vice versa. **Error correction** Add the missing data to the NC program.
402-0009	**Error message** FK programming: Illegal positioning block **Cause of error** Within an unresolved FK sequence you programmed an illegal positioning block other than FK blocks, RND/CHF, APPR/DEP, and L blocks with motion components exclusively perpendicular to the FK plane. **Error correction** First resolve the FK sequence completely or delete illegal positioning blocks. Geometry functions that are defined over the gray contouring keys and have coordinates in the working plane are illegal (exception: RND, CHF, APPR/DEP).
402-000A	**Error message** FK programming: Illegal operation **Cause of error** The following are illegal in open FK sequences: PGM END (program end), CYCL DEF 7-11 and 26 (coordinate transformations), TOOL CALL (tool change), and PGM CALL (program calls) **Error correction** First resolve the FK sequence or program the objectionable operation at another location in the program.

Error number	Description
402-000B	**Error message** FK programming: Illegal block reference **Cause of error** From an FK sequence, a block number is used to make reference to the end point or the end tangent of a block that either - does not exist - is too far away (> 64 blocks below or > 32 blocks above) - is not a positioning block - belongs to a category of positioning blocks which cannot be used for references (transitions, CC, FPOL, blocks containing only axis values or machine coordinates) **Error correction** Enter a reference to another block, or do without the reference
402-000C	**Error message** FK programming: Incomplete input **Cause of error** The FK sequence is not complete at its program end. You will have to program additional data or NC blocks. **Error correction** * Add FK blocks as the end or edit them. * Add the missing data or NC blocks within the program. Note: - In each block, program the data that do not change. (Non-programmed data are treated as unknown.) - If the first block of an FK contour is an FCT or FLT block, you must program at least two NC blocks with the gray path function keys to fully define the direction of contour approach. An FK contour must not be programmed immediately after an LBL command
600-0009	**Error message** Casting machining was interrupted due to an internal error. Machining is not possible. %1 **Cause of error** Data overflow or insufficient memory. **Error correction** Check the program. If necessary, correct the finished part.

Error number	Description
600-000A	**Error message** Blank defined smaller than finished part. %1 **Cause of error** Error in the part definition. **Error correction** Redefine the table.
600-000B	**Error message** Drill tip longer than bore! No rough drilling takes place. %1 **Cause of error** Perhaps the inside contour resulted unintentionally from contour generation of the finished part. **Error correction** Check the program. If necessary, correct the finished part.
600-000C	**Error message** No free memory capacity. %1 **Cause of error** The data module is too small or the contours are too large. **Error correction** If possible, simplify the part.
600-000F	**Error message** Internal error - more information in the system warning %1 **Cause of error** **Error correction**
600-0011	**Error message** There is nothing to machine or nothing can be machined under these preconditions. %1 **Cause of error** Error in the data. **Error correction** Redefine the program.

Error number	Description
600-0012	**Error message** No automatic function available for this function. Do the machining manually. %1 **Cause of error** Incorrect main machining mode. **Error correction** Redefine the main machining mode.
600-0013	**Error message** Since "Clamping" was not used, an external chuck with 15 mm clamping length is assumed. %1 **Cause of error** The part is not clamped. **Error correction** Interrupt TURN PLUS and clamp the part.
600-0015	**Error message** Since no cutting limit was defined, it will be set to the end of the workpiece %1 **Cause of error** The cutting limit assignment will be exited without data. **Error correction** Clamp or enter the values for the cutting limit.
600-0031	**Error message** Tool %2 was programmed without cutting speed. A default value is set. %1 **Cause of error** The database is incomplete. **Error correction** Expand the cutting database.
600-0032	**Error message** Tool %2 was programmed without main feed! A default value is set. %1 **Cause of error** The database is incomplete. **Error correction** The cutting database must be expanded.

Error number	Description
600-0033	**Error message** You are attempting to load cutting data for an unidentifiable tool number. This is not possible. %1 **Cause of error** Since the tool was already loaded via DCS, the cause can only be a software or hardware error. **Error correction** Load the part again and restart AWG.
600-0034	**Error message** No cutting data available for this tool. (Tool number, Material, Cutting material %2) %1 **Cause of error** The database has no data beyond the current combination of cutting material. **Error correction** Expand the cutting database, then restart the AWG.
600-0041	**Error message** Defined secondary machining mode is invalid! %1 **Cause of error** Software error or incorrect data in the machining sequence. **Error correction** Check the entered machining sequence.
600-0049	**Error message** Generated working block contains incorrect record types or technology record is missing. %1 **Cause of error** No technology record was made. **Error correction** Check whether a tool was selected.
600-0051	**Error message** Due to a tool geometry cutting limitation an area to be finished cannot be machined. %1 **Cause of error** The tool diameter is too large. **Error correction** Select or define another tool.

Error number	Description
600-0081	**Error message** For automatic calculation of the tool change position, tool selection must be set to turret! %1 **Cause of error** The parameter for tool selection is set incorrectly. **Error correction** In the parameter editor, set the tool selection to turret.
600-0083	**Error message** No valid slide number was found, machining is taking place with slide number 1! %1 **Cause of error** Header is invalid. **Error correction** The slide number must be entered in the header.
600-00A9	**Error message** No data on machining site; no automatic tool selection possible! %1 **Cause of error** The data were not entered correctly. **Error correction** Reenter the data.
600-00AA	**Error message** No data on machining direction; no automatic tool selection possible! %1 **Cause of error** The data were not entered correctly. **Error correction** Reenter the data.
600-00AB	**Error message** No data on machining mode; no automatic tool selection possible! %1 **Cause of error** The data were not entered correctly. **Error correction** Reenter the data.

Error number	Description
600-00B1	**Error message** Since no drill with sufficient effective length is available, no through-drilling is possible. %1 **Cause of error** No suitable tool available. **Error correction** If possible, add to the data bank.
600-00B2	**Error message** Since no suitable internal roughing tool was found, only a partial section can be machined. %1 **Cause of error** No suitable tool available. **Error correction** If possible, add to the data bank.
600-00B3	**Error message** Since no internal finishing tool was found, only a partial section can be machined. %1 **Cause of error** No suitable tool available. **Error correction** If possible, add to the data bank.
600-00B4	**Error message** No suitable tools available (Ideal-/Alternative-/Emergency tool: %2)! %3 %1 **Cause of error** The database is too small. **Error correction** Enter more tools, or increase the possible tolerance values.
600-00B5	**Error message** Unknown tool type defined! No automatic tool selection possible. %1 **Cause of error** Tool type input error. **Error correction** Reenter the tool type.

Error number	Description
600-00CC	**Error message** The 1st hole limit diameter must not be smaller than the 2nd hole limit diameter. %1 **Cause of error** UBD2 > UBD1 **Error correction** Exchange the diameter values.
600-00F9	**Error message** Due to technological cutting limitations, specific machining areas must be omitted. %1 **Cause of error** Cutting limitations of the chuck. **Error correction** Clamp the part differently.
600-0101	**Error message** No tool selection possible with available data on machining mode, site and direction! %1 **Cause of error** The data were not entered correctly. **Error correction** Reenter the data.
600-0149	**Error message** Elements with unknown machining data were found in the finished part contour. %1 **Cause of error** Error in the analysis. **Error correction** Reload the contour and restart the AWG.
600-0181	**Error message** Starting or overtravel length of thread too long! Collision with workpiece or chuck jaws! %1 **Cause of error** Starting length or overtravel length is defined too large. **Error correction** Correct the starting or overtravel length.

Error number	Description
600-0189	**Error message** Secondary machining direction of tool invalid; end face elements are not finished faced. %1 **Cause of error** Auxiliary cutting edge undefined or incorrectly defined. **Error correction** Define the auxiliary cutting edge correctly.
600-01C3	**Error message** No attributes defined for thread. %1 **Cause of error** No thread attributed defined. **Error correction** Define thread attributes.
600-01C4	**Error message** Contour contains thread whose edge elements are not finish machined. %1 **Cause of error** Unmachined contour areas. **Error correction** Machine manually or after a second clamping.
600-01C9	**Error message** More than 6 threads were defined within a machining site. %1 **Cause of error** More that six threads were defined for one machining location. **Error correction** Define a maximum of six threads per machining location.
600-0211	**Error message** Finished part does not line entirely within the workpiece blank. Defined part can't be machined in this condition. %1 **Cause of error** The parts were entered incorrectly. **Error correction** Delete one part and define it again.

Error number	Description
600-0212	**Error message** Contour sense of rotation undeterminable! %1 **Cause of error** The parts were entered incorrectly. **Error correction** Delete the part and define them again.
600-0213	**Error message** Blank contour contains irreparable errors! Machining is not possible. %1 **Cause of error** The part was entered incorrectly. **Error correction** Delete the part and define it again.
600-0214	**Error message** Finished part contour contains irreparable errors! Machining is not possible. %1 **Cause of error** The part was entered incorrectly. **Error correction** Delete the part and define it again.
600-0215	**Error message** No program header defined! Definition required prior to machining. %1 **Cause of error** The program header was not generated or it has an old structure. **Error correction** Generate a program head.
600-0229	**Error message** Corner is unsuitable for the separation point. Cond.: inner corner angle > 180 deg. - inward copy angle %1 **Cause of error** The AWG cannot follow the machining strategy resulting from the chosen separation point. **Error correction** Either machine the part with the interactive working plane generation (IWG) or change the separation point.

Error number	Description
600-022A	**Error message** Contour element for machining through the separation is within clamping range. Separation point is deleted. %1 **Cause of error** The separation point lies within the clamping range. **Error correction** Either clamp differently or change the separation point.
600-0239	**Error message** Either all secondary machining modes must be defined or none. %1 **Cause of error** **Error correction**
600-0261	**Error message** Pocket/island milling is not yet possible. Alternatively the contour is milled. %1 **Cause of error** You defined a contour without attributes. You did not define whether it is machined internally or externally, therefore pocket milling is assumed. **Error correction** Assign contour attributes.
600-0262	**Error message** The cutter radius cannot be determined from the contour. A default cutter is used (%2). %1 **Cause of error** The contour now has circular inside corners. The cutter diameter cannot be determined. **Error correction**
600-0263	**Error message** Contour sense of rotation undetermined. The cutter radius cannot be determined ==> standard cutter (%2 dia.) %1 **Cause of error** The contour is open. Open contours can only be engraved. **Error correction**

Error number	Description
600-0264	**Error message** Machining side is not clear. The contour side is selected depending on the depth. %1 **Cause of error** There were no contour attributes assigned. **Error correction** Assign contour attributes.
600-0265	**Error message** Pockets can only be machined internally. %1 **Cause of error** You assigned either the "contour" or "external" attribute to the pocket. **Error correction** Assign the "internal" attribute.
600-0266	**Error message** Islands can only be machined externally. %1 **Cause of error** You assigned either the "contour" or "internal" attribute to the island. **Error correction** Assign the "external" attribute.
600-0267	**Error message** Tool with the defined %2 diameter was not found. Select tool with a smaller diameter %3. %1 **Cause of error** The corresponding tool is not in the turret or in the file, or the tool with the given diameter is not well suited for the task. **Error correction** Make the tools available or change the parameter.
600-02D9	**Error message** No tool found. Use a left-hand tool to machine the front side and a right-hand tool to machine the rear. %1 **Cause of error** Optimization deletes all tools because they seem unsuitable for the AWG. **Error correction** Check the parameters stored under tool geometry with those of the tool.

Error number	Description
600-02DA	**Error message** No tool found in the file with which machining is to be carried out. %1 **Cause of error** Optimization deletes all tools because they seem unsuitable for the AWG. **Error correction** Check the parameters.
600-02DB	**Error message** No tool found in the file which can be used to carry out the machining process. %1 **Cause of error** Optimization deletes all tools because they seem unsuitable for the AWG. **Error correction** Check the parameters stored under tool geometry with those of the tool.
600-02DC	**Error message** No tool found with a permissible secondary machining direction needed for machining. %1 **Cause of error** Optimization deletes all tools because they seem unsuitable for the AWG. **Error correction** Check the parameters stored under tool geometry with those of the tool.
600-02DD	**Error message** No tool found. Contour cannot be machined using the adjustment and tool tip angle specified %1 **Cause of error** Optimization deletes all tools because they seem unsuitable for the AWG. **Error correction** Check the parameters stored under tool geometry with those of the tool.

Error number	Description
600-02DE	**Error message** No tool found. The tool cutting width (without radius) is too large for the recess. %1 **Cause of error** Optimization deletes all tools because they seem unsuitable for the AWG. **Error correction** Check the parameters stored under tool geometry with those of the tool.
600-02DF	**Error message** No tool found. The plunging depth of the tool is insufficient. %1 **Cause of error** Optimization deletes all tools because they seem unsuitable for the AWG. **Error correction** Check the parameters stored under tool geometry with those of the tool.
600-02E0	**Error message** No tool found whose direction of rotation fits the machining side of the contour and the milling direction. %1 **Cause of error** A tool is being sought whose a direction of rotation that has not yet been defined. **Error correction** In the machining attributes, change up-cut to climb, or vice versa.
600-02E1	**Error message** No tool found. Machining is only possible with stationary tools. %1 **Cause of error** Optimization deletes all tools because they seem unsuitable for the AWG. **Error correction** Check the parameters stored under tool geometry with those of the tool.

Error number	Description
600-02E2	**Error message** No tool found. Machining is only possible with driven tools. %1 **Cause of error** Optimization deletes all tools because they seem unsuitable for the AWG. **Error correction** Check the parameters stored under tool geometry with those of the tool.
600-02E3	**Error message** No tool found. Please check the milling machine cutting teeth. %1 **Cause of error** Optimization deletes all tools because they seem unsuitable for the AWG. **Error correction** Check the parameters stored under tool geometry with those of the tool.
600-02E4	**Error message** No tool found. The effective length is insufficient %1 **Cause of error** Optimization deletes all tools because they seem unsuitable for the AWG. **Error correction** Check the parameters stored under tool geometry with those of the tool.
600-02E5	**Error message** No tool found. Please check the milling diameter. %1 **Cause of error** Optimization deletes all tools because they seem unsuitable for the AWG. **Error correction** Check the parameters stored under tool geometry with those of the tool.

Error number	Description
600-02E6	**Error message** No tool found. Please check the milling angle. %1 **Cause of error** Optimization deletes all tools because they seem unsuitable for the AWG. **Error correction** Check the parameters stored under tool geometry with those of the tool.
600-02E7	**Error message** Multi-cut tools are not supported and are therefore rejected. %1 **Cause of error** The automatic tool selection does not work for multi-cut tools. **Error correction**
600-02E8	**Error message** No tool found that also fits in the tool mount location. %1 **Cause of error** The mount types of tool and tool carrier do not match. **Error correction** If the mount type is incorrect, adjust the mount type of the tool to the mount type of the tool-carrier mount positions.
600-02E9	**Error message** No tool found. The effective length is insufficient %1 **Cause of error** Optimization deletes all tools because they seem unsuitable for the AWG. **Error correction** Check the parameters stored under tool geometry with those of the tool.
600-02EA	**Error message** No tool found. Please check drill diameter. %1 **Cause of error** Optimization deletes all tools because they seem unsuitable for the AWG. **Error correction** Check the parameters stored under tool geometry with those of the tool.

Error number	Description
600-02EB	**Error message** No tool found. Please check tool tip angle. %1 **Cause of error** Optimization deletes all tools because they seem unsuitable for the AWG. **Error correction** Check the parameters stored under tool geometry with those of the tool.
600-02EC	**Error message** No tool found. Please check tappet diameter. %1 **Cause of error** Optimization deletes all tools because they seem unsuitable for the AWG. **Error correction** Check the parameters stored under tool geometry with those of the tool.
600-02ED	**Error message** No tool found. Please check tappet length. %1 **Cause of error** Optimization deletes all tools because they seem unsuitable for the AWG. **Error correction** Check the parameters stored under tool geometry with those of the tool.
600-02EE	**Error message** No tool found. Check countersinking angle. %1 **Cause of error** Optimization deletes all tools because they seem unsuitable for the AWG. **Error correction** Check the parameters stored under tool geometry with those of the tool.

Error number	Description
600-02EF	**Error message** No tool found. Please check thread pitch. %1 **Cause of error** Optimization deletes all tools because they seem unsuitable for the AWG. **Error correction** Check the parameters stored under tool geometry with those of the tool.
600-02F0	**Error message** No tool found. Please check centering angle. %1 **Cause of error** Optimization deletes all tools because they seem unsuitable for the AWG. **Error correction** Check the parameters stored under tool geometry with those of the tool.
600-02F1	**Error message** No tool found. Data on cutting materials are missing. %1 **Cause of error** There are no cutting materials entered on the tool data. **Error correction** Enter the cutting materials in the tool data.
600-0301	**Error message** Selection parameters for tool selection mode not set! %1 **Cause of error** Parameter error. **Error correction** In the parameter editor, set the parameter for type of tool selection.
600-0302	**Error message** No tool and turret data defined for entered slide number. %1 **Cause of error** Parameter error. **Error correction** In the parameter editor, set the parameter for type of tool selection.

Error number	Description
600-0304	**Error message** Machining only possible using the turret! %1 **Cause of error** The automatic magazine position assignment is not supported by the AWG. **Error correction** In the parameter editor, set the parameter for type of tool selection.
600-0305	**Error message** Invalid slide/spindle assignment in program header! %1 **Cause of error** Incorrect parameter description in the program header. **Error correction** Change the program header.
600-0306	**Error message** Invalid slide number specification in program header! %1 **Cause of error** Incorrect parameter description in the program header. **Error correction** Change the program header.
600-0307	**Error message** Mount type of tool %2 does not fit any mount type in turret. %1 **Cause of error** During automatic tool selection from a file, the control compares the tool mount types listed for the turret with the tool mount types entered in the NC program. The types must match. **Error correction** Ensure that the tool holder types match.
600-0309	**Error message** Selected tool not in turret. %1 **Cause of error** The turret was incorrectly assigned, or the tool selection parameter is incorrectly set. **Error correction** Set the tool selection to "NEW" turret and start INI_REVBELE-GUNG.

Error number	Description
600-030A	**Error message** Turret is full! %1 **Cause of error** The tool turret is full. **Error correction** Check the turret assignment and remove superfluous tools.
600-030B	**Error message** Selection parameter for tool selection mode not set! %1 **Cause of error** Parameter error. **Error correction** In the parameter editor, set the parameter for type of tool selection.
600-030C	**Error message** Tool %2 is not suitable for mount location %3. %1 **Cause of error** Due to its mount type and preferred mount in the tool carrier description, the tool does not fit into its ideal, alternative, or emergency location. It is therefore simply placed in a vacant location. **Error correction** Edit the tool mount locations in the tool carrier description.
600-030D	**Error message** There are no longer any free tool mount locations or tool does not fit in carrier due to the mount type. %1 **Cause of error** The tool carrier is full, or the tool or the vacant locations in the carrier do not share the same mount types. **Error correction** If the mount type is incorrect, adjust the mount type of the tool to the mount type of the tool-carrier mount positions.

Error number	Description
600-030E	**Error message** No tool was found that also fits in the tool mount location. %1 **Cause of error** The mount types of tool and tool carrier do not match. **Error correction** If the mount type is incorrect, adjust the mount type of the tool to the mount type of the tool-carrier mount positions.
600-030F	**Error message** Tool %2 has no cam or location number. %1 **Cause of error** A cam number or code number is missing in the database. **Error correction** Enter a code or cam number in the tool data.
600-0379	**Error message** Tool not contained in data base. (Tool number %2)! %1 **Cause of error** The tool was inserted directly into the turret. **Error correction** Save the tool data in the database.
600-0399	**Error message** Shaft is not prepared; no reverse machining possible in this clamping mode. %1 **Cause of error** The shaft has a constant diameter. **Error correction** Delete the part and define it again.
603-0161	**Error message** Extension of limiting contour at traversing angle not possible due to formation of a contour loop. %1 **Cause of error** You selected an traversing angle at which the limiting contour intersects itself when extended in the traversing angle. **Error correction** Select a traversing angle that rules out a contour loop, or select a different machining range.

Error number	Description
603-0162	**Error message** Extension of limiting contour at travel angle not possible due to formation of a contour loop. %1 **Cause of error** You selected an departure angle at which the limiting contour intersects itself when extended in the travel angle. **Error correction** Select a travel angle that rules out a contour loop, or select a different machining range.
603-0164	**Error message** Error in finished part or blank definition. Starting element of BEA area outside blank. %1 Contour area cannot be executed with active tool. **Cause of error** There is probably a blank form definition error. This means that the limiting contour lies in the vicinity of the starting element outside the workpiece blank. **Error correction** Check the workpiece blank definition in the part program and correct it if necessary.
603-0165	**Error message** Error in finished part or blank definition. An end element of BEA area outside blank. %1 **Cause of error** This is probably a blank form definition error, which means that the limiting contour lies in the vicinity of the end element outside the workpiece blank. **Error correction** Check the workpiece blank definition in the part program and correct it if necessary.
603-0182	**Error message** Residual material due to cutting edge geometry! %1 **Cause of error** You selected a poorly suited tool. **Error correction** Select a tool whose geometry enables it to machine grooves in the contour.

Error number	Description
603-01A2	**Error message** The complete machining area is a recessing contour and was erased. %1 **Cause of error** The cycle was not intended to machine recessing contours. Because it identified the entire limiting contour as recessing contour, it was deleted. **Error correction** Either select the cycle "with recessing," or select another machining area.
603-01A3	**Error message** Too many recessing areas! Cycle not executable due to a lack of memory. Reduce machining area. %1 **Cause of error** The recessing areas are saved internally in a contour list. Since there was not enough memory to save all recessing areas, the cycle had to interrupt. **Error correction** Try to run the cycle with a smaller machining area.
603-01E0	**Error message** Invalid position of workpiece blank corner (X1,Z1) %1 **Cause of error** The workpiece blank corner was defined such that the workpiece does not fully include the ICP contour. **Error correction** Correct the coordinates (X1,Z1)
603-01E2	**Error message** Residual material in recess due to cutting edge width of recessing tool. %1 **Cause of error** Due to its cutting-edge geometry, the tool cannot reach every point in the selected machining area. **Error correction** Select another tool, or change the machining area.

Error number	Description
603-0242	**Error message** Nothing to machine for cycle in selected contour area. %1 **Cause of error** It could be that the oversize is greater than the maximum distance between limiting contour and workpiece blank contour. **Error correction** Select a smaller oversize or another machining area.
603-0243	**Error message** Nothing to machine for cycle in selected contour area. %1 **Cause of error** You selected oversizes that are greater than the max. distance between limiting contour and workpiece blank contour, or you programmed machining in an area that has already been machined. **Error correction** Select a smaller oversize or another machining range.
603-0244	**Error message** Longitudinal cutting limitation incompatible with current tool position. Position the tool. %1 **Cause of error** You defined a longitudinal cutting limitation and the tool is positioned so that the cutting limitation shields the limiting contour from the tool. **Error correction** The tool must be positioned on the same side of the cutting limitation as the limiting contour to be machined. Reposition the tool accordingly.
603-0245	**Error message** Transverse cutting limitation incompatible with current tool position. Position the tool. %1 **Cause of error** You defined a transverse cutting limitation and the tool is positioned so that the cutting limitation shields the limiting contour from the tool. **Error correction** The tool must be positioned on the same side of the cutting limitation as the limiting contour to be machined. Reposition the tool accordingly.

Error number	Description
603-0247	**Error message** Equidistant allowance contour cannot be calculated. Cycle cannot be executed. %1 **Cause of error** The equidistant replied with an error message and the equidistant was not executed. **Error correction** Inform your service agency.
603-0261	**Error message** Machining with the selected tool is impossible! Select another tool! %1 **Cause of error** The auxiliary machining direction, which results from the cutting edge geometry, is not entered in WZ_NORM. The use of the tool is therefore not permissible. **Error correction** Select another tool.
603-0281	**Error message** Tool position unknown! Position tool. %1 **Cause of error** You defined a longitudinal cutting limit. There are no valid position coordinates defined for the tool. **Error correction** Position the tool.
603-0282	**Error message** Tool position unknown! Position tool. %1 **Cause of error** A cutting limit plan was defined. There are no valid position coordinates defined for the tool. **Error correction** Position the tool.

Error number	Description
603-0283	**Error message** Tool positioned exactly on longitudinal cutting limitation. Machining area cannot be determined. %1 **Cause of error** The control cannot recognize which side of the limit along the limiting contour to machine, because the tool is located exactly on the limiting axis. **Error correction** Position the tool longitudinally on the side of the cutting limitation to be machined.
603-0284	**Error message** Tool positioned exactly on transverse cutting limitation. Machining area cannot be determined. %1 **Cause of error** The control cannot recognize which side of the limit along the limiting contour to machine, because the tool is located exactly on the limiting axis. **Error correction** Position the tool transversely on the side of the cutting limitation to be machined.
603-02A1	**Error message** Rough-machining cycle called with invalid tool! %1 **Cause of error** **Error correction** Select another tool.
603-02A2	**Error message** Recessing cycle called with invalid tool! %1 **Cause of error** **Error correction** Select another tool.
603-02A3	**Error message** Finish-machining cycle called with invalid tool! %1 **Cause of error** **Error correction** Select another tool.

Error number	Description
603-02A4	**Error message** Contour area cannot be machined with current tool either with main (+Z) or secondary cutting edge (+X). %1 **Cause of error** **Error correction** Select another contour area or another tool.
603-02A5	**Error message** Contour area cannot be machined with current tool either with main (+Z) or secondary cutting edge (-Z). %1 **Cause of error** **Error correction** Select another contour area or another tool.
603-02A6	**Error message** Contour cannot be machined with current tool either with main (+Z) or secondary cutting edge (-X). %1 **Cause of error** **Error correction** Select another contour area or another tool.
603-02A7	**Error message** Contour area cannot be machined with current tool either with main (+X) or secondary cutting edge (+Z). %1 **Cause of error** **Error correction** Select another contour area or another tool.
603-02A8	**Error message** Contour area cannot be machined with current tool either with main (+X) or secondary cutting edge (-Z). %1 **Cause of error** **Error correction** Select another contour area or another tool.

Error number	Description
603-02A9	**Error message** Contour area cannot be machined with current tool either with main (+X) or secondary cutting edge (-X). %1 **Cause of error** **Error correction** Select another contour area or another tool.
603-02AA	**Error message** Contour area cannot be machined with current tool either with main (-Z) or secondary cutting edge (+Z). %1 **Cause of error** **Error correction** Select another contour area or another tool.
603-02AB	**Error message** Contour area cannot be machined with current tool either with main (-Z) or secondary cutting edge (X). %1 **Cause of error** **Error correction** Select another contour area or another tool.
603-02AC	**Error message** Contour area cannot be machined with current tool either with main (-Z) or secondary cutting edge (-X). %1 **Cause of error** **Error correction** Select another contour area or another tool.
603-02AD	**Error message** Contour area cannot be machined with current tool either with main (-X) or secondary cutting edge (+Z). %1 **Cause of error** **Error correction** Select another contour area or another tool.

Error number	Description
603-02AE	**Error message** Contour area cannot be machined with current tool either with main (-X) or secondary cutting edge (+X). %1 **Cause of error** **Error correction** Select another contour area or another tool.
603-02AF	**Error message** Contour area cannot be machined with current tool either with main (-X) or secondary cutting edge (-Z). %1 **Cause of error** **Error correction** Select another contour area or another tool.
603-02B0	**Error message** Machining direction incompatible with contour direction. Longitudinal or transverse cycle cannot be executed. %1 **Cause of error** A longitudinal or transverse cycle was called with a tool whose machining direction does not match the limiting contour direction. **Error correction** Select another tool or change the machining direction.
603-02B1	**Error message** Recess cannot be machined with selected tool. Check RECESS and TOOL SELECTION. %1 **Cause of error** Either you attempted to machine a recess with the width 0, or you attempted to machine a radial recess with an axial tool, or vice versa. **Error correction** Check the recess and the selected tool.
603-02C1	**Error message** Approach to limiting contour at this traversing angle invalid due to cutting edge geometry! %1 **Cause of error** With the programmed tool, the approach to the limiting contour is not permissible at this angle because otherwise the side rake would gouge the workpiece. **Error correction** Select another traversing angle or another tool.

Error number	Description
603-02C2	**Error message** Travel from limiting contour at this travel angle invalid due to cutting edge geometry. %1 **Cause of error** With the programmed tool, the departure from the limiting contour is not permissible at this angle because otherwise the side rake would gouge the workpiece. **Error correction** Select another travel angle or another tool.
603-02C3	**Error message** Transverse cutting limitation incompatible with current tool position. Position the tool. %1 **Cause of error** The present tool position and the selected longitudinal cutting limitation make it impossible to machine the limiting contour in the roughing cycle. **Error correction** Position the tool so that it is on the other side of the cutting limitation axis, or select another transverse cutting limitation.
603-02C4	**Error message** Longitudinal cutting limitation incompatible with current tool position. Position the tool. %1 **Cause of error** The present tool position and the selected longitudinal cutting limitation make it impossible to machine the limiting contour in the roughing cycle. **Error correction** Position the tool so that it is on the other side of the cutting limitation axis, or select another longitudinal cutting limitation.
603-02E1	**Error message** Longitudinal cutting limitation incompatible with current tool position. Position the tool. %1 **Cause of error** The present tool position and the selected longitudinal cutting limitation make it impossible to machine the limiting contour in the recessing cycle. **Error correction** Position the tool so that it is on the other side of the cutting limitation axis, or select another longitudinal cutting limitation.

Error number	Description
603-02E2	**Error message** Transverse cutting limitation incompatible with current tool position. Position the tool. %1 **Cause of error** The present tool position and the selected longitudinal cutting limitation make it impossible to machine the limiting contour in the recessing cycle. **Error correction** Position the tool so that it is on the other side of the cutting limitation axis, or select another transverse cutting limitation.
603-0301	**Error message** Insufficient memory for individual contour areas. Cycle cannot be executed. Reduce machining area. %1 **Cause of error** The limiting contour switches so often with the workpiece contour that the individual limiting contour areas cannot be saved in the contour list. **Error correction** Reduce the machining area and try again.
603-0321	**Error message** Incorrect tool for machining. Select WO 2 or WO 8. %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select on of the proposed tools.
603-0322	**Error message** Incorrect tool for machining. Select WO 4 or WO 6. %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.

Error number	Description
603-0323	**Error message** Incorrect tool for machining. Select WO 5 or WO 7. %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.
603-0324	**Error message** Incorrect tool for machining. Select WO 1 or WO 3 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools..
603-0325	**Error message** Incorrect tool for machining. Select WO 1 or WO 2 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.
603-0326	**Error message** Incorrect tool for machining. Select WO 2 or WO 3 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.
603-0327	**Error message** Incorrect tool for machining. Select WO 3 or WO 4 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.

Error number	Description
603-0328	**Error message** Incorrect tool for machining. Select WO 4 or WO 5 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.
603-0329	**Error message** Incorrect tool for machining. Select WO 5 or WO 6 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.
603-032A	**Error message** Incorrect tool for machining. Select WO 6 or WO 7 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.
603-032B	**Error message** Incorrect tool for machining. Select WO 7 or WO 8 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.
603-032C	**Error message** Incorrect tool for machining. Select WO 8 or WO 1 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.

Error number	Description
603-032D	**Error message** Incorrect tool for machining. Select WO 2, WO 3, WO 5 or WO 6 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools. CAUTION: The selection of the tool determines whether the contour is machined from the left or right!
603-032E	**Error message** Incorrect tool for machining. Select WO 1, WO 2, WO 6 or WO 7 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools. {0>ACHTUNG:<}0{>CAUTION:<0} The selection of the tool determines whether the contour is machined from the left or from the right!
603-032F	**Error message** Incorrect tool for machining. Select WO 1, WO 8, WO 3 or WO 4 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools. ACHTUNG: The selection of the tool determines whether the contour is machined from the left or right!
603-0330	**Error message** Incorrect tool for machining. Select WO 4, WO 5, WO 7 or WO 8 %1 **Cause of error** An unsuitable tool was chosen for the intended operation. **Error correction** Select one of the proposed tools CAUTION: The selection of the tool decides whether cutting is on the left or right of the contour!

Error number	Description
603-0331	**Error message** Incorrect tool for machining. Select WO 1, WO 3, WO 5 or WO 7 %1 **Cause of error** An unsuitable tool was chosen for the intended operation. **Error correction** Select one of the proposed tools CAUTION: The selection of the tool decides whether cutting is on the left or right of the contour!
603-0332	**Error message** Incorrect tool for machining. Select WO 2, WO 4, WO 6 or WO 8 %1 **Cause of error** An unsuitable tool was chosen for the intended operation. **Error correction** Select one of the proposed tools CAUTION: The selection of the tool decides whether cutting is on the left or right of the contour!
603-0333	**Error message** The machining contour exceeds the center of turning Modify the corresponding coordinates! %1 **Cause of error** The machining contour corners were programmed past the turning center **Error correction** Enter the coordinates so they all lie on one side of the center of rotation
603-0334	**Error message** No surface for machining Cycle has nothing to process! %1 **Cause of error** The cycle cannot calculate a machining surface because the contour only consists of one paraxial segment. **Error correction** Edit the entered coordinates

Error number	Description
603-0335	**Error message** Tool position not permissible! Position in front of, or over the machining area! %1 **Cause of error** The cycle cannot move the tool from its given position to the starting point of machining without danger of collision. **Error correction** Position the tool in front of or over the machining area
603-0336	**Error message** RAM data memory is full! Contact Service! %1 **Cause of error** Insufficient memory for contour calculation **Error correction** This problem can only be fixed by service personnel.
603-0337	**Error message** Incorrect tool for turning. Select a lathe tool. %1 **Cause of error** An unsuitable tool was chosen for the intended operation. **Error correction** Select one of the proposed tools CAUTION: The selection of the tool decides whether cutting is on the left or right of the contour!
603-0338	**Error message** Incorrect tool for cutting off. Select a recess. tool. %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools. CAUTION: The selection of the tool determines whether the contour is machined from the left or right!

Error number	Description
603-0339	**Error message** Incorrect tool for machining. Select WO 1, WO 3 or WO 2. %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools..
603-033A	**Error message** Incorrect tool for machining. Select WO 1, WO 3 or WO 4. %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.
603-033B	**Error message** Incorrect tool for machining. Select WO 2, WO 8 or WO 1. %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select on of the proposed tools.
603-033C	**Error message** Incorrect tool for machining. Select WO 2, WO 8 or WO 7. %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select on of the proposed tools.
603-033D	**Error message** Incorrect tool for machining. Select WO 4, WO 6 or WO 3. %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select on of the proposed tools.

Error number	Description
603-033E	**Error message** Incorrect tool for machining. Select WO 4, WO 6 or WO 5. %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select on of the proposed tools.
603-033F	**Error message** Incorrect tool for machining. Select WO 5, WO 7 or WO 6. %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.
603-0340	**Error message** Incorrect tool for machining. Select WO 5, WO 7 or WO8. %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.
603-0341	**Error message** Incorrect tool for machining. Select WO 1, WO 2, WO 3, WO 4 or WO 5 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.
603-0342	**Error message** Incorrect tool for machining. Select WO 3, WO 4 or WO 5 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.

Error number	Description
603-0343	**Error message** Incorrect tool for machining. Select WO 3, WO 4, WO 5, WO 6 or WO 7 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.
603-0344	**Error message** Incorrect tool for machining. Select WO 5, WO 6 or WO 7 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.
603-0345	**Error message** Incorrect tool for machining. Select WO 5, WO 6, WO 7, WO 8 or WO 1 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.
603-0346	**Error message** Incorrect tool for machining. Select WO 7, WO 8 or WO 1 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.
603-0347	**Error message** Incorrect tool for machining. Select WO 7, WO 8, WO 1, WO 2 or WO 3 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.

Error number	Description
603-0348	**Error message** Incorrect tool for machining. Select WO 1, WO 2 or WO 3 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.
603-0355	**Error message** Incorrect tool for machining. Select WO 5, WO 6, WO 7, WO 8 or WO 1 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.
603-0356	**Error message** Incorrect tool for machining. Select WO 7, WO 8 or WO 1 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.
603-0357	**Error message** Incorrect tool for machining. Select WO 7, WO 8, WO 1, WO 2 or WO 3 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.
603-0358	**Error message** Incorrect tool for machining. Select WO 1, WO 2 or WO 3 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.

Error number	Description
603-0359	**Error message** Incorrect tool for machining. Select WO 1, WO 2, WO 3, WO 4 or WO 5 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.
603-035A	**Error message** Incorrect tool for machining. Select WO 3, WO 4 or WO 5 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.
603-035B	**Error message** Incorrect tool for machining. Select WO 3, WO 4, WO 5, WO 6 or WO 7 %1 **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.
603-035C	**Error message** Incorrect tool for machining. Select WO 5, WO 6 or WO 7 %1 The main cutting direction does not fit the contour. **Cause of error** An unsuitable tool was selected for the next operation. **Error correction** Select one of the proposed tools.
603-0360	**Error message** Invalid tool orientation for transverse machining (roughing) **Cause of error** In the facing cycle (transverse machining), tool orientations 2 and 6 are not possible for roughing **Error correction**

Error number	Description
603-0361	**Error message** Invalid tool orient. for longitudinal machining (roughing) **Cause of error** In longitudinal machining, tool orientations 4 and 8 are not possible for roughing **Error correction**
603-0366	**Error message** The cycle cannot completely create the programmed contour; residual material will remain. %1 **Cause of error** Aufgrund von z. B. der Schneidengeometrie und/oder dem Anstellwinkel zwischen Werkzeug und Werkstück kann der Zyklus Teile der programmierten Kontur nicht erreichen. **Error correction** Prüfen Sie die aktuelle Bearbeitungssituation und beurteilen Sie, ob - die zu bearbeitende Kontur - das gewählte Werkzeug - die gewählte Anstellung - der programmierte Zyklus der geforderten Bearbeitung entspricht bzw. korrigieren Sie diese. Prüfen Sie, ob ein evtl. nachfolgender (Schlicht-)Zyklus das Restmaterial ohne Überlastung des Werkzeugs bearbeiten kann und korrigieren Sie auch hier gegebenenfalls die oben genannten Parameter. Falls das verbleibende Restmaterial für ihre Bearbeitungssituation akzeptabel ist, können Sie diese Meldung ignorieren.
605-024E	**Error message** Programmed cutting depth too small %1 **Cause of error** The programmed value is too small. **Error correction** Check the NC program
605-0278	**Error message** Feed axis is already braked in the thread %1 **Cause of error** The run-out length P in the thread cycle G31 is less than the cutting width SB of the tool being used. **Error correction** Enter a run-out length P at least as large as the cutting width SB of the tool, or select a tool with a smaller cutting width SB.

Error number	Description
605-0279	**Error message** Feed axis is still accelerated in the thread %1 **Cause of error** The run-in distance of the feed axis is too small. The tool cannot achieve the speed necessary in order to cut the thread correctly. **Error correction** Increase the run-in length B
605-027A	**Error message** Determined run-in length is too short %1 **Cause of error** The space automatically determined from the recess or undercut is too short for the run-in length. **Error correction** Program a run-in length, or increase the recess or undercut
605-027B	**Error message** Determined run-out length is too short %1 **Cause of error** The space automatically determined from the recess or undercut is too short for the run-out length. **Error correction** Program a run-out length, or increase the recess or undercut
605-032C	**Error message** "TOOL_P" configured without tool magazine **Cause of error** The path to a pocket table was given in the machine configuration although no tool magazine is configured. Access by the PLC run-time system to the pocket table is enabled through the symbolic name "TOOL_P" only for tool magazines. **Error correction** Adapt the machine configuration: - Delete the "TOOL_P" path for the pocket table if no tool magazines are configured.

Error number	Description
605-032D	**Error message** Tool magazine configured without path for "TOOL_P" **Cause of error** Tool magazines were configured without the TOOL_P path for the pocket table. **Error correction** Adapt the machine configuration: - Enter the symbolic name "TOOL_P" for the pocket table in CfgTablePath - Enter the path to the pocket table under "TOOL_P"
605-0342	**Error message** Active tool pocket unknown **Cause of error** The tool change was canceled. **Error correction** - Correct any pending error messages and repeat - Inform your service agency
605-0344	**Error message** Protective zone monitoring not allowed in axis system with B axis **Cause of error** The protection zone monitor in the axis system does monitor any position changes of the tool by rotary axes (e.g. the B axis). **Error correction** - Activation of the expanded protection zone monitor is required (MP_enhancedProtZone = 2: Machine base system) - In addition, for machines with rear-face machining, adjust-ments in the kinematics is required - Contact the machine tool builder - Inform your service agency
605-0358	**Error message** Starting block of channel <%2> cannot be reached because other channels are already waiting at the sync. point %1 **Cause of error** The starting blocks were set on the individual channels in such a manner that, because of sync. points, they cannot be reached. **Error correction** Cancel the mid-program startup, and set the starting block before the sync. point.

Error number	Description
605-0359	**Error message** Program run blocked due to a serious error (e.g., configuration data or table) %1 **Cause of error** The configuration data or tables are not complete. Reliable program execution cannot be performed. See the LogFile.log for more information. **Error correction** Correct the configuration data and complete the tables.
606-0062	**Error message** Calculation of the approach path not possible %1 **Cause of error** All calculated approaching paths damage the workpiece. **Error correction** Select another tool position
606-02E2	**Error message** Area to be machined was not provided %1 **Cause of error** The area to be machine has not been provided. **Error correction** - Check the NC program - Contact your service agency if the error occurs during program generation with TURN PLUS
606-02E3	**Error message** A negative safety clearance is not allowed %1 **Cause of error** Global machining parameters are incorrect or safety clearance is set to an invalid value **Error correction** Revise the global machining parameters or set the safety clearance before the cycle call
606-0343	**Error message** No valid cutting depth was defined; cycle is working with 2/3 of the tool’s max. cutting depth %1 **Cause of error** The value of the G function’s P parameter is less than or equal to 0. **Error correction** Reset the P parameter of the NC block

Error number	Description
606-0345	**Error message** Internal memory of calculating the cuts is full %1 **Cause of error** The cycle needs too much memory space to save all cut lines. Example: 50 mm oversize with 0.003 mm cutting depth. **Error correction** Enter a larger cutting depth
606-0385	**Error message** Too many stepping angles for simultaneous turning cycle **Cause of error** Calculation of the simultaneous turning cycle takes too long because the resolution of the angle range is too high. The resolution was reduced automatically. **Error correction**
606-0386	**Error message** Not a valid machining contour for simultaneous turning cycle No valid tool contour for simultaneous turning cycle **Cause of error** - The cycle has received an invalid contour. - Internal software error. **Error correction** Check the contour: workpiece blank, tool holder, and machining contour must be closed. All elements must be greater than zero. - Inform your service agency.
606-0387	**Error message** Contour elements not properly marked (simultaneous turning) **Cause of error** The contour elements of the center point contour are not correctly marked for the simultaneous turning cycle. **Error correction** The following conditions must be fulfilled: - An open space of the contour must be marked as "CYC". - The starting element of the space must be the first element of the contour.

Error number	Description
606-0388	**Error message** Internal error in the simultaneous turning cycle **Cause of error** Due to an internal error, the simultaneous turning cycle could not be executed. **Error correction** - See "INTERNAL INFO" for more information. - Generate the service files and inform your service agency.
606-0389	**Error message** The contour cannot be completely machined **Cause of error** With the selected parameters, the simultaneous turning cycle cannot completely finished the programmed contour without collision. **Error correction** Inasmuch as is technically meaningful, adapt the range of the inclination angle in the cycle and, if required, select another tool for machining.
606-038B	**Error message** Simultaneous turning: Tool is too far "behind" input contour **Cause of error** Correct approach and departure behavior is not possible if the tool along the Z axis is behind the workpiece blank or the machining contour. **Error correction** Position the tool farther away from the chuck (along Z+) in order to enable correct approach and departure behavior.
606-038C	**Error message** The tilting motion results in a collision with the tool **Cause of error** The cycle could not rotate the tool from the initial inclination to the start inclination calculated by the cycle, or from the end inclination back to the initial inclination. **Error correction** Position the tool outside the collision range, farther away from the workpiece.
606-038D	**Error message** Simultaneous turning: Tool tip radius must not be null **Cause of error** The simultaneous turning cycle requires a tool with a cutter radius greater than zero. **Error correction** Select another tool for the operation

Error number	Description
606-038E	**Error message** Tool position not defined **Cause of error** For open contours, the tool position must be programmed for the simultaneous turning cycle. **Error correction** Enter whether the tool should move to the right or left of the contour.
606-0391	**Error message** Collision-free approach/departure could not be calculated **Cause of error** No collision-free approach/departure paths could be calculated for the given turning contour and position of the tool. **Error correction** It may be that the contour does not allow collision-free approach/departure paths. Check the contour, and correct the position of the tool if necessary.
606-0392	**Error message** Desired inclination angles can't be reached without collision Cannot reach desired angle of incidence at beginning of contour %1 **Cause of error** The cycle could not be run because the programmed inclination angles could cause collisions. **Error correction** Change the NC program - adjust the inclination angle accordingly
606-0394	**Error message** Clearance angle + cutting edge angle must be less than 180 %1 **Cause of error** Clearance angle + cutting edge must not be more than 180°. **Error correction** - Decrease the clearance angle or - Select a different tool

Error number	Description
606-0396	**Error message** Cycle changes angle of incidence at starting point %1 **Cause of error** An inclination angle was defined at the beginning of machining, together with the option "do not approach". **Error correction** - Select a different type of approach or - Approach the desired inclination angle manually
606-0397	**Error message** Aux. contour of tool head faulty, collision monitoring not possible %1 **Cause of error** The description of the tool head does not include a closed envelope. **Error correction** Adapt or correct the description of the tool head.
606-0398	**Error message** Wear comp. violates holder oversize %1 **Cause of error** The wear compensations of the tool are greater than the selected holder oversize **Error correction** Check the wear compensations and the holder oversize; you might need to choose a different tool
606-0399	**Error message** Maximum infeed exceeded **Cause of error** The desired infeed must be chosen so that it is less than the maximum infeed. **Error correction** Reduce the desired infeed or increase the maximum infeed.
606-039A	**Error message** Initial tool angle not in permitted inclination range **Cause of error** The pre-positioned tool angle violates the minimum or maximum inclination angle. **Error correction** Either pre-position the tool angle within the permitted angle range or expand the angle range correspondingly

Error number	Description
606-039B	**Error message** %2 Residual material will remain %1 **Cause of error** The target contour cannot be completely machined; residual material will remain. This can be due to various reasons, such as the tool cannot reach the respective area due to geometrical reasons, the prescribed inclination angle range makes it impossible to reach the residual material, etc. **Error correction** Residual material must be considered for the subsequent machining operations.
606-039C	**Error message** The cycle cannot machine the indicated target contour **Cause of error** The cycle cannot use the defined input parameters and the selected tool to machine the target contour. **Error correction** Adapt the corresponding input parameters or adapt the target contour or select an appropriate tool.
606-039D	**Error message** Maximum infeed of tool exceeded **Cause of error** The desired infeed exceeds 2/3 of the cutting edge length of the tool. Cutting lines will be adapted if necessary. **Error correction** Reduce the desired infeed or select an appropriate tool
606-039F	**Error message** The infeed does not match the length of the cutting edge **Cause of error** Possible causes: - The current infeed is greater than the maximum cutting depth - The maximum cutting depth is greater than 2/3 of the current length of the cutting edge **Error correction** Reduce the (maximum) infeed or use an appropriate tool

Error number	Description
606-03A0	**Error message** The safety clearance is too small %1 **Cause of error** The cycle requires a greater safety clearance in order to work without collision. **Error correction** Program a greater safety clearance.
60F-0033	**Error message** Finished part no longer located within current workpiece. %1 **Cause of error** An area of the finished part, e.g. an end point, lies outside of the defined workpiece blank. This note has no effect on the program run. **Error correction**
612-0001	**Error message** System warning: %1 **Cause of error** System warning. A recoverable internal error has occurred. The process will NOT be canceled. **Error correction**
612-0002	**Error message** System error: %1 **Cause of error** A fatal error has occurred. The process will be canceled. **Error correction**
620-004D	**Error message** Tool ID %1 not found Tool not found (%1) **Cause of error** A tool not included in the tool table has been entered in the turret or magazine assignment. **Error correction** Remove the tool from the turret/magazine assignment, or add the tool to the tool table.

Error number	Description
621-003F	**Error message** Helix diameter is greater than twice the cutter diameter %1 **Cause of error** With the selected cutter diameter, material remains standing in the middle of the plunging helix. **Error correction** Program a smaller “Diameter of helix”
621-0040	**Error message** Pilot holes were calculated for a different contour %1 **Cause of error** For the calculation of the pilot hole positions, a different contour was programmed than the one in the current milling cycle. **Error correction** Change the position marker of the pilot holes or exchange the contour to be machined
621-0041	**Error message** Pilot holes were calculated for a different trochoid width %1 **Cause of error** For the calculation of the pilot hole positions, a different trochoid width was programmed than the one in the current milling cycle. **Error correction** Correct the trochoid width.
621-0042	**Error message** Pilot holes were calculated with a different oversize %1 **Cause of error** For the calculation of the pilot hole positions, a different oversize was programmed than the one in the current milling cycle. **Error correction** Correct the oversize

Error number	Description
621-0043	**Error message** No corners for trochoidal milling present %1 **Cause of error** For slots and circular pockets, there are no corners to be milled trochoidally. **Error correction** Program the machining operation as “Complete” or “W/o corner machining”
621-0044	**Error message** Pilot holes on the other side of the contour %1 **Cause of error** For the calculation of the pilot hole positions, a different tool position was programmed than the one in the current milling cycle. **Error correction** Correct the tool position
621-0045	**Error message** Tool diameter is too large %1 **Cause of error** The tool diameter must be smaller than the plunging length or the diameter of the helix. **Error correction** Use a suitable tool
621-0047	**Error message** Cutter diameter must be less than the trochoid width %1 **Cause of error** With the current cutter diameter and the programmed trochoid width, no trochoidal paths can be calculated. **Error correction** Select a cutter with smaller diameter, or program a larger trochoid width
621-0048	**Error message** Radius for return greater than half the trochoid width %1 **Cause of error** With the programmed radius, the path for return lies outside of the trochoidal path. **Error correction** Program a smaller radius for return or a larger trochoid width

Error number	Description
621-0049	**Error message** Trochoid width smaller than plunging helix radius %1 **Cause of error** The plunging paths lie partially outside of the trochoidal path. **Error correction** Program a smaller plunging helix or larger trochoid width
621-004A	**Error message** Pilot holes not present %1 **Cause of error** No position markers were programmed under the specified position marker. **Error correction** Correct the position marker
621-004B	**Error message** Depth of the pilot hole less than the milling depth %1 **Cause of error** The drilling depth must not be less than the milling depth. **Error correction** Correct the drilling or milling depth
621-004C	**Error message** No trochoid width programmed %1 **Cause of error** Without a specified trochoid width, the cycle cannot calculate any paths. **Error correction** Program the trochoid width
621-004D	**Error message** Programmed oversize too large %1 **Cause of error** The oversize is so large that inside machining of the contour is no longer possible. **Error correction** Correct the oversize

Error number	Description
621-004E	**Error message** Programmed trochoid width too large %1 **Cause of error** The trochoid width must be less than the slot width or rectangle width when the oversize values are taken into account. **Error correction** Correct the trochoid width.
663-04EA	**Error message** Error when loading a dialog: %1 **Cause of error** The dialog box could not be opened because of a faulty or missing dialog description by the machine manufacturer. **Error correction** Inform your service agency Inform your machine tool builder
900-0BB8	**Error message** File '%1' not found **Cause of error** The given file path does not refer to a graphic file. **Error correction** Select another graphic file.
900-0BB9	**Error message** Failed to send internal message **Cause of error** Error in the internal system communication. **Error correction** Inform your service agency.
900-0BBA	**Error message** Unable to open configuration server queue **Cause of error** Error in the internal system communication. **Error correction** Inform your service agency.
900-0BBB	**Error message** Unable to read configuration data '%1' **Cause of error** Error in the internal system communication. **Error correction** Inform your service agency.

Error number	Description
900-0BBC	**Error message** Configuration data '%1' could not be written **Cause of error** Error in the internal system communication. **Error correction** Inform your service agency.
900-0BBD	**Error message** Internal error! **Cause of error** Internal GRED software error. **Error correction** Inform your service agency.
900-0BBE	**Error message** Internal error: %1 **Cause of error** Internal GRED software error. **Error correction** Inform your service agency.
900-0BBF	**Error message** Invalid data in graphic file: %1 **Cause of error** The existing data cannot be read as graphic data. **Error correction** - Correct/remove and save the corresponding data, or - Delete the graphic file and make a new one
900-0BC0	**Error message** No graphic file: %1 **Cause of error** The specified file cannot be read as a graphic file. **Error correction** Select another graphic file.
900-0BC1	**Error message** Missing object '%1' **Cause of error** Missing object in the selected graphic file. **Error correction** - Add the corresponding object and save, or - Delete the graphic file and make a new one

Error number	Description
900-0BC2	**Error message** Object '%1' is incomplete **Cause of error** Missing object elements in the selected graphic file. **Error correction** - Correct the corresponding object and save, or - Delete the graphic file and make a new one
900-0BC3	**Error message** Object '%1' already exists **Cause of error** Displayed object already exists in the selected graphic file. **Error correction** - Remove the redundant object and save, or - Delete the graphic file and make a new one
900-0BC4	**Error message** Working plan '%1' is incomplete **Cause of error** Steps are still missing in the displayed working plan. **Error correction** - Add the missing work steps and save, or - Remove all entries in the working plan
900-0BC5	**Error message** Geometry object list is incomplete **Cause of error** More geometry objects are needed to fully describe the workpiece form. **Error correction** - Add the missing geometry objects and save, or - Delete the graphic file and make a new one
900-0BC6	**Error message** Redundant object '%1' present **Cause of error** A redundant object is in the selected graphic file and will no longer be used. **Error correction** Remove the redundant object manually and save: - Remove the object in the graphic file and save the file, or - Resave the loaded graphic file

Error number	Description
900-0BC7	**Error message** Environment variable '%1' not defined **Cause of error** Internal GRED NC program template error. **Error correction** Inform your service agency.
900-0BC8	**Error message** Control structure variable '%1' not defined **Cause of error** Internal GRED NC program template error. **Error correction** Inform your service agency.
900-0BC9	**Error message** Maximum nesting depth of control structures has been reached **Cause of error** Internal GRED NC program template error. **Error correction** Inform your service agency.
900-0BCA	**Error message** Faulty composition of control structure **Cause of error** Internal GRED NC program template error. **Error correction** Inform your service agency.
900-0BCB	**Error message** Unknown control structure '%1' **Cause of error** Internal GRED NC program template error. **Error correction** Inform your service agency.
900-0BCC	**Error message** Invalid value '%1' in object '%2' **Cause of error** There is an incorrect attribute value in the current object. **Error correction** Use a text editor to check and correct the attribute value in the object and to save it again to the corresponding graphic file.

Error number	Description
900-0BCD	**Error message** Tool data incomplete: '%1' **Cause of error** Required data on the tool are missing. **Error correction** Add the required tool data to the workpiece table and save it.
900-0BCE	**Error message** Error when opening the tool table '%1' **Cause of error** The corresponding tool table cannot be opened: - Tool table is not missing in the given file path - Tool table has an invalid format - Tool table is inconsistent **Error correction** Inform your service agency.
900-0BCF	**Error message** New parameters of input form '%1' inserted **Cause of error** Some required parameters are missing in the form. **Error correction** The system has already made the correction. Please check the result!
900-0BD0	**Error message** Old parameters of input form '%1' removed **Cause of error** There are too many parameters in the current form. **Error correction** The system has already made the correction. Please check the result!
900-0BD1	**Error message** Variable name '%1' already exists **Cause of error** Internal GRED NC program template error. **Error correction** Inform your service agency.

Error number	Description
900-0BD2	**Error message** Graphic file '%1' cannot be opened **Cause of error** An error occurred when the graphic file was opened. **Error correction** Ensure that the graphic file exists, that the given path is correct, and that the file is in a readable format.
900-0BD3	**Error message** Graphic file '%1' is too large **Cause of error** The graphic file does not fit into the space provided. **Error correction** Ensure that the graphic file fulfills the required dimensions.
900-0BD4	**Error message** Error when writing the tool data '%1' **Cause of error** The tool cannot be saved to the table. **Error correction** Check the corresponding tool data.
900-0BD5	**Error message** Object '%1' is faulty **Cause of error** Incorrect object elements in the selected graphic file. **Error correction** Correct the corresponding object and save.
900-0BD6	**Error message** Parameter '%1' not defined **Cause of error** The given parameter is not fully defined in the configuration. **Error correction** Complete the definition of the configuration and save.
900-0BD7	**Error message** Environment variable '%1' not initialized **Cause of error** Internal GRED NC program template error. **Error correction** Inform your service agency.

Error number	Description
900-0BD8	**Error message** Error when reading the tool data '%1' **Cause of error** Required data on the tool are missing. **Error correction** Add the corresponding tool data.
900-0BD9	**Error message** Configuration data are incomplete **Cause of error** The given references/information regarding configuration data are incomplete. **Error correction** Complete the configuration data.
900-0BDA	**Error message** Parameter '%1' not allowed in this formula! **Cause of error** The input form lists an illegal parameter that cannot be evaluated. **Error correction** Remove the corresponding form parameter and replace it with another.
900-0BDB	**Error message** Configuration object '%1' is faulty **Cause of error** Configuration object has incorrect or incomplete data. **Error correction** Correct the configuration object and save.
903-0001	**Error message** Starting position of noncircular contour not in workpiece system Starting position of noncircular contour not in workpiece system **Cause of error** - Axis-value programming is active **Error correction** - Edit the program

Error number	Description
903-0002	**Error message** Polar starting position is programmed incrementally Polar starting position is programmed incrementally **Cause of error** The radius or angle of the polar-programmed starting position is programmed incrementally **Error correction** Edit the program or the cycle
903-0003	**Error message** Starting position is programmed incrementally Starting position is programmed incrementally **Cause of error** Polar programmed starting position is programmed incrementally **Error correction** Edit the program or the cycle
903-0004	**Error message** Relative programming of the reciprocation starting position is not allowed Relative programming of the reciprocation starting position is not allowed **Cause of error** Starting position of the reciprocation is programmed in relative values **Error correction** Program the starting position with absolute values
903-0005	**Error message** Absolute programming of the relief vector is not allowed Absolute programming of the relief vector is not allowed **Cause of error** - Relief vector was programmed absolutely instead of incrementally **Error correction** - Program the relief vector incrementally

Error number	Description
903-0006	**Error message** Relative programming of the infeed starting position is not allowed! Relative programming of the infeed starting position is not allowed! **Cause of error** Starting position of the infeed is programmed in relative values **Error correction** Program the starting position with absolute values
903-0007	**Error message** Programmed axis is not a grinding axis Programmed axis is not a grinding axis **Cause of error** Wrong axis selected for grinding **Error correction** Program a grinding axis
903-0008	**Error message** Programmed value is not interpreted as a coordinate Programmed value is not interpreted as a coordinate **Cause of error** Presumably a system error **Error correction** Inform your service agency
903-0009	**Error message** Incremental programming of the starting position is not allowed Incremental programming of the starting position is not allowed **Cause of error** Starting position is programmed incrementally **Error correction** Program the starting position with absolute values
903-000A	**Error message** Reciprocation over zero length is not allowed Reciprocation over zero length is not allowed **Cause of error** **Error correction** - Edit the program

Error number	Description
905-2711	**Error message** Pre-position [Ls] **Cause of error** **Error correction**
905-2712	**Error message** Thread type (0=ext. / 1=int.) **Cause of error** **Error correction**
905-2713	**Error message** Thread pitch **Cause of error** **Error correction**
